CONTENTS.

ERRATA FOR VOLUME C OF THE OFFICIAL GAZETTE.

ANNOUNCEMENTS—VOLUME C.

DISCLAIMERS—VOLUME C.

TEXT OF THE OFFICIAL GAZETTE, JULY 1 TO SEPTEMBER 30, 1902, INCLUSIVE.

INDEX TO THE DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

INDEX OF PATENTS AND PATENTEES FOR THE QUARTER YEAR, JULY TO SEPTEMBER, 1902.

ERRATA.

703,915, page 198, in heading, name of patentee, for "James G. Halapiens" read *James G. Halapiens.*

704,110, page 294, fourth claim, line 4, strike out the word "draft" and the hyphen following.

704,194, page 327, nineteenth claim, line 5, for the word "prevent" read *permit.*

704,490, page 442, in heading, title of invention, for "Composition for the Production of Vapors of Formaldehyde" read *Composition for the Production of Vapors of Formic Aldehyde.*

704,706, page 535, first claim, line 1, for the word "main" read *name.*

705,442, page 873, in heading, name of patentee, for "Isaac Rallston" read *Isaac Rallston.*

706,102, page 1154, in heading, assignment, name of assignee, for "Pendleton-Topscott Company" read *Pendleton-Tapscott Company.*

707,498, page 1736, claim, line 7, for the compound word "pawl-plate" read *awl-plate.*

708,166, page 2045, in heading, assignment, name of assignee, for "The American Automatic Photographic Company" read *The American Automatic Photograph Company.*

708,167, page 2046, in heading, assignment, name of assignee, for "The American Automatic Photographic Company" read *The American Automatic Photograph Company.*

708,168, page 2046, in heading, assignment, name of assignee, for "American Automatic Photographic Company" read *The American Automatic Photograph Company.*

708,197, page 2060, in heading, assignment, name of assignee, for "Compagny Albert Masifat and Co." read *Albert Matifat and Co.*

708,236, page 2072, ninth claim, lines 10–11, for the word "cylinder" read *chamber.*

708,493, page 2162, in heading, assignment, name of assignee, for "American Automatic Photographic Company" read *The American Automatic Photograph Company.*

709,446, page 2584, fifth claim, lines 5–6, for the compound word "weft-works" read *weft-forks.*

709,808, page 2746, third claim, lines 1–2, strike out the words "containing non-crystalline" and insert *of,* and same claim, line 3, strike out the word "of" and insert *containing non-crystalline.*

709,867, page 2784, first claim, line 2, after the word "arc" insert the words *of minimum volume,* and same claim, line 4, strike out the words "of minimum volume."

710,286, page 2957, in heading, after residence of patentee, insert *assignor to Charles T. Schoen, Philadelphia, Pa.*

710,305, page 2964, in heading, second-mentioned patentee, for Emil Krvaysser" read *Emil Kwaysser.*

Disclaimer.

604,125.—*William Rogers*, Leechburg, Pa. PROCESS OF AND APPARATUS FOR MANUFACTURING TIN-PLATE. Patent dated May 17, 1898. Disclaimer filed June 23, 1902, by the executor of said WILLIAM ROGERS and the present assignees.

Enter their disclaimer—

"To those parts of the specification which are in the following words:

On line 102 of the first page of the said specification the words "or other coating metal."

Page 4, the 6th, 7th, 8th, 9th, 10th, 11th, 12th, and 13th lines, as follows:

"In the above description I have spoken of my invention as applied to the purpose of making tin-plate; but it is also applicable to the manufacture of terne-plate or sheet-iron covered with a mixture in various proportions of tin and lead or of zinc or other metal which is capable of being coated onto the surface of sheet metal."

Claim 1, lines 2 and 3, the words "or other coating metal or alloy."

Claim 2, line 2, the words "or other metal or alloy."

Claim 4, lines 2 and 3, the words "or other metal-coated sheets."

Claim 5, lines 1 and 2, the words "or other metal-coated sheet-iron."

Claim 5, line 10, the words "or other coating metal."

Claim 6, line 2, the words "or other metal or alloy."

Hearings.

Notice is hereby given that there will be no cases placed upon the docket to be heard by either the Commissioner or the Assistant Commissioner during the months of July and August, 1902.

F. I. ALLEN,
Commissioner.

NEW DIVISIONS.

Changes in Classification.

(ORDER No. 1,484.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 26, 1902.

On July 1, 1902, two new divisions will be established in this Office, containing the following classes, respectively:

Division XXXVII:

173. Electricity. Conductors.
175. Electricity. Special Applications.
176. Electric Lighting.
177. Electric Signaling.
219. Electric Heaters.

Division XXXVIII:

166. Artesian and Oil Wells.
215. Bottles and Jars.
35. Educational Appliances.
116. Signals.
125. Stone-Working.
211. Store Furniture.
119. Care of Live Stock.
120. Stationery.
43. Fishing and Trapping.

F. I. ALLEN,
Commissioner.

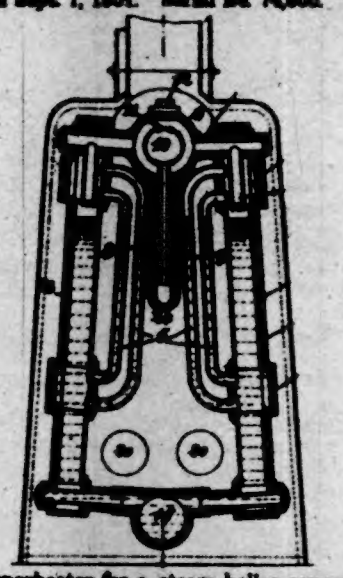
Classification Bulletin.

CLASSIFICATION BULLETIN No. 6, containing the revision made during the months of March and April, 1902, is now out. Price, ten cents.

PATENTS

GRANTED JULY 1, 1902.

703,862. STEAM-BOILER. CHARLES P. ALTHAUS, Lyons-Vaise, France. Filed Sept. 7, 1901. Serial No. 74,600. (No model.)



Claim.—A superheater for a steam-boiler comprising a cylindrical reservoir, a cylindrical drum located in said reservoir, a series of vertical tubes depending from the reservoir, tubes concentrically located within the said vertical tubes and depending from the inner drum, and a layer of refractory material protecting the parts of the superheater directly subject to the action of the heat, the parts being arranged and combined substantially as and for the purposes described.

703,863. BLANK FOR LIFE-PRESERVERS. HACHIB A. AYVAD Hoboken, N. J. Filed Dec. 2, 1901. Serial No. 84,620. (No model.)

Claim.—1. A blank for life-preservers, such blank consisting of a main portion and a narrow extension in line with one edge of the same, substantially as described.

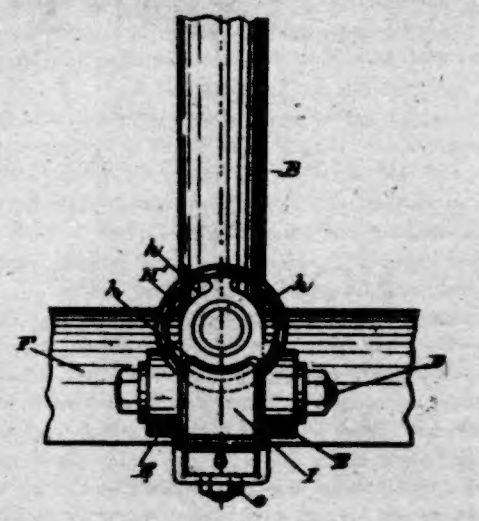
2. A blank for life-preservers, such blank consisting of a main portion and a narrow extension in line with one edge, the edge of the main portion, which is joined with the inner edge of the extension, having two similar curves, one being convex and the other concave, substantially as described.

703,864. SHAFT-SHACKLE FOR VEHICLES. SAMUEL R. BAILEY, Amesbury, Mass. Filed Jan. 25, 1902. Serial No. 91,292. (No model.)

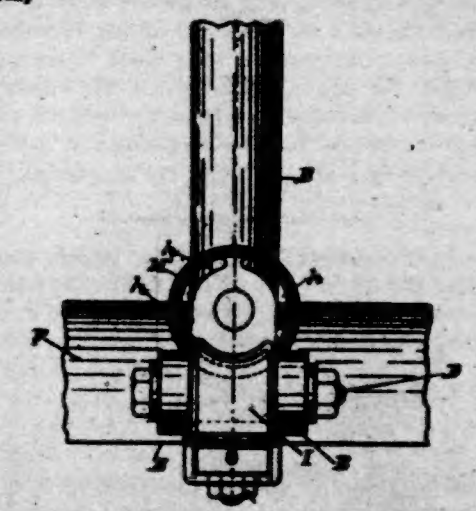
Claim.—1. In a shaft-shackle, the combination with the thill-iron terminating at its extremity in a jaw *b*, and provided on its inner face with a threaded stud *b''*, of the interiorly-threaded sleeve H, engaging said stud and provided with an adjuster, and the jaw C, journaled on said sleeve and provided with an extremity adapted to encompass the bolt D, or its elastic cushion *d*, as set forth.

2. In a shaft-shackle, the combination with the thill-iron terminating at its extremity in a jaw and recessed on its inner face, at *b'*, of a threaded stud *b''*, projecting from said recessed face, the interiorly-threaded sleeve H, engaging said stud and provided with an adjuster, and the jaw C, journaled on said sleeve, and provided with an extremity adapted to encompass the bolt D, or its elastic cushion *d*, as set forth.

3. In a shaft-shackle, the combination with the thill-iron terminating at its extremity in a jaw *b*, and recessed on its inner face at *b'*, of a threaded stud *b''*, projecting from said recessed face, the interiorly-threaded sleeve H, engaging said stud and provided with an adjuster H', and means for connecting the latter to the shaft or thill-coupling and the jaw C, journaled on the sleeve H, adapted to encompass the bolt D, or its cushion *d*, as set forth.



703,865. SHAFT-SHACKLE FOR VEHICLES. SAMUEL R. BAILEY, Amesbury, Mass. Filed Jan. 25, 1902. Serial No. 91,293. (No model.)



Claim.—1. In a shaft-shackle, the combination with the thill-iron terminating at its extremity in a jaw *b*, and provided on its inner flap with an internally-screw-threaded cylindrical sleeve or nut *b''*, of the screw-threaded bolt H, engaging said nut and provided with an adjuster, and the jaw C journaled on said bolt and adapted to encompass the bolt D, or cushion *d*, as set forth.

2. In a shaft-shackle, the combination with the thill-iron terminating at its extremity in a jaw and recessed at *b'* of an internally-screw-threaded cylindrical nut or sleeve *b''*, projecting from said recessed face, the screw-threaded bolt H engaging said nut and provided with an adjuster, and the jaw C journaled on said bolt and adapted to encompass the bolt D, or cushion *d*, as set forth.

3. In a shaft-shackle, the combination with the thill-iron terminating at its extremity in a jaw *b*, and recessed on its inner face at *b'*, of an internally-screw-threaded cylindrical sleeve or nut *b''* projecting from said recessed face, the screw-threaded bolt H, engaging said nut and provided with an adjuster H', and means for connecting the latter to the shaft or thill-coupling and the jaw C journaled on said bolt H, and adapted to encompass the bolt D, or cushion *d*, as set forth.

708,366. SLEEVE-HOLDER. ARTHUR J. BARBER, Rochester, N. Y. Filed Aug. 15, 1901. Serial No. 72,095. (No model.)

Claim.—1. A device for temporarily shortening and holding sleeves on the person comprising members pivotally connected whereby they may be closed and opened, a fabric-engaging pin situated in one of said members to engage the fabric when the member is rotated in contact therewith, and means for holding the members when closed in approximate parallelism, one within the folds of the sleeve and one without, whereby a sleeve in use may be shortened by rotating the device in contact therewith and may then be held in shortened condition by closing the members.

2. A device for temporarily shortening and holding sleeves on the person comprising members pivotally connected whereby they may be closed and opened, a fabric-engaging pin situated in one of said members to engage the fabric when the member is rotated in contact therewith, and means for holding the members when closed in approximate parallelism, one within the folds of the sleeve and one without, whereby a sleeve in use may be shortened by rotating the device in contact therewith and may then be held in shortened condition by closing the members, one of said members having an offset 10.

3. A holder for sleeves and like purposes comprising two members pivotally connected and adapted to be opened and closed, a fabric-engaging pin in one of said members, and means for holding the members in approximate parallelism when closed, said means comprising a spring surrounding one member, and a pin sliding in a fork on said member and having a head extending outside thereof and situated immediately between the spring and the other member of the holder.

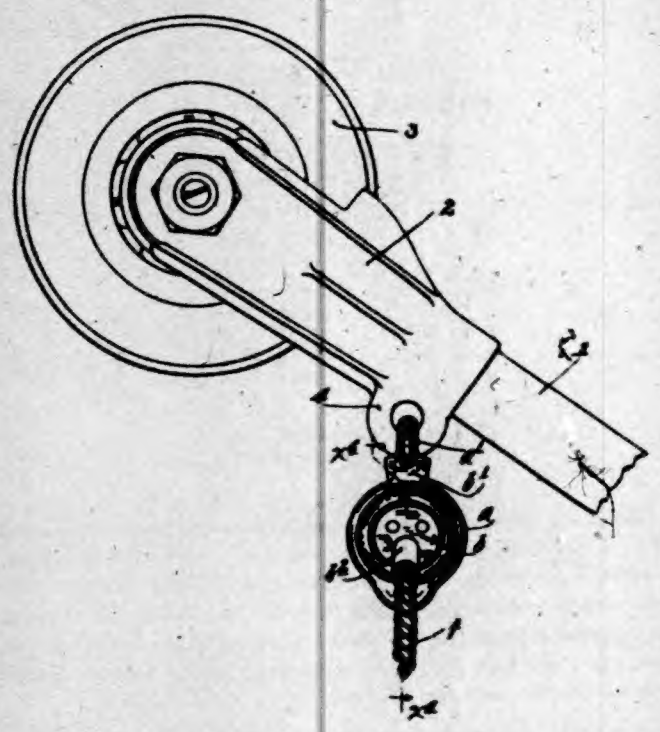
4. A device for temporarily shortening and holding sleeves on the person comprising members pivotally connected whereby they may be closed and opened, fabric-engaging pins situated in one member on opposite sides thereof to engage the fabric when the member is rotated in contact therewith, and means for holding the members when closed in approximate parallelism, one within the folds of the sleeve and one without, whereby a sleeve in use may be shortened by rotating the device in contact therewith and may then be held in shortened condition by closing the members.

5. A device for temporarily shortening and holding sleeves on the person comprising members pivotally connected whereby they may be closed and opened, a fabric-engaging pin situated in one of said members to engage the fabric when the member is rotated in contact therewith, and means for holding the members when closed in approximate parallelism, one within the folds of the sleeve and one without, whereby a sleeve in use may be shortened by rotating the device in contact therewith and may then be held in shortened condition by closing the members, said members being of substantially the same length.

708,367. ANIMAL-POKE. JOHN I. BARNES, Blooming Grove, Tex. Filed Nov. 28, 1900. Serial No. 38,080. (No model.)

Claim.—An animal-poke comprising a face-bar having opposite terminal longitudinal grooves formed in the outer surface thereof and extending outward through the respective ends of the bar, an upstanding forwardly-curved fixed guard seated in the upper groove flush with the outer surface of the bar, the inner end of the guard being passed through the bar and rebent into a socket in the back thereof and flush with its inner surface, a rigid cross-bar disposed near the upper terminal of the face-bar and secured thereto at opposite sides of the said guard serving thereby to clamp the same in place, the terminals of the bar being bent rearward to lie against the head of the animal, horn-embracing loops connected to the outer ends of the cross-bar, a swinging spring-pressed guard hinged within the lower groove and provided with a rearwardly-projecting prod working in an opening in the face-bar and with an outward-curved extremity, the two guards being braced by the opposite side walls of the respective grooves, and a jaw-embracing strap secured to the face-bar near its lower end, substantially as and for the purpose specified.

708,368. SELF-LOCKING SPRINGLESS HOOK. DELBERT R. BARTON, Racine, Wis. Filed July 27, 1901. Serial No. 69,912. (No model.)



Claim.—1. The combination with a pair of pivotally-connected members having coöperating lock-notches and the one having a hook and the other having a coöperating lock-flange, of a draft connection having interlocking engagement with the lock-notches of said members when said locking-notches are registered and normally serving to positively lock said members against rotation, the one with respect to the other, substantially as described.

2. The combination with the external member *a* having the hook *a'*, of the internal member working pivotally within said member *a* and provided with the lock-flange *b'* and notch b^2, and a draft connection applied within said notch b^2 and normally holding said lock-flange *b'* and hook *a'* in locking relations, substantially as described.

3. A pair of pivotally-connected members having coöperating locking parts, said members having coöperating relatively shallow and deep lock-notches, adapted to register when said locking parts are in locking positions, and a draft connection applied to said members and working in said lock-notches, which draft connection is normally held in said shallow lock-notch, to lock said members against rotation and is movable into said deep lock-notch to unlock said members, substantially as described.

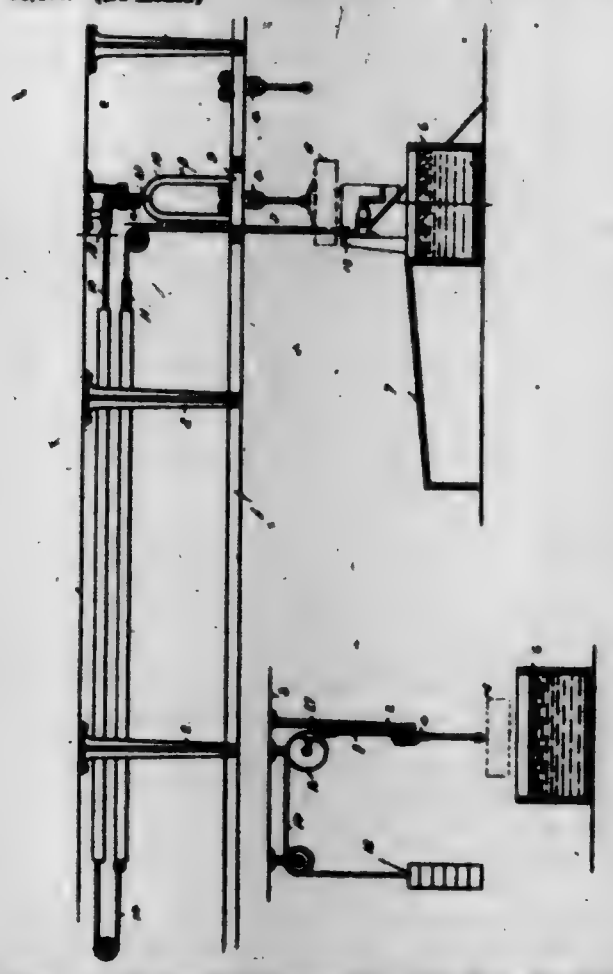
4. The combination with an annular exterior member, of disk-like interior members rotatively mounted therein, one member having a hook and the other a coöperating lock-flange, and a draft connection applied to said interior member and normally serving to hold said hook and lock-flange in locking relations, substantially as described.

708,369. ELECTRIC INSTRUMENT FOR CAUTERY. WALTER B. BATCHELLER, Chicago, Ill., assignor to George G. Hunter, Des Moines, Iowa. Filed Mar. 8, 1902. Serial No. 97,326. (No model.)

Claim.—1. In an instrument for cauterizing, an elbow-shaped handle straight on the top of one end portion and the inner end and under side of the straight portion having a chamber and the ends of two pieces of a wire conductor extended into said chamber and over each other a trigger pivoted to the handle to extend into the chamber for pressing one of the ends of the wire into contact with the end of the other wire, in the manner set forth for the purposes stated.

2. An electric centering instrument comprising an elbow-shaped handle having a straight top surface at one end portion, provided with a cavity in the under side and inner end of the straight portion, a trigger pivoted in the cavity, two pieces of a wire conductor embedded in the handle and extended into the cavity, a third piece of wire conductor embedded in the handle to extend from one end to the other and binding-screws seated at the upper end of the handle for connecting the ends of a centering-wire with the wires embedded in the handle and binding-screws at the lower end of the handle for connecting wires extending from a battery, arranged and combined to operate in the manner set forth, for the purposes stated.

708,870. PAINTING APPARATUS. CHARLES L. SAGER, Springfield, Ohio, assignor to the Warder, Bushnell & Glessner Co., Springfield, Ohio, a Corporation of Ohio. Filed May, 16, 1901. Serial No. 61,477. (No model.)



Claim.—1. In a painting apparatus, the combination, with a dipping-tank, of an elevator above the same to support the article to be treated, a counterpoise, and a compensating device interposed between the counterpoise and elevator for regulating the action of the counterpoise relatively to the elevator and the article supported thereby, substantially as described.

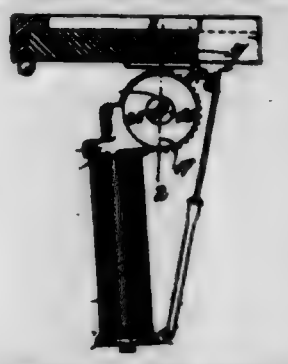
2. In a painting apparatus, the combination, with a dipping-tank, an overhead track or way, and carriers traveling thereon and adapted to have the articles to be painted suspended therefrom, of an elevator comprising a separable section of the track or way, adapted to receive a carrier when in alinement with the remainder of the track and support said carrier during the vertical travel of the elevator, a counterpoise, and a compensating device interposed between said counterpoise and elevator and adapted to regulate the resistance of said counterpoise to the depression of the elevator, substantially as described.

3. In a painting apparatus, the combination, with a dipping-tank, of an elevator located above the same and adapted to receive and support the articles to be treated, a counterpoise, and a compensating device comprising two members, one flexibly connected with the elevator and the other flexibly connected with the counterpoise, and adapted to regulate the resistance of the counterpoise to the movement of the elevator, substantially as described.

4. In a painting apparatus, the combination, with the dipping-tank and an elevator located above the same and adapted to receive and support the articles to be treated, of a counterpoise, and a compensating device comprising two members moving in unison, one of said members being circular in form, a flexible connection between said circular member and the elevator, and the other member having a cam-periphery and a flexible connection between the same and the counterpoise, substantially as described.

5. In a painting apparatus, the combination, with a dipping-tank and an elevator located above the same and adapted to receive and support the articles to be treated, of a counterpoise comprising a spring of increasing resistance, and a compensating device consisting of two members moving in unison, one of said members being a wheel or drum circular in form and having a flexible connection with the elevator, and the other of said members having a spiral periphery of decreasing radius and an interposed straight or flat portion and flexibly connected with the counterpoise-spring, substantially as described.

708,871. DOOR CHECK AND SPRING. VICTOR BEATTIEBARD, Boston, Mass., assignor of one-half to Charles E. Gooding, Boston, Mass. Filed Sept. 18, 1901. Serial No. 75,433. (No model.)



Claim.—1. In a door-check a bracket adapted to be attached to a door-casing or door and an angle-piece detachably connected to said bracket.

2. In a door-check, a bracket adapted to be attached to a door-casing or door, said bracket provided with a recess opening from one face thereof, and a hole extending from said recess to the opposite face of said bracket for the purpose specified.

3. In a door-check, a bracket adapted to be attached to a door-casing or door, in combination with an angle-piece said bracket provided with a recess opening from one face thereof, and a hole extending from said recess to the opposite face of said bracket, whereby said angle-piece may be reversibly connected to said bracket for the purpose specified.

4. In a door-check a bracket adapted to be attached to a door-casing or door and an angle-piece adjustably connected to said bracket.

5. In a door-check a spring-casing, a bracket adapted to be attached to a door-casing or a door and an angle-piece detachably connected to said spring-casing and bracket.

6. In a door-check, a spring-casing, a bracket adapted to be attached to a door-casing or door, and an angle-piece adjustably connected to said bracket and detachably connected to said spring-casing.

7. In a door-check, a bracket adapted to be fastened to a door or door-casing, a link provided with a right-angle projection at one end thereof, and a swivel-block connecting said link and bracket rotatably mounted upon said right-angle projection and rotatably mounted upon said bracket.

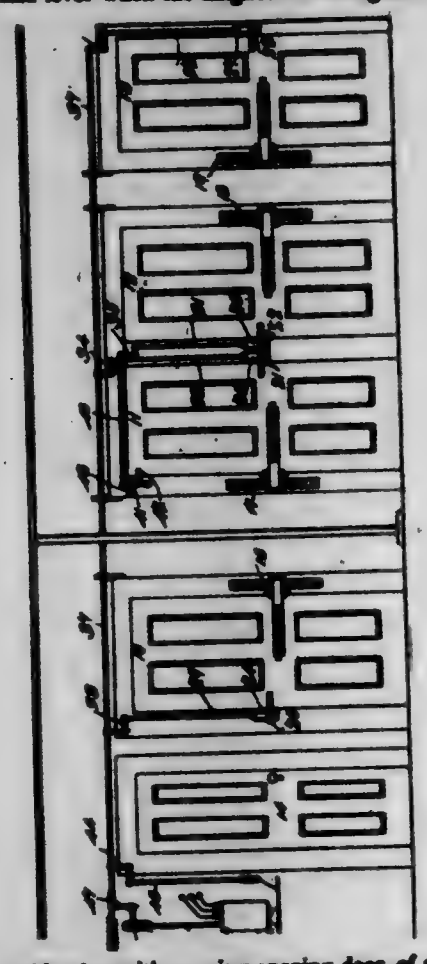
8. In a door-check a spring-casing consisting of a stationary member and a rotary member, in combination with a spring, one end of said spring connected to said rotary member, the other to said stationary member, and a link interposed between the outer end of said spring and said stationary member.

708,872. DOOR-OPERATING DEVICE. PETER J. BRUHL, Allentown, Pa., assignor of one-half to Harry F. Smith, Allentown, Pa. Filed Nov. 4, 1901. Serial No. 81,134. (No model.)

Claim.—1. The combination with a series of spring-opening doors, of a series of locking-bolts adapted to hold said doors in closed position, a main operating-rod, a series of rods and bell-crank levers connecting said main operating-rod to the series of bolts, a vertical rod, a bell-crank lever connecting the same to the main operating-rod, an actuating-weight secured to said vertical rod, a pivoted lever supporting said weight, a pivoted trip-lever adapted to engage with the weight-supporting lever, an armature carried by said trip-lever, and an electromagnet arranged in a closed electric circuit and normally acting to hold the trip-lever in engaging position, substantially as specified.

2. The combination with a door provided with a latch-bar, of a bolt

for securing the latch-bar, a bell-crank lever for operating said bolt, a rod operatively connected to said bell-crank lever, a vertical bar, a bell-crank lever connected to said rod and to the vertical bar, a weight on said vertical rod, a pivoted weight-supporting lever, a trip-lever in locking engagement therewith, an electromagnet disposed in a normally closed circuit and adapted to hold said trip-lever in engaging position, and a spring for disengaging said lever when the magnet is deënergized.



3. The combination with a spring-opening door, of a bolt, an operating-rod operatively connected to said bolt, a spring acting on said rod and normally tending to hold the bolt in locked position, a bell-crank lever having one end connected to the operating-rod, a weighted vertical rod having a slotted connection with the opposite end of said bell-crank lever, means for normally sustaining the weighted vertical rod in elevated position, an electrical alarm system, and means actuated by the alarm system for releasing said weighted bar, substantially as specified.

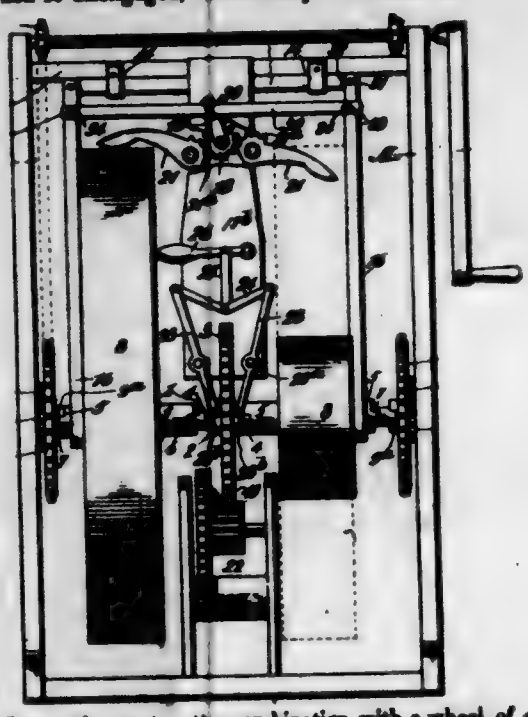
4. The combination with a plurality of doors, latches arranged on each door, bolts for engagement with said latches, a main operating-rod, bell-crank levers and connecting-rods extending between the main operating-rod and the several bolts, a spring acting on said main operating-rod and tending to normally maintain the bolts in locking position, a bell-crank lever having its vertical arm connected to said main operating-rod, a hand-operating rod or cord connected to the horizontal arm of said bell-crank lever, a weighted vertical rod having an elongated slot in its upper end, a bell-crank lever connecting the slotted end of the vertical rod to the main operating-rod, means for supporting the weighted rod in an elevated position, an electrical alarm system and means actuated by the alarm system for releasing said weighted bar, substantially as specified.

5. The combination with a door provided with a latch-bar, of a bolt for securing the latch-bar, a bell-crank lever for operating the bolt, means for operating said bell-crank lever to effect the release of the latch, a second door provided with a latch-bar, a locking-bolt therefor, a pivoted arm arranged in the path of the first door in opening, and mechanism operatively connecting said pivot-arm to said locking-bolt, substantially as specified.

6. The combination with a door provided with a latch-bar, of a bolt for securing the latch-bar, a bell-crank lever for operating the bolt, a rod for operating the bell-crank lever, an electrical alarm-circuit, means actuated by the alarm-circuit for operating the rod to release the door, a second door provided with a latch, a bolt, a vertical rod and bell-crank levers, a second horizontal rod connected to the vertical arm of the last-mentioned bell-crank lever, a bar pivoted to the second door-frame and connected to the opposite end of said second horizontal rod, and an arm on said pivoted bar in the path of the first door in opening, substantially as specified.

703,378. SPRING-MOTOR. ANDREW BUSSER, Washington, D. C. Filed Oct. 12, 1901. Serial No. 78,456. (No model.)

Claim.—1. In a spring-motor, the combination with a driven wheel, of two springs, a clutch connecting the driven wheel with each spring, levers, each of which is adapted to be struck by a corresponding spring when unwound to a predetermined extent, and means actuated by each lever to throw that spring out of clutch with the wheel and the other spring into clutch therewith, whereby the springs are alternately disengaged from the driving-wheel, and means whereby the spring may be wound when so disengaged, substantially as described.



2. In a spring-motor, the combination with a wheel, of a collar and a longitudinally-movable sleeve on each side of the wheel, the sleeves being interposed between the wheel and collars and being adapted to be clutched to either, a driving-spring secured to each sleeve, a common axle upon which the wheel is mounted and the collars and sleeves rotate, and means whereby each sleeve is automatically longitudinally moved upon the axle, and the springs are alternately thrown into clutch with the wheel and released from the corresponding collar, and released from the wheel and clutched with corresponding collar, substantially as described.

3. In a spring-motor, the combination with a wheel, having each of the ends of its hubs shouldered to form one member of a clutch, of a collar having its one end shouldered to form one member of a clutch and a longitudinally-movable sleeve, each end of each of the sleeves being slotted to form one member of a clutch on each side of the wheel, the sleeves being interposed between the wheel and collars and being adapted to be clutched to either, a driving-spring secured to each sleeve, means for rotating the said collars to wind up the springs, a common axle upon which the wheel is mounted and the collars and sleeves rotate, and means whereby each sleeve is automatically longitudinally moved upon the axle, whereby it is successively thrown into clutch with the wheel and released from the corresponding collar, and released from the wheel and clutched with the corresponding collar, substantially as described.

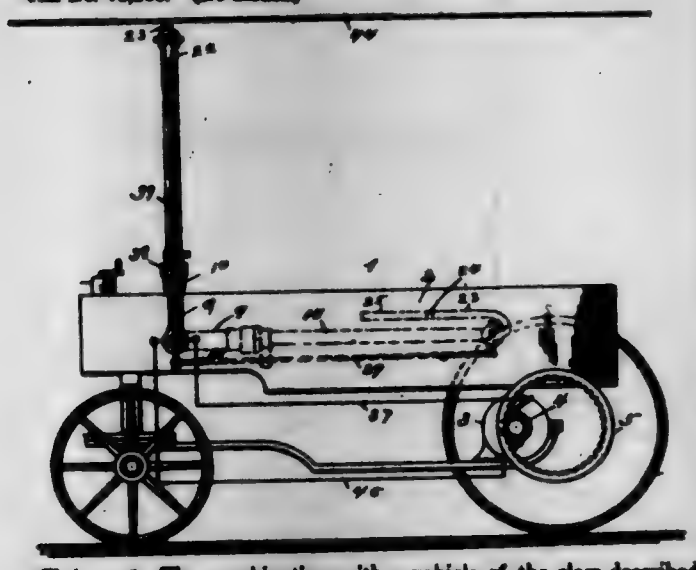
4. In a spring-motor, the combination with a wheel, of a collar and a longitudinally-movable sleeve on each side of the wheel, the sleeves being interposed between the wheel and collars, and being adapted to be clutched to either, a driving-spring secured to each sleeve, and means for rotating the said collars to wind up the springs, a common axle upon which the wheel is mounted and the collars and sleeves rotate, a sliding rod connected to the said sleeves, a pinion provided with an arm connected to the rod, and pivoted levers having circular rack-teeth upon their one ends engaging the said pinion, the opposite ends of the said levers being adapted to be struck by the spring when unwound to a predetermined extent and thus to shift the rod and the sleeves, substantially as described.

5. In a spring-motor, the combination with a driven wheel, a longitudinally-movable sleeve on each side thereof, adapted to be secured thereto, a spring secured to each sleeve, a sliding rod, having pivoted pendent arms, connecting the said sleeves, a link adapted to be thrown in one direction or the other by the unwinding of the several springs, and a slot-and-pin connection between the link and pendent arms, whereby the engagement of said springs with the driven wheel may be shifted and rectified, the one spring engaging therewith before the other spring is released therefrom, substantially as described.

6. In a spring-motor the combination with a driven wheel, a longitudinally-movable sleeve on each side thereof adapted to be secured thereto, a spring secured to each sleeve, pendent arms connected to the said sleeves, a lever adapted to be thrown in one direction or the other by the unwinding of the several springs, and a loose connection between the le-

ver and pendent arms, whereby the engagement of said springs with the driven wheel may be shifted and reshifted, the one spring engaging therewith before the other spring is released therefrom, substantially as described.

708,874. MECHANISM FOR ELECTRIC PROPULSION OF ROAD-VEHICLES. DANIEL S. DUNCAN, Chicago, Ill. Filed Sept. 23, 1901. Serial No. 76,208. (No model.)



Claim.—1. The combination with a vehicle of the class described of positive and negative line conductors, a motor and a jointed trolley-pole having a contact-section arranged to extend horizontally and laterally from the main or supporting pole, beneath said conductors, said horizontal section consisting of two contact portions each adapted to be brought into sliding contact with one of said conductors, said portions being insulated from each other, and means for electrically connecting one of said portions with one terminal and the other with the other terminal of said motor, whereby said contact portions may be removed from said conductors at will and again brought into contact therewith while permitting a considerable lateral variation in the relative position of the vehicle with respect to that of said line conductors.

2. The combination with a vehicle of the class described of positive and negative line conductors, a motor and a folding or jointed trolley-pole having insulated contact-sections, one being electrically connected with one and the other with the other terminal of said motor, and means for bringing said sections into sliding contact with said line conductors respectively.

3. The combination with a vehicle of the class described, of a motor, a double-jointed tubular trolley-pole the portion constituting the outer joint being divided into two contact-sections insulated from but rigid with each other, means for electrically connecting said sections with the respective terminals of said motor, and means controllable from the seat of the operator for manipulating said pole, whereby said contact-sections may respectively be brought into sliding contact with outward and return electrical conductors.

4. The combination with a vehicle of the class described, of a motor, a trolley-pole pivotally mounted at its lower end upon a horizontal axis, a two-part section jointed to the upper or free end of the main pole, the two parts of said section being rigid with but insulated from each other, means for electrically connecting said parts respectively with the terminals of said motor, an arm rigidly connected with said two-part section at its pivotal point, and a pivoted rod arranged parallel with said main pole and connecting the free end of said arm with a stationary point upon said vehicle.

5. The combination with a vehicle of the class described, of a motor, a trolley-pole pivotally mounted at its lower end upon a horizontal axis, a two-part section jointed to the upper or free end of the main pole, the two parts of said section being rigid with but insulated from each other, means for electrically connecting said parts respectively with the terminals of said motor, an arm rigidly connected with said two-part section at its pivotal point, a pivoted rod arranged parallel with said main pole and connecting the free end of said arm with a stationary point upon said vehicle, and means for moving said two-part section laterally when the same is elevated.

708,875. SEMI-AUTOMATIC BREECH-LOADING ORDNANCE. WILLIAM H. BOVARD, Washington, D. C. Filed Jan. 8, 1900. Serial No. 947. (No model.)

Claim.—1. The combination with a breech-loading gun, a recoil-mount, and a breech-block, of an arm pivoted to the gun, an arm carried by a non-recoiling part of the mount and having an operative connection with said first-mentioned arm, means for operatively connecting said first-mentioned arm with the block on counter-recoil of the gun, and means for disconnecting said arm from said block, substantially as described.

2. The combination with a breech-loading gun, a recoil-mount, and a breech-block, of an arm pivoted to the gun, an arm pivoted to a non-recoiling part of the mount and having an operative connection with said pivoted arm, means for operatively connecting said first-mentioned arm with the block on counter-recoil of the gun, and means for disconnecting said arm from said block, substantially as described.

3. The combination with a breech-loading gun, a recoil-mount, and a breech-block, of an arm pivoted to the gun, an arm pivoted to a non-recoiling part of the mount and having an operative connection with said first-mentioned arm, means for operatively connecting said first-mentioned arm with the block on counter-recoil of the gun, a spring placed under tension by said arm, and means for disconnecting said arm from said block to permit the latter to be closed by the spring, substantially as shown and described.

4. The combination with a breech-loading gun, a recoil-mount, a breech-block, and a rock-shaft for actuating said block, an arm loose on said shaft, an arm pivoted to a non-recoiling part of the mount and having an operative connection with said first-mentioned arm, and means for automatically locking said first-mentioned arm to the shaft on counter-recoil of the gun, substantially as described.

5. The combination with a breech-loading gun, a recoil-mount, a breech-block, and a rock-shaft for actuating said block, an arm loose on said shaft, an arm pivoted to a non-recoiling part of the mount and having an operative connection with said first-mentioned arm, means for automatically locking said first-mentioned arm to the shaft on counter-recoil of the gun, and means for releasing said arm from said shaft, substantially as described.

6. The combination with a breech-loading gun, a recoil-mount, and a breech-block, of an arm pivoted to the gun, an arm pivoted to the mount and having an operative connection with said first-mentioned arm, means for operatively connecting said first-mentioned arm with the block on counter-recoil of the gun, a spring placed under tension by said arm, and means for automatically releasing said first-mentioned arm from the block when a fresh cartridge is inserted in the gun, substantially as described.

7. The combination with a breech-loading gun, a recoil-mount, and a breech-block, of an arm pivoted to the gun and movable relatively to the block, means for preventing such relative movement of the arm on counter-recoil of the gun, and an arm carried by a non-recoiling part of the mount and operatively connected with said pivoted arm, substantially as described.

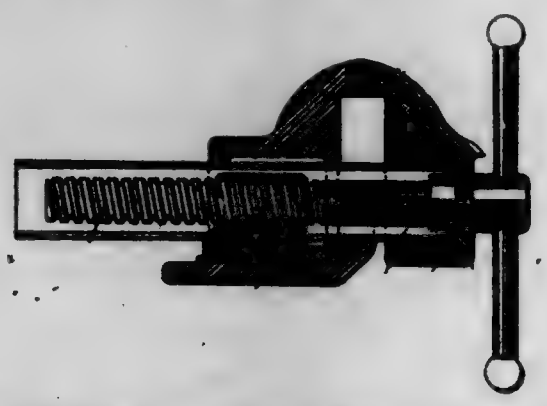
8. The combination with a breech-loading gun, a recoil-mount, and a breech-block, of an arm pivoted to the gun and movable relatively to the block, means for preventing such relative movement of the arm on counter-recoil of the gun, means for releasing said arm, an arm carried by a non-recoiling part of the mount and operatively connected with said pivoted arm, and means for moving the block to its closed position, substantially as described.

9. The combination with a breech-loading gun, a recoil-mount, a breech-block, and a rock-shaft actuating the block, of an arm fixed on said shaft, an arm loose on said shaft, locking means for locking said arms together on counter-recoil of the gun, an arm carried by a non-recoiling part of the mount and pivoted to said loose arm, a spring connected to the gun and to said fixed arm, and a tripping device for operating said locking means to release the fixed arm from the loose arm, substantially as described.

10. The combination with a breech-loading gun, a recoil-mount, a breech-block, and a rock-shaft actuating the block, of an arm fixed on said shaft, an arm loose on said shaft, locking means for locking said arms together on counter-recoil of the gun, an arm carried by a non-recoiling part of the mount and pivoted to said loose arm, a spring connected to the gun and to said fixed arm, and a sliding extractor adapted to operate

said locking device to release the fixed arm from the loose arm, substantially as described.

708,876. VISE. CHARLES D. SUNERAM, Watertown, N. Y., assignor to Prentice Vise Company, New York, N. Y. Filed Feb. 7, 1902. Serial No. 93,062. (No model.)



Claim.—In a vise a sliding jaw composed of a cast-iron head a wrought-metal pipe-shank united with the cast-iron head by cast during the casting operation, and longitudinally slotted for the passage of the neck of the fixed nut on the stationary jaw or vise-body, and a screw to engage said nut swiveled in the front wall of the cast-metal head and housed in the wrought-metal pipe-shank, as and for the purposes hereinbefore set forth.

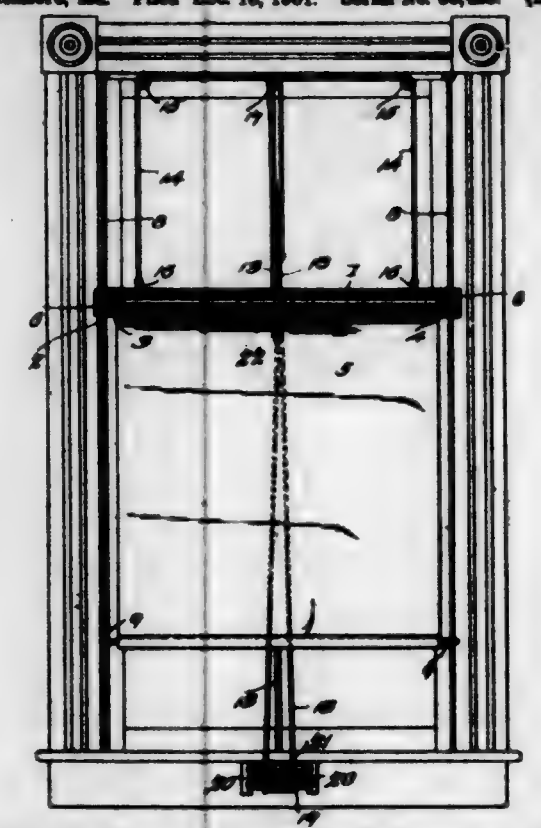
708,877. WRENCH. ABRAHAM RIVER, Denver, Colo. Filed Apr. 22, 1902. Serial No. 104,150. (No model.)

Claim.—1. In a wrench, a hollow handle, a fixed jaw, a shank secured to said fixed jaw and pivoted at a point between its two ends to the upper end of the handle, a spring interposed between the handle and the front face of the shank, a movable jaw slidably mounted upon the shank, a screw-threaded extension extending downward from the movable jaw, a nut threaded upon said screw-threaded extension, means whereby said nut and movable jaw can be slid downward upon the shank when said shank is rocked upon its pivot, and a spring for returning said nut and movable jaw to their original position, substantially as and for the purpose specified.

2. In a wrench of the character described, a hollow handle, a fixed jaw, a shank secured to said fixed jaw and pivoted between its two ends to the lower end of the handle, a movable jaw slidably mounted upon said shank, a screw-threaded extension extending downward from said jaw, two slide-bars, one arranged upon each side of the shank and provided with slots through which the pivot of the shank extends, a nut surrounding the upper end of the slide-bars, shank, and threaded upon the screw-threaded extension of the movable jaw, flanges formed upon the slide-bars above and below the nut, a spring interposed between the lower flanges and the upper end of the handle, means for allowing the nut, slide-bars and movable jaw to be pressed away from the fixed jaw when the shank is rocked upon its pivot, and a spring for returning the shank to its normal position, substantially as described and for the purpose specified.

3. In a wrench of the character described, a hollow handle, a fixed jaw, a shank secured to the fixed jaw and pivoted at a point between its ends to the upper end of the handle into which the shank extends, a movable jaw slidably mounted upon the shank, a screw-threaded extension extending downward from the movable jaw, two slide-bars, one arranged upon each side of the shank and extending into the handle, said slide-bars provided with slots through which passes the pivot securing the shank to the handle, an interiorly-threaded nut surrounding the upper end of the slide-bars also surrounding the shank and threaded upon the screw-threaded extension of the movable jaw, flanges upon each of the slide-bars arranged above and below the nut, a spring interposed between the lower flanges and the upper end of the handle, a spring interposed between one of the walls of the handle and the forward edge of the shank below the pivotal point of said shank, two cross-pieces secured upon the interior of the handle and extending across the same, one upon each side of the shank, a step formed in each cross-piece in which the lower end of the slide-bars rest when the parts are in their normal position, a cut-away portion formed in each cross-piece for the reception of the slide-bars when the shank is rocked and the said slide-bars are pressed downward, and means for locking the shank in its straight or normal position, substantially as described and for the purpose specified.

708,878. WINDOW-SHADE HANGER. SOLOMON BLANKEMA, Baltimore, Md. Filed Dec. 18, 1901. Serial No. 86,626. (No model.)



Claim.—1. A device of the class described comprising central and side guides, a bracket or bar provided with central and side casings having top and bottom apertures receiving the guides, rollers or wheels mounted within the casings and arranged to run on the guides, means for raising and lowering the bracket or bar, and a window-shade mounted on the bracket or bar, substantially as described.

2. A device of the class described comprising a bracket or bar, side pulleys, central pulleys, a central branch or cord and the side branches or cords arranged on the said pulleys and connected at their outer ends with the bracket or bar and at their inner ends with the central cord or branch, the inner ends forming a crotch arranged to engage the central pulleys, substantially as described.

3. A device of the class described comprising the central and side pulleys designed to be arranged at the top of a window, a bottom roller, a transverse bar or bracket, the side cords or branches arranged on the pulleys and forming a crotch for engaging the central pulleys and connected at their outer ends to the bracket or bar, and the central branch or cord wound around the bottom roller and connected with the bracket or bar and with the inner ends of the side cords or branches, substantially as described.

4. A device of the class described comprising the central and side pulleys designed to be mounted at the top of a window, the bottom rollers 19 and 21 designed to be mounted at the bottom of the window, a transverse bar or bracket, the side cords arranged on the central and side pulleys and forming a crotch and connected with the bracket or bar, and the central cord or branch wound around the roller 19 and connected with the bracket or bar and with the inner ends of the side cords or branches, substantially as described.

708,879. CAR-BOLSTER. HARRY C. BUSHOP, Chicago, Ill. Filed Mar. 14, 1902. Serial No. 98,318. (No model.)

Claim.—1. The combination of a body-bolster and a truck-bolster having a central connection comprising counterpart members fixed with relation to the respective bolsters, said members having spherical bearing-surfaces, the entering member having a depth substantially equal to the radius of curvature of the lowest part of said bearing-surfaces, substantially as and for the purposes specified.

2. The combination of a body-bolster and a truck-bolster having a central connection comprising counterpart members the bearing-surfaces of which are composed of segments of concentric hemispheres, substantially as and for the purposes specified.

3. The combination of a body-bolster and a truck-bolster having a central connection comprising members having corresponding concentric bearing-surfaces, the included member having an extension which intersects the including member, substantially as and for the purposes specified.

4. A cast-metal bolster having a centrally-disposed projection provided with spherical bearing-surfaces, said central projection having a depth substantially equal to the radius of curvature of the lowest part of said bearing-surfaces, substantially as and for the purposes specified.

5. A cast-metal bolster having a centrally-disposed bearing projection compounded of concentric spherical surfaces of depth substantially equal to the radius of curvature of the greater sphere, as and for the purpose specified.

6. A cast-metal bolster having a centrally-disposed spherical bearing projection and a radial extension therefrom substantially as and for the purpose specified.

7. A cast-metal bolster having parallel sides, interposed webs, and a centrally-disposed projection provided with spherical bearing-surfaces the depth of said projection being substantially equal to the radius of curvature of the lowest part of said bearing-surfaces, substantially as and for the purpose specified.

708,880. **NUT-LOCK.** JAMES BUTLER, St. Louis, Mo. Filed Nov. 8, 1901. Serial No. 81,715. (No model.)

Claim.—In a nut-lock, the combination with an axle (bolt or the like) having a reduced screw-threaded end portion and shoulder thereon, of a washer, non-revolubly on the said end portion and bearing against the said shoulder, a nut adapted to engage the said end portion and formed with a surrounding circular flange having a circumferential notch, the said nut bearing against the washer, a spring fixed at one end to the washer, opposite to the periphery of the said flange, a pawl or tooth projecting from the spring and adapted to engage the said notch, a pin projecting from the pawl and adapted to engage in a hole in the washer, and means for disengaging the pawl and pin from the said notch and hole respectively, and for holding the pawl and spring in the unlocked and retracted position, substantially as described.

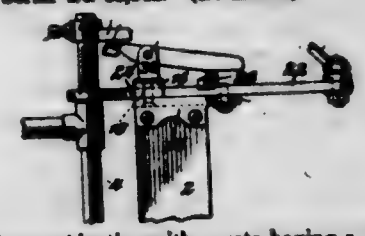
708,881. **TIMING DEVICE FOR CARRIER-PIGEONS.** EDWARD BYRNE, South Bend, Ind. Filed Jan. 2, 1902. Serial No. 88,181. (No model.)

Claim.—1. In a timing device for carrier-pigeons, the combination with a box having compartments formed therein and an opening through the wall of the box into each compartment, of a pivoted shutter to close said opening and provided with a notch, a timing device mounted in the box, a pivoted pawl to engage the notch in the shutter when the shutter is operated, a post, a lever fulcrumed on the post having one end in engagement with the pawl and the other end adapted to be thrown into engagement with the balance-wheel of the timing device when the shutter is turned to close the opening.

2. In a timing device for carrier-pigeons, the combination with a box having compartments therein and an opening through the wall into each compartment, of a pivoted shutter having a notch therein, a pivoted pawl, means to throw the pawl into engagement with the notch in the shutter when the shutter is operated, a timing device, a lever in engagement with the pawl and having an extension for engagement with the balance-wheel of the timing device, and means to normally hold the lever out of engagement with the said wheel.

3. The combination of the box, compartments formed therein having openings communicating therewith, timing devices in the box, a shutter to close the opening and provided with a notch, a pawl, one end of which engages the shutter, a lever having one end in engagement with the other end of the pawl and its other end provided with a pin to engage the balance-wheel of the timing device when the shutter is turned to close the opening, and a push-rod mounted in the box to engage the lever to reset the pawl, substantially as shown and described.

708,882. **GATE.** WILLIAM A. BYRELY, Bridgewater, Va. Filed Dec. 14, 1901. Serial No. 85,962. (No model.)



Claim.—1. The combination with a gate having a shiftable hinge-pintle, of a shifting device connected thereto, means for moving the shifting device in opposite directions from an intermediate direction to open the gate in opposite directions, means for locking the shifting device at its opposite limits and also in its intermediate position during swinging movements of the gate, and means carried by the gate for holding the locking means out of engagement with the shifting means when the gate is stationary.

2. The combination with a gate having a shiftable hinge-pintle, of a shifting device connected thereto, means for moving the shifting device in opposite directions from an intermediate point to shift the hinge-pintle in opposite directions for opening the gate, means for locking the shifting device at its opposite limits and at its intermediate position during swinging movements of the gate and means carried by the gate for normally holding the locking means out of engagement with the shifting device, and capable of disengagement from the locking device when the gate is moved by hand to permit the locking device to engage with the shifting means to lock the same during the swinging movement of the gate.

3. The combination with a hinge-post and a gate having an upper shiftable pintle, of a swinging device fulcrumed intermediately upon the top of the post and having its inner end connected to the shiftable pintle, said shifting means being movable in opposite directions from an intermediate position to move the hinge-pintle in opposite directions for opening the gate, oppositely-disposed controlling devices connected to the outer end of the shifting device, locking means mounted upon the top of the post for engagement with the shifting device to lock the same at its opposite limits and at its intermediate position, and means carried by the gate for engagement with the locking means to normally hold said locking means out of engagement with the shifting device when the gate is stationary, and also capable of disengagement from the locking means when the gate is opened by hand to permit the locking means to engage with the shifting device to lock it in its intermediate position.

4. The combination with a hinge-post, and a gate having a shiftable hinge-pintle, of a shifting-lever fulcrumed upon the post and con-

nected to the pintle, a latch pivoted intermediately upon the post, one end of the latch having a locking engagement with the shifting-lever and a trip carried by the gate and normally bearing upon the opposite end of the latch to hold the first-mentioned end thereof out of engagement with the shifting-lever.

5. The combination with a gate having a shifting pintle, of a shifting-lever connected to the pintle, a locking cross-head carried by the lever and having opposite locking-shoulders, a latch having one end constructed for alternate engagement with the locking-shoulders, and a trip device carried by the gate and lying in engagement with the opposite end of the latch to hold the first-mentioned end out of engagement with the locking cross-head when the gate is stationary only.

6. The combination with a gate having a shiftable pintle, of a shifting-lever connected thereto, a locking cross-head carried by the lever and having opposite and intermediate locking-shoulders, a pivoted latch having one end constructed for alternate engagement with the opposite locking-shoulders, and a trip carried by the gate and normally lying in engagement with the other end of the latch to hold the first-mentioned end out of engagement with the locking-head when the gate is stationary, and also capable of disengagement from the latch during swinging movements of the gate, whereby the latch may lock the shifting-lever.

7. The combination with a hinge-post, and a gate having an upper shiftable hinge-pintle, of a lever fulcrumed intermediately on top of the post and connected to the pintle, a bridge supported upon the post and spanning the lever, a vertically-swinging latch pivoted intermediately upon the bridge, opposite transversely-alined locking-shoulders carried by the shifting-lever and capable of traveling transversely beneath the rear end of the latch for alternate engagement therewith at opposite limits of the lever, and a lateral trip projection carried by the upper pintle and lying in engagement with the adjacent upper end of the latch when the gate is open and closed only to hold the latch out of engagement with the locking-shoulders of the lever.

8. The combination with a hinge-post, and a gate having an upper shiftable hinge-pintle projected above the post, of a plate secured to the top of the post and provided with opposite upstanding studs or pins alined transversely of the normal position of the gate, and also provided with intersecting arcuate slots struck from the studs or pins as centers, an arched support rising from the plate and disposed in front of the slot, a shifting-lever lying between the pins or studs and beneath the arched support, the inner end of the lever having an eye loosely receiving the upper hinge-pintle, and the intermediate portion of the lever being provided with opposite transversely-alined hooked fingers or projections embracing the respective studs or pins to form alternate fulcrums for the lever, a pin carried by the lever and working in the intersecting slots, a gravity-latch pivoted intermediately upon the arched support and having its rear end weighted, a locking cross-head carried by the lever and working transversely beneath the rear end portion of the latch, the opposite ends of the cross-head being formed into abrupt locking-shoulders for alternate engagement with the latch, the upper edge of the cross-head being inclined upwardly and inwardly in opposite directions and provided at its center with a notch or socket for the reception of the latch, and a trip device comprising a collar carried by the shiftable pintle and having a lateral projection normally lying upon the upper end of the latch to depress the same and raise the rear end out of engagement with the locking cross-head.

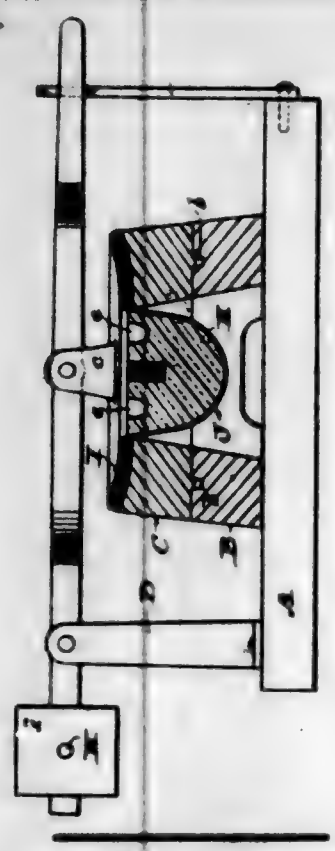
9. The combination with a hinge-post, and a gate having an upper shiftable hinge-pintle, of a shifting device mounted upon the top of the post and connected to the pintle, means for locking the shifting device during swinging movements of the gate and mounted upon top of the post independently of said shifting device, and means carried by the gate for normally holding the locking means out of engagement with the shifting device.

10. The combination with a hinge-post, and a gate having a shiftable hinge-pintle, of a shifting-lever fulcrumed upon the post and connected to the hinge-pintle, means for limiting the movement of the lever, a latch mounted intermediately upon the post and having one end in locking relation with the shifting-lever, and a trip carried by the hinge-pintle and normally bearing upon the opposite end of the latch to hold the first-mentioned end thereof out of engagement with the shifting-lever.

708,888. MAKING HATS. JOSEPH A. DYER, Milwaukee, Wis. Filed Dec. 16, 1901. Serial No. 86,144. (No model.)

Claim.—That improvement in the art of blocking millinery hats which comprises the following steps: first, securing the brim portion of the hat in a rigid position; second, applying an adhesive substance to the body or crown portion, to maintain its position on the block, and subjecting the said crown or body portion to the operation of heat and pressure, for the purpose of shrinking the same, as a preliminary step to the pouncing operation, as set forth.

708,888.



708,884. HYDROCARBON-LAMP. JOHN BYRNES, Chicago, Ill. Filed Apr. 5, 1901. Serial No. 54,899. (No model.)

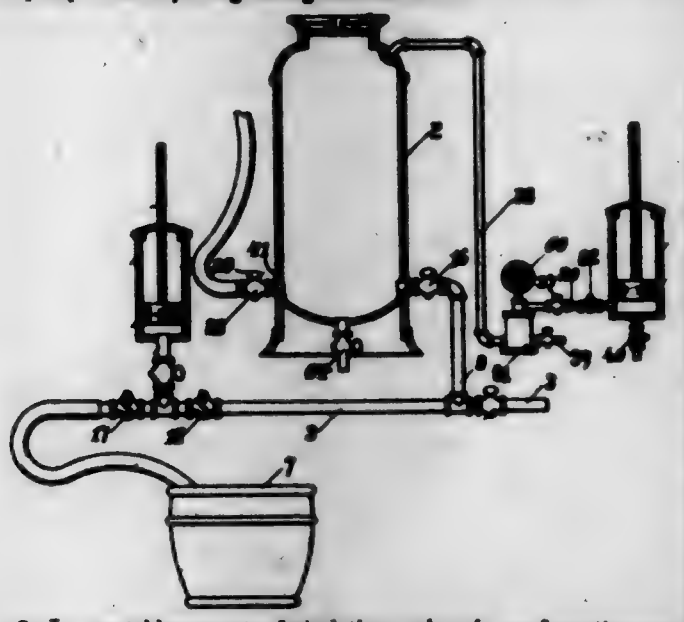
Claim.—1. A needle-valve for hydrocarbon-lamps, having a valve-stem and a needle-point, said needle-point consisting of a wire fixed centrally of said valve-stem and at the forward end thereof, one-half of said point being cut away along its axial diameter, and said valve-stem being flattened at its end to coincide with the flat side of the needle-point, in order to permit the escape of a small quantity of gas when the needle-valve is nominally closed.

2. The combination with a valve-casing having a tube with a stop-shoulder in said tube and a discharge-orifice, of a valve-stem adapted to lie within said tube and having a shoulder adapted to engage the stop-shoulder, said valve-stem having a needle-point adapted to enter said orifice, which needle-point consists of a wire fixed centrally of said valve-stem at the forward end thereof, and being cut away at one side, said valve-stem also being flattened at its end to permit the escape of a small quantity of gas when the shoulder of the valve-stem is in contact with the stop-shoulder of the tube.

708,885. PAINTING APPARATUS. HENRY B. CARRYL, New York, N. Y., assignor to James B. Hay, Nutley, N. J. Filed Aug. 9, 1901. Serial No. 71,422. (No model.)

Claim.—1. In a portable apparatus for painting or cleaning surfaces, the combination of a chamber and a suitable base or stand, a supplemental chamber connected therewith, a receptacle for containing the painting or cleaning material, a pump connected with the principal chamber and arranged to be connected with the receptacle for introducing the material into the chamber in convenient quantities, an independent air-compressor connected with said supplemental chamber by a suitable pipe for causing the air in the chamber to be compressed and the material to flow automatically therefrom, a portable hand-tool arranged to paint or cleanse, a flexible conducting-hose connecting the chamber with the tool, whereby the painting or cleaning material can be introduced into the tool, and a valve in the handle of the tool for controlling the supply of the material to it through the hose.

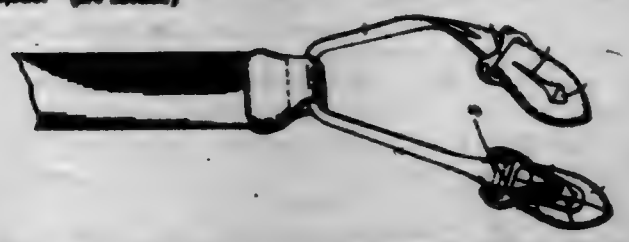
2. In a portable apparatus for painting or cleansing surfaces, the combination of a chamber and a suitable base or stand, a receptacle for containing the cleansing or painting material, a pump connected with the chamber and arranged to be connected with the receptacle for introducing the material from the receptacle into the chamber in convenient quantities, an independent air-compressor connected with the chamber by a suitable pipe for causing the air in the chamber to be compressed and the material to automatically flow therefrom, a portable hand-tool arranged to paint or cleanse, a flexible hose of convenient length connecting the chamber with the tool, whereby the painting or cleansing material can be introduced into the tool, a valve in the handle of the tool for controlling the supply of the material to it, a pump for forcing liquid into the chamber and a direct connection between the pump and the tool provided with appropriate valves, whereby the pump, hose and tool may be washed out by means of a liquid introduced by the force-pump without passing through the chamber.



3. In a portable apparatus for painting or cleansing surfaces, the combination of a chamber, and a suitable base or stand, a supplemental chamber connected therewith, for catching any overflow, an independent air-compressor connected with the supplemental chamber for causing the air in both chambers to be compressed and the material to automatically flow from the chamber, a portable hand-tool arranged to paint or cleanse, a flexible conducting-hose connecting the chamber with the tool, whereby the painting or cleansing material can be introduced into the tool, a valve in the handle of the tool for controlling the supply of the material to it, a pump for forcing liquid into the chamber and a direct connection between the pump and the tool provided with appropriate valves whereby the pump, hose and tool may be washed out by means of a liquid introduced by the pump without passing through the chamber.

4. In a portable apparatus for painting or cleansing surfaces, the combination of a closed chamber; a receptacle for containing the cleansing or painting material; a pump connected with the chamber and arranged to be connected with the receptacle by a flexible tube or hose for introducing the material from the receptacle into the chamber in convenient quantities; an air-compressor connected with chamber by a suitable pipe for causing the air in the chamber to be compressed and the material to automatically flow therefrom; a gage for indicating the pressure in the chamber; a portable hand-tool arranged to paint or cleanse; a flexible hose of convenient length connecting the closed chamber with the tool, whereby the paint or cleansing material can be introduced into the same; a valve in the handle of the tool for controlling the supply of the material to it; a pipe connecting the pump and the tool; appropriate valves placed therein by opening and closing which, the pump, hose and tool may be washed out by a liquid introduced by the pump without passing through the chamber.

708,886. SUSPENDERS AND TROUSERS CONNECTION. REUBEN T. CLARKE, Columbus, Ohio. Filed Aug. 26, 1901. Serial No. 73,522. (No model.)



Claim.—In a suspender and trousers connection, the combination with a suspender-end having a buttonhole or similar opening therein, of a button-engaging attachment therefor comprising a doubled clip-body, the inner member thereof having an opening in its upper portion adapted to receive a suspender-end and having an opening in its lower portion and the outer member thereof being in the nature of an open frame having an enlarged upper or mouth portion terminating in a tapering socket or neck and an end tongue 4 adapted to be inserted through the lower end opening of the inner member of the clip and through the opening in a suspender-end, substantially as specified.

708,887. KEYLESS LOCK. ALBERT W. CRAIG, Chicago, Ill., assignor to Craig Keyless Lock Company, Chicago, Ill., a Corporation of Illinois. Filed Aug. 21, 1901. Serial No. 72,811. (No model.)

Claim.—1. In a keyless lock, the combination with a bolt having recesses therein, of a plate having projections adapted to successively engage said recesses, tumblers having notches therein, and a pawl pivoted to said plate and adapted to be received by the notches in said tumblers when in register, substantially as described.

2. In a keyless lock, the combination with a bolt having an extension provided with a plurality of recesses, of a cam-plate having a plurality of projections adapted to successively engage said recesses, a pawl pivotally supported on said cam-plate, tumblers having notches adapted to be brought into register to receive said pawl, and a guide engaging said pawl when the latter is rotated with the cam-plate and disengaged from said pawl when the tumblers are disconcerted, substantially as described.

3. In a lock, the combination with a bolt, of a rotary plate operatively engaging said bolt, means for rotating said plate and thereby reciprocating said bolt, a projection on said plate, and a coöperating projection on said bolt, the first projection adapted to engage the second to throw the bolt outwardly and the second projection adapted to engage the first to lock the bolt and plate against retrograde movement when pressure is applied to the bolt, substantially as described.

4. In a lock, the combination with a bolt having recesses and projections, of a plate having recesses and projections engaging the recesses in and projections on the bolt, means for actuating said plate and thereby reciprocating said bolt, and means whereby any pressure exerted on the bolt when shot is prevented from being communicated through said plate to said actuating means, substantially as described.

5. In a keyless lock, the combination with a bolt, of a plate engaging and adapted to reciprocate said bolt, a pawl pivotally mounted on said plate having a flange projecting therefrom, tumblers having notches to receive said flange, a guide engaging said flange and retaining the same in the notches in the tumblers when the bolt is actuated, and means for preventing any pressure exerted on the bolt from being transmitted to said flange, substantially as described.

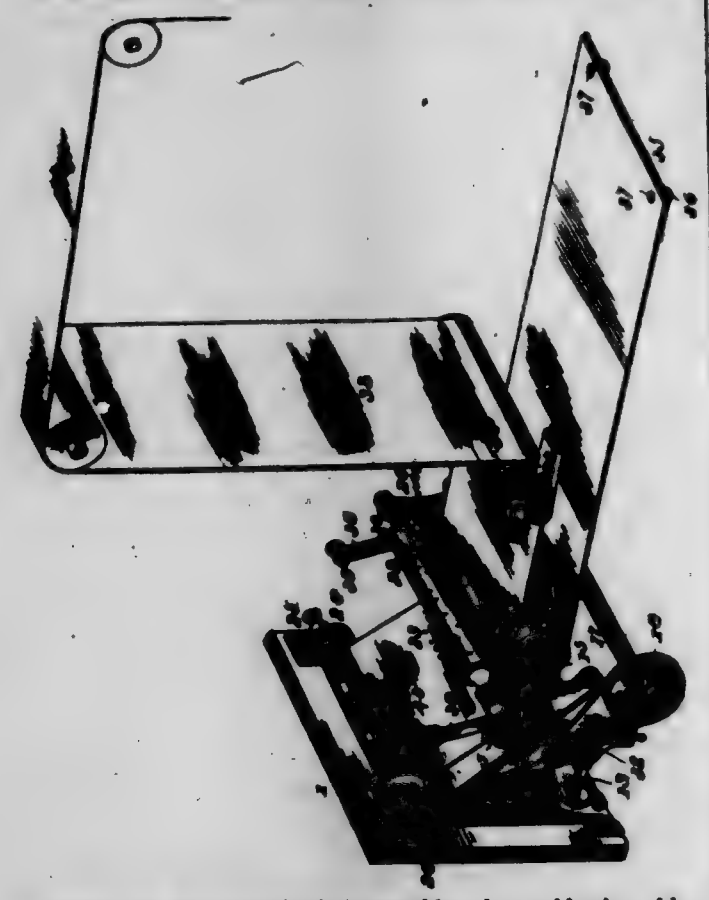
6. In a keyless lock, the combination with a bolt, of a rotary plate operatively engaging said bolt, a spindle adapted to be operatively connected with said plate by means of tumblers and a pawl, a projection on said plate, and a coöperating projection on said bolt, the first projection adapted to engage the second and throw the bolt outwardly and the second projection adapted to engage the first and lock the bolt and plate against retrograde movement when pressure is applied to the bolt, substantially as described.

7. In a keyless lock, the combination with a bolt, of a plate operatively engaging said bolt, a pawl pivoted to said plate, tumblers having notches adapted to be brought into register to receive said pawl, a guide retaining said pawl in engagement with the notches in the tumblers to insure the reciprocation of the bolt, said guide terminating at a point to permit the pawl to be swung out of engagement with said notches to disconnect the lock when the bolt is shot, and interlocking means between said bolt and plate for locking the bolt in its shot position and thereby preventing any pressure exerted on the bolt from being transmitted to said pawl, substantially as described.

8. In a keyless lock, the combination with a bolt having a deep recess and a shallow recess and a projection between said recesses, of a rotary plate having an elongated projection and an extended low projection adapted to engage with the deep and shallow recesses respectively in said bolt to reciprocate the latter, the projection on said bolt being adapted to engage the low projection on said plate to lock the bolt when shot and prevent any pressure exerted thereon from rotating the plate, a pawl pivoted to said plate, tumblers having notches adapted to be brought into register to receive said pawl, and a guide retaining said pawl in engagement with the notches in the tumblers when the bolt is reciprocated,

said guide terminating below the position of the pawl when the bolt is shot thereby permitting the pawl to be swung out of engagement with the notches in the tumblers, substantially as described.

708,888. STENCIL-PRINTING MACHINE. GEORGE H. DAVIS, Brooklyn, N. Y. Filed Apr. 17, 1901. Serial No. 56,267. (No model.)



Claim.—1. In a stencil-printing machine, the combination with an inking-roller and an impression-roller, of a stencil-sheet adapted to be passed between said rollers, a conveyer belt or web, and means for attaching the stencil-sheet to said belt or web, for the purpose specified.

2. In a sheet-stencil-printing machine, the combination with an inking-roller and an impression-roller, of a pair of supply-rolls, a stencil-sheet mounted upon one of said rolls and adapted to travel between the inking and impression rollers, and an endless conveyer belt or web to which said stencil-sheet may be attached and by which it is conveyed.

3. In a sheet-stencil-printing machine, the combination with an inking-roller and an impression-roller, of a pair of supply-rolls adapted to receive a stencil-sheet and a sheet to be printed, an endless conveyer belt or web arranged in front of said rolls and to which one end of the said sheets may be attached and by which they will be conveyed, and means for driving said belt or web.

4. In a sheet-stencil-printing machine, the combination with a suitable frame, of ink-supplying rollers journaled in said frame, an impression-roller journaled above the inking-rollers, a pair of sheet-supply rolls, an endless conveyer-belt for the purpose specified, means carried by the belt for attaching a stencil-sheet thereto, means for driving said belt, and gearing operated by the belt-driving means for imparting motion to the inking-rollers and delivery-roll.

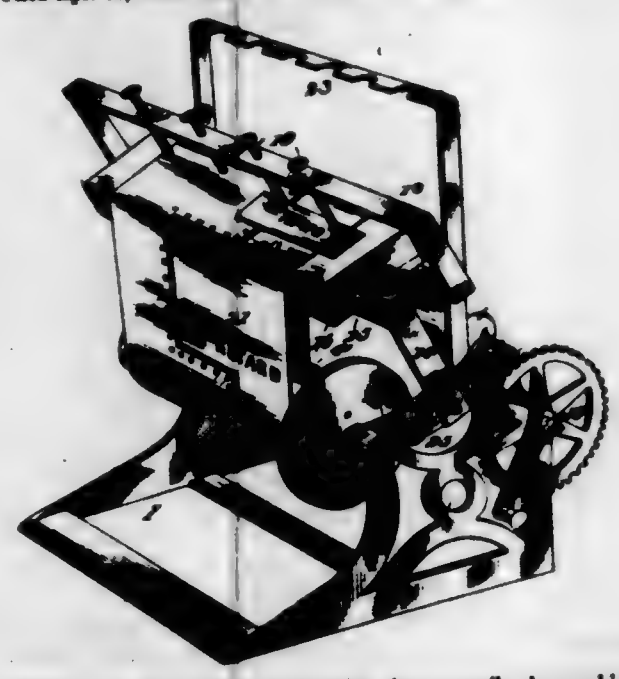
5. In a sheet-stencil-printing machine, the combination with an inking-roller and an impression-roller, of a pair of sheet-supply rolls carrying the stencil-sheet and sheet to be printed respectively, an endless conveyer belt or web arranged in front of said rollers and to which one end of the said sheets is attached and by which they are conveyed, means for moving said belt or web, and a pair of arms 38, carrying bearings for a sheet-receiving roller.

6. In a sheet-stencil-printing machine, the combination with a suitable frame, of ink-supplying rollers and an impression-roller journaled in said frame, a pair of supply-rolls journaled in the frame above the impression-roller, a main drive-shaft 15 journaled in front of said last-named roller, a driven shaft 17, arranged below the main drive-shaft, intermeshing gears mounted on said shafts, a pulley on the driven shaft, and separate belts passing from said pulley to pulleys on one of the inking-rollers and supply-rolls respectively.

7. In a sheet-stencil-printing machine, the combination with a suitable frame, of ink-supplying rollers and an impression-roller journaled in said frame, a pair of supply-rolls journaled in the frame above the impression-roller, a main drive-shaft journaled in front of said last-named roller, a driven shaft 17, intermeshing gears mounted on said shafts, a pulley on the driven shaft, belts passing from said pulley, to pulleys on one of the inking-rollers and supply-rolls respectively, arms 38, secured to the machine-frame intermediate the said delivery-rolls, said arms carrying rotary bearings for a sheet-receiving roller, and a pulley on one of said bearings, substantially as described.

8. In a stencil-printing machine, the combination with suitable printing mechanism, of an endless conveyer belt or web mounted adjacent to said printing mechanism, and provided with a clamping device by which the stencil-sheet and printed sheet are clamped to said belt or web, substantially as described.

708,889. MACHINE FOR FORMING STENCILS FROM WHICH MUSIC-SHEETS ARE PRINTED. GEORGE H. DAVIS, Brooklyn, N. Y. Filed Apr. 17, 1901. Serial No. 56,268. (No model.)



Claim.—1. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery-roll and a receiving-roll journaled in said frame, a cutting block or platen arranged above the said rolls and over which the sheet-stencil is moved during its passage from one roll to the other and means for clamping a stencil-plate upon said block or platen.

2. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery-roll and a receiving-roll journaled in the said frame, a cutting block or platen arranged above the plane of said rolls and over which the stencil-sheet is moved during its passage from one roll to the other, clamping devices for holding a stencil-plate to the face of the platen and means for operating said rolls.

3. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery and a receiving roll journaled in said frame, a cutting block or platen arranged above the plane of said rolls and over which the stencil-sheet is passed during its movement to and from the rolls, and suitable clamping means adapted to bind the stencil-sheet to the face of the cutting-block, for the purpose specified.

4. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery and a receiving roll journaled in said frame, a cutting block or platen arranged intermediate and above the plane of said rolls and over which the stencil-sheet passes, means for clamping a stencil-plate to the face of the platen and a friction device acting upon the said receiving-roll, substantially as described.

5. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery and a receiving roll journaled in said frame, a cutting block or platen arranged intermediate and above the plane of said rolls, and a tool-holder mounted upon the frame adjacent to the said cutting-block.

6. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery and a receiving roll journaled in said frame, a milled head secured to one end of said receiving-roll, and a cutting block or platen mounted upon the frame and arranged intermediate the two rolls for the purpose specified.

7. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery and a receiving roll journaled in said frame, a cutting block or platen arranged intermediate said rolls, a friction-plate having one end free to rest upon one end of the receiving-roll, a thumb-screw for regulating the pressure of said friction-plate, and means for operating the said rolls.

8. In a machine for forming sheet-stencils, the combination with a suitable base-frame, of a delivery and a receiving roll journaled in said frame, a cutting block or platen mounted upon the frame intermediate the

said rolls, a pinion upon one end of the delivery-roll, a gear-wheel meshing with said pinion, means for operating the gear-wheel, a milled head upon one end of the receiving-roll, and a clamping device arranged above the cutting-block, for the purpose specified.

9. In a machine of the class described, the combination with a suitable frame, of a delivery-roll and a receiving-roll journaled in said frame, an inclined cutting block or platen fixed to the frame and over which the sheet-stencil is caused to move during its passage from one roll to the other and means for clamping a stencil-plate to the face of said block or platen.

10. In a machine of the class described, the combination with a suitable base-frame, of a sheet delivery roll and a receiving roll journaled in said frame, an inclined cutting block or platen arranged above the plane of said rolls and over which the sheet-stencil is caused to move during its passage from one roll to the other and means for clamping the stencil-sheet to said block or platen.

11. In a machine of the class described, the combination with a suitable base-frame, of a sheet delivery roll and a receiving roll journaled in said frame, an inclined cutting block or platen arranged intermediate and above the plane of said rolls, clamping devices arranged above the cutting-block and means for imparting a rotary movement to said rolls.

12. In a machine of the class described, the combination with a suitable base-frame, of a delivery-roll and a receiving-roll journaled in said frame, a cutting block or platen arranged intermediate said rolls and over which the sheet-stencil to be cut is caused to move during its passage from one roll to the other, and independent means for rotating said rolls.

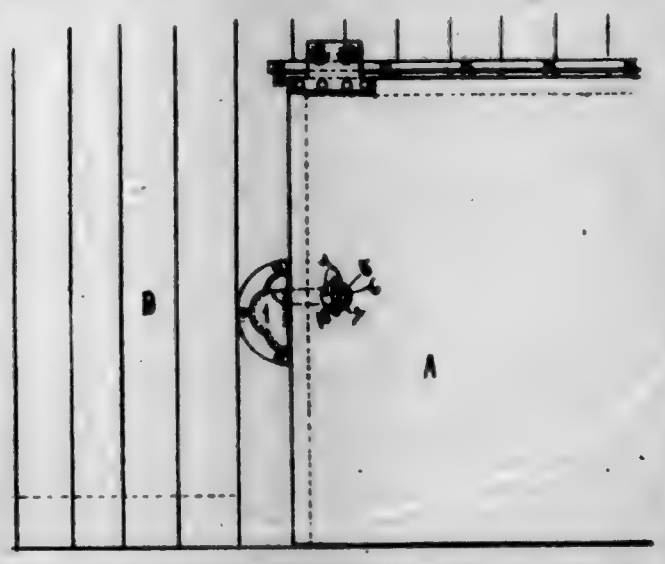
13. In a machine of the class described, the combination with a suitable base-frame, of a delivery-roll and a take-up roll journaled in said frame, a block-support secured to the frame intermediate the rolls, a cutting block or platen removably attached to said support, and means for rotating the rolls to cause a sheet-stencil to move from one roll over the cutting block or platen and to be wound upon the other roll.

14. In a machine of the class described, the combination with a suitable frame, of a delivery-roll and a take-up roll journaled in said frame, an inclined block-support carried by the frame and extending above the plane of the rolls, a cutting block or platen carried by said support, means for clamping a stencil-sheet to the face of the cutting-block and means for rotating said rolls.

15. In a machine of the class described, the combination with a suitable frame, of a delivery-roll and a take-up roll journaled in said frame, a block-support fixed to the frame intermediate the rolls, a cutting block or platen carried by said support, a bar disposed above the cutting block or platen, and clamping-screws tapped through said bar and adapted to clamp a stencil-plate to the face of the cutting block or platen.

16. In a machine of the class described, the combination with a sheet delivery roll and a take-up roll, of a cutting block or platen arranged above and overhanging one of said rolls, and means for clamping a stencil-plate to the face of the cutting block or platen.

708,890. **SLIDING-DOOR LATCH.** GRANT S. DEUTSBACH, Madisonburg, Ohio. Filed July 31, 1901. Serial No. 70,332. (No model.)



Claim.—1. In a latch for sliding doors, the combination with a pivotally-mounted latch-bar provided with an enlarged head forming laterally-projecting hooks; of a keeper provided with an opening in its strike-plate for the reception of the laterally-extending hooks of a latch-bar, a recess extending from said opening to form a seat for the stem of the latch-bar, and a rearwardly and downwardly extending chute, opposite and to the rear of said opening and recess, whereby the head of said latch-bar is forced downwardly into the said recess and said laterally-extending hooks are brought into engagement with said strike-plate.

2. A keeper for sliding doors, the same consisting of a strike-plate provided with the oppositely-disposed openings for the reception of the laterally-extending hooks of a latch-bar, recesses extending from said openings toward its center to form a seat for the stem of the latch-bar, and oppositely-disposed rearwardly-extending chutes formed in the rear wall opposite the said openings and recesses whereby the head of said latch-bar is brought into contact therewith and is forced downwardly into engagement with said strike-plate.

3. In a latch for sliding doors, the combination with a pivotally-mounted latch-bar provided with an enlarged head forming laterally-projecting hooks; of a keeper provided with a strike-plate formed with the oppositely-disposed openings for the reception of the latch-bar, recesses extending from said openings toward its center to form a seat for the stem of the latch-bar, and oppositely-disposed rearwardly-extending chutes formed in the rear wall opposite the said openings and recesses whereby the head of said latch-bar is brought into contact therewith and is forced downwardly into engagement with said strike-plate.

708,891. **TELEGRAPHIC CODE.** JAMES R. DUNPHY, Chicago, Ill. Filed Apr. 19, 1900. Serial No. 713,673. (No model.)

a ..... *about*
b ..... = *grass and lace weight*
c ..... = *grass weight*
d ..... = *cord weight*
e ..... = *lace weight*
f ..... = *weight*
g ..... *that so recognized for*
h ..... *any quantity*
i ..... *division*
m ..... = *of cross*
n ..... = *lacing*
o ..... *Barrel-cake*
p ..... *Box cover*
q ..... *Basket*
r ..... *Cardage*

Claim.—1. In a cipher-code, a code-book having words, phrases and sentences arranged in columns therein, the pages of the book being numbered and the words, phrases and sentences on each page being also numbered, a code-book key comprising within its range all the numbers employed to designate pages of the book or words, phrases, and sentences therein, the numbers of the key having associated therewith arbitrarily-selected syllables, whereby such syllables may be combined to represent words of the code-book, as set forth.

2. In a cipher-code, a code-book having words, phrases and sentences arranged in columns therein, the pages of the book and the words, phrases and sentences on each page being numbered consecutively, a code-book key comprising within its range all the numbers employed to designate pages of the book or words, phrases and sentences therein, the numbers of the key having associated therewith arbitrarily-selected syllables, whereby such syllables may be combined to represent words of the code-book, as set forth.

3. In a cipher-code, a code-book having words, phrases and sentences arranged in columns therein, the pages of the book and the words phrases and sentences on each page being numbered, a changeable code-book key comprising within its range all the numbers employed to designate pages of the book or words, phrases and sentences therein, the numbers of the key having associated therewith arbitrarily-selected syllables whereby such syllables may be combined to represent words of the code-book, as set forth.

4. In a cipher-code, a code-book having words, phrases and sentences arranged in columns therein, the pages of the book being numbered and the words, phrases and sentences on each page being also numbered, an independent code-book key comprising within its range all the numbers employed to designate pages of the book or words, phrases and sentences therein, the numbers of the key having associated therewith arbitrarily-selected syllables, whereby such syllables may be combined to represent words of the code-book, as set forth.

5. A code-book key comprising within its range all the numbers employed to designate pages, words, phrases and sentences in a code-book, the numbers of the key having associated therewith arbitrarily-selected syllables, whereby such syllables may be combined to represent words of the code-book, as set forth.

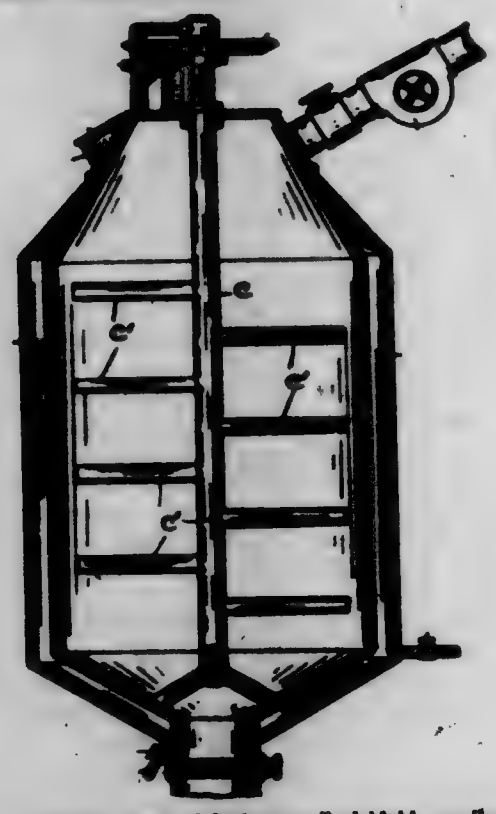
6. A cipher-code, comprising a code-book containing a part of the message or information it is intended to transmit, and an independent, changeable code-book key, prepared separately from the code-book, and having associated therewith certain characters and symbols whereby it is possible to change a code-word having one expression or meaning into another expression by affixing thereto a character or symbol provided for in the code-book key, as set forth.

7. In a cipher-code, a permanent code-book, having words, phrases and sentences arranged in columns therein, the pages of the book being numbered and the words, phrases and sentences being also numbered, but containing no code-words or parts thereof, a changeable auxiliary code and code-book key, prepared separate from the code-book and containing syllables, characters and symbols arranged in column order and used jointly in ciphering and deciphering, whereby it is possible to provide a new code as often as necessary by forwarding a new auxiliary code and code-book key, the permanent code-book being retained indefinitely, as set forth.

708,892. PLATFORM-SCALE. ANDREW BRENNEN, Burt, Iowa, assignor of three-fourths to Wm. E. Ferguson, E. J. Hartsuyth, and Winfield P. Jones, Algona, Iowa. Filed Oct. 7, 1901. Serial No. 77,988. (No model.)

Claim.—In platform-scales, platform-levers having their inner ends overlapped and each comprising outwardly-diverged arms having their outer end portions widened and chambered upon their lower sides, two knife-edged bearings arranged within the chamber of each of the said arms, bearing-steels coöperating with a set of the said knife-edged bearings, a platform-support comprising transverse bars having knife-edged bearings at their lower sides, links connecting said bars with the other set of knife-edged bearings of the platform-levers, a third lever arranged transversely of the platform-levers and having its inner end portion chambered on its lower side, bearings for the said lever protected by the chamber thereof, and a shackle connecting the third lever with the platform-levers, the pivot-bearings between the shackle and the several levers being protected by the chambered portion of said third lever, substantially as set forth.

708,893. DRYING OIL-YIELDABLE OR OIL-CONTAINING MATERIAL. EDWARD R. ESTEN, Cleveland, Ohio. Filed Oct. 8, 1901. Serial No. 78,093. (No specimens.)



Claim.—1. The process of drying an oil-yieldable or oil-containing mass of material consisting in partially drying the material, then adding an oil-absorbing material to the reduced mass, and then drying the enlarged mass, substantially as and for the purpose set forth.

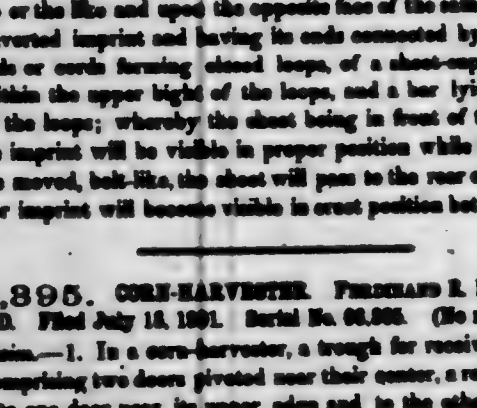
2. An improved process of drying an oil-yieldable or oil-containing mass of material, consisting in drying the material at a temperature low enough to avoid injury to or deterioration of the oil until a large portion of the oiliess moisture has been eliminated from the mass, then adding oil-absorbing material to and mixing the same with the reduced mass, and then drying the enlarged mass at a temperature not detrimental to the oil.

3. An improvement in drying a mass of material which contains more oil than the solid particles or portion of the mass can absorb or carry, consisting in adding, to the mass, oil-absorbing material capable of absorbing and carrying free oil not already absorbed, substantially as and for the purpose set forth.

4. An improved process of drying a mass of material which contains more oil than the solid particles or portion of the mass can absorb or carry, consisting in vaporizing a portion of the oiliess moisture contained in the mass, then adding oil-absorbing material and mixing the same with the reduced mass, and then drying the enlarged mass.

5. The improved process of drying an oil-yieldable or oil-containing mass of material herein described, consisting in partially drying the material at a temperature below 300° Fahrenheit, and in vacuo, until enough oiliess moisture has been eliminated to reduce the mass to the consistency of a sludge, then adding oil-absorbing material to and mixing the same with the reduced mass, and then drying the enlarged mass at a temperature below 300° Fahrenheit, and in vacuo, substantially as and for the purpose set forth.

708,894. REVERSIBLY-SUSPENDED FLEXIBLE SHEET. WILLIAM R. BLAIR, Atlanta, Ga. Filed Jan. 6, 1902. Serial No. 88,454. (No model.)



Claim.—1. The combination with a flexible sheet bearing upon opposite faces of the same portion relatively inverted imprints, of means whereby the sheet is bent back upon itself or reversed when moved endwise, whereby either imprint may be brought to view in proper position for inspection from the same side of the apparatus.

2. The combination with a suitable bar, of a flexible sheet adapted and arranged to pass belt-like around the bar and bearing upon one face an imprint and upon the opposite face of the same portion a relatively inverted imprint; whereby one imprint being in position for inspection, passing the sheet around the bar reverses the sheet and brings the other imprint into like position.

3. The combination with a suitable bar, of a flexible sheet arranged to pass, belt-like, around the bar and bearing relatively inverted imprints upon its opposite faces, respectively, and wires or the like extended across that face of the sheet next said bar protecting the sheet's surface from abrasion.

4. The combination with a suitable bar, of a flexible sheet arranged to pass belt-like around the bar and bearing relatively inverted maps upon its two faces, respectively, and a series of wires extended across that face of the sheet next the bar and occupying the places of meridian-lines of the map upon that face.

5. The combination with a suitable bar, of a flexible sheet arranged to pass belt-like around the bar, bearing upon opposite faces of the same portion relatively inverted imprints, and means for preventing the sheet from passing in either direction the proper limit of its movement.

6. The combination with a sheet having upon one face an imprint of a map or the like and upon the opposite face of the same portion a relatively inverted imprint and having its ends connected by narrow marginal bands or cords forming closed loops, of a sheet-supporting bar located within the upper bight of the loops, and a bar lying in the lower bight of the loops; whereby the sheet being in front of the plane of the bars one imprint will be visible in proper position while if the sheet and bands be moved, belt-like, the sheet will pass to the rear of said plane and the other imprint will become visible in erect position between the bands.

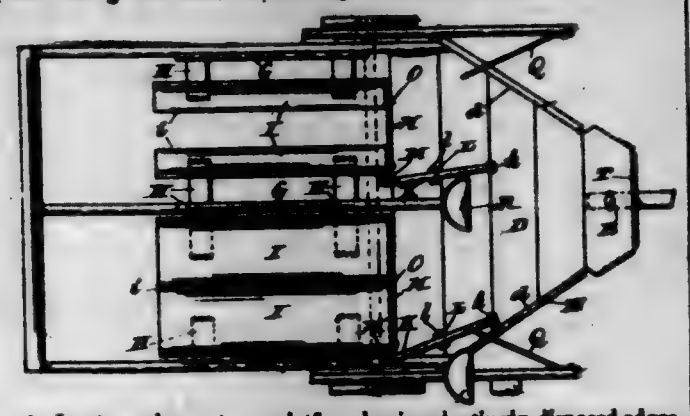
708,895. CORN-HARVESTER. FERDINAND E. EVERS, Ripstone, S. D. Filed July 15, 1901. Serial No. 68,205. (No model.)

Claim.—1. In a corn-harvester, a trough for receiving the severed stalks comprising two doors pivoted near their center, a rod pivotally connected to one door near its upper edge and to the other near its lower edge, and means for positively opening and closing the doors, substantially as shown and described.

2. In a corn-harvester, doors pivoted near their center and forming a rectangular trough, a rod pivotally connected to one door near its upper edge and to the other near its lower edge, and a suitably-mounted lever connected to one of said doors for operating same, substantially as shown and described.

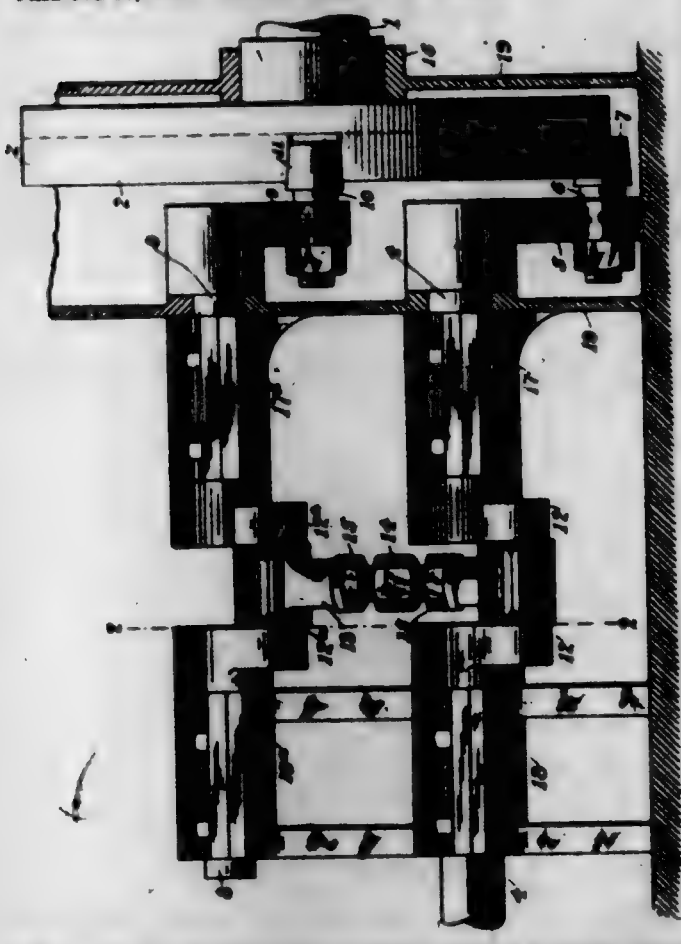
3. In a corn-harvester, a platform having shootingly-disposed edges, cutting edges mounted thereon, standards at the rear of said platform,

doors mounted on said standards and pivoted near their center to form a rectangular trough, a rod pivotally connected to one door near its upper edge and to the other near its lower edge, and means for positively opening and closing the doors, substantially as shown and described.



4. In a corn-harvester, a platform having slantingly-disposed edges, cutting edges mounted thereon, standards at the rear of said platform, doors mounted on said standards and pivoted near their center to form a rectangular trough, a rod pivotally connected to one door near its upper edge and to the other near its lower edge, and a suitably-mounted lever connected to one of said doors for operating them simultaneously, substantially as shown and described.

708,896. MECHANICAL MOVEMENT. HENRY H. PEIRCE, New York, N. Y., assignor, by mesne assignments, to New York-Pittsburgh Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Oct. 30, 1901. Serial No. 80,515. (No model.)



Claim.—1. The combination of a driving-shaft, a radially-grooved trammel-disk carried thereby; a pair of crank-shafts each having a driving-crank engaging by its wrist-pin in one of the radial grooves of the trammel-disk; coupling-cranks on said crank-shafts; and a connecting-rod mounted at its ends on the coupling-cranks of the respective crank-shafts, whereby one of said crank-shafts through which power may be transmitted is driven directly by the trammel-disk and the second crank-shaft acts as an intermediary driving device between the trammel-disk and the primary driven shaft.

2. The combination of a driving-shaft; a radially-grooved trammel-disk carried thereby; a pair of crank-shafts having driving-cranks whose wrist-pins engage in grooves of different diameters of the trammel-disk; parallel cranks on the respective crank-shafts; and a rod connecting said parallel cranks, whereby the coupled crank-shafts are driven continuously from the trammel-disk and dead-centers avoided, as explained.

3. The combination of the driving-shaft 1; a radially-grooved trammel-disk 2 mounted thereon; a shaft 4, through which power may be transmitted, having a crank 5 engaging in a groove 2 of the trammel-disk so that said shaft will be driven directly from the trammel-disk; a second crank-shaft 8, having a crank 9 engaging with a groove 2ª of the trammel-disk on a different diameter from that by which the first crank-shaft is driven; parallel cranks 12, 12ª on the shafts 4 and 8; and a connecting-rod 13 between said cranks; whereby the second crank-shaft 8 serves as an intermediary and supplementary driving device between the trammel-disk 2 and crank-shaft 4, as explained.

4. The combination of the driving-shaft 1; a radially-grooved trammel-disk 2, mounted thereon; a shaft 4, through which power may be transmitted, having a crank 5 driven by engagement in a groove 2 of the trammel-disk; a second crank-shaft 8 also having a crank 9, driven by engagement in a groove of the trammel-disk; and two pairs of coupling-cranks 12, 12ª and 20, 20ª, mounted respectively at different angles on the shafts 4 and 8, and connected by rods 13 and 21; whereby the second crank-shaft 8 acts as an intermediary and supplementary driving device between the trammel-disk and the primary driven shaft 4 and operates thereon with uniform rotative force, as described.

708,897. WHIP. BENJAMIN O. PEIRCE, Chicora, Pa. Filed July 1, 1901. Serial No. 66,677. (No model.)

Claim.—A whip comprising a body portion of reed, rattan, or the like, a tube of sheet metal swaged or bent around the butt or handle portion of the body and held in place thereon by frictional contact, a wrapping of flexible material, such as cloth or paper, inclosing said tube, and an outer covering, substantially as described.

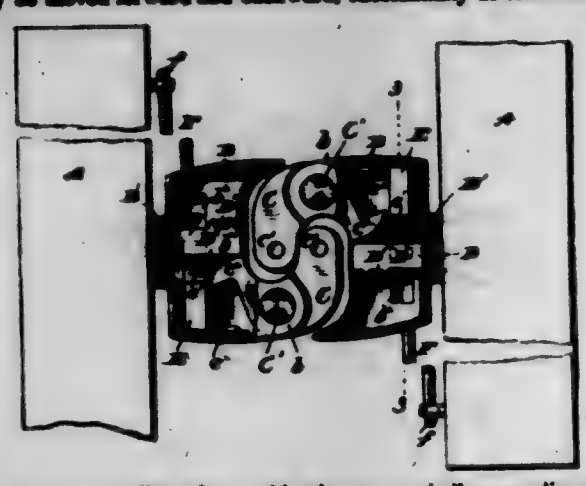
708,898. NON-REFILLABLE BOTTLE. BENJAMIN PEIRCE, Paterson, N. J. Filed Mar. 20, 1902. Serial No. 100,514. (No model.)

Claim.—A guard for non-refillable bottles consisting of two split rings disposed the one above the other in combination with a divided perforated disk-like body secured between said rings with its sections overlapping each other, substantially as described.

708,899. CAR-COUPLING. JEAN B. QUEEN, New York, N. Y. Filed Apr. 29, 1902. Serial No. 105,163. (No model.)

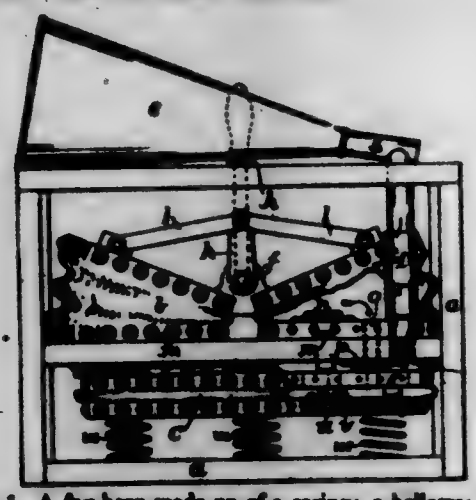
Claim.—1. In a car-coupling, the combination with a coupling-head having a vertical pivot-bearing at one side of its face, a knuckle pivoted in said bearing, one curved end thereof projecting forward and laterally

across the center line of the draw-bar and shaped to engage and interlock with its counterpart on an opposite head and the tail end of reduced depth projecting within the cavity of the head, a latch placed longitudinally within the cavity of the coupler-head and having a vertical movement therein bearing against abutments forming sideways and held in suitable guides and forming in its normal position a block between said abutment and the tail end of the knuckle but clearing it when raised, a latch-key placed transversely to said latch on the bottom of the head and having a wedge-shaped nose engaging a beveled notch in said latch and lifting the latter when drawn toward it, and provided with a lug projecting through a slot in the bottom of the head and a rod coupled to said latch-key lug and held in guides secured to the car-sill, by which said latch-key may be moved forward and backward, substantially as set forth.



2. In a car-coupling, the combination with a hollow coupling-head closed at one side and having a bearing for a vertical pivot-joint at the other, a knuckle pivoted in said bearing to have a limited horizontal swing and having one part projecting beyond the face of the head and adapted to engage and interlock its counterpart on an opposite head, and the tail end projecting into the cavity of the head and being of reduced depth, a latch normally interposed between said tail end and an abutment on which it may slide vertically, guide-lugs on said latch, a vertical guide-bar engaged by said lugs, and a beveled notch in one of the lower edges of said latch, a latch-key placed transversely to said latch in a groove at the bottom of the head and having a wedge-nose engaging said bevel-notch, and a spur adapted to engage the nose of the tail end of the knuckle and provided with a lug projecting below the bottom of the head, and a rod coupled to said lug and held slidingly in guides on the car-sill and adapted to move said latch-key, substantially as set forth.

708,400. FOG-HORN. HARVEY A. HILL, Gloucester, Mass. Filed May 24, 1901. Serial No. 61,518. (No model.)



Claim.—1. A fog-horn made up of a casing; a bellows; means to operate said bellows; an air-compressor below said bellows; a horn above said casing; a reed; and an air-conduit connecting the horn with the air-compressor.

2. In combination in a fog-horn, a bellows; an air-compressor below said bellows, said compressor being formed with apertures in its bottom; valves controlling said apertures; a horn; and a pipe connecting said horn with said compressor.

3. In combination in a fog-horn, a bellows formed with inlets in its bottom piece; a valve controlling said inlet; and an air-compressor below and connected with said bellows, and a valve controlling the passage between the air-compressor and the bellows.

4. In combination in a fog-horn, a bellows formed with inlets in its bottom piece, the area of said inlets being small and designed to admit air slowly into the bellows; a valve controlling said inlet; an air-compressor below and connected by a passage with said air-compressor; and a valve controlling the passage between the air-compressor and the bellows.

5. In combination a fog-horn; a bellows; an air-compressor below said bellows and connected therewith; a horn; an air-pipe connecting said horn with said air-compressor; said air-compressor being formed with apertures in its bottom; and valves controlling said apertures in the bottom of the compressors; each of said valves being provided with projections on its outer edge, and formed with a flexible central portion.

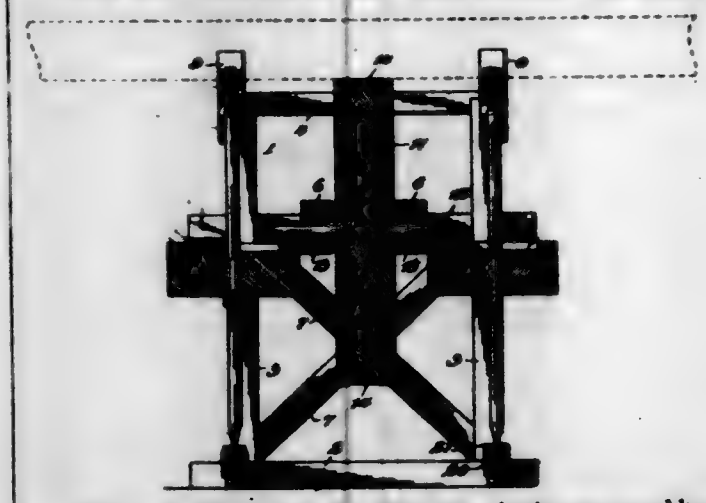
6. In combination a fog-horn; a bellows; an air-compressor below said bellows and connected therewith; springs interposed between the bottom of said air-compressor and the bottom of the casing; and said casing.

708,401. SUPPORT FOR CASEMENT-WINDOWS. ANTON GUSSMA and FERDINAND HLAVKA, Agram, Austria-Hungary. Filed Dec. 9, 1901. Serial No. 85,292. (No model.)

Claim.—1. The combination with a swinging sash, as described, of a window-frame having a recess or socket, a lever having one end arranged within the socket and adapted to swing therein when the lever is swung in vertical and horizontal planes, a roller on the swinging sash having a bearing on the upper edge of the lever, and a brace-rod arranged to support the lever when in a horizontal position.

2. The combination with a swinging sash as described, of a window-frame having a recess or socket, a lever having one end arranged within the socket and having a pin *c* also within the socket and upon which the lever turns in its horizontal swinging movements, a roller on the swinging sash having a bearing on the lever, and a brace-rod pivoted at one end to the lever and provided at the other end with a pin *g* pivotally mounted on the frame, the said pin *g* serving as a pivot for the brace-rod in the horizontal movements of the latter.

708,402. ANTIFRICTION-BEARING. JOHN GOTTBERT, Fort Scott, Kans. Filed May 23, 1901. Serial No. 61,561. (No model.)



Claim.—1. The combination with a frame having upper and lower sets of guard-bearings in vertical alinement, of a rotatable shaft seated in the upper set of bearings, a circular vertically-disposed rotatable bearing element in frictional supporting engagement with the under side of the shaft, and having opposite journals carried by and rotatable with the circular element and seated in the lower set of bearings, upstanding rotatable shafts located at opposite sides of the vertically-disposed bearing element and in alinement with the upper and lower sets of bearings, and opposite horizontal bearing elements carried by and rotatable with the respective upstanding shafts, the journals of the vertical bearing element resting in frictional engagement with the upper surfaces of the respective horizontal bearing elements.

2. In a shaft-bearing, the combination with a horizontal rotatable shaft, of a vertically-disposed rotatable wheel bearing against the under side of the shaft to support the same and provided with a journal, and a vertically-adjustable horizontal rotatable wheel bearing against the under side of the journal to form a bearing therefor, whereby the vertical wheel may be adjusted into supporting engagement with the shaft.

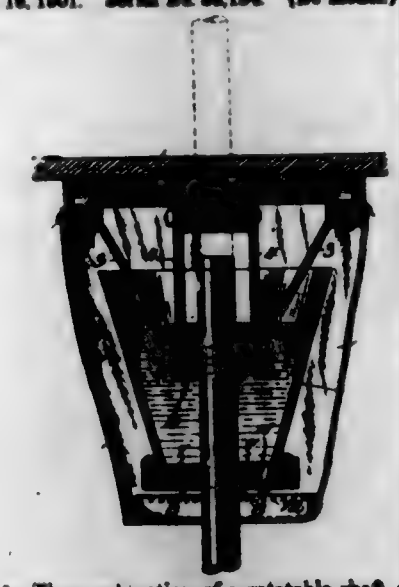
3. In a shaft-bearing, the combination of a vertically-disposed rotatable bearing-wheel having a journal rotatable therewith, the top portion of the periphery of the wheel forming a bearing to engage the under side of the shaft to be supported, an endwise-adjustable vertical shaft located at one side of the vertical bearing-wheel, and a horizontal bearing-wheel carried by the shaft and bearing against the under side of the journal to support the same and the vertical wheel.

4. In a shaft-bearing, the combination with a frame having a guard-bearing for the shaft to be supported, of a vertically-disposed rotatable wheel having opposite journals loosely mounted in guard-bearings carried by the frame and below the bearing for the shaft, the top portion of the periphery of the wheel being projected above the bottom of the shaft guard-bearing to form a roller-bearing support for the shaft, vertically-disposed endwise-adjustable shafts mounted in the frame at opposite sides of the vertical wheel, and horizontal bearing-wheels carried by the respective shafts and in frictional supporting engagement with the under sides of the respective journals, whereby the vertical bearing-wheel may be adjusted into engagement with the shaft to be supported.

5. An antifriction-bearing comprising a frame carrying bearings, a shaft supported therein, a wheel arranged below the shaft and bearing thereagainst, a shaft passing through the latter wheel and supported by suitable bearings on the frame, two vertically-disposed shafts, one arranged on each side of the vertically-disposed wheel, horizontally-disposed wheels carried by the said shafts, the upper faces of the wheels being inset to present a rim or flange upon which the ends of the shaft of the vertically-disposed wheel bear, and means for adjusting the vertical shafts whereby to keep the horizontally-disposed wheels in engagement with the shaft ends of the vertically-disposed wheel.

6. An antifriction-bearing comprising a frame carrying bearings, a shaft supported therein, a wheel arranged below the shaft and bearing thereagainst, a shaft passing through the latter wheel and supported by suitable bearings on the frame, two vertically-disposed shafts, one arranged on each side of the vertically-disposed wheel, horizontally-disposed wheels carried by the said shafts, the upper faces of the wheels being inset to present a rim or flange upon which the ends of the shaft of the vertically-disposed wheel bear, the lower ends of the vertical shafts being tapered to present pivot-bearings, and adjustable pivot-bearings supported by the base of the frame with which the tapered ends of the shafts engage, thereby to adjust the shafts to keep the wheels carried in operative relation to the shaft ends of the vertically-disposed wheel.

703,403. LUBRICATOR. JOHN GOTTSHALL, Montrose, Kans. Filed Dec. 16, 1901. Serial No. 86,154. (No model.)



Claim.—1. The combination of a rotatable shaft, a stationary bearing therefor, a sectional lubricant-containing cup or casing carried by the shaft and embracing the bearing to normally submerge the latter in a lubricant, and means for drawing the sections of the cup into engagement with the shaft to adjust the cup endwise thereon.

2. The combination of an upright rotatable shaft, a stationary bearing therefor, a sectional open-topped lubricant-containing cup or casing carried by the shaft and normally embracing the bearing to submerge the latter in a lubricant, and fastenings connecting the sections of the cup to bind the same upon the shaft.

3. A lubricator, comprising an open-topped cup or casing formed in longitudinal half-sections, the inner edges of the bottoms of the sections having corresponding shaft-openings, and fastenings connecting the sections to clamp the same upon a shaft.

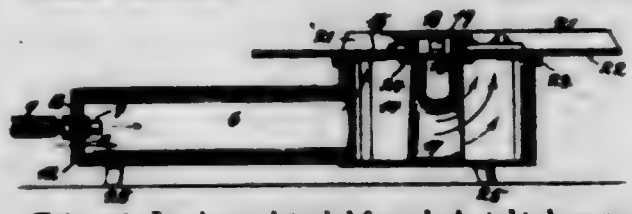
4. A lubricator, comprising an open-topped cup or casing formed in vertical half-sections, the inner edges of the bottom of the sections having corresponding shaft-openings, corresponding ears located at the opposite ends of the inner edges of the cup-bottom, and clamping-fastenings piercing the corresponding ears to clamp the cup upon a shaft.

5. The combination with a frame, of a hanger pendent therefrom, a bearing carried by the hanger, an upright shaft journaled in the bearing, a lubricating-cup carried by the shaft and embracing the bearing, and a hood pendent from the frame and embracing the cup to exclude foreign matter therefrom.

6. The combination with a support, of a bearing, a shaft journaled in the bearing, a lubricating-cup carried by the shaft and embracing the bearing, and a collapsible hood pendent from the support and embracing the cup to exclude foreign matter therefrom.

7. The combination with a support, of a bearing, an upright shaft journaled in the bearing, a lubricating-cup carried by the shaft and embracing the bearing, and a flexible hood hung from the support and embracing the cup to exclude foreign matter therefrom, the lower end of the hood being provided with a weighted band to hold the hood distended.

708,404. ACETYLENE-GAS BURNER. JOHN J. GRAF, Cincinnati, Ohio, assignor, by direct and mesne assignments, to Union Light & Heat Company, Cincinnati, Ohio. Filed Apr. 19, 1899. Serial No. 713,689. (No model.)



Claim.—1. In a burner intended for and adapted to burn gases under low pressure, such like for instance acetylene gas, the combination of a mixing-chamber adapted to receive gas and air, an expansion-chamber of about double capacity communicating therewith and the open top of which is closed by wire-gauze, which forms also the burner-surface upon which the flame rests.

2. In a burner intended for and adapted to burn gases under low pressure, such like for instance acetylene gas, the combination of an expansion-chamber the top of which is closed by wire-gauze which forms also the support upon which the base of the flame rests, inlets to admit gas and air thereto, and an additional inlet for air only, entering through the wire-gauze, the discharging capacity of said chamber being about double of its receiving capacity.

3. In a device to burn gas for heating purposes, the combination of a perforated surface upon which the base of the flame rests, a chamber below this surface from which a mixture of gas and air is supplied to the perforations in this latter, a central air-supply opening in this surface to add an additional supply of unmixed air to the flame above the burner and a spreader closed on top and having lateral outlets to cause this added air to become divided and distributed laterally across the burner-surface as soon as it arrives thereat.

4. In a burner intended for and adapted to burn gases under low pressure, such like for instance acetylene gas, the combination of a mixing-chamber adapted to receive gas and air, and an expansion-chamber of about double capacity communicating therewith, the former entering it through the side thereof, the otherwise open top of the expansion-chamber being closed by wire-cloth, which forms also the burner-surface upon which the flame rests.

5. In a device to burn gas for heating purposes, the combination of a mixing-chamber adapted to receive gas and air, an expansion-chamber communicating therewith, wire-cloth closing the top of the latter and forming the burner-surface upon which the base of the flame rests, a central air-inlet opening in this wire-cloth communicating with an air-conduit from below and flanges projecting over the edges of this wire-cloth to hold the same in position and close part of the open meshes thereof.

6. In a device to burn gas for heating purposes, the combination of a mixing-chamber 6, adapted to receive air and gas, a bridge 8, across the mouth of the same, the air entering at each side thereof through the open parts 11, a nipple 7, adapted to receive a gas-supply pipe and seated in this bridge and projecting therefrom, a rotary cut-off 12 mounted on nipple 7 to regulate within certain limits the admission of air, being incapable however of cutting it off altogether, for which purpose the open parts 13 therein are smaller than the open parts 11, but larger than the area otherwise closed by bridge 8, an expansion-chamber communicating with the mixing-chamber and a perforated burner-surface forming the top of the former.

7. In a device to burn gas for heating purposes, the combination of a mixing-chamber 6, adapted to receive gas and air, an expansion-chamber 14, open at the top, receiving the mixture from chamber 6, wire-cloth closing this open top and forming the burner-surface, a central air-conduit having projecting flange 24, below this wire-cloth, which latter

is cut out to admit the air from this conduit, a spreader 18, resting on flange 24, to hold the wire-cloth in position thereon and provided with lateral air-discharge openings through which the air is diffused over the burner-surface, a ring 22, having a downwardly-projecting flange 23, fitted around the top of the burner and projecting inwardly to hold the wire-cloth in place, and bars 21, connecting the spreader and ring 22, whereby these parts aid each other to retain their respective positions.

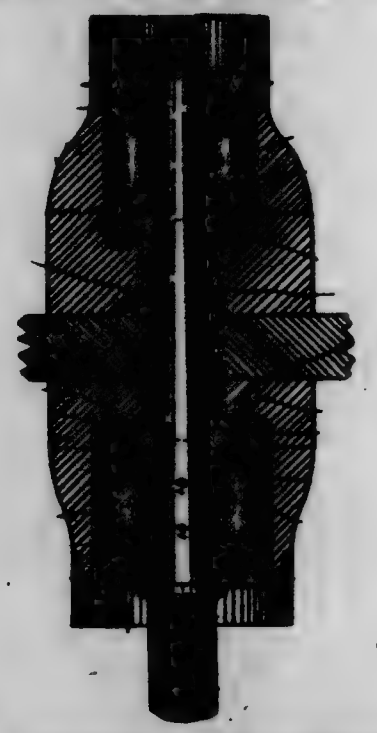
8. In a device to burn gas for heating purposes, the combination of a mixing-chamber 6, adapted to receive gas and air, an expansion-chamber 14, having a perforated top through which the mixture received from chamber 6, is discharged, a central air-inlet opening 16, in this perforated top and two air-conduits 17, starting from the bottom of chamber 14, near the edge thereof, and converging upwardly, merging into one and communicating with opening 16, mentioned, these conduits being so located that the space between them is opposite the inner end of chamber 6, and where the same discharges into chamber 14.

9. In a burner intended for and adapted to burn gas under low pressure, such like for instance acetylene gas, the combination of a mixing-chamber adapted to receive gas and air, an expansion-chamber of about double capacity communicating therewith and open at the top and a burner-surface formed by wire-gauze of fine mesh which closes this open top of the expansion-chamber.

10. In a burner, the combination of an expansion or mixing chamber, a screen covering said chamber, and an air-distributing chamber situated above said screen and adapted to discharge air laterally across the upper surface of the screen.

11. In a burner, the combination of an expansion or mixing chamber, a screen covering said chamber, an air-distributing chamber situated above said screen and adapted to discharge air laterally across the upper surface of the screen, and tubes passing through said expansion or mixing chamber and discharging into the distributing-chamber.

708,405. ROLLER-BEARING. WILLIAM G. GRIFFIN, Washington, D. C. Filed Oct. 5, 1901. Serial No. 77,601. (No model.)



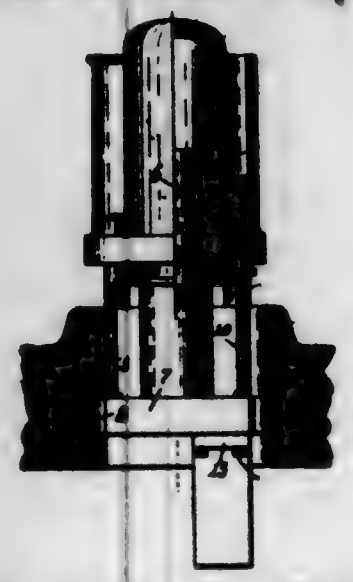
Claim.—1. A roller-bearing comprising antifriction-rollers, a revolving cage, bearing-pins adjustably secured in opposite ends of the cage and forming bearings for the rollers, and means for preventing the removal of said pins from engagement with said rollers.

2. A roller-bearing comprising antifriction-rollers, a revolving cage formed in a single piece, a sleeve inclosed by said cage and forming a race for the rollers, bearing-pins adjustably secured in opposite ends of the cage and forming bearings for the rollers, and means for preventing the removal of the pins from the cage, whereby said rollers are locked in position within the cage.

3. A roller-bearing comprising antifriction-rollers, a revolving cage, bearing-pins adjustably secured in opposite ends of the cage, and having tapered ends projecting into recesses in the ends of the rollers and forming bearings therefor, and means for locking said pins against removal from engagement with the rollers.

4. The combination with cups having inclined inner surfaces; of a barrel adjustably connected to said cups and a bearing in each cup, said bearing comprising a sleeve, a cage formed in one piece and rovolubly mounted on the sleeve, antifriction-rollers bearing upon the sleeve and cup, bearing-pins adjustably secured in opposite ends of the cage and forming bearings for the rollers, and means for locking said pins against removal from engagement with the rollers.

708,406. FLANGING-PRESS. WILLIAM J. HAGMAN, Philadelphia, Pa., assignor to Niles-Bement-Pond Company, Jersey City, N. J. Filed Mar. 24, 1902. Serial No. 99,547. (No model.)



Claim.—1. In a flanging-press, the combination, substantially as set forth, of a head-plate provided with an opening through it, an rotating-cylinder fixedly secured over said opening, a ram projecting from the cylinder into the opening, a cross-head disposed at the lower end of the ram and reciprocating within said opening, and a flanging-tool secured within said opening to the lower face of the cross-head and arranged for horizontal adjustment thereon.

2. In a flanging-press, the combination, substantially as set forth, of a head-plate provided with an opening through it having guideways supported by its walls, an rotating-cylinder fixedly secured over said opening, a ram projecting from the cylinder into the opening, a cross-head at the lower end of the ram and engaging said guideways in the opening of the head-plate, and a flanging-tool secured within said opening to the lower face of the cross-head and arranged for horizontal adjustment thereon.

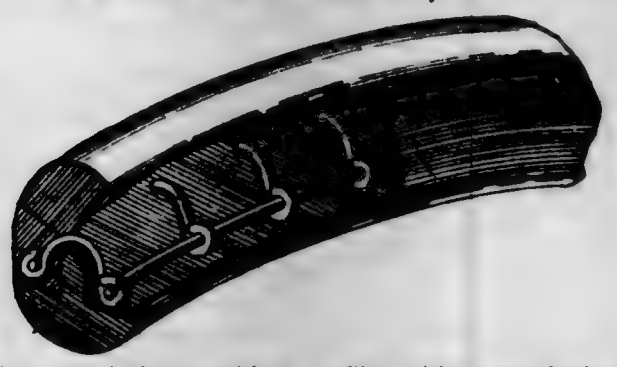
3. In a flanging-press, the combination, substantially as set forth, of a fixedly-supported rotating-cylinder, a ram projecting axially therefrom, a cross-head at the end of the ram provided with a pair of parallel T-slots in its face, a flanging-tool provided with a flange at its end to rest against the cross-head, and bolts engaging said flange and T-slots.

708,407. ANIMAL-POKE. ASA B. HALE, Ragsville, Mo. Filed Oct. 18, 1901. Serial No. 79,208. (No model.)

Claim.—An animal-poke comprising two members bowed to conform to the shape of the animal's neck, one of the members having its terminals curved forward to present fence-engaging means, prods constructed each of a flat piece of metal having one end bifurcated to pro-

sent prongs and twisted at right angles midway of its length to cause the prongs to be transversely disposed with relation to the fence-engaging means and its other end arranged between the poke members, and fastening devices for rigidly clamping the poke members and the prods together, said devices passing through the terminals of the prods, substantially as and for the purpose specified.

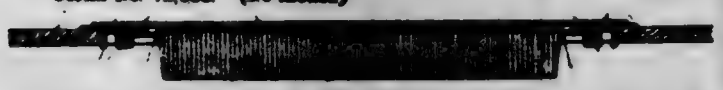
708,408. RUBBER TIRE. WILLIAM B. HARRIS, Akron, Ohio. Filed Dec. 30, 1901. Serial No. 87,703. (No model.)



Claim.—1. A tire comprising a resilient body portion having a groove throughout its inner face and also provided upon each side with circumferential reinforcing-bands, said body portion also having a plurality of transversely-disposed wires, each wire section being bent upon itself near its middle portion to provide a U-shaped loop portion adapted to compensate for said groove, in combination with a rim having a rib fitting said groove, all combined substantially as specified and for the purpose set forth.

2. The combination with a rim having a centrally-disposed rib, of a resilient tire provided with a groove in its inner face fitting said rib, and also having upon each side a circumferential band and a plurality of reinforcing transversely-disposed wires embedded in the tire-body, each transverse wire having near its middle section a U-shaped member fitting around said groove, each end of said stay-wires being directed outward into engagement with the circumferential band, whereby when the base of the tire-body is spread said U-shaped portion will yield and again draw the tire back into a normal position, all substantially as specified and for the purpose set forth.

708,409. REGISTER, VENTILATOR, OR THE LIKE. EDWARD S. HART, New Britain, Conn., assignor to the Hart & Cooley Company, New Britain, Conn., a Corporation of Connecticut. Filed Aug. 15, 1901. Serial No. 72,033. (No model.)



Claim.—1. A border-plate for registers, ventilators and the like comprising a frame having an opening adapted to receive a register-box, the inner edge of said border-plate being depressed to provide a supporting-shoulder for said box, a device carried by said depressed portion, said device projecting downwardly to center the border with respect to the floor-opening, said device being extended so as to center the box with respect to said border.

2. A border-plate for registers, ventilators, and the like, comprising an angular frame having an opening therein adapted to receive a register-box, said opening being substantially larger than the body portion of said box, a depression at the inner edge of said border to form a supporting-ledge for the top of said box, downwardly-projecting lugs at the lower side of said border-frame to center the same relatively to the floor-opening, and inwardly-projecting lugs at two or more angles of said opening adapted to engage with the register-box and center it with respect to the border-frame.

3. A border-plate for registers, ventilators, and the like, comprising a rectangular frame, lugs carried thereby and extending downwardly therefrom and adapted to center said frame relatively to the opening in which it is to be placed, inwardly-directed lugs carried by said frame and adjacent the inner angles thereof and adapted to engage with and center the register-box of smaller external proportions than said opening.

708,410. FLUID-REGULATING DEVICE. JAMES HASTINGS, Springfield, Vt. Filed Jan. 21, 1901. Serial No. 44,073. (No model.)

Claim.—1. A fluid regulating or measuring device comprising an expanding chamber having a loose movable element, valve mechanism exterior to said chamber and independent of said movable element, for permitting the ingress and egress of liquid under pressure into and from the chamber, on both sides of the movable element, and a spring bearing against said movable element to eject the liquid under pressure.

2. A fluid regulating or measuring device comprising a chamber, a loose liquid-measuring member moved in one direction by fluid, a spring for moving said member in the other direction, and valve mechanism independent of said member, said parts being combined whereby fluid is measured and discharged under a continuous yielding pressure.

3. A fluid regulating or measuring device comprising a cylinder having a loose piston, valve mechanism operable independently of said piston for conveying fluid alternately to and from said cylinder on both sides of said piston, a spring bearing against said piston for ejecting the fluid from said cylinder and a separate exhaust for the fluid on the spring side of the cylinder.

4. A fluid regulating or measuring device comprising an expanding chamber having a movable element, valve mechanism independent of said element for admitting fluid alternately to the opposite sides of said element, mechanical means for augmenting the pressure against one side of said element to increase the pressure of the fluid discharged from the other side of said element, and separate exhaust-ducts for the fluid from the opposite sides of said element.

5. A fluid regulating or measuring device comprising a cylinder having a loose piston, valve mechanism operable independently of said piston for conveying fluid alternately to and from said cylinder on both sides of said loose piston, a spring bearing against said piston for ejecting the fluid from said cylinder, and adjustable non-yielding means for checking the movement of said piston at any point in its travel.

6. A fluid regulating or measuring device comprising a casing having a plurality of cylinders with loose independent pistons therein, ducts leading to the opposite ends of said cylinders, a common fluid-inlet, fluid-outlets, and a single valve mechanism operable independently of said pistons for supplying fluid to and exhausting it from said ducts in succession.

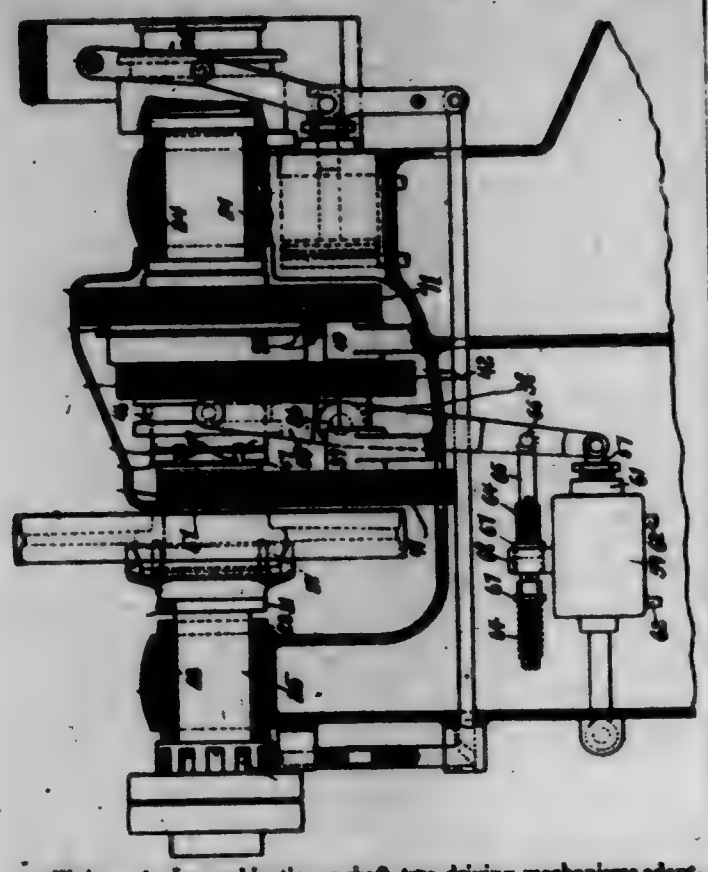
7. A fluid regulating or measuring device comprising a casing having a plurality of cylinders with loose independent pistons therein, ducts leading to the opposite ends of said cylinders, a common fluid-inlet, outlets, and a valve mechanism operable independently of said pistons for alternately supplying fluid to and exhausting it from said ducts in succession.

8. A fluid regulating or measuring device comprising a casing having a plurality of cylinders with loose pistons therein, ducts leading to the opposite ends of said cylinders, a common fluid-outlet, a common waste-outlet, and a valve mechanism governing the passage of fluid through said outlets.

9. A fluid regulating or measuring device comprising a casing having a plurality of cylinders with loose independent pistons therein, a single valve operable independently of said pistons for permitting the ingress and egress of fluid to and from the cylinders on both sides of the loose pistons, pins projecting through the ends of said cylinders to limit the play of the pistons, and an adjustable member having a threaded connection with the casing for adjusting said pins simultaneously.

10. A fluid regulating or measuring device comprising a casing having a plurality of cylinders with loose independent pistons therein, a single valve operable independently of said pistons for permitting the ingress and egress of fluid to and from the cylinders on both sides of the loose pistons, pins projecting through the ends of said cylinders to limit the play of the pistons, a threaded stud on the casing and a nut on said stud and adjustable relatively thereto, for adjusting said pins simultaneously.

708,411. BACK GEARING FOR LATHES. JAMES HASTINGS, Springfield, Vt. Filed Mar. 20, 1901. Serial No. 52,053. (No model.)



Claim.—1. In combination, a shaft, two driving mechanisms adapted to be driven in either direction, a friction-clutch for connecting one of said driving mechanisms to the shaft, a reversible ratchet-clutch in constant potential relation to the other said driving mechanism, for connecting it to the shaft, and provisions for throwing the friction-clutch into and out of operation.

2. In combination, a shaft, two driving mechanisms adapted to be driven in either direction, a friction-clutch for connecting one driving mechanism with said shaft, a reversible ratchet-and-pawl clutch for connecting the other driving mechanism with said shaft, means for throwing said friction-clutch into and out of operation, and provisions for holding the pawl out of engagement from the ratchet when the friction-clutch is in operation.

3. In combination, a shaft, two driving mechanisms adapted to be driven in either direction, a clutch for connecting one driving mechanism with the shaft, means for throwing said clutch into and out of operation, and a positive clutch operable when the first-mentioned clutch is out of operation, said positive clutch having a ratchet and automatically-reversible pawls for engaging said ratchet.

4. In combination, a rotary shaft, three differently-speeded driving mechanisms, clutch mechanism located between two of said driving mechanisms and having a member movable in opposite directions to clutch said last-mentioned driving mechanisms to the shaft, and a third clutch mechanism thrown automatically into operative relation to the third driving mechanism when said movable member occupies a middle or neutral position.

5. In combination, a rotary-shaft, three differently-speeded driving mechanisms adapted to be driven in either direction, friction clutch mechanism located between two of said driving mechanisms and having a member movable in opposite directions to clutch said last-mentioned driving mechanisms to the shaft, and a third clutch mechanism thrown automatically into operative relation to the third driving mechanism, irrespective of the direction of rotation of said driving mechanisms, when said movable member occupies a middle or neutral position.

6. In combination, a rotary shaft, three differently-speeded driving mechanisms, clutch mechanism located between two of said driving mechanisms and having a member movable in opposite directions to clutch said last-mentioned driving mechanisms to the shaft, and a positive clutch mechanism thrown automatically into operative relation to the third driving mechanism when said movable member occupies a middle or neutral position.

7. In combination, a rotary shaft, three differently-speeded driving mechanisms, friction clutch mechanism located between two of said driving mechanisms and having a member movable in opposite directions to frictionally clutch said last-mentioned driving mechanisms to the shaft, and a positive clutch mechanism thrown automatically into operative relation to the third driving mechanism, when said movable member occupies a middle or neutral position.

8. In combination, a shaft having two differently-speeded driving-wheels thereon, adapted to be driven in either direction, independent clutches for rotating said driving-wheels in either direction, means for operating one of said clutches, and devices disconnected from said operating means whereby when said last-mentioned clutch is inoperative, the other clutch is operated, and vice versa.

9. In combination, a shaft, a driving mechanism for rotating said shaft in either direction, and automatic mechanism whereby when the speed of the shaft exceeds the speed of the driving mechanism in either direction the latter is unclutched therefrom, and when the speed of the shaft is less than that of the driving mechanism the latter is clutched thereto.

10. In combination, a shaft, two differently-speeded driving mechanisms rotatable in either direction, a clutch for the high-speed driving mechanism, and automatic mechanism whereby when the shaft is clutched to the high-speed mechanism, the low-speed driving mechanism is unclutched, and when the speed of the shaft is less than that of the low-speed mechanism, the latter is clutched thereto.

11. In combination, a shaft having a member, a positive-clutch member, said members being respectively fast and loose on said shaft and rotating in the same direction, and one or more independently-movable pawls carried by one of said members and moved into operative position by the other of said members to positively clutch said members together when the speed of said members differs.

12. In combination, a reversibly-rotatable shaft having a fast member and a loose member rotating in the same direction, one of said members having ratchet-teeth, and one or more pawls carried by the other member to coöperate with said teeth for connecting said members, said pawl or pawls being automatically reversible by a change in the speed of movement of the loose member.

13. In combination, a driving member, a driven member, a pawl carried on one member, ratchet-teeth on the other member, automatic provisions by which the pawl is moved to inoperative position when the speed of the driven member exceeds that of the driving member and is moved to operative position when the speed of the driven member is less than that of the driving member, and a guard for preventing the pawl from engaging the ratchet-teeth when it is in inoperative position.

14. In combination, a driving member adapted to move in either direction, a driven member, an oscillatory reversible pawl carried by one member, ratchet-teeth on the other member, provisions for automatically oscillating said pawl to inoperative position when the speed of the driven member in either direction exceeds that of the driving member and to operative position when the speed of the driven member is less than that of the driving member, and an automatic guard which automatically prevents the engagement of the pawl with the ratchet-teeth when said pawl is in inoperative position.

15. In combination, a driving member, a driven member, an oscillating pawl on one member having a single operative end, ratchet-teeth on the other member, a friction-surface on the last-mentioned member, and a rotatable disk on said pawl to engage said friction-surface, substantially as described.

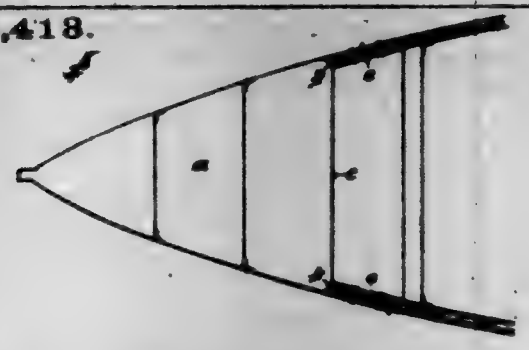
708,412. HAIR-PIN. ELLA O. HASSEN, Jersey City, N. J. Filed Aug. 11, 1900. Serial No. 26,633. (No model.)

Claim.—In a hair-pin the combination with a substantially U-shaped pin, the head of which is provided with a transverse recess and is cut off at an angle on the rear side, and each leg is bent or cranked and provided with a recess in its inner side, the portion of the leg between the head and the recess being provided with a hole extending diagonally therethrough from the outer or rear side of the head to the wall of the recess in the leg near one end, the leg being curved or bent outward at a point opposite said recess of a substantially U-shaped locking member, the legs of which fit within the holes in the legs of the pin, and when in position to retain the pin the head will bear against the cut-off portion of the head of the pin and the tips will each engage with the wall of its respective recess opposite the entrance to the hole in the other side of the recess.

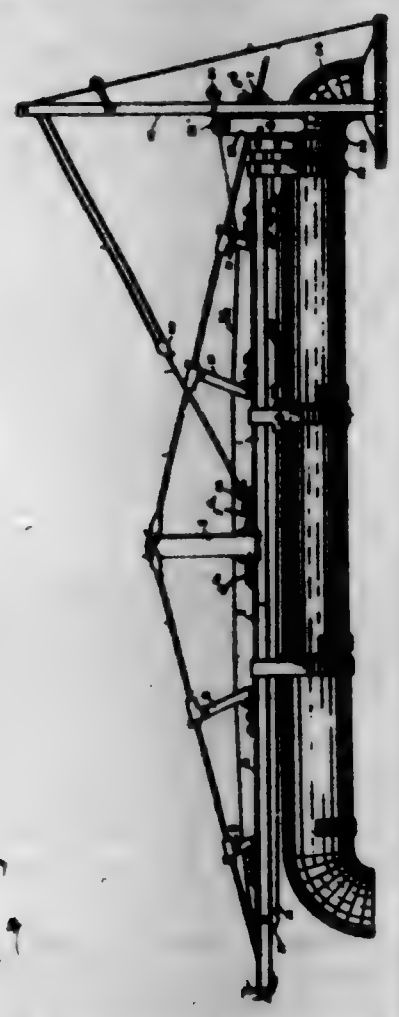
708,418. CONSTRUCTION OF COMPOSITE VESSELS. EDWARD HAYES, Wolverton, England. Filed Nov. 26, 1901. Serial No. 83,794. (No model.)

Claim.—Improvements in the construction of composite vessels, comprising independent metallic bow and stern portions having extending external and internal plates forming grooves at the aft and forward ends respectively of said portions, said grooves adapted to receive and rigidly connect the ends of the planks forming the body of the vessel, substantially as described.

708,418.



708,414. STRAW-STACKER. CHARLES E. HAGER, Xenia, Ohio. Filed Apr. 18, 1901. Serial No. 56,057. (No model.)



Claim.—1. In a straw-stacker, the combination with the telescoping cylindrical tubes or sections, of a hinged and folding beam supporting the same, substantially as described.

2. In a straw-stacker, the combination with the telescoping cylindrical tubes or sections, of a hinged and folding beam supporting the same and folding braces for said beam, substantially as described.

3. In a straw-stacker, the combination with the telescoping stacker-sections, of a supporting-beam therefor comprising hinged sections, sliding connections between said beam and telescoping sections, an upright hinged to said beam, and folding truss-rods connecting said upright and beam-sections, substantially as described.

4. In a stacker, the combination with the telescoping stacker-sections, of a sectional supporting-beam therefor, sliding connections between said beam and telescoping sections, an upright hinged to said beam, truss-rods extending from the top of said upright to opposite ends of the beam, and folding braces between said rods and the sections of the beam, substantially as described.

5. In a stacker, the combination with the telescoping sections, of a sectional supporting-beam therefor, sliding connections between said beam and said telescoping sections, an upright hinged to said beam, and truss-rods pivotally connected to the upper end of said upright and having their opposite ends slidingly connected with opposite ends of the beam, substantially as described.

6. In a stacker, the combination with the telescoping stacker-sections, of a folding supporting-beam therefor, sliding connections between the beam and said stacker-sections, an upright hinged to said beam, truss-rods pivotally connected to the upper end of said upright, and extending through eyes at opposite ends of the beam, and nuts threaded on said rods and coöperating with said eyes, substantially as described.

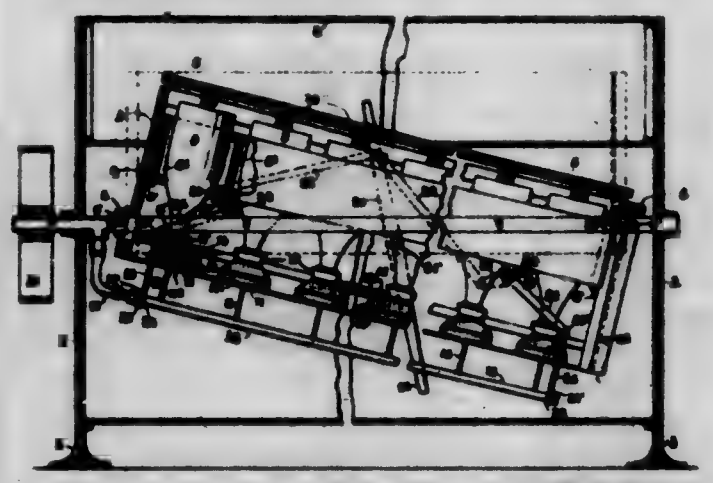
7. In a stacker, the combination with the telescoping stacker-sections, of a supporting-beam comprising two members, an upright at the junction of said members having a hinged connection to each, and truss-rods pivotally connected to the upper end of said upright and slidingly connected to opposite ends of said beam and sliding connections between said beam and stacker sections, substantially as described.

8. In a stacker, a supporting-beam, a plurality of telescoping sections having sliding connections therewith, an operating-cord permanently connected to one of said sections for moving it in both directions, an automatically-detachable connection between said cord and the adjoining section, substantially as described.

9. In a stacker, a supporting-beam, a plurality of telescoping stacker-sections slidingly supported thereby, an operating cord or rope having a permanent connection with an outer section, a stop member on said cord, an engaging device on the next inner section for engaging said stop member, and stationary means for releasing said engaging means at the limit of their inward movement, substantially as described.

10. In a stacker, a supporting-beam, a plurality of telescoping stacker-sections slidingly supported thereby, an operating cord or rope having a permanent connection with an outer section, a stop member on said cord, pawls for engaging said stop device, spring-pressed arms carrying said pawls, and stationary inclines in the path of said arms for operating them to release the pawls, substantially as described.

703,415. BOTTLE-WASHING MACHINE. JOHN G. HESS, Pittsburg, Pa., assignor of two-thirds to Edward J. Vilsack and John J. O'Reilly. Filed Oct. 22, 1900. Renewed Dec. 6, 1901. Serial No. 84,945. (No model.)



Claim.—1. In a bottle-washing machine, the combination of a revolving shaft, a frame mounted on said shaft obliquely to the vertical, transverse and longitudinal planes intersecting said shaft, means for securing bottles in said frame, and means for cleaning said bottles.

2. In a bottle-washing machine, the combination of a revolving shaft, a frame attached to said shaft, means for lowering and raising one end of said frame, means for securing bottles in said frame and means for cleaning said bottles.

3. In a bottle-washing machine, the combination of a tank, a rotating shaft secured in said tank, a frame mounted on said shaft obliquely to the vertical, transverse and longitudinal planes intersecting said shaft, means for securing bottles in said frame and means for cleaning said bottles.

4. In a bottle-washing machine, the combination of a tank, a rotating shaft secured in said tank, a frame mounted on said shaft at an obtuse angle to the line of said shaft, a lid secured to the top of said frame, packers secured to said lid and adapted to press on the bottom of bottles, said bottles resting in racks, said racks secured in said frame and means for cleaning said bottles.

708,416. SHADOWGRAPH. JOHN G. HIXSON, Milwaukee, Wis. Filed Feb. 1, 1902. Serial No. 92,158. (No model.)

Claim.—1. A shadowgraph, comprising a translucent shadow-board, a figure secured thereto at one or more points, one at least of which points

is medially of the figure or at a distance from its termination other parts of the figure extending a distance from the board whereby light can pass obliquely under the part or parts of the figure thus separated from the board and cast a shadow thereon.

2. A shadowgraph, comprising a board or sheet of light-transmitting material, a figure in light-obstructing material secured medially to the light-transmitting material, other parts of the figure being at a distance from but opposite to the light-transmitting material.

3. An article of manufacture, consisting of a sheet or board of light-transmitting material, a figure of light-obstructing material secured at a point or points one at least of which points is medially of the figure or at a distance from its termination to the surface of the light-transmitting material and having other parts opposite to but at a distance from the light-transmitting material.

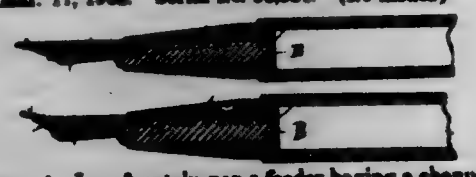
708,417. CANE-STRIPPER. ENOCH W. HOLDENBECK, Lawley, Ala. Filed Apr. 12, 1901. Serial No. 55,727. (No model.)

Claim.—1. In a cane-stripper the combination of a handle-section, diverging spring-arms fixedly held in said handle, strengthening-plates securely fastened to the said handle, handles secured to the said arms at their outer ends, the said arms having bowed sections arranged between the handles and opposite each other which form tubular sections when the arms are pressed together, substantially as shown and described.

2. In a cane-stripper comprising a handle portion, spring-arms diverging therefrom, said arms being formed of one piece of metal bent in the middle to form the said arms, handle portions held upon the free ends of the arms, spring portions formed integral with said arms, and bowed sections arranged on the arms between the handles, substantially as shown and described.

3. In a cane-stripper, the combination of a handle-section composed of two semicircular portions having their inner faces recessed, arms securely held within the said recesses, spring portions formed in the arms adjacent the handle-section, handles secured to the outer or free ends of the arms, bowed portions formed in the said arms and arranged between the said handles, substantially as shown and described.

708,418. FOUNTAIN-PEN. JOHN HOLLAND, Cincinnati, Ohio. Filed Mar. 17, 1902. Serial No. 98,581. (No model.)

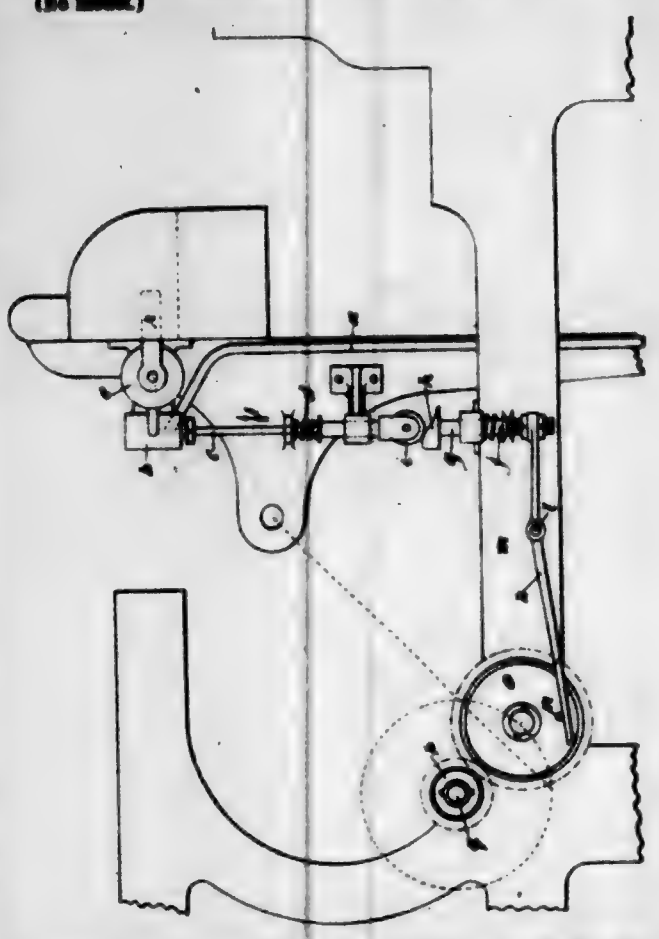


Claim.—1. In a fountain-pen a feeder having a channel beneath the pen and having its end elastic and curved upward to follow the pen when the nibs are bent, substantially as shown and described.

2. In a fountain-pen a feeder having a channel beneath the pen, a longitudinal slit beneath the channel forming an elastic end upon the feeder which is bent upward to contact the pen at all times, substantially as shown and described.

3. In a fountain-pen a feeder having a channel with a central partition beneath the pen and being curved upward at the end to contact the pen at all times, substantially as shown and described.

708,419. MEANS FOR DRIVING SHUTTLES OF LOOMS. JOHN HOGGETT, Sunderland, England. Filed Oct. 12, 1900. Serial No. 33,376 (No model.)



Claim.—In looms and other textile machinery, a cylinder piston and piston-rod attached to the desired part of the machine and adapted to be operated by compressed air, said piston-rod having a projection for throwing the shuttle, a valve controlling the admission of compressed air to the cylinder aforesaid, a valve-rod carrying said valve and having a roller or wheel attached thereto, a cam carried by an intermediate rod and engaging with the roller or wheel aforesaid, a pivoted lever engaging with the end of said intermediate rod, a projection carried by one of a train of gear-wheels driven from the main shaft and adapted to periodically engage with and operate the pivoted lever aforesaid, substantially as described and illustrated herein and for the purpose set forth.

708,420. PROCESS OF MAKING ELECTRIC ACCUMULATOR-PLATES. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Aug. 1, 1899. Serial No. 726,748. (No model.)

Claim.—1. The process of making an accumulator-plate which consists in first forming a series of elementary parts with a large number of thin lead walls, in then placing said elementary parts in a mold and clamping their outer edges tightly, in then passing a cooling medium through the central or interior portions of the elementary parts, in then forcing molten lead into the mold so as to cast it around the segments under pressure, and in finally transforming the surfaces of the thin walls of the segments into peroxid of lead.

2. The process for making a positive plate for an electrical accumulator which consists in forming an elementary part of lead in light porous condition, then placing said elementary part in a mold and clamping the outer edges near the periphery tightly, then passing a cooling medium through the central or interior portion of the elementary part, and while thus cooled casting a lead body-plate about said elementary part.

3. The herein-described method of making a positive plate for an electrical accumulator, which consists in forming a series of elementary parts of lead with highly-fusible peripheries formed by wrapping or folding a lead strip upon itself, placing a series of said elementary parts in a mold and shielding all but their peripheries, positively cooling the central portions of all of the elementary parts, casting a body of lead or lead alloy entirely around and between the exposed peripheries of said elementary parts and by its heat fusing the peripheries alone of the elementary parts into an integral structure with the body metal to make a close clean electrical connection, and finally transforming those portions of the surfaces of the segments not fused to the body into peroxid of lead.

4. The herein-described process of making a positive plate for an electrical accumulator, which consists in forming a series of elementary parts each presenting a large number of thin lead walls wrapped upon each other, placing said segments in a mold, retaining their central portions only in a cool condition, casting a lead body-plate entirely around their peripheral edges, fusing their outer peripheral edges to said plate to constitute an integral structure, condensing the interior layers of the elementary parts upon each other by the cooling of the body-plate, and finally subjecting the plate to an electrolytic action to convert the outer surfaces of the thin lead walls of the elementary parts into peroxid of lead.

5. The herein-described method of making a positive plate for an electrical accumulator, which consists in wrapping or folding a long strip of lead into elementary parts each having a series of thin layers resting one upon the other, in placing said elementary parts between the side walls of a mold of greater cubic capacity than the mass of the elementary parts and making tight joints between the exterior side circumferential edges of the elementary parts and the inside walls of the mold, and in finally filling the space within the mold entirely around and between the circumferential peripheries of the elementary parts with molten lead or its alloy and solidifying the same before removal from the mold, whereby the shrinking of the body metal condenses the layers of the elementary parts one upon the other to greatly strengthen the finished plate and reduce the internal electrical resistance when the plate is formed.

708,421. CAMERA ATTACHMENT. JAMES L. JACKSON, Williamsport, Pa. Filed Oct. 26, 1901. Serial No. 79,968. (No model.)

Claim.—1. As a new article of manufacture, a collapsible frusto-helical wire frame, and a flexible cover carried by and embracing the periphery of the frame, the opposite ends of the article being open.

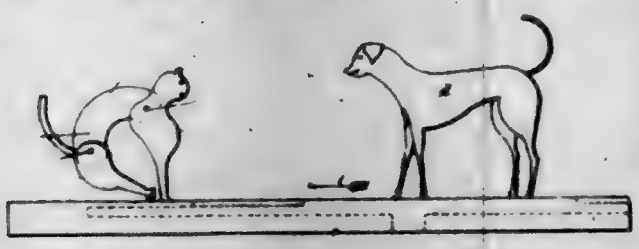
2. A device for excluding reflected light from the lenses of cameras, comprising a tapered and collapsible tube formed of light-excluding material, the opposite ends of the device being open.

3. A device for excluding reflected light from the lenses of cameras, comprising a tube formed by a collapsible frusto-helical frame, and a flexible light-excluding cover therefor, the opposite ends of the device being open.

4. A device for excluding reflected light from the lenses of cameras, comprising a tube formed by a collapsible frusto-helical frame, a flexible light-excluding cover therefor, and attaching means carried by the smaller end of the device, the opposite ends of the device being open.

5. As a new article of manufacture, a flexible frusto-helical wire frame, a flexible cover carried by and embracing the periphery of the frame, the opposite ends of the article being open, and means carried by the smaller end of the article for mounting the same upon a support without obstructing the open end thereof.

708,422. TOY. JOHN JACKSON, Alnwick, England. Filed Nov. 7, 1901. Serial No. 81,500. (No model.)



Claim.—In toys of the class herein described, two or more animal figures secured to a base, one or more of which have their hind legs pivotally connected to a sliding portion of said base, and their legs and body pivotally attached together, so that when one figure approaches another, the second is caused to change its position, substantially as described and illustrated herein.

708,428. GATE. CLAUS B. JAGER, Roland, Iowa. Filed May 8, 1901. Serial No. 59,260. (No model.)

Claim.—1. The combination with a supporting structure having a gateway, of a vertically-swinging gate pivoted in the gateway and leaving an open space therein, locking means movably mounted upon the gate for holding it against opening, and operating means for the lock located in the open space of the gateway and movable transversely of the gate.

2. The combination with a fence having a gateway, of a gate pivoted in the gateway and leaving an open space therein, said gate having a free swinging movement in both directions, locking means for holding the gate against opening in either direction, and operating means for the lock, said means being located in the open space of the gateway.

3. The combination with a fence having a gateway, of a vertically-swinging gate pivoted at its upper end in the gateway and having its lower edge spaced from the ground or floor leaving an open space, locking means movably mounted upon the gate to hold it against opening, and an operating device for the lock located in the open space below the gate and movable transversely thereof.

4. The combination with a fence having a gateway, of a vertically-swinging gate pivoted at its upper end in the gateway and having its lower edge spaced from the ground or floor leaving an open space, locking means movably mounted upon the gate to hold it against opening, and an operating device for the lock located in the open space below the gate and movable transversely thereof.

5. The combination with a swinging gate, of a lock pivoted to the gate to hold the same against opening, and operating means suspended from the lock and depending below the lower edge of the gate.

6. The combination with spaced supporting-standards, of a vertically-swinging gate pivoted to the standards, a transverse locking-bar pivoted to the gate to engage means located upon the standards to hold the gate against opening, and an operating-plate secured to the locking-bar and depending beneath and movable transversely of the gate.

7. The combination with spaced supporting-standards, of a vertically-swinging gate pivoted at its upper end to the upper ends of the standards, keeper-plates secured to the standards, and having notches in their upper edges, a transverse locking-bar pivoted to the gate and normally engaging in the notches of the keeper-plates, and an operating-plate secured to the locking-bar and depending beneath and movable transversely of the gate.

8. The combination with a vertically-swinging gate, of a lock movably mounted upon the gate, and operating means for the lock carried by and depending below the lower edge of the gate, said operating means being movable transversely of the gate.

9. The combination with a swinging gate, of spaced steps located adjacent to the gate, a lock carried by the gate and arranged to have a movable engagement between the steps to permit of a limited movement of the gate, and operating means for the lock.

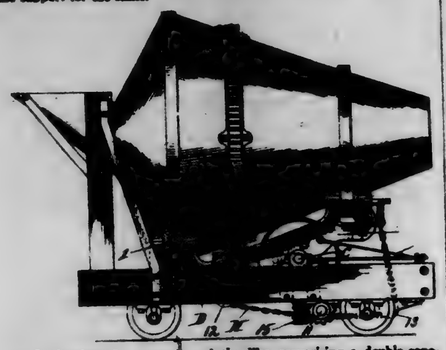
10. The combination with a swinging gate suspended from its upper end, of locking means for the gate mounted upon the lower end thereof, and a keeper arranged contiguous to the lower end of the gate and having spaced steps between which a portion of the lock movably engages to permit of a limited movement of the gate without unlocking the same.

708,424. ROTARY MIXER FOR CONCRETE &c. WILLIAM J. JUDD, New York, N. Y., assignor to Frederick C. Austin, Chicago, Ill. Filed Aug. 8, 1901. Serial No. 71,333. (No model.)

Claim.—1. A mixer for concrete and the like, comprising a rotary, tilting mixing-drum having charging and discharge openings respectively at opposite ends and tapered toward its discharge-opening; and a series of straight, longitudinally-disposed flat blades projecting radially inward from the inner wall of the drum and arranged parallel or substantially parallel with the axis of said drum and extending substantially from end to end thereof, whereby the mixing of the material is effected when the drum is rotated, and the material permitted to slide freely toward the contracted discharge-opening when the drum is both rotated and tilted.

2. A mixer for concrete and the like, comprising a rotary mixing-drum having oppositely-arranged charging and discharge openings; a tilting support for the drum; mechanism for rotating the drum; and

mechanism for applying the power employed to rotate the drum, to tilt the support for the same.



3. A mixer for concrete and the like, comprising a double-cone-shaped, rotary mixing-drum containing mixing devices; a tilting support for the drum; mechanism for rotating the drum; and mechanism for applying the power employed to rotate the drum to tilt the support for the same.

4. A mixer for concrete and the like, comprising a rotary, tilting mixing-drum having oppositely-arranged charging and discharge openings; power-actuated mechanism for both rotating and tilting the drum; and mechanism for automatically arresting the tilting movement of the drum.

5. A mixer for concrete and other substances, comprising a rotary mixing-drum; a tilting support for the rotary mixing-drum; a rotary driving-shaft; power-transmitting means carried by the tilting support and arranged for driving the drum from the rotary driving-shaft; means for operating the tilting support from the rotary driving-shaft; and means for connecting and disconnecting the power with and from such tilting support.

6. A mixer for concrete and other substances, comprising a rotary mixing-drum; a tilting support for the rotary mixing-drum; power-actuated means for rotating the mixing-drum; power-transmitting means for applying the power to operate the tilting support for the drum; and a clutch mechanism connected with and operated by the tilting support and arranged for disconnecting the power from the tilting support.

7. A concrete-mixer comprising a rotary mixing-drum having oppositely-arranged charging and discharge openings, said drum being provided between its said openings with an external ring-gear; a rotary driving-shaft arranged under the drum and transverse to the axis about which the drum revolves; a tilting drum-support forming a double-armed lever which is fulcrumed to tilt about the axis of the rotary driving-shaft, gear connection between the rotary driving-shaft and the gear-ring on the drum; and antifriction-rolls arranged upon the arms of said lever and engaging and supporting opposite end portions of the rotary mixing-drum.

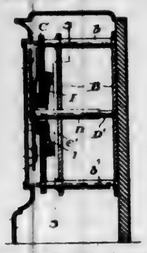
8. A mixer for concrete and the like, comprising a rotary mixing-drum having oppositely-arranged charging and discharge openings, said drum being provided between its said openings with an external ring-gear; a tilting drum-support forming a double-armed lever having long and short arms and fulcrumed between such arms to swing about an axis transverse to the axis about which the drum revolves and located between the middle portion and discharge-opening of the drum; gearing for rotating the drum; and antifriction-rolls arranged upon the arms of said lever and supporting the drum at opposite end portions thereof; the discharge-end portion of the rotary mixing-drum being supported by the short arm of said lever, whereby when the drum is tilted as in dumping, the extent of travel on the part of its discharge end will be less than the extent of travel on the part of its charging end.

9. A mixer for concrete and the like, comprising a rotary mixing-drum having oppositely-arranged charging and discharge openings; a tilting support for the rotary mixing-drum consisting of a double-armed lever pivotally supported to tilt about an axis between its arms; a flexible connection such as a chain or cable connected with the lever-arm at opposite sides of said axis; a winding device for operating the chain or cable; and mechanism for rotating the drum regardless of its position.

10. A mixer for concrete and the like, comprising a rotary drum having oppositely-arranged charging and discharge openings and provided with a ring-gear; a tilting support for the rotary drum; a transversely-arranged driving-shaft arranged under the drum; a counter-shaft 5; and power-transmitting connections between said counter-shaft and the driving-shaft and the ring-gear.

11. A mixer for concrete and the like, comprising a rotary mixing-drum; a base; a tilting support for the rotary mixing-drum fulcrumed between its ends upon the base and arranged to tilt about an axis transverse to the axis about which the drum revolves; a reversibly-operating device for tilting the drum in opposite directions; and connections between such reversibly-operating device and portions of the tilting drum-support at opposite sides of the axis about which said support is arranged to tilt.

708,425. ELECTRIC ALARM-CLOCK. ISAIAH H. KIVOKIAN, Philadelphia, Pa. Filed Feb. 12, 1901. Serial No. 46,977. (No model.)



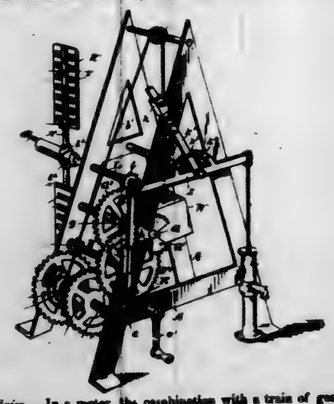
Claim.—1. In an alarm-clock of the character described, the combination of the hour-hand, the dial, the arm in the path of said hand, the central spur-wheel carrying said arm, the key provided with teeth adapted to engage those of the spur-wheel, a contact-spring bearing against said wheel, the electric alarm, and the normally broken circuit therefor connected with said contact-spring and with the clock-movement, substantially as described.

2. In an alarm-clock of the character described, the combination of the hour-hand, the apertured dial, the arm in the path of said hand, the central spur-wheel carrying said arm, the separate key adapted to be fitted to the aperture of the dial and provided with teeth to engage those of the spur-wheel, a contact-spring bearing against said wheel, the electric alarm, and the normally broken circuit therefor connected with said contact-spring and with the clock-movement, substantially as described.

3. In an alarm-clock of the character described, the combination of the hour-hand, a flat spring one end of which is secured to said hand, an antifriction-roller journaled in the free end of said spring, and a set-screw fitted to the hand and bearing against the spring, the electric alarm, the normally broken circuit therefor, a setting-arm in said circuit, a spur-wheel carrying said arm, and a toothed key for engaging and turning said spur-wheel, substantially as described.

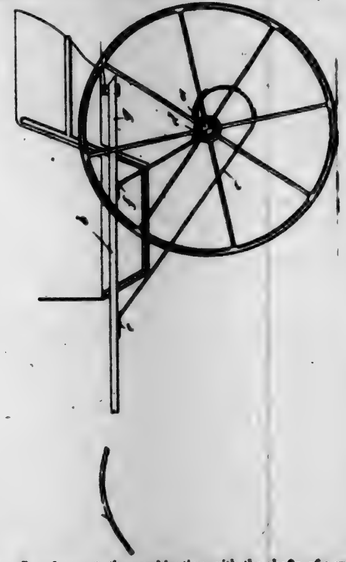
4. In an alarm-clock of the character described, the combination with the hour-hand, the dial of non-conducting material, the arm in the path of said hand, the central wheel or support for said arm, a contact-spring affixed to the dial and bearing against said wheel or support, the electric alarm, and the normally broken circuit therefor connected with said contact-spring and with the clock-movement, substantially as described.

708,426. MOTOR. CHARLES H. KILBE, Indianapolis, Ind., assignor of two-thirds to Sylvester F. Barhart, Indianapolis, Ind. Filed Feb. 17, 1902. Serial No. 94,446. (No model.)



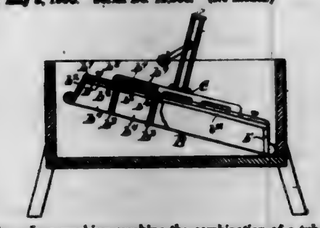
Claim.—In a motor, the combination with a train of gears, means for actuating a gear at one end of the series, a governor-shaft connected with said train of gears, lateral arms connected by said shaft and blades secured to said arms, said blades having a series of openings and slides to cover more or less of said openings.

708,427. DOG-CART. FRANZ KNECHT and WILHELM KNECHT, Wiedenbrück, Germany. Filed Nov. 1, 1901. Serial No. 80,731. (No model.)



Claim.—In a dog-cart, the combination with the shafts, of a spring one end of which is rigidly secured to said shaft, at an acute angle to the rear end thereof, said end of the spring extending to a point beneath the axle in the same plane throughout, said end encircling the axle and being rigidly secured thereto, the other end of said spring being pivotally connected to the shaft with its rear end at an angle to the rear end of the shaft, and a spring connected to the rear extremities of said shafts and engaging the lower face of the body of the cart, substantially as described.

708,428. WASHING-MACHINE. JOHN KNOCH, Cincinnati, Ohio. Filed May 5, 1900. Serial No. 15,892. (No model.)

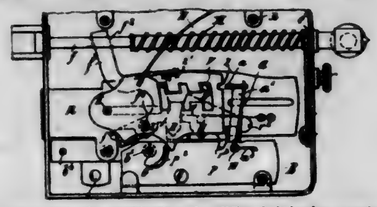


Claim.—In a washing-machine the combination of a tub, a rocker therein with its ends abutting against the ends of the tub and carrying a pair of parallel upwardly-projecting rods, and a shaft journaled in the sides of the tub and having a U-shaped curve to fit between the rods, substantially as shown and described.

708,429. LOCK. CARL KNEBELSAMP, Steinagen, Germany. Filed Aug. 20, 1900. Serial No. 827,092. (No model.)

Claim.—1. In a lock, the combination of a sliding bolt, a spring-plate located adjacent thereto, a hollow key-guide, a pin carried by said spring-plate and projecting into said hollow key-guide, a pin or detent carried by said bolt, and holes or recesses in said spring-plate adapted to receive said detent and hold said bolt at one or the other of its extreme positions.

2. In a lock, the combination of a sliding bolt, having a projection thereon, a movable tumbler plate or plates having notches therein, the said projection being normally adapted to engage one or another of said notches and hold said bolt against movement, a detent engaging with said tumbler plate or plates, whereby said plate or plates may be held against movement, and means, adapted to be controlled by a suitable key, for removing said detent from said tumbler plate or plates, thus disengaging the latter from the bolt whereby said bolt may be moved.



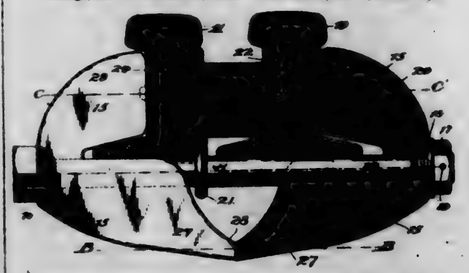
3. In a lock, the combination of a sliding bolt having a projection thereon, a movable tumbler plate or plates having notches therein, the said projection being normally adapted to engage one or the other of said notches and so hold said bolt against movement, a rocking lever adapted to engage and disengage said tumbler plate or plates and permit or prevent movement of the same, a projection carried by said lever and a spring-plate adapted to engage said projection when said lever is disengaged from the tumbler plate or plates.

4. In a lock, the combination of a sliding bolt, a projection thereon, a pivoted tumbler plate or plates, notches therein, the said projection being adapted to engage one or the other of said notches, a bell-crank lever having a detent adapted to normally engage with said tumbler plate or plates and prevent movement of the latter, and means controlled by a suitable key whereby the said bell-crank lever may be moved and held in disengaged relation to said tumbler plate or plates so that the latter may be moved to release the bolt.

5. A locking device for doors and the like, comprising a key having a bit and a moving pin guided obliquely therein, intermediate securing devices between the bolt and the key, and a safety device with means for arresting it to prevent the movement of said intermediate securing devices when locked, said pin being adapted to engage the safety device; substantially as described.

6. A locking device for doors and the like, comprising a key having a bit, a moving pin guided obliquely therein, intermediate securing devices between the bolt and the key, and a safety device swinging in a recess of the bolt, and an arresting mechanism having a plate provided with a projection protruding into the path of the safety device, said plate being fixed elastically to the back of the bolt, so that it can be pressed back by means of the pin, substantially as described.

708,430. RAIL-CLAMP. WILLIS C. LEE and HILES F. MOORE, Chicago, Ill. Filed Nov. 30, 1901. Serial No. 84,266. (No model.)



Claim.—1. In a rail-clamp, in combination with the rails to be clamped, one or more spacing-blocks between or adjacent to the webs of said rails, a pair of clamp-jaws each bearing against said combined rail-webs and spacing block or blocks, passing around the outside of the rail and meeting the other jaw below the rail, and means connecting said jaws between the said bearing-points and below the rails for tightening said jaws, for the purposes set forth.

2. In a rail-clamp, in combination with the rails to be clamped, one or more spacing-blocks between the webs of the rails, a bolt below the rails, a pair of clamp-jaws on said bolt, having upper arms bearing against the combined spacing block or blocks and rail-webs, and lower arms bearing against each other at a point below said bolt, the total length of the upper arms, spacing block or blocks and rail-webs being approximately the sum of the length of the two lower arms, for the purposes set forth.

3. In a rail-clamp, in combination with the rails to be clamped, a series of transferable spacing-blocks adjacent to the webs of said rails, a bolt passing below said rails, and a pair of clamp-jaws on said bolts, having upper arms bearing against said combined spacing-blocks and rail-webs and lower arms bearing against each other at a point below said bolt, the total length of the upper arms, spacing-blocks and rail-webs being approximately the sum of the length of the lower arms, for the purposes set forth.

4. In a rail-clamp, in combination with the rails to be clamped, a series of transferable spacing-blocks between and adjacent to the webs of said rails, a bolt passing below said rails and a pair of clamp-jaws on said bolts, having upper arms bearing against said combined spacing-blocks and rail-webs, and lower arms bearing against each other at a point below the center line of the bolt, approximately equal to the distance the center of the spacing-blocks and rails is above the center of the bolt, for the purposes set forth.

5. In a rail-clamp, in combination with the rails to be clamped, a series of transferable spacing-blocks between and adjacent to the webs of said rails, the total thickness of the webs of the rails and the spacing-blocks being substantially the same in all positions of the spacing-blocks, a bolt passing below the flanges of said rails, a pair of clamp-jaws on said bolts, having upper arms bearing against said combined spacing-blocks and rail-webs, and lower arms bearing against each other at a point below the center of the bolt, substantially equal to the distance of the center of the spacing-block from the center of the bolt, for the purposes set forth.

6. In a rail-clamp, in combination with the rails to be clamped, the spacing-blocks 20, 22, 23, and 24, the bolt 14 below the rails, the clamp-jaws 15, having the upper arms 29 bearing against the combined spacing-blocks and rail-webs and the lower arms 27 bearing against each other, all of the parts being arranged and disposed substantially as shown and described, for the purposes set forth.

708,481. ARTIFICIAL LIMB. EDWARD F. LESTER, Columbus, Ohio. Filed Mar. 24, 1902. Serial No. 99,508. (No model.)

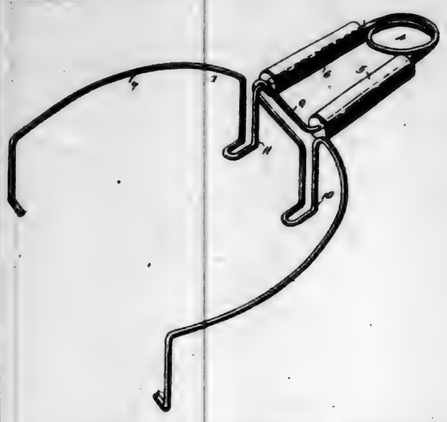
Claim.—In an artificial limb, the combination with an artificial foot-body, and a fixed plate on its upper side having a transverse rounded recess, of a foot-body having a fixed under side plate 11 provided with a rounded depressed portion 12, a T-bolt having its head portion loosely mounted in the plate depression 12 and having its stem portion passing loosely through opposite openings in said plates 11 and 3 and through the foot-body, and a hinge-bolt 17 independent of the bolt 23 having its upper end hinged in connection with the foot-body at a point in the forward portion thereof, said bolt extending downward loosely through openings in said plates and within a socket of the foot and being provided within said socket with a yielding bushing, substantially as specified.

708,482. PAN-LIFTER. FRED LEONARD, Cripplecreek, Colo. Filed Jan. 28, 1902. Serial No. 93,577. (No model.)

Claim.—1. A device of the class described comprising a pair of shanks, a spring connecting the shanks, sides connected with the shanks and provided with jaws, and a narrow supporting and guiding loop extending from one side of the device and receiving the opposite side, and provided with a depending extension forming an inner jaw, substantially as described.

2. A device of the class described consisting of a single piece of resilient material coiled between its ends to provide a spring and extending therefrom to form shanks, one of the sides of the wire being extended internally and bent backward to form a narrow transverse loop arranged to guide, support and limit the other shank in its movement and extended downward to form an inner jaw, said wire being also extended from both shanks to form pan-engaging sides, substantially as described.

3. A device of the class described comprising a pair of shanks, a spring connecting the shanks, the pan-engaging sides provided at their outer ends with depending jaws, and a narrow transverse loop extending from one side of the device and receiving the opposite side of the same and provided with an inner jaw extending downward from the bottom of the loop and consisting of a looped portion of the wire, substantially as described.



4. A device of the class described comprising the shanks, a spring connecting the shanks, the sides provided at their outer ends with depending L-shaped jaws and a narrow transverse loop extending from one side of the device and receiving and supporting the other side and provided with the inner L-shaped jaw extending downward from the lower portion of the transverse loop, substantially as described.

5. A device of the class described comprising the shanks, a spring connecting the shanks, the sides provided at their outer ends with depending L-shaped jaws, and the narrow transverse loop extending from one side of the device and receiving and supporting the other side of the device and forming a guide for the same and limiting the movement thereof, and provided with an inner depending jaw consisting of an L-shaped loop and formed by extending the wire at the lower side of the transverse loop, substantially as described.

708,488. MEANS FOR OPERATING DOORS. FRANK MAGNY, Grand Rapids, Mich. Filed Dec. 24, 1900. Serial No. 40,886. (No model.)

Claim.—1. In combination with a case and a front adapted to run into the case, a roll, a spring to rotate the roll, cords attached to the front and wound upon the roll by the action of the spring and operating to pull the front into the case, and cords attached to the front and oppositely wound upon the rolls and acting to restrain the inward movement of the front, substantially as described.

2. The combination of a case, a front adapted to turn from vertical to horizontal position and run back into the case, a roll journaled in the case, a spring to rotate the roll, cords attached to the roll and front and wound on the roll by the spring, and cords wound on the roll oppositely to the first named cords, and attached to the front, and guide-rolls at the front of the case engaging the last-named cords, substantially as described.

3. The combination of a case, a front adapted to turn to a horizontal position and run into the case, a roll journaled in the case, a spring to operate the roll, cords attached to the roll and front and wound on the roll by the action of the spring, cords wound on the roll oppositely to the first-named cords, and attached to the front, and guide-rolls near the front and rear of the case, and engaging the last-named cords, substantially as described.

4. The combination of a case, a front adapted to turn from vertical to horizontal and to run back into the case, hooks on the front, a support at the front of the case pivotally and detachably engaged by the hooks, a spring to constantly pull inward on the front, means for connecting the spring to the front at a point shifting from below the supports when the front is vertical, to above the supports when the front is horizontal, whereby the bottom of the front is held closed when the front is vertical, and the front pulled into the case when the front is horizontal, substantially as described.

5. The combination of a case, a front, adapted to turn from vertical to horizontal position, a hook, on the front, a support at the front of the case pivotally engaged by the hook, a roll journaled in the case, a spring to rotate the roll, and a cord attached to the roll, and wound on the same, and also attached to the front, below the support, whereby the spring pulls the lower part of the front inward, holds the front closed when the front is vertical and pulls the front into the case when the front is horizontal, substantially as described.

6. The combination of a case, a front, a roll journaled in the case, cords connecting the roll and front, supports near the front of the case, plates attached to the front having openings to receive the cords, and hooks on the plates engaging the supports, substantially as described.

7. The combination of a case, a front, a roll journaled in the case, a spring to operate the roll, cords wound on the roll by the spring and connected to the front, guide-rolls near the front of the case, cords attached to the spring-actuated roll and engaging the guide-rolls, plates having openings to receive the cords and attached to the front, hooks on said plates to engage the supports of the guide-rolls, and screws to adjustably secure the plates and clamp the cords between the plates and the front, substantially as described.

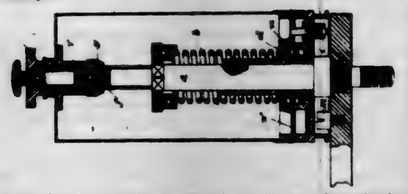
8. The combination of a case having upwardly-open slots, a roll detachably journaled in the slots, guide-rolls below said roll, a front, cords connecting the roll and front and engaging said guide-rolls, guide-rolls near the front of the case engaged by said cords, and cords extending directly from the roll to the front, substantially as described.

9. The combination of a case, a front adapted to turn from vertical to horizontal position, hooks on the front, supports at the front of the case pivotally engaged by the hooks, guide-rolls on the supports, a roll journaled in the case, a spring to rotate the roll, cords wound on the roll by the spring and connected to the front below the supports, when the front is closed, and adapted to pass above the rolls and supports when the front is opened, and cords wound on the rolls oppositely to the first-named cords, and passing under the guide-rolls and thence upward and attached to the front above the guide-rolls, substantially as described.

10. The combination of a case, a front adapted to turn from vertical to horizontal position and run back into the case, a roll journaled in the case, cords wound on the roll and attached to the front, and cords wound on the roll oppositely to the first-named cords and also attached to the front, and guide-rolls at the front of the case engaging the last-named cords, whereby the front is prevented from binding in the case, substantially as described.

11. The combination of a case, a front adapted to turn from vertical to horizontal position and to run back into the case, a roll, cords oppositely wound on the roll, and operating to limit the movement of the front and prevent binding of the same in the case, a spring to rotate the roll, substantially as described.

708,434. ENGINE-INDICATOR. HUGO A. C. A. W. MAIBAK, Hamburg, Germany. Filed July 5, 1901. Serial No. 67,447. (No model.)

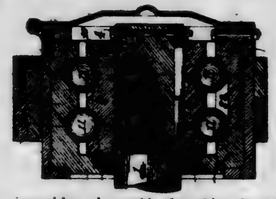


Claim.—1. In an engine-indicator, the combination of a spring-influenced pulley having a conical hub, with a vertically-movable paper-receiving drum having a coned seat adapted to engage said hub, substantially as specified.

2. In an engine-indicator, the combination of a spring-influenced pulley having a conical hub, with a paper-receiving drum having a coned seat adapted to engage said hub, a spring-pin coupling between pulley and drum, a vertically-movable adjusting-nut supporting the drum, and a fixed bolt engaged by the nut, substantially as specified.

708,485. BALL-BEARING JOURNAL-BOX. FRANK E. MANAHAN, East St. Louis, Ill. Filed Sept. 21, 1901. Serial No. 76,105. (No model.)

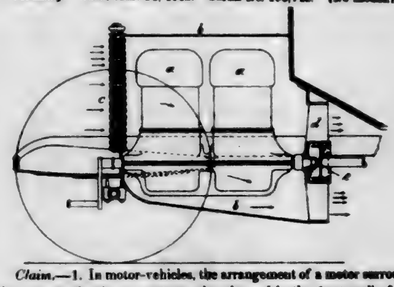
Claim.—1. In a journal-box, the combination with a threaded axle-spindle, of a box-shell, an outer bearing-ring seated in said shell, an inner bearing-ring having threaded connection with said spindle, bearing-balls located between said bearing-rings, a spline by which said inner ring is held from rotation on said spindle, and means for retaining said spline, substantially as described.



2. In a journal-box, the combination with a threaded axle-spindle, of a box-shell, an outer bearing-ring seated in said shell, an inner bearing-ring having threaded connection with said spindle, bearing-balls located between said bearing-rings, a spline by which said inner ring is held from rotation on said spindle, and a retaining-bolt passing through said spindle and spline to hold said spline from displacement.

3. In a journal-box, the combination with an axle-spindle, of a shell, an outer bearing-ring seated in said shell, an inner bearing-ring fixed to the axle-spindle, bearing-balls located between said bearing-rings, a key seated in said outer bearing-ring, and a block adapted to hold said key from displacement, substantially as described.

708,486. MOTOR-VEHICLE. WILHELM MAYBACH, Cannstadt, Germany. Filed Mar. 31, 1902. Serial No. 100,746. (No model.)



Claim.—1. In motor-vehicles, the arrangement of a motor surrounded by a protecting-box, a water-cooler situated in the front wall of this box, and a ventilator situated underneath the chest of the carriage in the back wall of the protecting-box, substantially as described and for the purpose set forth.

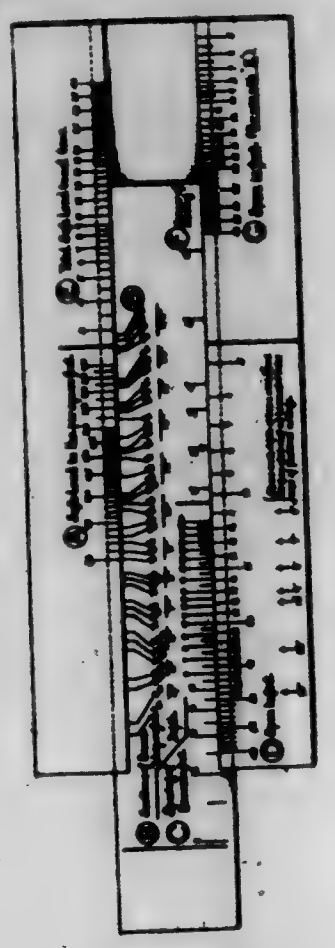
2. In motor-vehicles, the arrangement of a motor surrounded by a protecting-box, a water-cooler situated in the front wall of this box, a fly-wheel for the motor situated underneath the chest of the carriage in the back wall of the protecting-box, said fly-wheel being provided with ventilator-vanes on its circumference, substantially as described and for the purpose set forth.

708,487. SLIDE-SCALE. JAMES S. MERRITT, Philadelphia, Pa. Filed Mar. 5, 1901. Serial No. 49,695. (No model.)

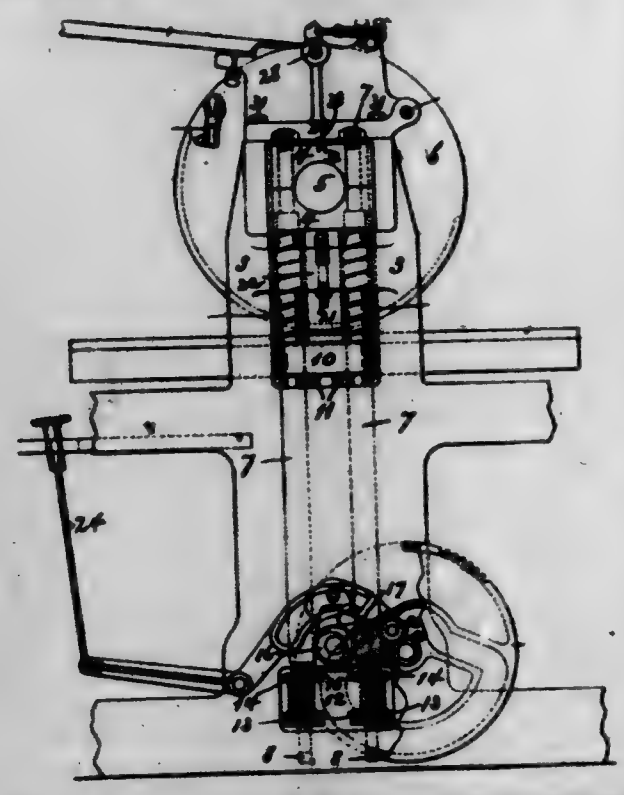
Claim.—1. A scale for calculating load, section, spacing, span and manner of supporting and loading beams, consisting of two members movable with respect to one another, one of said members having at one end a scale indicating the loads in pounds per square foot laid off in distances proportional to the logarithms of the factors and a scale indicating the span laid off in distances proportional to twice the logarithms of the numbers and in the opposite direction to the scale of loads, and at the other end a logarithmic scale indicating the total loads in net tons and a scale indicating the span laid off in distances proportional to the logarithms of the numbers and in the opposite direction to said scale of loads in tons, and the other member having a scale indicating the beam-sections laid off in distances proportional to the logarithms of the coefficient of said beams and common to both the scales of loads and also having at one end a logarithmic scale indicating the spacing of the beams and at the other end a logarithmic scale indicating the ratio of the bending moments of the beams for the different methods of supporting and loading.

2. A scale for calculating loads, &c., of beams, consisting of two independent series of scales indicating the different factors laid off in distances proportional to the logarithms of said factors and a scale movable with reference to one or more of the other scales in each series and common to both series of scales laid off in distances proportional to the coefficients of beams of given sections.

708,487



708,488. PRINTING-PRESS. ROBERT HOBBS, Chicago, Ill. Filed Aug. 12, 1901. Serial No. 71,726. (No model.)

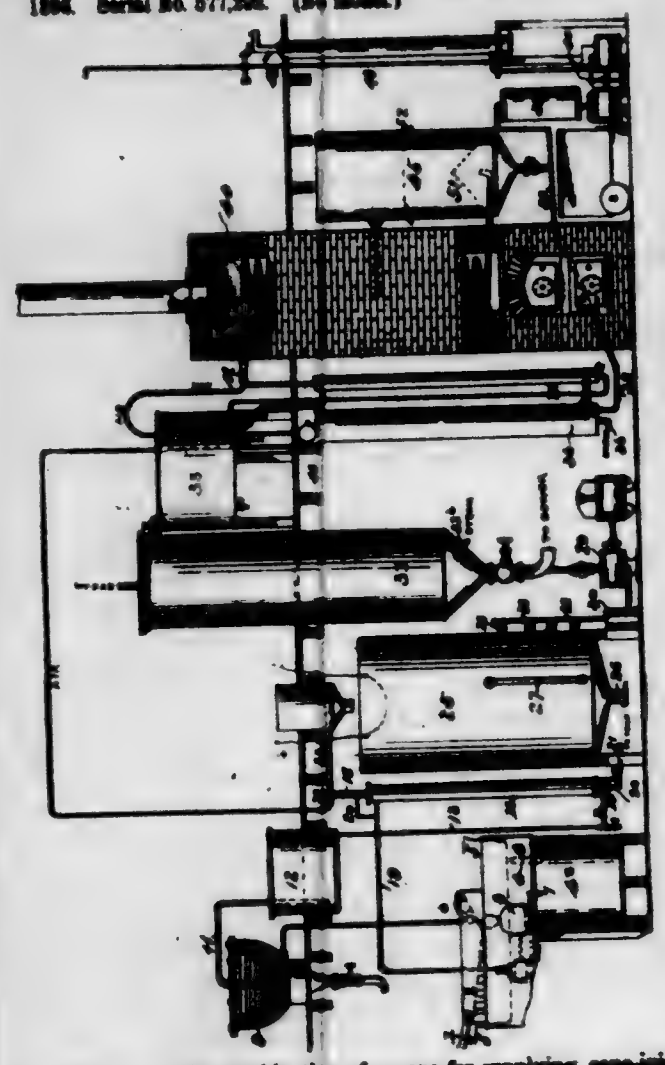


Claim.—1. The combination with a two-revolution impression-cylinder, its lifting-springs and depressing-eccentrics, of positive stop devices other than the eccentrics limiting the upward throw of the springs and relieving the spring tension, substantially as specified.

2. The combination with a two-revolution impression-cylinder and its lifting-springs and depressing-eccentrics, of rigid cross-bars attached to the frame of the machine above the cylinder-bearings and acting to limit the upward movements of the cylinder received from the springs, substantially as specified.

3. The combination with a vertically-moving impression-cylinder receiving its upward movements from springs and its downward movement from eccentrics, of stationary stop devices coming in contact with the cylinder-bearings and limiting the action of the springs and relieving the eccentrics, substantially as specified.

708,489. APPARATUS FOR THE MANUFACTURE OF SUGAR. JAMES A. MONRELL, Lansdale, Pa., assignor of two-thirds to Henry C. Stuart, Denver, Colo., and Samuel R. Allison, New Orleans, La.; C. A. Dorrestein administrator of said Allison, deceased. Filed Jan. 20, 1896. Serial No. 577,202. (No model.)



Claim.—1. The combination of means for supplying cane-juice, a sieve for separating the coarser solid matter from said juice, a wire-cloth basket, and electric-circuit wires attached to the basket whereby cane-juice may be screened and an electric current passed conjointly through the liquid and wire-cloth to precipitate solid matter preparatory to filtering, substantially as described.

2. The combination of means for supplying cane-juice, a sieve for separating the coarser solid matter from said juice, a wire-cloth basket, and electric-circuit wires attached to the basket whereby cane-juice may be screened and an electric current passed conjointly through the liquid and wire-cloth to precipitate solid matter preparatory to filtering, and a closed filter having a porous wall and a siphon-pipe to discharge the filtered liquid, substantially as described.

3. The combination of means for supplying cane-juice, a sieve for separating the coarser solid matter from said juice, a wire-cloth basket, and electric-circuit wires attached to the basket whereby cane-juice may be screened and an electric current passed conjointly through the liquid and wire-cloth to precipitate solid matter preparatory to filtering, and a closed filter having a porous wall and a siphon-pipe to discharge the filtered liquid, and a settling-tank 12 having draw-off cocks all substantially as described whereby the filtered juice may be electrically treated and bleached and glucose precipitated, and whereby the latter may be deposited and the juice decanted, substantially as described.

4. In combination, means for partially separating glucose and other matters from cane-juice, a heater for heating the juice, a discharge-pipe to convey the juice from the heater, a hot-air induction-pipe communicating with said discharge-pipe, a receiver for the heated liquid injected by the air and a wire-cloth basket situated in an electric circuit and adapted to finely divide liquid falling from the said receiver, all substantially as described.

5. In combination means for producing a heated aqueous solution of pure refined white sugar, a liquid heater comprising a coil situated in a furnace for superheating the hot solution, means for delivering hot defecated and purified juice to said coil, an air-heater, an air-pump to force air through said heater, an air-pipe leading from the heater and communicating with the liquid-heating coil of the furnace to induce liquid and inject it into said coil and a pyrometer, substantially as described.

6. In combination means for producing a heated aqueous solution of pure refined white sugar, a liquid-heater comprising a coil situated in a

furnace, for superheating the hot solution, means for delivering hot defecated juice to said coil, an air-heater, an air-pump to force air through said heater, an air-pipe leading from the heater and communicating with the liquid-heating coil of the furnace to induce liquid and inject it into said coil, said coil having a relatively short spiral conduit near the air-injector to whirl the fluids, substantially as described.

7. In combination means for producing a heated aqueous solution of pure refined white sugar, a coil for superheating such solution, a pipe for supplying the same, and an air-pipe communicating with said pipe to inject the solution in spray into said coil, a spiral conduit in the coil near the injector, and an open tank, all substantially as described whereby the fluids can be whirled through the heating-coil and the water then evaporated to produce refined crystal sugar, substantially as described.

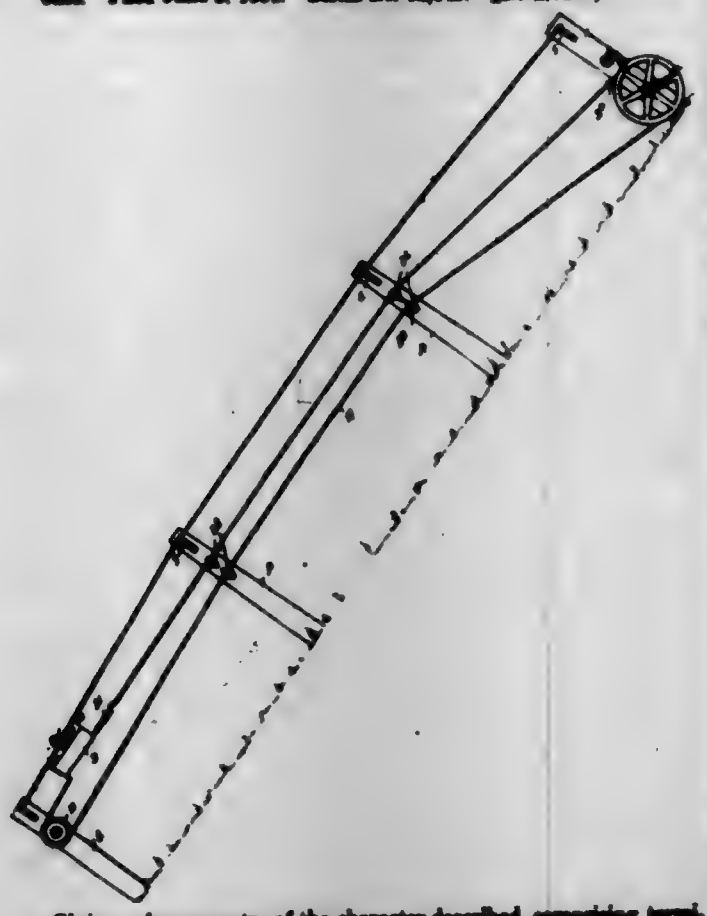
8. In combination means for producing a heated aqueous solution of pure refined white sugar, a coil for heating the refined liquid sugar, a pipe for supplying said liquid, an air-pipe communicating with said pipe to inject the liquid in spray into said coil, a spiral conduit in the coil near the injector, and an open tank whereby the fluids can be whirled through the heating-coil and the water then evaporated, said tank having a deflector 51 and a distinct exit 52 for condensed vapor, substantially as described.

708,440. SAW-SET. SARAH C. MERRILL, New York, N. Y., executrix of Charles Merrill, deceased. Filed Nov. 26, 1901. Serial No. 83,057. (No model.)

Claim.—1. In a saw-set a rotary concentric anvil having an eccentric bearing-surface and a beveled anvil-face, and a movable setting device having its operative face slightly inclined to the anvil-face, the inclination being toward the perimeter of the anvil as described.

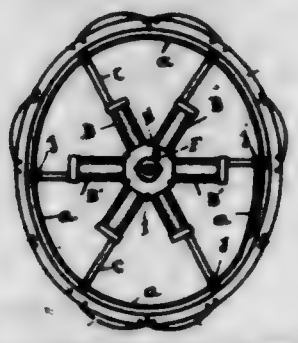
2. In a saw-set a rotary concentrically-pivoted anvil having an eccentric bearing-surface and a beveled anvil-face, and a plunger having its axis of movement perpendicular to the opposed portions of the beveled anvil-face, and its operative face arranged at an angle therewith, the inclination being toward the perimeter of the anvil as described.

708,441. MAIL-CARRIER. ABRAHAM L. HUMMEL, Mechanicsburg, Ohio. Filed June 3, 1901. Serial No. 62,845. (No model.)



Claim.—An apparatus of the character described, comprising terminal and intermediate supporting-posts, a trunk-wire supported on said posts, a letter-box provided with a trolley-wheel to travel on said trunk-wire, a grooved idle wheel supported on one terminal post, a grooved actuating-wheel supported on the other terminal post and provided with a crank-handle, grooved supporting-wheels mounted on the intermediate posts and forming an upper and a lower series, the upper series of supporting-wheels being mounted in upwardly-diverging arms or fingers having at their lower edges lips extending over the peripheries of the wheels, a traction-wire passing around the idle and actuating wheels and over the intermediate supporting-wheels and having its ends connected to the letter-box, and a spring interposed between said traction-wire and the letter-box, said supporting-wheels, idle wheel, actuating-wheel, trunk-wire and traction-wire being located in vertical alinement, substantially as described.

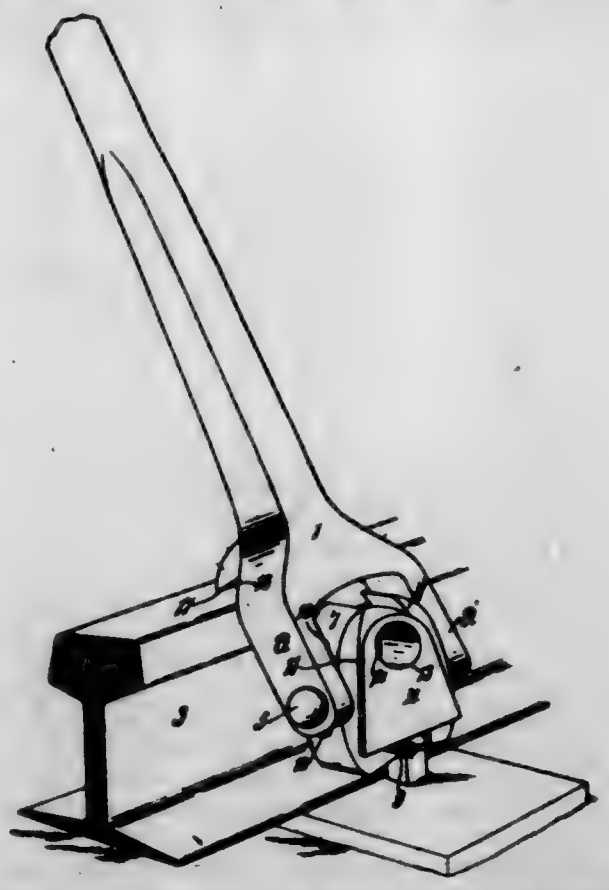
708,442. COMBINATION HAT CONFORMATOR, STRETCHER, &c. SAMUEL MANN, St. Joseph, Mo., assignor to Minnie E. Mann. Filed Oct. 29, 1901. Serial No. 79,966. (No model.)



Claim.—1. A hat-stretching device comprising a ring composed of a plurality of independent sections, means for adjusting the sections radially, and convex pads secured to the outer periphery of said sections, substantially as described.

2. A hat-stretching device comprising a ring composed of a plurality of independent sections, a rack-bar connected to each section, said rack-bars being arranged in pairs extending across the center of the ring with the members of each pair slidably connected together, a gear-wheel between each pair of rack-bars engaging the teeth of both members, and means for operating said gears, substantially as described.

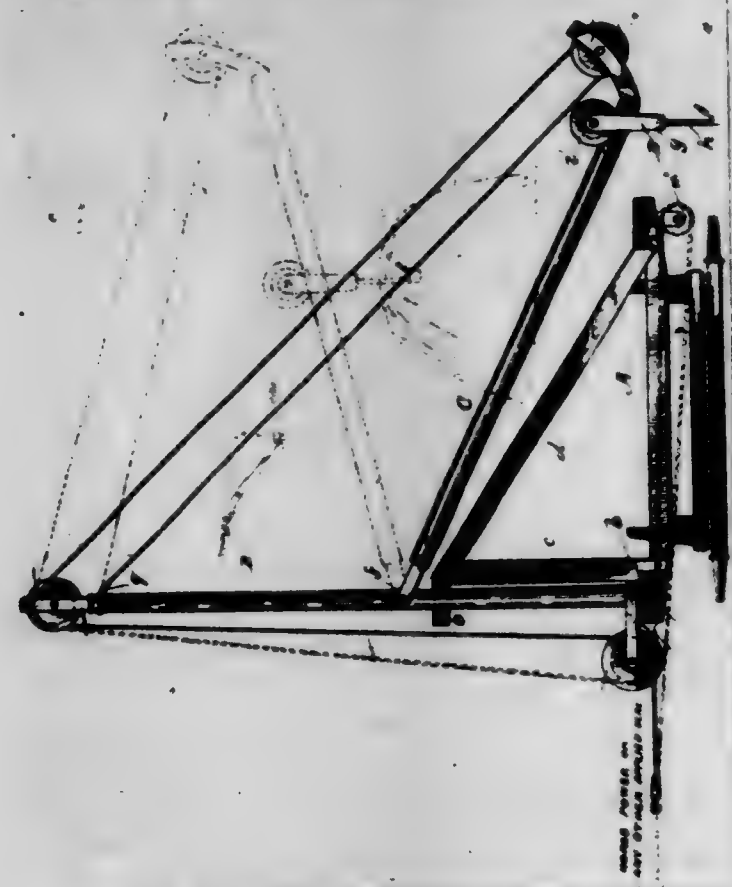
708,448. SPIKE-PULLER. NICHOLAS F. MURPHY, Bakersfield, Cal. Filed Jan. 6, 1902. Serial No. 88,994. (No model.)



Claim.—1. A spike-puller comprising a forked lever; a key-block pivoted between the forks; and two slotted curved clamping-jaws pivoted between the forks on the opposite sides of the block with their concave faces in contact with the block: the pivot extending through the slots and key-block.

2. A spike-puller comprising a lever; a key-block carried by the lever; and two clamping-jaws constructed to slide between the block and parts of the lever; said block being constructed to force the gripping portions of the jaws toward each other as the block moves therefrom.

708,444. LOADING DEVICE. WILLIAM F. MURPHY, Iowa City, Iowa. Filed Aug. 31, 1901. Serial No. 73,936. (No model.)



Claim.—1. In a loading apparatus a mast mounted so as to turn on its axis, upper and lower pulleys thereon, a boom pivotally connected to the mast and arranged to swing in a vertical plane and having a pulley on its outer portion, a carrier mounted and adapted to gravitate in opposite directions on the boom, and a cable connected at one end to the upper portion of the mast and passed around the pulley on the boom, the upper pulley on the mast and the lower pulley on the mast in the order named.

2. The combination of a wagon-body provided at one of its sides with an upright having a vertically-disposed bearing, a diagonal transversely-disposed brace interposed between said upright and the body, a mast journaled in the bearing on the upright and stepped at its lower end in a bearing in the body, and having vertically-disposed pulleys at its upper and lower ends, a vertically-movable boom pivotally connected at its inner end to the mast and having the combined bearing and step *j* at its outer end, and the pulley therein, a carrier arranged to travel on the boom, and a cable attached at one end to the mast and passed around the pulleys on the boom and mast.

3. The combination of a wagon body or rack, the rotary mast mounted in the bearings at one side of the body or rack and having vertically-disposed pulleys at its upper and lower ends, the boom pivoted at its inner end to the mast and carrying a vertically-disposed pulley at its outer end, a carrier arranged to travel on the boom, a pulley located at the opposite side of the rack with reference to the lower pulley on the mast, and the rope or cable attached at one end to the mast and carried around the said pulleys and carried to a suitable point for the attachment of power.

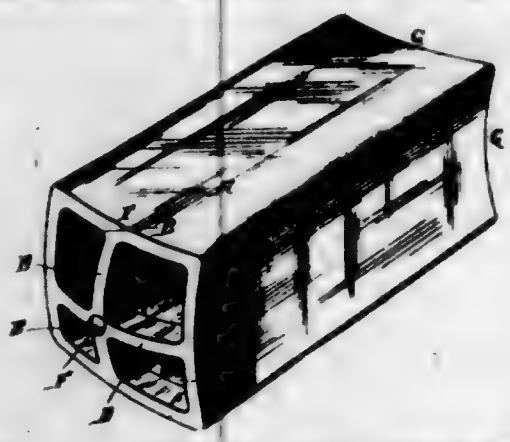
708,445. METAL CAN. FRANCIS P. MCCOLL, Chicago, Ill., assignor to the American Key Can Company, Chicago, Ill., a Corporation of New Jersey. Filed Oct. 12, 1901. Serial No. 78,493. (No model.)

Claim.—1. In a metal can, the combination with a body portion having an inwardly-extending integral shoulder and a downwardly-projecting flange, of a cover having a raised peripheral flange and a shoulder formed between the raised flange and the cover whereby extended engaging surfaces between the body portion and the cover are provided, said cover engaged to said downwardly-extending flange by solder, substantially as described.

2. In a metal can, the combination with a body portion having an inwardly-extending horizontal integral shoulder and a downwardly-projecting vertical flange, of a cover having a raised horizontal peripheral flange corresponding substantially in width to the shoulder on the body portion and a vertical depending shoulder corresponding substantially in depth to the flange on the body portion, whereby extended engaging surfaces between the body portion and cover are provided, said cover engaged to said downwardly-projecting vertical flange by solder, substantially as described.

3. In a metal can, the combination with a body portion having an inwardly-extending integral shoulder and a downwardly-projecting flange, of a cover having a raised peripheral flange and a shoulder formed between the raised flange and the cover whereby extended engaging surfaces between the body portion and the cover are provided, solder interposed between both of said extended engaging surfaces and thereby securely fastening the cover to the body portion of the can, and means projecting from the cover adapted to be engaged by a key, substantially as described.

708,446. CONDUIT. WILLIAM L. MCGOWAN, Philadelphia, Pa. Filed Oct. 22, 1901. Serial No. 79,678. (No model.)



Claim.—1. A conduit-section consisting of a body having a series of longitudinal ducts and division-walls separating them, one end of the section having the ends of the division-walls projecting to form a convex structure extending beyond the ends of all the side walls and the other end having the ends of the division-walls made recessed to form a concave structure of shape inversely corresponding to the convex structure and depressed beyond the ends of all the side walls.

2. A conduit-section consisting of a body having a series of longitudinal ducts and division-walls separating them, one end of the section having the ends of the division-walls projecting to form a convex structure and the other end having the ends of the division-walls made recessed to form a concave structure of shape inversely corresponding to the convex structure and further formed with a knob or button in the center of one of the ends and a recess in the center of the other end.

3. A conduit-section having its body formed rectangular in cross-section and divided by longitudinal walls into a series of parallel ducts and having the ends of its four side walls formed with convex-curved outside edges F and convex-curved ends D to the ends of the divisional walls projecting beyond the edges F.

4. A conduit-section having its body formed rectangular in cross-section and divided by longitudinal walls into a series of parallel ducts and having its end formed with convex-curved outside edges F and convex-curved ends D to the ends of the divisional walls and with a knob or button E at the apex of the convex end.

5. A conduit-section having its body formed rectangular in cross-section and divided by longitudinal walls into a series of parallel ducts and having the ends of its four side walls formed with concave-curved outside edges G and concave-curved ends H to the ends of the divisional walls depressed below the edges G.

6. A conduit-section having its body formed rectangular in cross-section and divided by longitudinal walls into a series of parallel ducts

and having its end formed with concavo-curved outside edges G and concave ends H to the ends of the divisional walls and with a recess *e* at the center of the concave end.

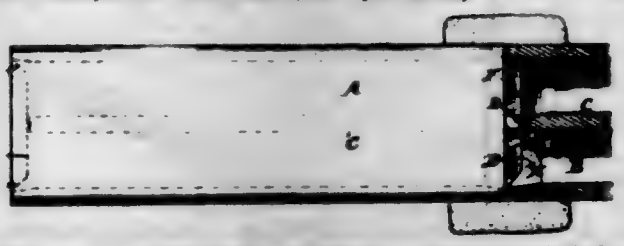
7. A conduit-section having outside walls and longitudinal division-walls forming a series of ducts, and in which the ends of the walls at one end of the section are projecting and shaped to conform to the curvature of a sphere and at the other end of the section are receding and also shaped to conform to the curvature of a sphere.

8. In a conduit structure the combination of two sections having longitudinal divisional walls and ducts butted together end to end and in which the ends of the division-walls of one section project to form a convex structure extending beyond the ends of all the sides of the conduit and the ends of the division-walls of the other section are recessed to form a corresponding concave structure.

9. In a conduit structure the combination of two sections having longitudinal divisional walls and ducts butted together end to end and in which the ends of the division-walls of one section project to form a convex structure and the ends of the division-walls of the other section are recessed to form a corresponding concave structure, and in which these ends of the sections are further coupled by a small knob and socket at the center one of which parts is upon the division-walls of one section and the other upon the division-walls of the other section.

10. In a conduit structure the combination of two sections having longitudinal divisional walls and ducts butted together end to end and in which the ends of the division-walls of one section project to form a convex structure highest at a point within the bounding sides, and the ends of the division-walls of the other section are recessed to form a corresponding concave structure recessed below the edges of the bounding sides, in combination with a cement or concrete bond encircling the conduit at the line of union.

708,447. CONDUIT. WILLIAM L. MCGOWAN, Philadelphia, Pa. Filed Feb. 8, 1902. Serial No. 93,121. (No model.)



Claim.—1. A conduit-section consisting of a tubular outer body having longitudinal partitions or walls dividing it internally into a series of longitudinal ducts, said dividing or partition walls at one end being extended beyond the ends of the walls of the outer body to form a projection composed of said partitions, and at the other end being abbreviated to terminate within the end walls of the outer body to form a recess or socket complementary to the projection of the partition-walls at the other end.

2. A conduit-section consisting of a tubular outer body having longitudinal partitions or walls dividing it internally into a series of longitudinal ducts, said dividing or partition walls at one end being extended beyond the ends of the walls of the outer body to form a projection composed of said partitions, and at the other end being abbreviated to terminate within the end walls of the outer body to form a recess or socket complementary to the projection of the partition-walls at the other end, the faces of said projecting and abbreviated ends of the partition-walls being tapered or inclined.

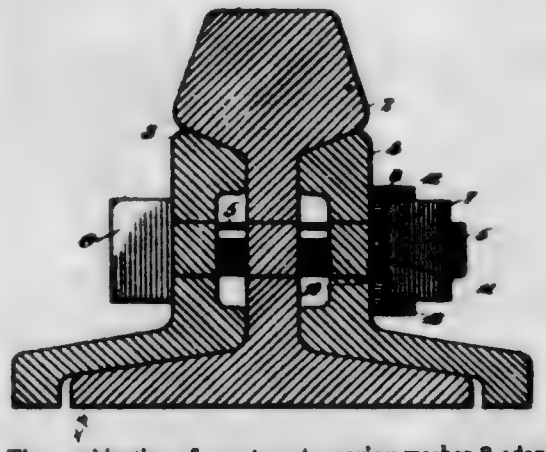
3. A conduit-section consisting of a tubular outer body having longitudinal partitions or walls dividing it internally into a series of longitudinal ducts, said partition-walls at one end being extended beyond the ends of the walls of the outer body to form a projection composed of said partitions.

4. A conduit-section consisting of a tubular outer body having longitudinal partitions or walls dividing it internally into a series of longitudinal ducts, said partition-walls at one end being abbreviated or terminated within the bounding edges of the outer body and at a distance therefrom, to form a recess or socket between the ends of the partitions and the end of the outer body.

5. A conduit having two hollow sections of polygonal cross-section provided with dividing-walls of which the extremities of the dividing-walls of the end of one section are provided with projections beyond the end of the section and the extremities of the dividing-walls of the end of the other section are provided with recessed portions within the end of the section and complementary to the projections on the end of the first section.

708,448. NUT-LOCK. ANDREW MCKINLEY, New York, N. Y. Filed Sept. 7, 1901. Serial No. 74,656. (No model.)

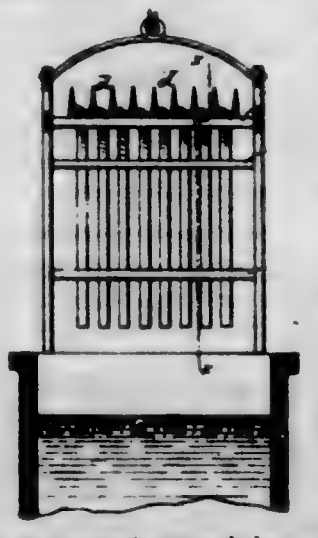
Claim.—1. The combination of a nut, and a spring-washer adapted to be detachably fastened to the nut so as to turn therewith, the said washer being formed with a transverse cut extending through the same and having one of the transverse edges adjacent to said cut formed with an inwardly-projecting tooth adapted to bite into the flat surface of the member against which the nut jams the washer to hold the nut fast, and fixed projections or flanges arranged between the nut and washer by means of which the two may be detachably fastened together for holding them in fixed rotary relation, substantially as and for the purpose set forth.



2. The combination of a nut, and a spring-washer S adapted to be detachably fastened to the nut so as to turn therewith, the said washer being formed with a transverse cut 10 extending through the same and having one of the transverse edges adjacent to said cut formed with an inwardly-projecting tooth 11 adapted to bite into the flat surface of the member against which the nut jams the washer to hold the nut fast, and fixed projections or flanges 12 and 13 formed upon opposite edges of the washer for engaging two opposite sides of the nut, substantially as and for the purpose set forth.

3. The combination of a nut, and a bowed or arched spring-washer adapted to be detachably fastened to the nut so as to turn therewith, the said washer being provided with a tooth for engaging and biting into the flat surface of the member against which the nut jams to hold the nut against backward rotation, substantially as and for the purpose set forth.

708,449. SUPPORTING DEVICE FOR LENGTHS OF HOOP-IRON. JAMES MCGINNESS, Pittsburg, Pa. Filed Apr. 14, 1902. Serial No. 102,862. (No model.)

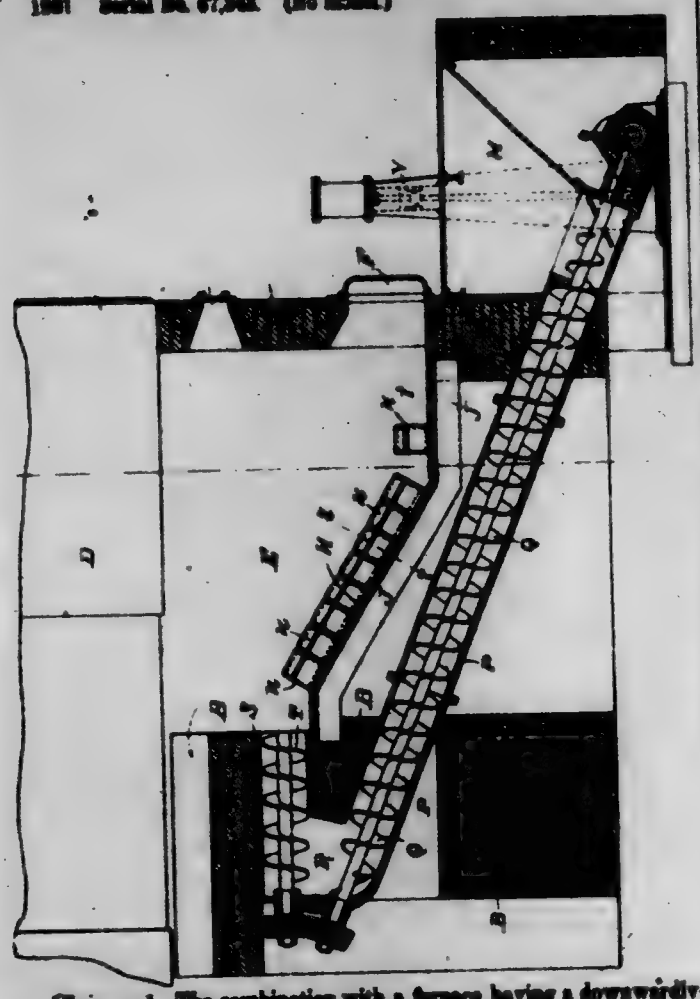


Claim.—1. Means for supporting curved pieces or lengths of metal comprising a skeleton frame of curved form and a cross-bar thereon having fixed spaced projections between adjacent side walls of which the middle portions of the pieces or lengths are seated.

2. A supporting device for pieces or lengths of curved metal said device including end bands and connecting cross members, and a bar at the upper portion of the device extending between said end bands and provided with fixed spaced projections between adjacent side walls of which the middle portions of the pieces or lengths are seated.

3. A supporting device for pieces of curved and flared hoop-iron said device including end bands and connecting cross-bars, and a horizontal bar at the upper portion of the device, extending between the end bands and having spaced projections between adjacent side walls of which the central portions of the curved and flared pieces or lengths of hoop-iron are seated whereby the separated end members of hoop-iron engage said connecting cross-bars, substantially as and for the purpose described.

708,450. MECHANICAL STOKER. AUGUSTUS F. HALE, Montclair, N. J., assignor to Haris H. Sewing, Reading, Mass. Filed July 6, 1901. Serial No. 67,242. (No model.)

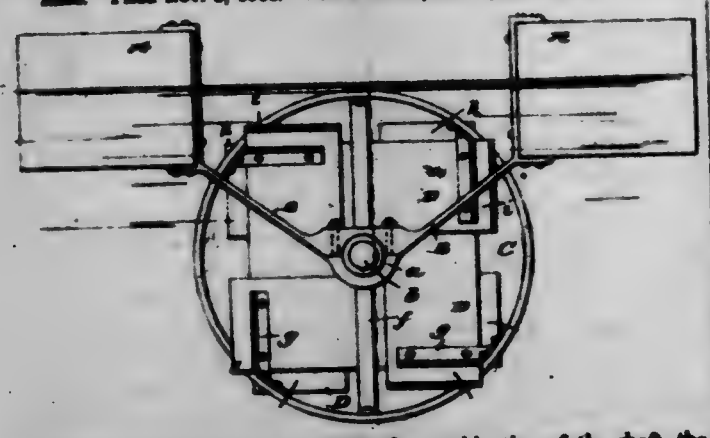


Claim.—1. The combination with a furnace having a downwardly-inclined combustion-surface and an ash-door opposite the lower end thereof, said combustion-surface being constructed to retain the unconsumed material for removal through said door, of a furnace-stoking apparatus adapted to supply fuel to the combustion-chamber through the rear wall thereof and to project such fuel upon said inclined surface.

2. The combination with a furnace having in its rear portion forwardly-inclined combustion-plates and a door opposite the lower end thereof, the entire floor of the combustion-chamber being constructed to retain unconsumed material for removal through said door, of a conveying-screw and tube opening through the rear wall above said plates and cooperating with gravitation to carry fuel toward said door.

3. The combination with a furnace having forwardly-inclined combustion-plates and interposed elevated tuyers, of a plurality of screw conveyers introducing fuel through the rear wall and depositing it on said inclined plates between adjacent rows of tuyers.

708,451. HYDRAULIC MOTOR. JOHN I. HEWSON, Vicksburg, Miss. Filed Nov. 5, 1901. Serial No. 81,940. (No model.)



Claim.—In the motor described, the combination of the shaft, the circular rims arranged one in advance of the other around the shaft, connecting means interposed between the shaft and rims, and the four blades located at equal intervals about the shaft with their edges in planes parallel with that of the axis of the wheel although said edges themselves are oblique as to the axis, and each attached to both of the rims at its ends, whereby the forward or upstream portion of each blade is disposed in advance of the rear portion of the blade which precedes it with reference to the direction in which the wheel is designed to turn.

708,452. MACHINE FOR MOLDING ARTIFICIAL STONE. EDWIN F. PALMER, Brooklyn, N. Y. Filed Apr. 22, 1902. Serial No. 104,144. (No model.)

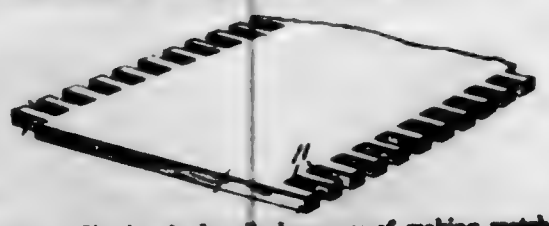
Claim.—1. In a machine for molding artificial stone, the combination of a mold with a slotted supporting-plate, an adjustable core, and a bolt extending through the core and engaging the slotted plate, substantially as specified.

2. In a machine for molding artificial stone, the combination of a mold with a supporting-plate having a longitudinal slot, an adjustable core, a headed bolt extending through the core and engaging the slotted plate, and a nut engaging the upper end of the bolt, substantially as specified.

3. In a machine for molding artificial stone, the combination of a mold with an adjustable grooved core, and with a partition engaging the core-groove, substantially as specified.

4. In a machine for molding artificial stone, the combination of a mold with a slotted supporting-plate, an adjustable grooved core, a bolt extending through the core and engaging the slotted plate, and a partition engaging the core-groove, substantially as specified.

708,453. PROCESS OF MAKING MATCHES. WILLIAM H. PARKER, Melrosville, N. Y., assignor, by mesne assignments, to Parker Match Company, a Corporation of New Jersey. Filed Mar. 1, 1900. Serial No. 96,267. (No specimens.)



Claim.—The herein-described process of making matches, which consists in notching opposite edges of a strip of stock so as to produce projections of essentially the cross-sectional size of a match-splint, the said notches being made so that the projection on one edge of the strip comes opposite the notch on the opposing edge, dipping both said edges in a firing composition, permitting the heads to set, and then cutting off the strip on lines forming essentially continuations of said projections thereby making complete matches.

708,454. REMOVABLE PIPE-BRACKET. FRANCIS F. PARSONS, Paterson, N. J., assignor of one-half to Alfred Schiffer and Herman Schiffer, Paterson, N. J. Filed Sept. 30, 1899. Serial No. 732,564. (No model.)

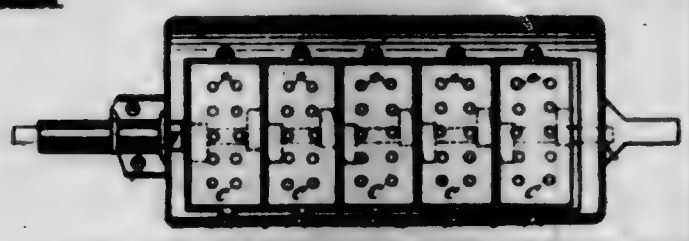
Claim.—1. In a pipe-hanger, the combination of a holder, consisting of a plate provided on one side with a boss and on the other with a recess extending into the boss, said boss being apertured for the reception of fastening means, with a bracket consisting of a plate provided with a hook, the structure of the holder and bracket being such that the latter is adapted to be held removably in place against the holder so as to cover the recess therein.

2. In a pipe-hanger, the combination of a holder, consisting of a plate provided at one side with one or more bosses and on the other with recesses extending into said bosses, said bosses being apertured for the reception of fastening means, legs on the side and bottom of said holder and cast integral therewith to receive and support the bracket, with a bracket consisting of a plate provided with hooks, the structure of the holder and bracket being such that the latter is adapted to be held removably in place against the holder so as to cover the recesses therein.

708,455. STOVE-GRATE. THOMAS PARTRIDGE, Jr., Hamilton, Canada. Filed Jan. 9, 1901. Serial No. 42,601. (No model.)

Claim.—1. In a grate, a frame constructed with oval-shaped grate-journal-bearing openings on one side, and a series of vertical notches open

at the top on the opposite side, for bearings for the grate-bars, the frame also constructed with a circular socket at one end and a longitudinal bearing on the opposite side to receive a cam-rod to operate the grate-bars, and a hold-bar provided with half-circular openings at its lower edge and projections on its rear side in contact with the said journals, the said bar being detachably secured to one side of the frame to hold the bearings of the grate-bars in their normal or horizontal position, substantially as specified.

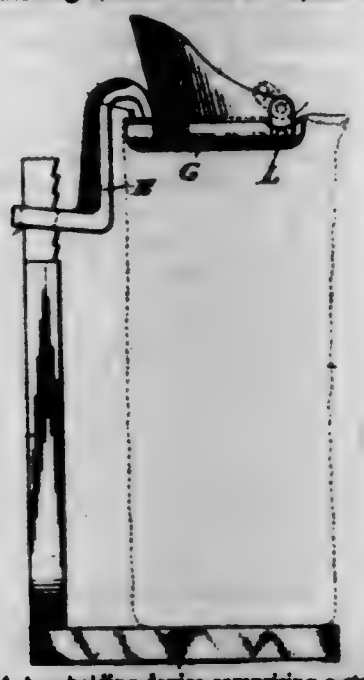


2. A series of journaled double grate-bars, each consisting of an upper bar and a lower bar made integral and provided with openings, in combination with a frame having bearings for the journals of said grate-bars, means for holding them therein and a rock-shaft journaled in said frame and having cams arranged to act on said bars substantially as set forth.

3. In a grate, the combination of a frame constructed with grate-journal openings on its opposite sides, and a series of grate-bars having their journals pivoted therein, a cam-rod journaled in the frame under the grate-bars having a series of double cams made to impinge alternately against and oscillate the grate-bars, and a side bar provided with notches to fit over the journals of the grates to hold them in position, attached to the frame, substantially as and for the purpose specified.

4. In a grate, a grate-frame provided with a notch, a circular opening in one end and a projecting lug on the other end recessed to form a bearing, grate-bars, a cam-shaft adapted to oscillate the grate-bars one end of which rests in the said opening and the other end in the said bearing, a bar similarly recessed and adapted to form the upper half of said bearing, one end of said bar extending inwardly and engaging the notch in said grate-frame, the other end of said bar carrying a projecting lug, a crank for oscillating the cam-shaft and having a lug in its socket adapted to engage the projecting lug on the said bar whereby the grate-frame may be damped.

708,456. BAG-HOLDING DEVICE. FREDERICK B. PAYNE, Powers, Mich. Filed Aug. 5, 1901. Serial No. 70,530. (No model.)



Claim.—1. A bag-holding device comprising a standard, a semicircular frame mounted thereon and provided with seats or depressions in the upper surface thereof, the edge of the open mouth of a bag adapted to be telescoped over said frame and over the seats or depressions therein, and means arranged to be projected into said seats or depressions to crowd the edge of the bag into said seats or depressions and clamp the same to said frame, as and for the purpose set forth.

2. In a bag-holding device, a standard, a frame supported thereon and having a pin or projection and locking seats or depressions in the upper surface thereof, the open mouth of a bag adapted to be telescoped over and around said frame to be engaged by said pin or projection, clamps arranged to project into said seats or depressions to force or crowd the edges of the bag into the same, and a deflector-plate arranged to direct the material into the open mouth of the bag, as and for the purpose set forth.

3. In a bag-holding device, the combination with a standard, of an open-sided frame supported thereon and provided with seats or depressions adjacent to the ends thereof, the open mouth of the bag adapted to be telescoped over and upon said frame, and clamp-arms journaled in said frame and provided with tongues or projections arranged to be projected into said seats or depressions to force the edge of the bag into said seats or depressions, as and for the purpose set forth.

708,457. FERRULE. CARL PFEIFFER, Berlin, Germany. Filed Nov. 3, 1900. Serial No. 35,555. (No model.)

Claim.—1. In combination, with a cane or umbrella made of metal tube, a ferrule, comprising an elastic stopper *a*, pressed into the said cane or umbrella, an elastic casing or ring *f*, a bolt *c*, consisting of hard or highly-resistant metal and a metal ring *g*, substantially for the purpose as described.

2. In combination with a cane or umbrella stick of wood, a ferrule, comprising an elastic stopper *a*, an elastic casing or ring *f*, a bolt *c*, consisting of hard or highly-resistant metal and a metal ring *g*, substantially for the purpose as described.

708,458. COLLAPSIBLE BABY-JUMPER. ALFRED P. PERCIER, New York, N. Y. Filed Nov. 27, 1901. Serial No. 83,822. (No model.)

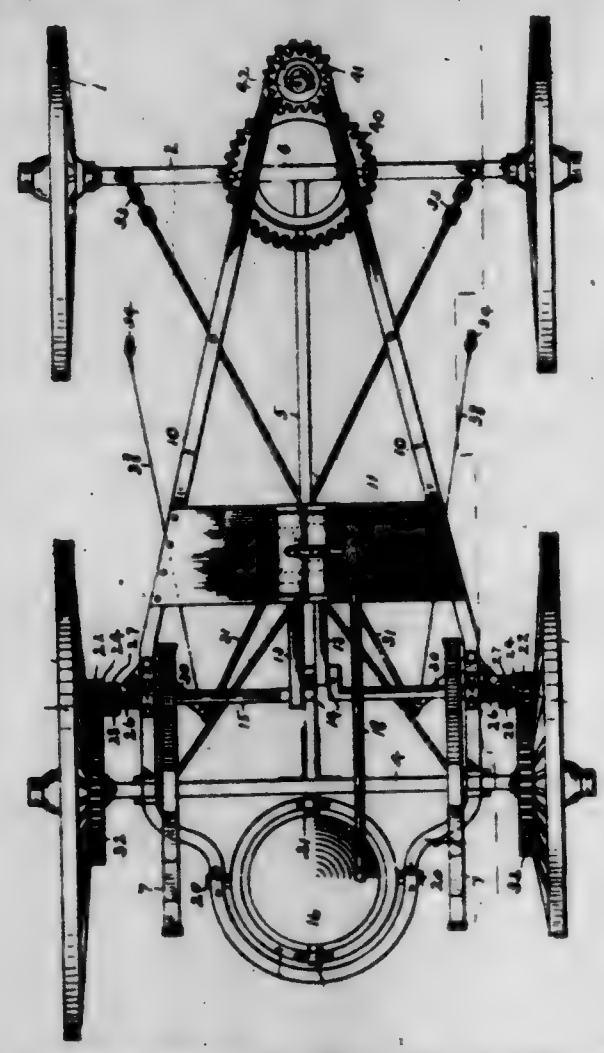
Claim.—1. In a chair of the character described, a seat-frame, hollow standards on the front of the side bars of the seat-frame, arms on the standards, a guard-rail on the arms, a back hinged to the side of the seat, shoulders on the back-frame for supporting the arms, and combined binding and suspending cords run through the guard, arms, standards and the side bars of the seat at the front and through the arms, shoulders and side bars of the seat at the rear, as and for the purpose described.

2. In a chair, a seat-frame, hollow standards, side arms and a guard, a back hinged to the seat-frame and a flexible connection run through holes of the guard, arms, hollow standards and seat-frame and comprising the means for binding the parts together and for suspending the chair as and for the purpose described.

708,459. AUTOMOBILE ATTACHMENT FOR VEHICLES. JOHN F. PETERSEN, Indianapolis, Ind. Filed Sept. 3, 1901. Serial No. 74,105. (No model.)

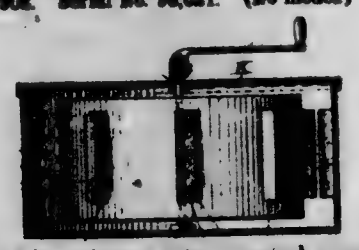
Claim.—1. The combination with a four-wheeled vehicle of the kind commonly drawn by horses having wheels rotatably mounted on fixed axles, a fifth-wheel, a head-block and a reach connecting the head-block with the rear axle, of a motor attachment comprising a frame removably secured to the head-block and rear axle, an engine mounted on said frame, a shaft driven by said engine, a cogged ring adjustably attached to the rear wheels of the vehicle by means of U-shaped bolts taking into openings in a flange clamped to the hubs of said wheels and into radial slots in the web of the ring, toothed wheels on the ends of the said

shaft meshing with the teeth of the rings on the vehicle-wheels and means connected with the front axle of the vehicle for disconnecting the shaft from its toothed wheel on the inner side of the vehicle when the vehicle is traveling in a curve.



2. In a motor attachment for vehicles, a frame adapted to rest on the head-block of the vehicle in front and on the rear axle of the vehicle, a motor supported by the frame, a shaft driven by the motor having cogged wheels loosely mounted on either side thereof, said wheels having conical sockets in their hubs, cones rotating with the shaft and mounted thereon, springs to press the cones into the sockets of the cog-wheels, a bell-crank connected with the cones, a rod connecting the bell-crank with the front axle of the vehicle, flexible links in said rod and cogged rings adjustably secured to the rear driving-wheels meshing with the cogged wheels on the said shaft.

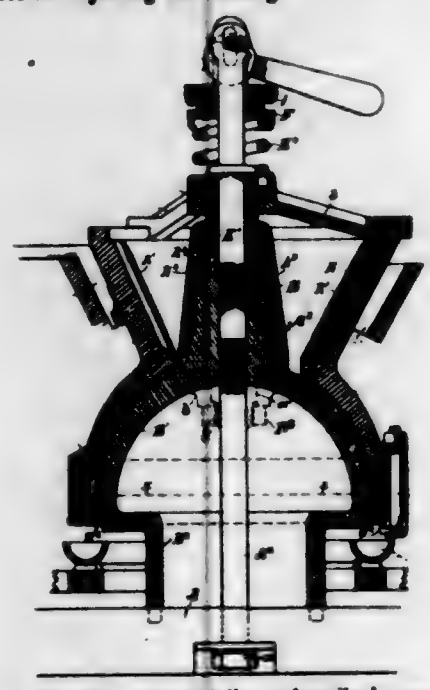
708,460. DISH-WASHER. JOHN PETTENGILL, Jefferson, Mo. Filed Feb. 7, 1902. Serial No. 93,621. (No model.)



Claim.—In a dish-washer an outer receptacl eprovided on its inner sides with vertical flanges extending at an angle therefrom, a socket mounted centrally in the receptacle, a bridge across the top of said receptacle provided with a bearing, in combination with a dish-holding receptacle having a perforated bottom and provided with vertical slots in its side wall, lips or flanges extending outwardly from the slots at an acute angle and in opposite directions from the flanges upon the inner wall of the outer receptacle, said inner receptacle being mounted on a shaft, said shaft being provided with a handle, substantially as set forth.

708,461. ORE CRUSHER AND PULVERIZER. ADOLPH J. PERTIER, San Francisco, Cal. Filed Aug. 22, 1900. Serial No. 27,718. (No model.)

Claim.—1. In an ore crusher and pulverizer, the combination with the cone-shaped crushing-head, of means for securing the same to the base or platform of the machine, a spheroidal shell secured to and depending from the crushing-head, an inclined hopper surrounding the crushing-head, means by which a gyratory motion is imparted to said hopper, a spheroidal shell depending from the hopper, which shell surrounds and works upon the shell of the crushing-head, a die-ring having a smooth periphery secured to the inner face of the outer shell at its lower edge, and of devices for adjusting the die-ring.



2. In combination substantially as described, superposed crushing-shells one of the same having an offset portion adjacent its lower end, a wear-ring inserted in said offset portion from the lower end of the shell having a smooth surface disposed toward said offset portion, and means for adjusting the ring.

3. In combination, substantially as described, superposed crushers, one of the same having an offset portion having an inclined upper wall, a split wear-ring inserted in said offset portion having a correspondingly-inclined upper edge, and means for causing the inclines of the ring and offset portion to engage and adjust the ring relative to the grinding-surfaces.

4. In combination, substantially as described, a head; a shell depending from the head; a second shell mounted on the outside of said first-mentioned shell; and means for regulating the pressure of one shell upon the other comprising a stem on the head, a spider slidable on the stem engaging the edges of said outer shell, a spring bearing upon the spider, and a cam-lever at the end of the stem bearing upon the spring.

5. In combination, substantially as described, a head; a shell depending from the head; a second shell on the outside of said first-mentioned shell; and means for regulating the pressure of one shell upon the other comprising a stem on the head, a spider slidable on the stem engaging the edge of said outer shell, a spring seated upon the spider, a swivel-bearing for the upper end of the spring, and means at the end of the stem adapted to press upon the swivel-bearing.

6. In combination, substantially as described, a head; a shell depending from the head; a second shell on the outside of said first-mentioned shell; and means for regulating the pressure of one shell upon the other comprising a stem on the head, a spider slidable on the stem engaging the edge of said outer shell, a spring seated on the spider, a bearing for the upper end of the spring, slotted ears on the bearing, and a cam-lever at the end of the stem working in the slotted ears adapted to press upon the spring-bearing to tension the spring.

708,462. HAY-RACK. PAUL PLOTNIK, Delano, Minn. Filed Feb. 27, 1902. Serial No. 96,909. (No model.)

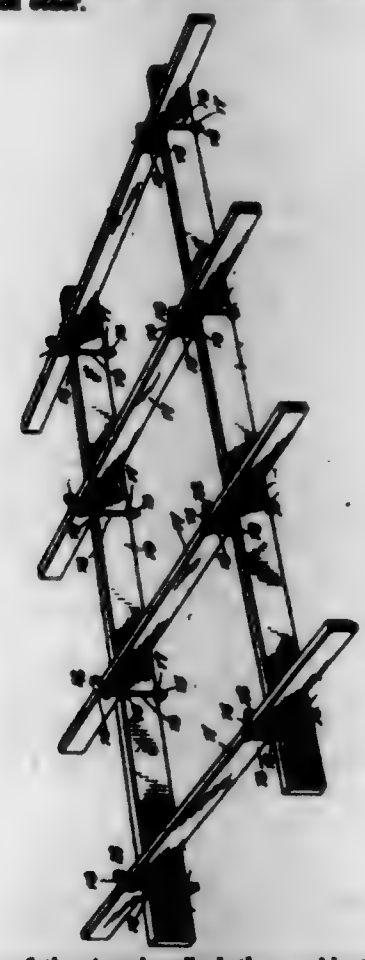
Claim.—1. The combination with crossed beams, of tie-rods located upon opposite sides of and in the angles formed by the said beams, clamping connections between the tie-rods extending across the outer faces of the beams, and means for clamping the connections against the beams.

2. The combination with crossed beams, of tie-rods located upon opposite sides of and in the angles formed by said beams, clamping connections between the tie-rods extending across the outer faces of the beams, an intermediate connection movable upon the rods and located between the beams, and means for clamping the connections against the beams.

3. In a binder of the class described, the combination with spaced tie-rods, of an intermediate clamp-plate mounted upon the rods and having recessed seats in its opposite faces.

4. In a binder of the class described, the combination with spaced tie-rods, of an intermediate clamp-plate mounted upon the rods and having recessed seats in its opposite faces, said seats being disposed in angular relation to each other and between the tie-rods.

5. In a binder of the class described, the combination with spaced tie-rods, of an intermediate clamp-plate movably mounted upon the rods and having recessed seats in its opposite faces, said seats being arranged in angular relation to the side edges of the plate between the rods and at right angles to each other.

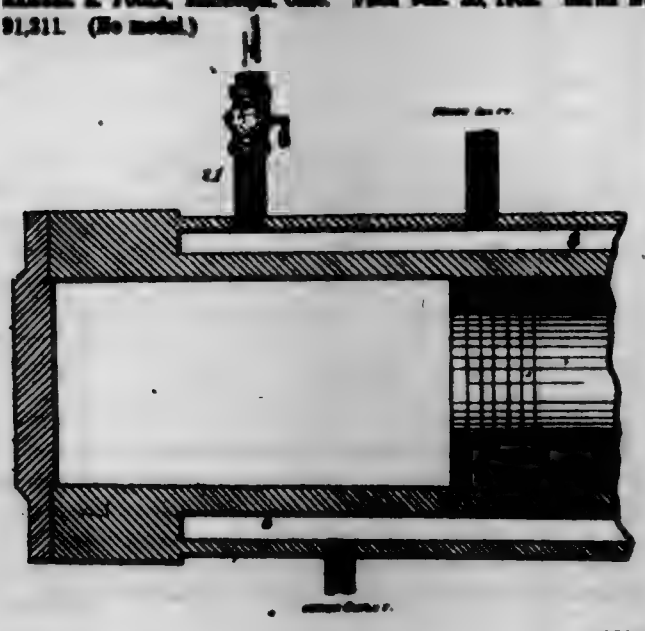


6. In a binder of the class described, the combination with spaced tie-rods, of end clamp-plates mounted upon the rods and having recessed timber seats in their opposing faces, said seats being located between the rods and in angular relation to each other.

7. In a binder of the class described, the combination with tie-rods, of end clamp-plates mounted upon the tie-rods, and an intermediate clamp-plate also mounted upon the rods between the two end plates, said plates having similarly-disposed seats in their opposing or adjacent faces, the seats in one end plate and one side of the intermediate plate being disposed in angular relation to the seats in the other end plate and other side of the intermediate plate.

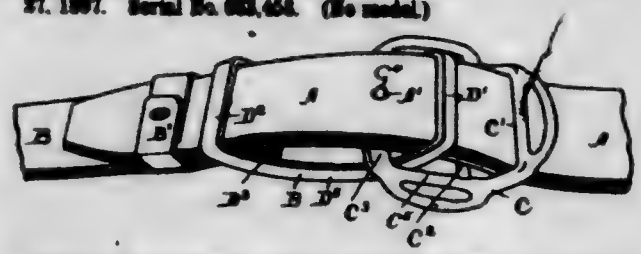
8. In a binder of the class described, the combination with an intermediate and end clamping plates having openings in their opposite ends, of tie-rods passing through the openings, said plates having similarly-disposed seats in their opposing faces between the openings, the seats in one end plate and one side of the intermediate plate being disposed in angular relation to the seats in the other end plate and other side of the intermediate plate.

708,468. STARTING GEARS FOR EXPLOSIVE-ENGINES. SAMUEL R. POOLE, Randolph, Ohio. Filed Jan. 25, 1902. Serial No. 91,211. (No model.)



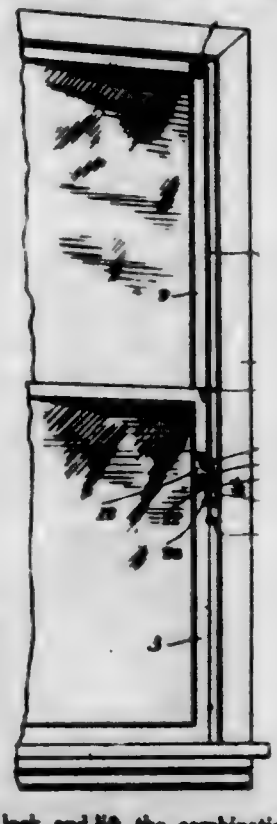
Claim.—In a gas or gasoline engine, in combination, a cylinder and its jacket, a pipe for introducing a cooling medium into the jacket, and a pipe for introducing a heating medium into the jacket.

708,464. BUCKLE. ROBERT PORTER, Ottumwa, Iowa. Filed Dec. 27, 1897. Serial No. 663,454. (No model.)



Claim.—The buckle consisting of a frame C having outer cross-bar C', and inner cross-bars C^3 and C^4, the latter carrying a tongue, and a bail adapted to be entered between said cross-bars C^3 and C^4 and having outer cross-bars D' and D^2 at its ends, both adapted to bear on the outside of the frame, and the bar D' being located between the planes of cross-bars C^3 and C^4, said bail also having an inside cross-bar D^3 for the attachment of the hame-tug, substantially as specified.

708,465. SASH LOCK AND LIFT. RICHARD H. PERRY, Somerville, Miss. Filed Feb. 10, 1902. Serial No. 93,396. (No model.)



Claim.—In a sash lock and lift, the combination with a window-frame and the upper and lower sashes, of a supporting-rod connected at one end to the upper sash, grips, one secured to the window-frame and the other to the lower sash and each provided with spring-actuated grip-levers having holes through which said rod passes and is free to slide, each of said grips having a fixed part projecting into the path of movement of one of the opposing grip-levers whereby the innermost or adjacent grip-levers are automatically unlocked from engagement with the rod when the sashes are in closed position, substantially as set forth.

708,466. BROOM-MILL. JOHN A. PRENTICE, New York, N. Y. Filed Dec. 21, 1901. Serial No. 86,754. (No model.)

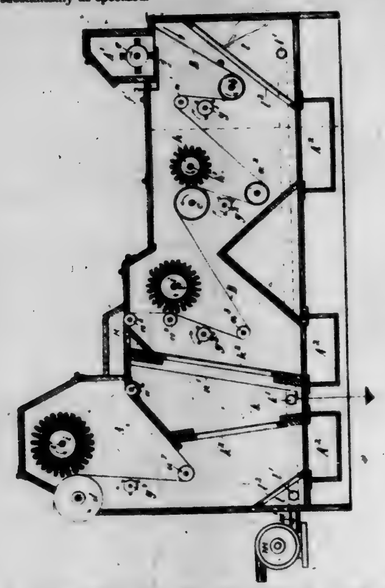
Claim.—1. A broom-mill provided with a feather-roller, a sleeve embracing the roller-shaft, a cam-lever pivotally connected to the sleeve, a cam engaged by the cam-lever, and means for rotating the cam, substantially as specified.

2. A broom-mill provided with a feather-roller, a sleeve having a hub and embracing the roller-shaft, a pin embraced by the hub, a forked cam-lever carrying the pin, a cam engaged by the cam-lever, and means for rotating the cam, substantially as specified.

3. A broom-mill provided with rollers for removing the loose powder from the sheet, and a vacuum-chest having a screened side and extending below said rollers, substantially as specified.

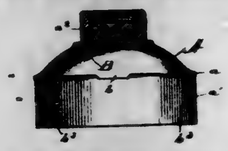
4. A broom-mill provided with a pair of rollers for removing the loose powder from the sheet, and a vacuum-chest arranged intermediate

said rollers and having a pair of screened sides facing in opposite directions, substantially as specified.



5. A bronze-mill provided with a series of rollers for removing the loose powder from the bronzed paper, and with a metal bar and ground connection for drawing the electricity out of the paper, substantially as specified.

708,467. ELECTRIC-INCANDESCENT-LAMP SOCKET. GUY H. PROCTOR, Somerville, Mass., assignor to New England Electric Manufacturing Company, Boston, Mass., a Corporation of Massachusetts. Filed Feb. 23, 1902. Serial No. 96,083. (No model.)



Claim.—1. An insulating cap-lining for the cap of incandescent-lamp sockets, formed to follow the concavity of the cap, and with retaining-catches adapted to fit a bead in the cap, and with depending holding-ears having their thickened extensions perforated to receive the holding-screws which connect the cap, shell, and base.

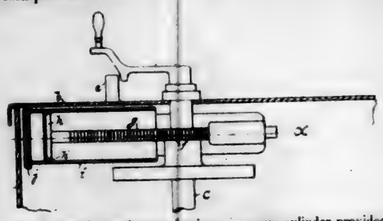
2. In an electric-incandescent-lamp socket, in combination with the cap A having the circumferential bead *a*, an insulating-lining B, formed to follow the concavity of the cap, and having catches or extensions *b* and holding-ears b^2 perforated at b'.

3. In an incandescent-lamp socket, in combination with the ordinary cap having a circumferential bead, an insulating-lining formed to follow the concavity of the cap, and with projections adapted to fit into said circumferential bead, depending metallic ears attached to said lining and perforated at their extremities; substantially as described and shown.

708,468. BRAKE FOR ADMINISTERING PRESCRIBED RESISTANCE TO THE STARTING MOVEMENTS OF HAND-OPERATED CONTROLLERS. WILLIAM H. QUIMBY, New York, N. Y. Filed Dec. 7, 1900. Renewed Dec. 12, 1901. Serial No. 85,844. (No model.)

Claim.—1. In electric starting mechanism the combination of the controller-operating shaft with a vacuum-cylinder; a piston traversing said cylinder and connections between said operating-shaft and said piston, whereby the starting movements of the controller are opposed by atmospheric pressure acting upon said piston.

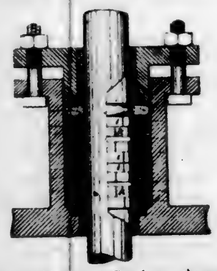
2. In electric starting mechanism, a vacuum-cylinder provided with an outwardly-yielding check-valve; a piston adapted to traverse said cylinder, in combination with the controller-operating shaft and connections between said piston and said controller-operating shaft, whereby the starting movement of the controller-operating shaft is opposed by atmospheric pressure acting upon said piston and its opposite movement is unopposed by such pressure.



3. In electric starting mechanism, a vacuum-cylinder provided with an adjustable leak-inlet; a piston traversing said cylinder; in combination with the controller-operating shaft and connections between said controller-operating shaft and said piston, whereby the starting movement of the controller-operating shaft is opposed by a prearranged amount of unbalanced atmospheric pressure acting upon said piston.

4. In electric starting mechanism, a vacuum-cylinder provided with an outwardly-yielding check-valve and with an adjustable leak-inlet; a piston traversing said cylinder; in combination with the controller-operating shaft and connections between said controller-operating shaft and said piston, as and for the purpose set forth.

708,469. PACKING FOR STUFFING-BOXES. WILHELM REINHOLD, Berlin, Germany. Filed Nov. 1, 1900. Serial No. 35,161. (No model.)



Claim.—1. In a packing for stuffing-boxes, the combination of two external conically-shaped rings, completing each other to a truncated cone of respectively-increased heights, each ring consisting of a plurality of radially-movable segmental members, with longitudinally-directed pins, engaging with both ends into holes in each two of the members, partly covering each other, such pins being adapted to connect both multidivided rings together in the manner of a chain, and means for pressing the rings against the rod to be tightened, substantially as set forth.

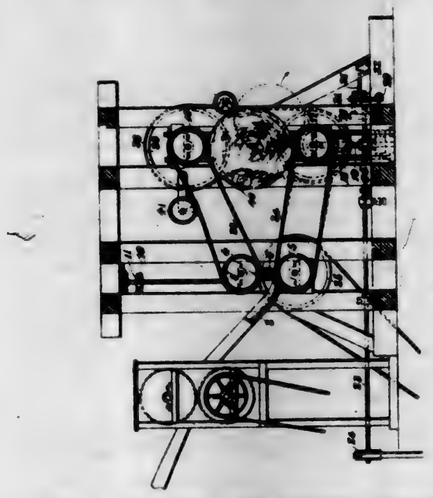
2. In a packing for stuffing-boxes, the combination of two external conically-shaped rings, completing each other to a truncated cone of increased height, each ring consisting of a plurality of radially-movable segmental members, with longitudinally-directed pins, one end of which engages by a thread the threaded hole of one of two segmental members, partly covering each other, the other end of each pin being provided with a head resting within a suitable recess of the other member, and means for pressing both rings against the rod to be tightened, substantially as set forth.

3. In a packing for stuffing-boxes, the combination of two external conically-shaped rings, completing each other to a truncated cone of respectively-increased height, each ring consisting of a plurality of radially-movable segmental members, with longitudinally-directed pins, one end of which engages by a thread the threaded hole of one of two segmental members, partly covering each other, the other end of each pin being provided with a head, resting within a suitable recess in the other member, each recess and the corresponding hole leaving a play around the head and the pin sufficient for widening the rings beyond the diameter of the rod to be tightened, substantially as set forth.

4. In a packing for stuffing-boxes the combination of two external conically-shaped rings, with their bottom faces resting against each other, each such ring being built up of two rows of segmental members, those of one row covering the joints between the members of the other row, both such rows being connected together by longitudinally-directed pins, with means for pressing the whole system of segmental members against

the rod to be tightened, and longitudinally against each other substantially as set forth.

708,470. METHOD OF MAKING COTTON-BALES. HENRY REHMET, Houston, Tex. Filed Mar. 10, 1901. Serial No. 51,323. (No model.)

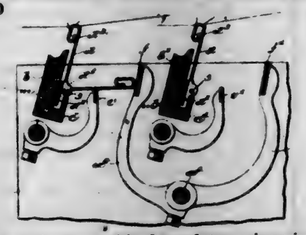


Claim.—1. The method of making cylindrical bales which consists in first forming the bale from a bat without compression in detail, and next applying pressure to the periphery of the bale at two or more separated points, said bale being rotated to present the various portions thereof in the line of compression successively, whereby a compressed bale of cylindrical form is produced.

2. The method of making cylindrical bales which consists in first forming a bale from a bat wound layer upon layer without compression in detail, and in thereafter applying pressure to the bale at two or more separated points, between which the bale rotates in the direction of its winding during the application of pressure thereto, whereby various portions of the bale are successively presented in the line of compression to produce a compressed bale of cylindrical form.

3. The method of making cylindrical bales which consists in first forming a hollow-center bale from a bat wound layer upon layer, without compression in detail, and in thereafter applying pressure to the periphery of the bale at two or more separated points and directed toward the axis thereof, said bale being constantly rotated during the application of pressure whereby various portions of the bale are successively presented in the line of compression to produce a solid compressed bale of cylindrical form, of standard size and weight and having a soft center.

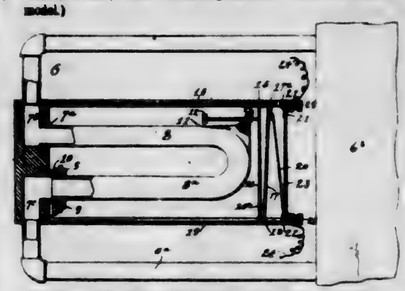
708,471. WARPER STOP-MOTION MECHANISM. ALONZO B. REGARDS, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., and Portland, Me. Filed Oct. 7, 1901. Serial No. 77,890. (No model.)



Claim.—1. As a new article of manufacture, a drop-wire comprising a straight shank having a fulcrum-eye at one end and at its opposite end bent to form a broadened warp-eye having a flattened top, to present a broad and flat bearing for the thread.

2. As a new article of manufacture, a drop-wire having a straight shank oppositely bent at its ends to constitute warp and fulcrum eyes, the plane of the warp-eye being oblique to the plane of the fulcrum-eye, the top of the warp-eye being flattened to present a broad bearing for the thread.

708,472. ELECTRIC LOW-WATER ALARM. REUBEN W. RIDER, Detroit, Mich. Filed July 24, 1901. Serial No. 69,493. (No model.)



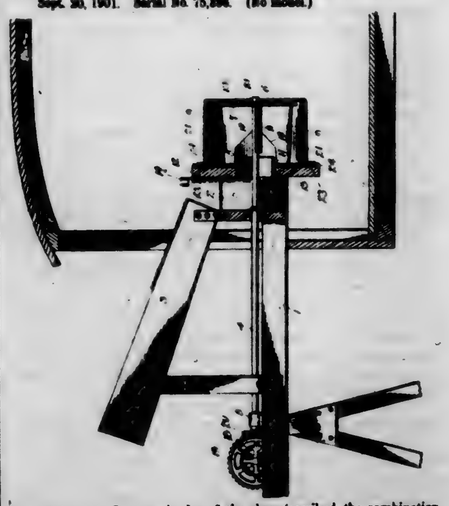
Claim.—1. In an electric low-water alarm, in combination, an expansible tube through which the boiler contents can flow having a plurality of connections with the boiler at different levels thereof, and means operated by the expansion of the tube to actuate an electric signal.

2. In an electric low-water alarm, in combination, a horizontal U-shaped expansible tube, each arm of which communicates with the boiler at a different level, and means operated by the expansion of the tube to actuate an electric signal.

3. In an electric low-water alarm, in combination, a bent expansible tube, the upper end of which communicates with an upper level of the boiler, a pipe communicating with the lower end of the tube from a lower level of the boiler, an expansion-joint between the pipe and said lower end, a lever connected to the tube, a contact device operated by the lever and adapted to close an electric circuit, and a signal device in said circuit.

4. In an electric low-water alarm, in combination, a pipe communicating with the boiler at an upper level, a U-shaped expansible tube, a connection between the said pipe and the upper arm of the tube, a lower pipe communicating with the boiler at a lower level, an expansion-joint between the lower pipe and the lower arm of the tube, a compound lever, an adjustable connection between the lever and the tube, contact-pieces adapted to be actuated by the lever to close an electric circuit, and a signal device in the circuit.

708,473. CAR-LOADER. JAMES L. ROBERTS, Pontiac, Ill. Filed Sept. 20, 1901. Serial No. 75,886. (No model.)



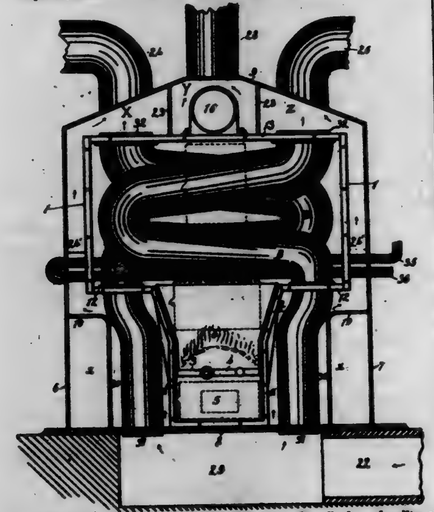
Claim.—1. In a car-loader of the class described, the combination of a hopper having a discharge-opening in one side, a revolubly-adjustable hood on said side of the hopper, opposite said discharge-opening, said

head having a circular flange bearing against the side of the hopper and provided further with a discharge-spout, an annular flange on the side of the hopper and engaging the flange of the head, thereby adjustably connecting the latter to the hopper, and a revolvable shovel in said head, substantially as described.

2. In a car-loader, of the class described, the combination of a revolvable shovel having blades provided with openings 10 at their inner corners and discharging means having a spout projecting into the said openings in said blades, substantially as described.

3. In a car-loader of the class described the combination of a hopper or the like grain-discharging means having a projecting spout, and a revolvable shovel comprising a pair of heads and blades connecting the said heads, one of said heads having an opening through which said spout extends and revolving around the said spout, substantially as described.

708,474. FURNACE. WILLIAM L. REES, Omaha, Nebr. Filed Apr. 30, 1902. Serial No. 104,978. (No model.)



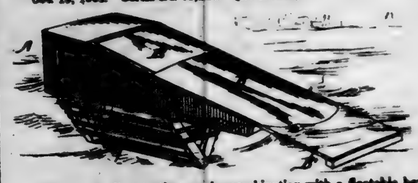
Claim.—1. In a furnace of the character described, a plurality of open-ended sterilizing-tubes passing through the combustion-chamber, a return air-supply duct communicating with the intake-openings of said tubes, a hot-air chamber receiving the exit ends of said sterilizing-tubes, said hot-air chamber communicating with said return air-supply duct, a draft-flue extending into said return air-supply duct and emptying into the smoke-flue of the furnace, and an evaporating-tank placed adjacent to the intake-opening of said return air-supply duct.

2. The combination in a furnace, of a lower fresh-air pit, a fire-pot, an auxiliary combustion-chamber above said fire-pot, a plurality of hot-air chambers above said auxiliary combustion-chamber, openings leading from said auxiliary combustion-chamber into a smoke-flue, supply-pipes leading from aforesaid hot-air chambers, and a plurality of sterilizing-tubes extending from aforesaid fresh-air-supply pipes and crossing and recrossing within said auxiliary combustion-chamber and finally emptying into aforesaid hot-air chamber.

3. In a furnace, the combination of the lower side air-chambers, of the fire-pot 6, the auxiliary combustion-chamber above said fire-pot 6, the upper hot-air compartments extending from the upper to the lower part of the furnace, the top 12 provided with suitable openings emptying into the dust 16, the fresh-air-supply pit 20 below the furnace, and the sterilizing-tubes B B extending from said pit 20 through the hot-air chambers crossing through the auxiliary combustion-chamber and emptying above into the compartments X and Z as shown.

4. In a furnace of the character described, a plurality of open-ended sterilizing-tubes passing through the combustion-chamber, a return air-supply tube communicating with the intake-openings of said tubes, a plurality of hot-air chambers, each chamber being adapted to receive the exit end of one of said sterilizing-tubes, said hot-air chamber communicating with said return air-supply tube, a draft-flue extending into said return air-supply tube and emptying into the smoke-flue of the furnace, and an evaporating-tank placed adjacent to the intake-opening of said return air-supply tube.

708,475. TURTLE-TRAP. ELAH J. ESSE, Kleinwood, La. Filed Oct. 19, 1901. Serial No. 79,267. (No model.)



Claim.—1. In a turtle-trap the combination with a floatable box or case having a sloping top provided with the pivoted trap-door and a cage arranged beneath the said box or case, said sloping top projecting beyond the end of the box or case and adapted to extend below the water-line for the purpose described.

2. A turtle-trap comprising in combination a floatable box or case, the top or cover of which is inclined and provided with a pivoted trap-door; said trap-door having a weighted frame connected thereto adapted to normally hold it in a position flush with the top of the box or case and a cage arranged beneath the box or case and adapted to receive the turtle after falling through the trap-door, substantially as shown and described.

3. A turtle-trap comprising in combination a box or case having an inclined top, the forward end of which projects beyond the end of the box or case, the pivoted trap-door arranged in the inclined top and provided with a weighted arm, the cage arranged beneath the box or case and the buoyant cylinders attached to the box or case at its lower end, substantially as shown and described.

708,476. OVERHEAD TROLLEY. SUMNER H. RUSSELL, Pittsfield, Mass. Filed Jan. 27, 1902. Serial No. 91,631. (No model.)

Claim.—1. In a trolley-wheel support, the combination of the harp, plates slidably held thereon, an axle journaled in the plates and having a wheel held thereon, and means carried by the plates for locking them to the harp, substantially as shown and described.

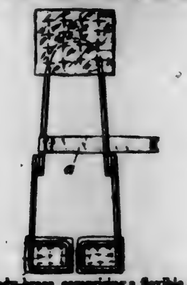
2. In a trolley-wheel support, a harp having grooves arranged upon its inner faces and openings arranged therein, plates slidably arranged in the said grooves, an axle carried by the plates and having a trolley-wheel mounted thereon, and spring locking members carried by the plates and adapted to engage the said harp, substantially as shown and described.

3. In a trolley-wheel support, the combination of the harp having openings arranged in the bifurcated portions, and dovetailed grooves arranged in the inner surfaces thereof, plates arranged in the said grooves, one of which being provided with a non-circular aperture, and the opposite plate with a circular aperture, an axle held in the said apertures, one end thereof having a non-circular head arranged thereon that is adapted to fit the non-circular aperture in the said plate, a wheel revolubly mounted on the said axle, and spring locking members carried by the said plates, the free ends of which being adapted for engagement with the bifurcated portions of the harp, substantially as shown and described.

4. In a trolley-wheel support, the combination of the harp having openings arranged in the bifurcated sections and dovetailed grooves arranged in the inner faces thereof, plates arranged in the said grooves, and having their lower outer faces beveled and also provided with recesses, spring locking members held to the beveled portion of the plates at one end and having their free ends terminating in inwardly-bent portions, an axle carried by the plates and having a wheel mounted thereon, substantially as and for the purpose specified.

5. In a trolley-wheel support, the combination of the harp having dovetailed grooves arranged in the inner faces thereof, plates operating in the said grooves, an axle carried by the said plates and having a wheel mounted thereon, the said plates having recesses formed in their outer faces, the lower outer edge of the plates being beveled, a spring locking member secured at one end to the beveled portion of each plate, the free end of each locking member engaging the said harp, the said ends being adapted to be forcibly projected into the recesses of the said plates, as and for the purpose set forth.

708,477. BODY-BRACE. HARRISON W. RUSSELL, Jacquin, Tex. Filed Apr. 14, 1902. Serial No. 102,998. (No model.)



Claim.—1. A body-brace, comprising a flexible wire which is bent at its center forming two portions, each of which is turned into a coil, a pad held above the coiled portion of the wire and adapted to be held by the wire against the chest of the wearer, a strap for holding the device to the body of the wearer, and leg-pads at the ends of said wire, as set forth.

2. A body-brace, comprising a flexible wire or rod bent at its longitudinal center forming two arms, each arm being bent to form a coil, a pad above the middle portion of the wire, a strap for holding the device to the body of the wearer, portions of each arm adjacent to its end being bent in semicircular form, and pads fastened between said semicircular portions, as set forth.

708,478. DEVICE FOR HOLDING CHALK OR OTHER MATERIAL. FRANK A. C. RUTH, Rochester, N. Y. Filed Dec. 5, 1900. Serial No. 38,888. (No model.)

Claim.—1. A holder for chalk or similar consumable material embodying a support having the spring-arms adapted to extend in opposite directions into the material to be held, the prominent ends of said arms having the opposed inclined faces and the shoulders in rear thereof, whereby they will become automatically interlocked when brought together, said arms being incapable of detachment by a relative longitudinal movement.

2. In a holder for chalk or similar material, the combination with the shell or ring 2 having apertures upon its opposite sides, of a support having the oppositely-extending arms 6 provided with beveled faces 7 upon their proximate ends, and interlocking projections 8.

3. A holder for chalk or similar consumable material embodying a band or shell confining the material to be held having the apertures on opposite sides and securing-arms passing through said apertures and adapted to most within the body of material said arms having the positively-engaging interlocking devices on their proximate ends automatically and positively engaged by a longitudinal movement toward each other to prevent their withdrawal.

4. A holder for chalk or similar consumable material embodying a band or shell confining the material to be held having the apertures and the loop having the inwardly-extending arms passing loosely through the apertures in the band and the interlocking projections on their ends adapted to automatically interlock within the material when thrust inwardly from opposite sides and prevent the withdrawal of the arms.

708,479. FOUNTAIN-PEN. WILLIAM W. SANFORD, Newark, N. J., assignor of one-half to Frederick D. Bennett, Freehold, N. J. Filed Apr. 22, 1902. Serial No. 104,200. (No model.)

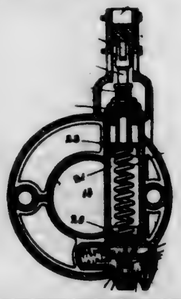
Claim.—1. The combination in a pen, of a barrel provided with an ink-feed, a collapsible expansible reservoir in said barrel, and an air-valve on said barrel, substantially as described.

2. The combination in a pen of a barrel provided with an ink-feed, an elastic collapsible sack in said barrel having its mouth communicating with said ink-feed, and a valve on said barrel adapted to admit air into the barrel to collapse said sack, and also adapted to be closed after said sack is full and to exclude external air-pressure thereafter from the filled sack, substantially as described.

3. The combination in a pen, of a barrel, a pen-section provided with an ink-feed and with a neck projecting into the barrel, an elastic expansible sack in the barrel attached at one end to said neck, and an air-valve on said barrel adapted to admit air into the barrel to collapse the sack, and to exclude external air-pressure from the barrel when the sack is filled, substantially as described.

4. The combination in a pen, of a barrel provided with an ink-feed, a collapsible expansible ink-reservoir in said barrel communicating with said ink-feed at one end, and having the other end narrowed to permit air to flow between the side of the reservoir and the barrel, and an air-valve on said barrel, substantially as described.

708,480. AIR-BRAKE MECHANISM. WILLIAM H. SAVAGE, Denver, Colo., assignor, by direct and mesne assignments, to the Savage Duplex Air Brake Company, Denver, Colo. Filed Feb. 6, 1901. Serial No. 46,573. (No model.)

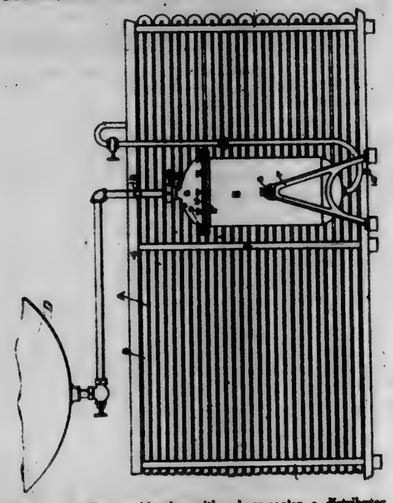


Claim.—1. In air-brake mechanism the combination of a valve interposed between the pressure source and the brake-cylinder, a spring normally holding said valve open, a rod connected with said spring and protruding from the valve-casing, a wedge-shaped device arranged to engage said rod, a spring connected with said device and having a tendency to cause it to act on the rod to increase the tension of the spring which holds the valve open, and a connection between the wedge-shaped device and the spring-supported body of the car, whereby the said device is held inactive against the tension of its spring when the car is empty, and allowed to act in response to the spring as the gravity of the load increases.

2. In brake mechanism the combination of a valve interposed between the pressure source and the brake-cylinder, a spring normally holding said valve open, a rod arranged within actuated, to increase the tension of the said spring, a wedge-shaped device arranged to engage said rod, a spring connected with the wedge-shaped device and having a tendency to cause it to act on the rod and increase the tension of the spring which holds the valve open, and a flexible connection between the wedge-shaped device and the body of the car, and arranged to be held taut by the car-body when the car is empty, and also arranged to slacken and allow the spring connected with the wedge-shaped device to cause the latter to actuate its engaging rod, as the spring-supported car-body descends in response to the weight of the load.

3. In air-brake mechanism, the combination of a valve interposed between the pressure source and the brake-cylinder, a spring normally holding said valve open, spring-actuated means having a normal tendency to increase the tension of the valve-opening spring, and two ropes connected with said tension-increasing means and extending in opposite directions toward the respective ends of the car, guides mounted on the body of the car and engaged by said ropes which extend downwardly and are attached to stationary supports below the springs, whereby as the car rocks and either rope is slackened, the other rope will remain taut and obviate vibration of the tension-increasing means.

708,481. ATTACHMENT FOR BEER-COOLERS. OTTO SCHELL, New Ulm, Minn. Filed Dec. 30, 1901. Serial No. 87,720. (No model.)



Claim.—1. The combination with a beer-cooler, a distributer extending along the entire length and above the top thereof, and a kettle arranged above the level of said distributer, of an upright closed receptacle for hops standing alongside said cooler and below said kettle and distributer, a perforated portion within said receptacle and adjacent to the lower end thereof, an inlet-pipe leading from the kettle into the upper end of said receptacle, an outlet-pipe leading from the space between said perforated portion and the adjacent wall of the receptacle upward to the distributer, the arrangement being such that all of the wort is passed from said kettle through said receptacle under pressure to said cooler.

2. The combination with a beer-cooler, a distributer along the top thereof, and a kettle, of a closed receptacle for hops standing alongside said cooler below said kettle, an open-work inner chamber arranged within said receptacle, a conduit leading from said kettle to the top of said receptacle and opening into the receptacle within said open-work chamber, and a conduit leading from the receptacle outside said open-work chamber to said distributer.

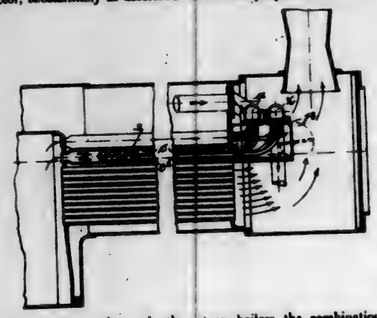
3. The combination with a beer-cooler, a distributer extending along the top thereof, and a boiling-kettle, of an upright closed receptacle for hops standing alongside said cooler and below said kettle, an open-work chamber arranged within said receptacle and interspaced from the bottom thereof, a conduit connecting said kettle with said receptacle, said conduit opening into the upper end of said open-work chamber, and a conduit leading from the lower end of said receptacle outside said open-work chamber to said distributer, whereby all of the wort is passed from said kettle to said receptacle under pressure to said cooler.

4. The combination with a beer-cooler and brewing-kettle, of a closed receptacle for hops arranged alongside said cooler and below said kettle, an open-work chamber arranged within said receptacle, a conduit connecting the kettle with the interior of said open-work chamber, a pipe opening into said conduit for the purpose of admitting air thereto, and a conduit leading from the lower end of said receptacle outside said open-work chamber to the cooler.

5. The combination with a beer-cooler, and a kettle arranged above the same, of a closed receptacle for hops arranged alongside said cooler below said kettle, an open-work hop-retainer within said receptacle, said retainer being interspaced from the bottom of the receptacle, a detachable cover for the upper ends of said receptacle and retainer, a conduit connecting said kettle and cover and opening into said retainer, a conduit leading from the bottom of said receptacle outside said retainer upward to the upper portion of the beer-cooler, and a pivotal support for said receptacle.

708,482. SUPERHEATING DEVICE IN TUBULAR STEAM-BOILERS. WILHELM SCHMIDT and PETER TREMMEL, Wilhelmshöhe, near Cassel, Germany, assignors to Schmidt'sche Steam Power Patent Co., Ltd., London, England, a Firm. Filed Jan. 26, 1901. Serial No. 44,914. (No model.)

Claim.—1. In locomotive and other steam-boilers, the combination with a steam-collector of a superheater consisting of superheating-pipes arranged in the boiler-tubes and having their ends bent to the steam-collector, substantially as described and for the purpose set forth.



2. In locomotive and other steam-boilers, the combination with a steam-collector of a superheater consisting of superheating-pipes arranged in the boiler-tubes and having their ends bent to the steam-collector, a regulating-damper behind the bends of the superheating-pipes, substantially as and for the purpose set forth.

3. In locomotive and other steam-boilers, the combination with a steam-collector of a superheater consisting of superheating-pipes arranged in the boiler-tubes and having their ends bent to the steam-collector, plates which are detachably fixed to the chambers and in which the superheating-pipe bends are fixed, a regulating-damper behind the bends of the superheating-pipe, substantially as described and for the purpose set forth.

708,488. SAFETY-HARNESS FOR CHILDREN. CONRAD J. SCHLICK, Gallipolis, Ohio. Filed Apr. 23, 1902. Serial No. 104,370. (No model.)

Claim.—1. As a new article of manufacture, a child's safety-harness comprising a girth-strap having means for adjustably and detachably connecting its ends, and a shoulder-strap reversely and intermediately engaging said girth-straps at opposite points and with depending ends, and means carried by said depending ends for connection to the support for the child, substantially as described.

2. As a new article of manufacture, a child's safety-harness, comprising a girth-strap having means for adjustably and detachably connecting its ends, and a shoulder-strap reversely and intermediately engaging said girth-straps at opposite points, and with depending ends, and buckles and straps upon said depending ends, substantially as described.

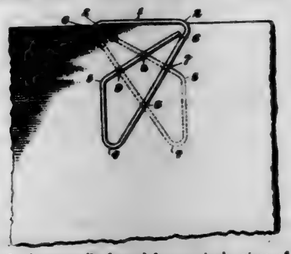
708,484. TWINE-CUTTER. IRA SHAFER, Afton, Iowa. Filed Apr. 23, 1902. Serial No. 105,101. (No model.)

Claim.—1. In a twine-cutter, the combination with a suitable base and a twine-tension device, of an angular arm hinged to the base and provided with a tubular portion through which the twine is adapted to pass, a knife pivoted to the outer end of the arm, a connection between the knife and the base-plate whereby when said arm is swung downwardly the knife will be actuated to sever the twine, and an expansible and compressible guide extending from the tension device to the tubular portion of the arm and adapted to bridge the space between said arm and the base when the arm is swung downwardly, substantially as set forth.

2. In a twine-cutter, the combination with a suitable base and a twine-tension device, of an angular spring-actuated arm hinged to the base and provided with a tubular portion through which the twine is adapted to pass, a knife pivoted to the outer end of the arm, a connection between the knife and the base-plate whereby when said arm is swung downwardly the knife will be actuated to sever the twine, and an expansible and compressible guide extending from the tension device to the tubular portion of the arm and adapted to bridge the space between said arm and the base when the arm is swung downwardly, substantially as set forth.

4. In a twine-cutter, the combination with a suitable base having an opening, of a tension device consisting of an apertured plate hinged to the base and having a lip projecting from the base of the opening, a spring for exerting pressure upon the plate to hold the lip against the base of the opening, an angular spring-actuated arm hinged to the base and provided with a tubular portion through which the twine is adapted to pass and with a cutter-head having an opening through which the end of the twine is adapted to project, a spring-actuated knife pivoted to said head, and a connection between said knife and the base whereby when said arm is swung downwardly the knife will traverse the opening in said head, substantially as set forth.

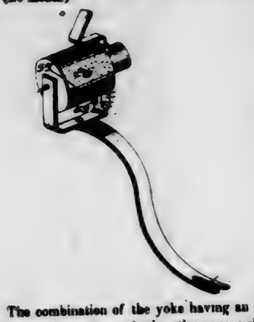
708,485. PAPER CLIP OR FASTENER. ALFRED SHERLOCK, Jersey City, N. J., assignor to Joseph W. Cushman, trading as Cushman and Denison, New York, N. Y. Filed Dec. 21, 1901. Serial No. 86,794. (No model.)



Claim.—1. A paper-clip formed from a single piece of wire and having a central part or head and convergent side parts crossing at and extending beyond the point 3, then extending upwardly and then inwardly and again crossing at 7 and 9, the ends of said parts again crossing at 8 in the space between the head and convergent sides, and each finally terminating adjacent the upper part of the convergent side part of which it forms a portion.

2. A paper-clip formed from a single piece of wire and having a central part or head and convergent side part crossing at and extending beyond the point 3, then extending upwardly in lines transverse to the central part or head and then inwardly, and again crossing at 7 and 9, the ends of said parts again crossing at 8 in the space between the head and convergent sides, and each finally terminating adjacent the upper part of the convergent side part of which it forms a portion.

708,486. GRINDING ATTACHMENT FOR POWER-MACHINES. ERASMUS W. SNOWALTER, Claypool, Ind. Filed Feb. 19, 1902. Serial No. 94,838. (No model.)



Claim.—1. The combination of the yoke having an oblique open slot in one of its arms and an aperture in the other arm, a shaft journaled in said aperture and slot and carrying a grinding-roller and a friction-wheel, and a guard having bent edges slidingly engaging one arm of the yoke.

2. The combination of the yoke the arms of which are provided respectively with an aperture and with an oblique open slot, the shaft journaled in said yoke, and the guard having bent edges slidingly engaging one arm of the yoke and provided with a vertical slot to receive the shaft.

3. A grinding attachment for power-machines comprising a supporting-standard having oppositely-disposed vertical arms at its upper end, a grinding-roller mounted detachably in said arms, said roller having a friction-wheel connected therewith for engaging a driving-wheel, and a detachable guard slidably mounted on one of said arms.

4. A grinding attachment for power-machines comprising a supporting-standard having vertical arms at its upper end, a grinding-roller mounted in said arms and provided with means for engaging a driving-wheel, and a detachable guard slidably mounted on one of said arms and having a member extending horizontally over said grinding-roller and provided with an upwardly-extending arm at its free end.

5. A grinding attachment for power-machines comprising a supporting-standard having upwardly-extending flat arms, a grinding-roller mounted in said arms, and a detachable guard provided with guideways for engaging one of said arms.

6. A grinding attachment for power-machines, comprising a supporting standard having an open slot at one end thereof and an inverted yoke disposed at the other end, the arms of said yoke being flat and provided with means for detachably receiving a shaft, a shaft carrying a grinding-roller mounted in said means, and a detachable guard provided with inwardly-bent edges forming guideways for engaging the edges of one of said arms.

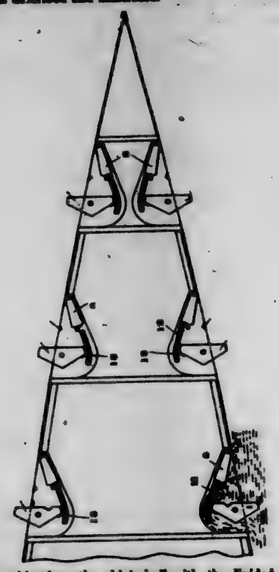
7. A detachable guard for a grinding attachment comprising a vertical member having means for engaging a supporting-standard and a horizontally-disposed member attached to said vertical member at its upper end, said horizontal member having an upwardly-extending arm at its free end.

708,487. MARINE BRAKE. HENRY SIMPSON, Liverpool, England. Filed Apr. 15, 1902. Serial No. 102,903. (No model.)

Claim.—1. In combination; a ship in the hull of which is formed a series of cavities symmetrically disposed in pairs on opposite sides of the center line; a series of arresters pivotally located in the said cavities and leaving, when in arresting position, passage-ways for the water to flow through the cavities and around the arresters; a series of hinged doors; means for articulating the doors to the arresters so that they open and close therewith and are held open thereby; and means for operating the arresters; substantially as described and illustrated.

2. In combination; a ship in the hull of which is formed a series of cavities symmetrically disposed in pairs on opposite sides of the center line, each cavity being divided longitudinally into two parts by one of the ship's decks and strengthened by bars and junction-plates; a series of twin arresters pivotally located in the said cavities and leaving, when in arresting position, passage-ways for the water to flow through the cavities and around the arresters; a series of hinged double doors; means for articulating the doors to the arresters so that they open and close there-

with and are held upon thereby; and means for operating the arresters; substantially as described and illustrated.



2. In combination; the ship's hull with the divided cavities; the twin arresters; the hinged doors; the means for operating the arresters; and the double spindle for the twin arresters, consisting of two parts jointed together so as to prevent relative rotary movement while permitting departure from absolute alinement; substantially as described and illustrated.

4. In combination; the ship's hull with the cavities and bars; the doors having projections adapted to abut against the said bars; the arresters having projections adapted to abut against the projections on the doors; means for articulating the doors to the arresters; and means for operating the arresters; substantially as described and illustrated.

5. In combination; the ship's hull with the cavities; the arresters; the doors; the means for operating the arresters; and the means for articulating the arresters to the doors, consisting of slotted bars attached to the doors and pins attached to the arresters and working in the said slots; substantially as described and illustrated.

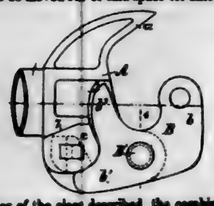
703,488. VEHICLE-AXLE LUBRICATOR. DANIEL W. SHIRKEY, Wilmot, Ohio, assignor of one-half to Albert F. Kemper, Wilmot, Ohio. Filed Mar. 13, 1902. Serial No. 98,031. (No model.)

Claim.—In a vehicle-axle lubricator, an axle provided with a groove having located therein oil-conveying pipes, said pipes being covered with metal, and leading to and communicating with open slots, and the axle provided with a reduced portion between the bearing-points of the hub-lugging, and an oil-cup provided with a passage leading to the oil-conveying tubes, and means for forcing the oil through the conveying-tubes from the cup, substantially as and for the purpose specified.

703,489. GAR-COUPLING. JOHN W. SMITH, Ottawa, Canada. Filed Mar. 20, 1902. Serial No. 100,003. (No model.)

Claim.—1. In a coupler of the class described, the combination with a head having the central or axial portion of its working end a solid or non-recessed mass of metal, of a pivoted knuckle having the face which meets the coacting knuckle an unbroken surface extending from top to bottom of the knuckle, substantially as set forth.

2. The combination with a head having a suitable lateral shoulder upon its knuckle-bearing side, of a knuckle pivoted upon the head and having upon that portion of its rear end which is most distant from the coupler's axis a face in position to approach said shoulder as the knuckle opens, and a block normally filling the space between said face and shoulder and arranged to be moved out of said space for unlocking the knuckle.



3. In a coupler of the class described, the combination with a head having a solid outer and recessed above and below to form a parallel-faced hub, a forked knuckle embracing, and pivoted to, said hub with its branches normally at some distance from the corresponding walls of the recesses, and locking devices arranged to pass into and out of the spaces between said branches and walls, substantially as set forth.

4. The combination with the head having the non-recessed central portion and the integrally-formed hub, of the forked knuckle embracing the hub and having the tails and arms, the pivotal pin passing vertically through the branches of the knuckle and the intermediate hub, and the vertically-sliding pin having parts adapted to pass into and out of the paths of said tails as the pin falls and rises.

5. The combination with the head of approximately the outline of the ordinary coupler, having the non-recessed end portion, and cut away above and below, on the knuckle side, leaving the medial hub with the shoulders, of the forked knuckle having the tails and arms, the vertically-sliding non-revolvable pin having portions adapted to fit and fill the spaces between said tails and the corresponding shoulders when the pin is in normal position, to pass out of the paths of the tails when raised, and to be held up by the tails when the knuckle is open.

703,490. STORAGE BATTERY. MALONE O. SMITH, Depew, N. Y., assignor of one-half to Thomas J. Carter, Depew, N. Y. Filed July 13, 1901. Serial No. 68,146. (No model.)

Claim.—1. An element for storage battery, composed of a metallic plate forming a tray with outwardly-sloping sides and ends, deepest in the center along a central longitudinal line, said plate provided upon its upper and lower sides with electrodes of opposing polarity, in conductive connection with the plate by means of a retaining-grid of vertically-disposed thin lamines, formed from the body of the plate on opposite sides of its central core to which said lamines remain united, the outer or marginal portion of the tray being formed by latent portions of the plate and bent upwardly to form a standing rim around the edge of the tray.

2. A storage battery, composed of an alternating series of conducting and non-conducting tray-shaped plates, nested together in a vertical pile, the conducting-plates adapted to contain an electrolyte and provided with electrodes in conductive connection with the plates, and the non-conducting plates of porous material retaining the electrodes out of contact with each other, and an electrolyte in which the non-conducting plates are immersed for electrically connecting the electrodes, a supporting-rack of non-conducting material having a tray-shaped depression in which the bottom tray fits and upon which the pile is supported, and a follower formed of the top tray by means of a stiffening-frame, said top tray formed upon its under side only with an electrode and constituting one pole of the battery, and the bottom tray formed upon its upper side only with an electrode constituting the other pole of the battery.

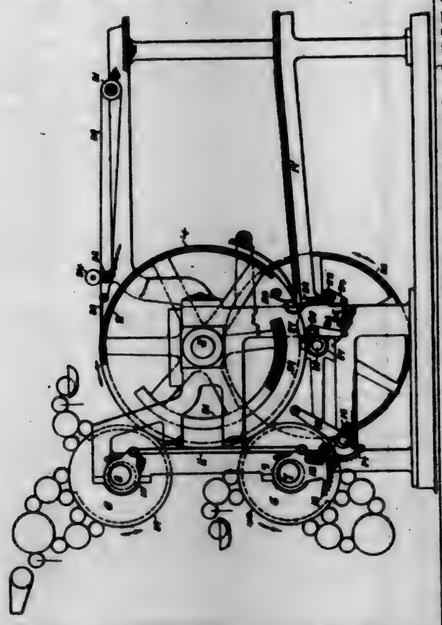
3. A storage battery, composed of an alternating series of conducting and non-conducting tray-shaped plates nested together in a vertical pile, the conducting-plates being cold-tight and provided with electrodes formed in conductive connection with the plates, and the non-conducting plates of porous material, interposed between the electrodes of the conducting-plates, and an electrolyte in which the non-conducting plates are immersed for electrically connecting the electrodes, a supporting-rack of non-conducting material formed with a tray-shaped depression in which the bottom tray is supported, a gutered flange around said bottom tray and supported upon the walls of the supporting-rack, an overflow vessel contained within the supporting-rack and communicating with the gutter, and a follower or cover formed of the top tray by means of a stiffening-frame within the tray, the edges of said top tray extending over the top of said frame and forming one terminal of the battery, and the gutered flange of the bottom tray forming the other terminal.

4. A storage battery, composed of conducting and non-conducting tray-shaped plates nested in the form of a vertical pile, and a supporting-base formed with a tray-shaped depression in which the pile is supported, the non-conducting plates of porous material interposed between the conducting-plates, and the conducting-plates adapted to contain an electrolyte and provided with electrodes in conductive connection therewith, the intermediate plates having electrodes upon both their upper and lower sides, and the top and bottom plates upon their lower and upper sides only, and forming the terminals of the battery.

5. A storage battery, composed of conducting and non-conducting tray-shaped plates nested in the form of a vertical pile, a supporting-rack having a like tray-shaped depression upon which the pile is supported as a base, and a cover on top of the pile, the non-conducting plates of porous material interposed between the conducting-plates and containing the electrolyte, and the conducting-plates provided with electrodes in conductive connection with the plates, the intermediate plates provided with electrodes upon their upper and lower sides, and the bottom and top plates upon one side only and constituting the terminals of the battery, said top plate formed into a rigid follower or cover by means of a stiffening-frame inclosed within the plate.

6. A storage battery, constructed in the form of a pile and composed of nested tray-shaped conducting-plates adapted to contain the electrolyte and provided with electrodes in direct conductive connection therewith, non-conducting tray-shaped porous plates interposed between the conducting-plates immersed in the electrolyte therein, an insulating-base supporting the pile and having a tray-shaped depression to receive the bottom tray of the pile, a gutered flange on said bottom tray extending around the top of the base in position to receive the overflow from the trays, an overflow vessel contained within the base and communicating with said gutter, and a follower or cover composed of the conducting plate or tray on top of the pile and a stiffening-frame inside said tray.

703,491. CYLINDER-MACHINE FOR PRINTING ON SHEETS. WILLIAM SPAIGHTAVER, New York, N. Y., assignor to Robert Hoe, New York, N. Y. Filed Apr. 12, 1901. Serial No. 55,561. (No model.)



Claim.—1. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, substantially as described.

2. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, and a delivery mechanism arranged over the feed-board, substantially as described.

3. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface and having a counterweighting-segment which is nearer the center of the cylinder than the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, substantially as described.

4. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface and having a counterweighting-segment which is nearer the center of the cylinder than the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, and a delivery mechanism arranged over the feed-board, substantially as described.

5. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface, of a feed-board, a front step coöperating with the feed-board, means for moving the front step below the plane of the board, and a delivery mechanism arranged over the feed-board, substantially as described.

6. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface and having a counterweighting-segment arranged nearer the center of the cylinder than the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, a front step coöperating with the board, and means for moving the step below the plane of the board, substantially as described.

7. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface and having a counterweighting-segment arranged nearer the center of the cylinder than the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, a front step, a rock-shaft on which the step is mounted located beneath the feed-board, and means for rocking the shaft to throw the step below the feed-board, substantially as described.

9. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface and having a counterweighting-segment arranged nearer the center of the cylinder than the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, a front step, a rock-shaft on which the step is mounted located beneath the feed-board, and means for rocking the shaft to throw the step below the feed-board, substantially as described.

10. In a printing-machine, the combination with the rotating sheet-carrying cylinder of a printing-couple, said cylinder being cut away opposite the sheet-supporting surface and having a counterweighting-segment arranged nearer the center of the cylinder than the sheet-supporting surface, of a feed-board arranged to present a sheet beneath the cylinder, a front step, a rock-shaft on which the step is mounted located beneath the feed-board, means for rocking the shaft to throw the step below the feed-board, and a delivery mechanism arranged over the feed-board, substantially as described.

11. In a printing-machine, the combination with a rotating impression-cylinder, said cylinder being cut away on the side opposite the impression-surface, a counterweighting-segment arranged nearer the center of the cylinder than the impression-surface, of a feed-board arranged to present a sheet beneath the cylinder, a rock-shaft mounted below the board, a front step on the rock-shaft, a cam on the cylinder, and means whereby said cam rocks the shaft to throw the front step below the board, substantially as described.

12. In a printing-machine, the combination with a rotating impression-cylinder, said cylinder being cut away on the side opposite the impression-surface, a counterweighting-segment arranged nearer the center of the cylinder than the impression-surface, of a feed-board arranged to present a sheet beneath the cylinder, a rock-shaft mounted below the board, a front step on the rock-shaft, a cam on the cylinder, means whereby said cam rocks the shaft to throw the front step below the board, and a delivery mechanism arranged over the feed-board, substantially as described.

708,492. SHAFT-HANGER. WILLIAM B. SPENCER, Chicago, Ill. Filed Oct. 12, 1899. Serial No. 733,502. (No model.)

Claim.—The combination of a crank-hanger having enlarged end portions 7 and 8 provided with exterior screw-threads, the interiorly-threaded sleeves 9 arranged on the exterior of the end portions of the crank-hanger and extending outward beyond the same and provided with inwardly-extending annular flanges 10 located between the ends of the sleeves 9 at points beyond the ends of the hanger and having their inner edges arranged substantially in alinement with the body portion of the hanger and forming ball-races with the outer portions of the sleeves 9, a crank-shaft extending through the hanger, cranks provided with hubs secured to the crank-shaft and provided with ball-race grooves 18, the inner portions of the hubs extending into the sleeves 9 beyond the intermediate flanges 10 and the outer portions of the hubs extending over the said sleeves 9 and arranged on the exterior of the same, balls located within the ball-races of the sleeves 9 and in the grooves 18 of the hubs, the jam-nuts 11 arranged on the threaded end portions of the hanger adjacent to the inner ends of the sleeves 9, and washers interposed between the jam-nuts and the sleeves, substantially as described.

708,493. RING. FRANK B. STAFFORD, Providence, R. I., assignor to Stafford & Randall Manufacturing Company, Saco, Me., a Corporation of Maine. Filed Oct. 7, 1901. Serial No. 77,998. (No model.)

Claim.—1. The improved jeweler's finding for ring manufacture herein described, consisting of a tube of base metal having an annular groove or channel in each of its ends, an outer tube of precious metal united to said base-metal tube on the outer surface of the base-metal tube, and having beveled edges and an inner tube of precious metal united to the base-metal tube on the inner surface of the base-metal tube and having beveled edges, substantially as set forth.

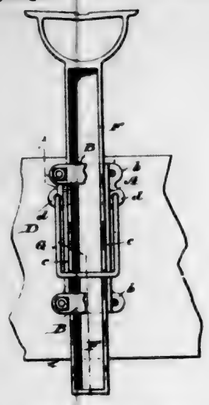
2. The improved jeweler's finding for ring manufacture herein described, consisting of a tube of base metal having an annular groove or channel in each of its ends, an outer tube of precious metal united to said base-metal tube on the outer surface of the base-metal tube, an inner tube of precious metal united to said base-metal tube on the inner surface of the base-metal tube each of said tubes of precious metal exceeding the base-metal tube in length, substantially as specified.

3. The improved jeweler's finding for ring manufacture herein described, consisting of a tube of base metal having an annular groove or channel in each of its ends, an outer tube of precious metal united to the base-metal tube on the outer surface of the base-metal tube and having a convexed outer surface and beveled ends and an inner tube of precious metal united to the base-metal tube on the inner surface of the base-metal tube and having beveled ends, substantially as specified.

708,494. WAGON-SEAT SUPPORT. HARVEY STARKS, Rhine Corners, Wis. Filed Apr. 26, 1902. Serial No. 104,720. (No model.)

Claim.—1. The combination of a shouldered guide attachable to a side-board of a wagon-body, a rack-standard vertically adjustable in the guide, the upper end of this standard being made to serve as a bolster for a wagon-seat spring, a bail having offset ends extended through lugs of said guide into clearance-recesses provided in the wagon-body side-board, and means in connection with the bail ends for preventing their withdrawal through said lugs, the bail being adjustable to engage said standard and rest on the guide-shoulders.

2. The combination of a flat plate-casting having a pair of outer parallel longitudinal flanges, flange-abutting bars having their ends provided with apertures in register with apertures in lugs of the casting, bolts engageable with a wagon-body side-board, said lugs and bars; nuts on the bolts, a rack-standard vertically adjustable in the guide comprising said casting and bars, the upper end of this standard being made to serve as a bolster for a wagon-seat spring, a bail having offset screw-threaded ends extended through lugs of the aforesaid casting, and nuts on the bail ends having clearance in recesses provided in the wagon-body side-board, the bail being adjustable to engage the said standard and rest on shoulders of said casting-flanges.



708,495. BOOKBINDER'S CLAMP. LOUIS J. A. STANIEWSKI, Chatham, Canada. Filed Dec. 11, 1901. Serial No. 85,453. (No model.)

Claim.—1. The combination with the stationary base provided with a curved or arc-shaped top, of the rocking base provided with a curved or arc-shaped bottom designed to rest upon the arc-shaped top, the clamping-bars secured on the rocking base and designed to receive between them the book to be embossed, means for holding such bars together to grip the book and means for connecting the bases together, so as to permit of a rocking lateral movement as and for the purpose specified.

2. The combination with the stationary base provided with a curved or arc-shaped top, of the rocking base provided with a curved or arc-shaped bottom designed to rest upon the arc-shaped top, the clamping-bars secured on the rocking base and designed to receive between them the book to be embossed, the hand-screw extending through the ends of the bars and means for connecting the bases together, so as to permit of a rocking lateral movement as and for the purpose specified.

3. The combination with the stationary base provided with a curved or arc-shaped top, of the rocking base provided with a curved or arc-shaped bottom designed to rest upon the arc-shaped top, the clamping-bars secured on the rocking base and designed to receive between them the book to be embossed, the hand-screw extending through the ends of the bars, the said rocking bar being provided with a cross-groove, a hand-screw extending through the clamping-bar into and against the bottom of such groove and means for connecting the bases together so as to permit of a rocking lateral movement as and for the purpose specified.

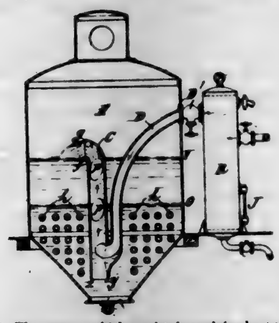
4. The combination with the stationary base provided with a curved or arc-shaped top, of the rocking base provided with a curved or arc-shaped bottom designed to rest upon the arc-shaped top, the clamping-bars secured on the rocking base and designed to receive between them the book to be embossed, means for holding such bars together to grip the book, a cord extending through holes in the bases and spring means located intermediate of the length of the cord for allowing it to give and a suitable fastening for the bottom end of the cord as and for the purpose specified.

5. The combination with the stationary base provided with a curved or arc-shaped top, of the rocking base provided with a curved or arc-shaped bottom designed to rest upon the arc-shaped top, the clamping-bars secured on the rocking base and designed to receive between them the book to be embossed, means for holding such bars together to grip the book, a flexible cord extending through the central holes in the bases, the spring located at the lower end, the triangle connected to the lower end of the spring, a bracket and hook connected to the floor and a thumb-screw extending through the upper end of the bracket and into the triangle as and for the purpose specified.

6. The combination with the top rocking base and the clamps carried thereby for holding the book in place, of the bottom base and bottom base-board, said top and bottom bases having central holes, the cord extending through the central holes in both bases and the central bearing between the bottom base and base-board and a spring-plunger designed to extend through the base-board into a hole in the bottom base as and for the purpose specified.

7. The combination with the curved rocking base, of the curved stationary base of the clamps carried by the rocking base, the cord extending through the center holes of said bases, and the ball-bearings in which the top of the cord is fastened and which permits of the horizontal rotation of the bases without twisting as and for the purpose specified.

708,496. PROCESS OF SUGAR-BOILING. CARL STEFFEN, Vienna, Austria-Hungary. Filed Aug. 8, 1900. Serial No. 626,062. (No specimens.)



Claim.—1. The process, which consists in applying heat to the lower portion of a column of saccharine solution in presence of a vacuum and lifting successive portions of the solution from said lower to the upper portion of said column through an open-ended conduit, by introducing into the latter near its lower end series of bubbles of a gaseous fluid of a pressure but slightly greater than the pressure within the conduit at the point of introduction of the bubbles, for the purpose set forth.

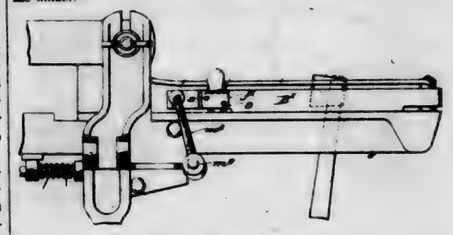
2. The process, which consists in applying heat to the lower portion of a column of saccharine solution in presence of a vacuum and lifting successive portions of the solution from said lower to the upper portion of said column through an open-ended conduit, by introducing into the latter near its lower end series of bubbles of a gaseous fluid of a pressure but slightly greater than the pressure within the conduit at the point of introduction of the bubbles, each of said bubbles containing sufficient of the fluid to cause them to expand approximately to the full internal diameter of said conduit, substantially as and for the purpose set forth.

708,497. GRAIN-DIVIDER FOR HARVESTERS. JOHN F. STEWARD, Chicago, Ill. Filed Apr. 21, 1902. Serial No. 104,099. (No model.)

Claim.—In combination with a grain-receiving platform, the forward extension pivoted at its rear end to said platform, the divider-board I pivoted to the forward end of said forward extension, the post H, means for securing the board to the said post, and means for securing the forward extension to the said post, substantially as described.

708,498. SHUTTLE-BINDER FOR LOOMS. EDWARD S. STEVENS, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Jan. 2, 1902. Serial No. 87,999. (No model.)

Claim.—In a loom, the lay, a shuttle-box thereon, a spring-controlled binder, and an upturned finger secured to the outer face of the binder and offset therefrom, said finger projecting above the shuttle-box and behind the cover-plate thereof, to permit ready manual retraction of the binder.



708,499. HINGE-JOINT. JOHN J. H. SYDENHAM, Coventry, England. Filed Sept. 4, 1900. Serial No. 29,977. (No model.)

Claim.—1. In a hinge-joint, the combination with the two parts to be connected together, of a projection on the first part having a flat thereon, a pair of jaws on the second part having a hole therein, adapted to contain the said projection and having also a slot therein, adapted to admit the projection to its seat in said hole when the two parts are approached at an abnormal angle, substantially as specified.

2. In a hinge-joint, the combination with the two parts to be connected together, of a projection on the first part having a flat thereon and an axial hole therein, a pair of jaws on the second part having a hole therein, adapted to contain the said projection and having also a slot therein, adapted to admit the projection to its seat in said hole when the two parts are approached at an abnormal angle, a pin passing through the holes in the projection and jaws, and means for retaining the said pin in position, substantially as specified.

3. In a hinge-joint, the combination with the two parts to be connected together, of a projection on the first part having a flat thereon and an axial hole therein, a pair of jaws on the second part of greater depth than the projection and having a hole adapted to contain the said projection and of greater diameter than the said projection except at the bottom, and a slot therein adapted to admit the said projection to its seat in the said hole when the parts are approached at an abnormal angle, a pin having a head with portions of two diameters, the larger portion being adapted to lie on the top of one jaw and the portion of smaller diameter being adapted to fit into the hole in the said jaw, while the body of the pin is adapted to fit into the axial hole in the projection and the lower end of the pin is adapted to be screwed into the bottom of the hole in the other jaw, substantially as specified.

4. In a hinge-joint, the combination with the two parts to be connected together, of a projection on the first part having a flat thereon and an axial hole therein, a pair of jaws on the second part of greater depth than the projection and having a hole adapted to contain the said projection and of greater diameter than the said projection except at the bottom, and a slot therein adapted to admit the said projection to its seat in the said hole when the parts are approached at an abnormal angle, a pin having a head with portions of two diameters, the larger portion being adapted to lie on the top of one jaw and the portion of smaller diameter being adapted to fit into the hole in the said jaw, while the body of the pin is adapted to fit into the axial hole in the projection and the lower end of the pin is adapted to engage in the bottom of the hole, and means for locking the pin, substantially as specified.

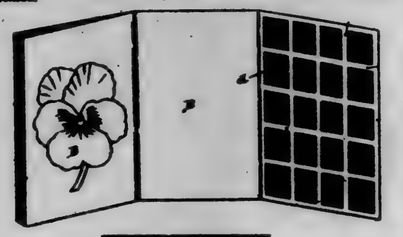
708,500. ARTIST'S SKETCH-BOOK. WILLIAM T. SHALVAR, Cincinnati, Ohio. Filed Apr. 7, 1902. Serial No. 101,955. (No model.)

Claim.—1. An artist paint-book having a folding sheet containing a series of colors, secured to the outer marginal edge of one of its covers adapted to be folded in against the inner face of said cover-leaf, substantially as specified.

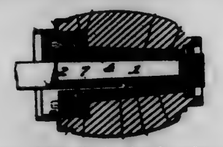
2. An artist paint-book having a folding sheet carrying a series of colors, each color being separated from its adjacent color by marginal spaces, said folding sheet being secured to the outer marginal edge of one of the book-covers adapted to be folded in against the inner face of said cover-leaf, substantially as specified.

3. An artist paint-book having a folding sheet carrying a series of

colors, each color being separated from its adjacent color by marginal spaces, said folding leaf being secured to the outer marginal edge of one of the covers adapted to be folded in against the inner face of said cover-leaf, and figures in outline printed upon the book-pages, substantially as specified.



708,501. SELF-LUBRICATING HUB-BEARING. THEODORE TUNELWOOD, Harrington, Del. Filed Sept. 7, 1901. Serial No. 74,650. (No model.)

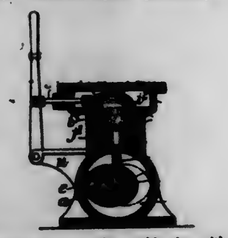


Claim.—1. In a lubricating-bearing for axles and in combination with the axle and the hub-box, a wear-sleeve fixed to the axle-arm, having an enlarged rimmed end telescoping with the inner end of the hub-box, and having a slot or channel extending through its enlarged rimmed end, and pockets on each side of the channel, and a plunger-key adapted for insertion into the channel to displace the oil therefrom into the pockets and means for locking the key.

2. A self-lubricating hub-bearing comprising a sleeve interposed between the hub-chain and axle-arm, to receive the wear, said sleeve having a reduced enlargement engaging annular shoulders on the chain and having a longitudinally-disposed channel and staggered pockets at intervals about its circumference, a plunger-key adapted to be inserted in the channel to displace the introduced oil and force it into the pockets, said key having at its outer end a head provided with a depression, and a shoulder spring on the sleeve enlargement engaging at one end the depression to lock the inserted key.

3. In a self-lubricating hub-bearing, a wear-sleeve interposed between the axle-arm and hub chain or box and provided with a longitudinal slot for receiving a supply charge of oil, and oil-distributing pockets, the slot and the pockets opening on the axle-arm and on the inner wall of the hub chain or box, and means for displacing the oil from the charging-slot into the distributing-pockets.

708,502. ROTARY ENGINE. CHARLES TUCKFIELD, Hist Holmey, England, assignor of two-thirds to Dyson Weston, London, England. Filed Nov. 15, 1901. Serial No. 82,333. (No model.)



Claim.—1. In a rotary motor, the combination with a cylinder, of a drum having one or more eccentric tapered peripheral grooves formed therein, each groove being stopped at one point and of one or more sliding abutments engaging the said groove or grooves, substantially as described.

2. In a rotary motor, the combination of a cylinder, of a drum keyed upon a shaft journaled in the cylinder, of a number of eccentric peripheral grooves formed in the drum the said grooves being stopped or closed at one point, of sliding abutments engaging each groove and of a compound-passage slide distributing-valve and ports whereby the motor can be operated as a high-pressure or as a compound motor, substantially as described.

708,503. BOLSTER GUIDE-BLOCK. HELEN H. TUBBS, Toledo, Ohio, assignor to Frank B. Harrison, Toledo, Ohio. Filed Oct. 24, 1901. Serial No. 79,894. (No model.)

Claim.—1. The combination with a truck-bolster and a truck guide-bar, of a guide-piece, movable relative to the bolster.

2. The combination with a truck bolster and guide-bar, of a rotary guide-piece.

3. The combination with a truck bolster and guide-bar, of a guide-piece having an endwise motion.

4. The combination with a truck bolster and guide-bar, of a guide-piece having a rotary and an endwise motion.

5. The combination with a truck bolster and guide-bar, of a movable guide-piece having a trunnion.

6. The combination with a truck bolster and guide-bar, of a guide-piece having flanges, and movable relative to the bolster.

7. The combination with a truck bolster and guide-bar, of a base-piece and a guide-piece, movable relative to the base-piece.

8. The combination with a truck bolster and guide-bar, of a base-piece having a hole, and a guide-piece provided with a trunnion.

9. The combination with a truck bolster and a guide-bar, of a base-piece having a seat, and a movable guide-piece located within the seat.

10. A bolster guide-block consisting of a base-piece, and a guide-piece, movable relative to the base-piece.

11. A bolster guide-block consisting of a base-piece having flanges and a movable guide-piece.

12. A bolster guide-block consisting of a base-piece having a seat, and a flanged and movable guide-piece.

13. A bolster guide-block consisting of a base-piece having a hole and a movable guide-piece provided with a trunnion.

14. A guide for a truck-bolster having flanges and a trunnion; the said guide being adapted to rotate when applied to said bolster.

15. A movable guide for a truck-bolster provided with flanges to embrace the edges of a guide-bar; and also having means for uniting the same to the end of a bolster in such a manner that the said guide can move relative to the bolster.

708,504. NUT-LOCK. JAMES W. S. TUBB, Potosi, Ind. Ter. Filed Oct. 30, 1900. Serial No. 34,944. (No model.)

Claim.—1. A nut-lock comprising a bolt having a portion beyond its threaded section tapered and devoid of threads and shaft, the shaft extending some distance into the threaded portion, and a nut to engage the bolt, the tapered terminal permitting application thereto of a socket-tool of less external diameter than the internal diameter of the bolt-opening when the said terminal is within the bolt-opening.

2. A nut-lock comprising a bolt having a portion beyond its threaded section tapered and devoid of threads and shaft, the shaft extending some distance into the threaded portion, and a nut having its outer face countersunk or concaved from the bolt-opening outward to its perimeter, substantially as and for the purpose specified.

708,505. BUGGY-TOP ADJUSTER. JOSHUA R. VILES, Detroit, Mich., assignor of one-half to Charles H. Reuhan, Detroit, Mich. Filed May 2, 1902. Serial No. 105,691. (No model.)

Claim.—1. In a buggy-top adjuster, a prop-iron provided with an enlarged bearing-surface, separable bearing-plates adapted to embrace the same, said bearing-plates provided with engaging flanges formed on one side of the bearing and adapted to rest one within the other, the construction being such that the plates forming the bearing may be engaged to one side of the bow, substantially as described.

2. In a buggy-top adjuster, a prop-iron provided with an enlarged bearing-surface, separable bearing-plates adapted to embrace the same, each provided with engaging flanges formed on one side of the bearing-plates, the construction being such that the flanges of the bearing-plates are adapted to be engaged to one side of the bow, substantially as described.

708,506. LOCK. ANDREW F. WALLBERG, Brooklyn, N. Y. Filed Apr. 13, 1901. Serial No. 55,694. (No model.)

Claim.—1. In a lock of the class described, a bolt, an operating member, and means for operatively connecting said bolt with said operating member and for disconnecting said bolt from said operating member; said means comprising a pivoted dog provided with a projection arranged for engagement with said operating member and a tumbler which operates in connection with said dog to lock said dog against movement when said projection is in position of engagement or disengagement, said tumbler and said dog being arranged for simultaneous actuation by a suitable key.

2. In a lock of the class described, a bolt, an operating member, and means for operatively connecting said bolt with said operating member, and for disconnecting said bolt from said operating member; said means comprising a pivoted dog connected with said bolt and provided with a projection arranged for engagement with said operating member and with a shoulder arranged to prevent independent movement of the bolt when said projection is disconnected from said operating member, and a tumbler which is operatively connected with said dog and whereby said dog may be locked against movement when said projection is in position of engagement and disengagement.

3. In a lock of the class described, the combination with a bolt, a bolt-carrying member and knob-operated means, of a dog pivotally mounted on said bolt-carrying member and provided at one end with a hooked finger on one side adapted to engage said knob-operated means, and a laterally-projecting shoulder on the other side adapted to enter a recess in the lock-casing when said finger is disengaged, and at the other end with two spaced projections adapted to receive the operative end of the key between them, said dog having on one face an angular lateral projection, and a tumbler provided with an elongated opening to receive the pivot carrying the dog and with a projection adapted to bear against the inside of the bolt-carrying member, said tumbler having its end adjacent to said enlargement provided with a curved shoulder and having a cut-out portion provided with spaced extensions adapted to receive the angular projection on the dog when in or out of engagement, and a spring normally retaining said angular projection in one or the other of said extensions.

708,507. HAT-FASTENER. MARGARET E. WAFLER, Ann Arbor, Mich. Filed July 12, 1902. Serial No. 54,302. (No model.)

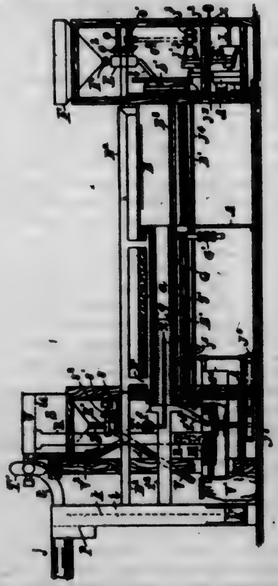
Claim.—1. A plate, having a central aperture, radial guides combined therewith, a rubber against the back of said plate, and means adapted to hold the rubber in place at the back of said plate, the rubber compressed between such plate and said rear holding means, and extending through the said aperture, substantially as and for the purposes specified.

2. A hat-pin, guide, shield and fastener composed of two pieces A and A^1 having a central aperture, and an elastic medium located between them, covering these apertures, and extending beyond their edges, and confined between these pieces so as to extend through the apertures, thus presenting a raised surface, adapted to catch the point of the pin, substantially as and for the purposes specified.

3. A hat-pin, guide, shield and fastener composed of two pieces A and A^1 having a central aperture, and an elastic medium located between them, covering these apertures, and extending beyond their edges, and confined between these pieces so as to extend through the apertures, thus presenting a raised surface, adapted to catch the point of the pin, and the piece having the radial ribs, substantially as and for the purposes specified.

4. As an article of manufacture, two flat discal plates, of metal or the like, each having a central aperture, and so located with reference to each other that these apertures are concentric, a discal diaphragmic piece of rubber located between these two plates, and across the apertures of the plates, and in connection with the inner plate, radial ribs leading from the outer or circumferential edge of the plate to the central aperture, substantially as and for the purposes specified.

708,508. COFFEE-ROASTER. THEODORE H. WARD, Newark, N. J. Filed Nov. 30, 1901. Serial No. 84,174. (No model.)



Claim.—1. In a coffee-roaster, a roasting-cylinder, means for heating the same, means for feeding the coffee to the cylinder, a cooling-table having a progressively-moving surface, means for discharging the roasted coffee from the cylinder to the table, means for regulating the heat, and means connected with the cylinder, the feeding device and the movable surface of the cooling-table to move them all in unison at a regulated speed.

2. In a coffee-roaster, a roasting-cylinder, means for heating the same, means for feeding the coffee to the cylinder, means, as the flue connection f^3, for drawing the steam from the cylinder, a perforated cooling-

table having a progressively-moving surface, means for discharging the roasted coffee from the cylinder to the surface of the cooling-table, mechanism for removing the coffee from the cooling-table, means for regulating the heat of the cylinder, and means connected with the feeding device, the roasting-cylinder, the surface of the cooling-table and the mechanism for removing the coffee from the cooler to move them all in unison at a regulated speed.

3. In a coffee-roaster, a roasting-cylinder, means for heating the same, a coffee-feeder to supply the cylinder, a perforated cooling-table having a progressively-moving surface, means for discharging the roasted coffee from the cylinder to the table, means for regulating the speed of the cylinder, means connected with the cooling-table to move its surface in unison with the cylinder, and means connected with the cylinder for varying the speed of the feeding device.

4. In a coffee-roaster, the combination, with the roasting-cylinder *a* having supporting-rings *a'* at its opposite ends and antifriction-rolls *b* to carry the same, of the driving-shaft J and counter-shaft I connected by the tapering speed-cones J' and a driving-belt applied to the same, the annular gear *b'* upon the roasting-cylinder connected with the driving-shaft J, the coffee-feeder connected with the cylinder by pipe *l* and having its shaft *o* connected with shaft *o'* by belt and speed-cones o^2, and the shaft *o'* connected with the shaft J, the whole arranged and operated substantially as set forth to vary the speeds of the roasting-cylinder and the feeding device independently.

5. An automatic coffee-roaster comprising a roasting-cylinder with a smoke pipe or flue connection for withdrawing the vapors, means for heating the cylinder, means for continuously feeding the coffee into the cylinder, a movable cooling-table, means for discharging the roasted coffee continuously from the cylinder upon the moving table in a thin layer, means for removing the cooled coffee from the table, and means for regulating the heat of the cylinder, and for varying the speed of the cylinder, the feeding device and the cooling-table.

6. An automatic coffee-roaster comprising a roasting-cylinder with a smoke pipe or flue connection for withdrawing the vapors, means for heating the cylinder, means for continuously feeding the coffee into the cylinder, a movable cooling-table, means for discharging the roasted coffee continuously from the cylinder upon the moving table in a thin layer, a pneumatic lifter applied to the table to remove the coffee when cooled, and means for regulating the heat of the cylinder, and for varying the speed of the cylinder, the feeding device and the cooling-table.

7. An automatic coffee-roaster comprising a roasting-cylinder with a smoke pipe or flue connection for withdrawing the vapors, means for heating the cylinder, means for continuously feeding the coffee into the cylinder, a movable cooling-table, means for discharging the roasted coffee continuously from the cylinder upon the moving table in a thin layer, an exhaust-receiver to store the coffee, a pneumatic lifter to lift the coffee from the table to the receiver, a discharger connected with the receiver and adapted to discharge the coffee from the receiver and prevent the access of air thereto, and means for regulating the heat of the cylinder and for varying the speed of the cylinder, the feeding device, and the cooling-table.

8. An automatic coffee-roaster comprising a roasting-cylinder with a smoke pipe or flue connection for withdrawing the vapors, means for heating the cylinder, means for continuously feeding the coffee into the cylinder, a movable cooling-table, means for discharging the roasted coffee continuously from the cylinder upon the moving table in a thin layer, an exhaust-receiver to store the coffee, a pneumatic lifter to lift the coffee from the table to the receiver, means for discharging the coffee from the receiver to a discharge-pipe V, and an exhaust connection from the upper part of such discharge-pipe to remove the light beans and chaff therefrom.

9. An automatic coffee-roaster comprising a roasting-cylinder with a smoke pipe or flue connection for withdrawing the vapors, means for heating the cylinder, means for continuously feeding the coffee into the cylinder, a movable cooling-table, means for discharging the roasted coffee continuously from the cylinder upon the moving table in a thin layer, an exhaust-receiver to store the coffee, a pneumatic lifter to lift the coffee from the table to the receiver, a discharger to draw the coffee from the receiver, and a feed-pipe extended downward from the receiver to the discharger to remove the coffee from the influence of the vacuum.

10. In a coffee-roaster, the combination, with the roasting-cylinder and spiral blades for propelling the coffee through the same, of a hopper connected with the receiver by feed-pipe *l*, and the coffee-feeder interposed in such pipe and having the casing E with inlet at the top, the wall *n* inclined below the inlet as set forth, and the drum *m* pivoted horizontally adjacent to such wall and provided with one or more chambers *m'*.

11. In a coffee-roaster, the combination, with the roasting-cylinder and spiral blades for propelling the coffee through the same, of a hopper connected with the receiver by feed-pipe *l*, and the coffee-feeder interposed in such pipe and having the casing E with inlet at the top, and funnel m^3 at the bottom, with the wall *n* inclined below the inlet, the drum *m* pivoted horizontally adjacent to such wall and provided with one or more chambers *m'* as set forth, and a check-valve fitted to the outlet of the funnel to exclude the cylinder-vapors from the drum.

12. In a coffee-roaster, a feeding device for the roasting-cylinder, comprising the casing E with inlet at the top, and funnel m^3 at the bottom, with a wall extended downward from the inlet, the drum *m* pivoted horizontally adjacent to such wall and provided with one or more chambers *m'* as set forth, a removable cover upon the casing over the drum, the check-valve fitted to the outlet of the funnel, and the chamber below each outlet having glass panel upon the front and pipe connection at the bottom, the whole arranged and operated substantially as herein set forth.

13. In a coffee-roaster, the combination, with the roasting-cylinder and spiral blades for propelling the coffee through the same, of a hopper connected with the receiver by feed-pipe *l*, and the coffee-feeder interposed in such pipe and having the casing E with inlet at the top, a wall extended downward from the inlet, and the drum *m* pivoted horizontally adjacent to such wall and having one or more chambers *m'*, and a bottom m^3 movable in each chamber, and a screw and spring to adjust the same, as and for the purpose set forth.

14. In a coffee-roaster, the combination, with standards A having bearings provided with antifriction-rolls *b* and lugs C and C' to support a jacket, of a roasting-cylinder *a* supported upon such antifriction-rolls, means for continuously feeding the coffee to and discharging it from the cylinder, a non-conducting jacket forming a chamber about the cylinder and made in detachable sections B and B' supported upon the lugs C and C', and the chamber being provided with smoke-outlets and a flue connection, as and for the purpose set forth.

15. A coffee-roaster having a roasting-cylinder divided longitudinally and provided with carrying-rings and antifriction-rolls to support the same, means for continuously feeding the coffee to and discharging it from the cylinder, standards supporting the antifriction-rolls, with a jacket in sections supported upon the standards, whereby the sections of the jacket may be removed and the cylinder divided to inspect its interior as and for the purpose set forth.

16. In a coffee-roaster, the combination, with the roasting-cylinder and means for propelling the coffee through the same, of the discharger for removing the cooled coffee continuously and preventing the free passage of air with the coffee, said device having a circular casing E' with opposite heads E^2 and E^3 having, respectively, the inlet *u* and outlet *s'*, and the rotary drum *e* with one or more chambers *e'* adapted to carry the coffee from the inlet to the outlet, and the top of the drum being eccentric, as by channel e^2, from the head E^2 of the casing by sufficient space to admit a layer of coffee-berries, to avoid obstruction from the berries in the rotation of the drum.

17. In a coffee-roaster, the combination, with the roasting-cylinder, means for continuously feeding the coffee into the cylinder and discharging it continuously from the same, of a rotary cooling-table M with perforations around its margin, means, as the walls or flanges M', to form the channel N' upon such perforated surface, means for drawing air downwardly through the perforations to cool the coffee, and means for removing the coffee from the channel in its rotations, as and for the purpose set forth.

18. In a coffee-roaster, the combination, with the roasting-cylinder, means for continuously feeding the coffee into the cylinder and discharging it continuously from the same, of the curb N, the rotary cooling-table with perforations around its margin, walls forming an annular channel along such perforations, and a pneumatic lifter applied to the channel to remove the coffee at a given point in its circuit, and operating to draw air through the perforations into the curb to cool the coffee.

19. In a coffee-roaster, the combination, with the roasting-cylinder, means for continuously feeding the coffee into the cylinder and discharging it continuously from the same, of a rotary cooling-table with annular channel upon its margin, a receiver supported above the level of the table with closed top having a screened chamber and exhaust-fan connected thereto, a pneumatic lifter-tube connected with the receiver and extended to the channel to remove the coffee, and means for discharging the coffee from the receiver and cutting off the inlet of air to the receiver during such discharge.

20. In a coffee-roaster, the combination, with the roasting-cylinder, of a hopper for supplying coffee thereto, a feeding device for delivering coffee from the hopper to the cylinder, and cutting off the inlet of air to the hopper during such delivery, means for continuously discharging the coffee from the roasting-cylinder, a movable cooling-table receiving the coffee from such cylinder, a receiver with closed top supported above the level of the table, and means for exhausting the air from the same, a pneumatic lifting-tube connected with the upper part of the receiver and extended to the cooling-table to remove the coffee, and means for discharging the coffee from the receiver and cutting off the inlet of air to the receiver during such discharge.

21. In a coffee-roaster, the combination, with the roasting-cylinder and continuous feeding device, of spiral conveyer-blades secured inside its shell with central opening in each blade to form a smoke-passage, a stationary head for the cylinder with outlet at the bottom for continuous discharge, a nozzle upon such head connected with a chaff-box, a vertical partition in the chaff-box directing the smoke to the end of the box, and a flue connection from the box upon the side opposite to the partition, whereby the chaff is separated from the smoke, substantially as herein set forth.

22. In a coffee-roaster, the combination, with the roasting-cylinder and continuous feeding devices, of spiral conveyer-blades secured inside the shell of the cylinder and provided in their convolutions with aligned notches g^2, continuous ribs *g'* extended through a series of the aligned notches in contact with the interior of the cylinder, a stationary head for the cylinder fitted to the exterior of the same and having outlet at the bottom for continuous discharge, and means for exhausting the smoke and steam from the cylinder, substantially as herein set forth.

23. In a coffee-roaster, the combination, with a roasting-cylinder, means for rotating the same, and means for feeding the coffee continuously to and discharging it from the cylinder, of a non-conducting jacket forming a chamber about the cylinder and made in detachable sections, the chamber having gas-pipe G supported in its lower part and provided with burners, and the sections being shaped to form the lateral division B^2 inclined toward the burners to permit inspection of the flames.

703,509. TYPE-WRITING MACHINE. MAX W. WEIL, Newark, N. J., assignor, by direct and mesne assignments, to Densmore Typewriter Company, Syracuse, N. Y., a Corporation of New York. Filed Dec. 10, 1900. Serial No. 39,311. (No model.)

Claim.—1. In a type-writer, the combination, with the carriage, a platen-roll, adapted to receive and feed a sheet of paper, and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, and means on said carriage held in its inactive position by contact with said sheet of paper, but adapted to engage with said stop and prevent the return of said carriage to its initial starting-point, when released by disengagement with the sheet of paper, substantially as and for the purpose set forth.

2. In a type-writer, the combination, with the carriage, a platen-roll, adapted to receive and feed a sheet of paper, and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, and means on said carriage held in its inactive position by contact with said sheet of paper, but adapted to engage with said stop and prevent the return of said carriage to its initial starting-point, consisting, essentially, of a stylus or tongue, and means for actuating said stylus or tongue and causing the same to engage with said stop, when said stylus or tongue is disengaged from contact with the sheet of paper, substantially as and for the purposes set forth.

3. In a type-writer, the combination, with the carriage, a platen-roll, and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a cam-disk in rotative engagement with said platen-roll, and means operated from said cam-disk, adapted to be brought into engagement with said stop and to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth.

4. In a type-writer, the combination, with the carriage, a platen-roll, and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a cam-disk in rotative engagement with said platen-roll, and a stylus or tongue operated from said cam-disk, adapted to be brought into holding engagement with said stop and to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth

5. In a type-writer, the combination, with the carriage, a platen-roll and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a rod on said carriage, an arm extending from said rod, a cam-disk on said arm in rotative engagement with said platen-roll, and means on said rod adapted to be actuated by said cam-disk and brought into engagement with said stop to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth.

6. In a type-writer, the combination, with the carriage, a platen-roll and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a rod on said carriage, an arm extending from said rod, a cam-disk on said arm in rotative engagement with said platen-roll, and a stylus or tongue on said rod adapted to be actuated by said cam-disk and brought into holding engagement with said stop and to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth.

7. In a type-writer, the combination, with the carriage, a platen-roll and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a rod 10 in said carriage, a pair of upwardly-extending arms on said rod 10, a second rod 20 supported by said arms, a cam-disk supported from said rod 20 and in rotative engagement with said platen-roll, and means operated from said cam-disk, adapted to be brought into engagement with said stop and to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth.

8. In a type-writer, the combination, with the carriage, a platen-roll and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a rod 10 in said carriage, a pair of upwardly-extending arms on said rod 10, a second rod 20 supported by said arms, an arm 22 on said rod 20 provided with a stud or pin, a cam-disk on said stud or pin in rotative engagement with said platen-roll, and means on said rod 20 adapted to be actuated by said cam-disk and brought into engagement with said stop to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth.

9. In a type-writer, the combination, with the carriage, a platen-roll and means for rotating said platen-roll and causing a lateral movement of said carriage and platen-roll, of a stop, a rod 10 in said carriage, a pair of upwardly-extending arms on said rod 10, a second rod 20 supported by said arms, an arm 22 on said rod 20 provided with a stud or pin, a cam-disk on said stud or pin in rotative engagement with said platen-roll, and a stylus or tongue on said rod 20 adapted to be actuated by said cam-disk and brought into holding engagement with said stop and to prevent the return of said carriage to its initial starting-point, substantially as and for the purposes set forth.

10. In a type-writer, the combination, with the frame thereof, and a platen-roll, adapted to receive a sheet of paper, of a cam-disk in rotative engagement with said platen-roll, and means adapted to be actuated by said cam-disk and to lock the parts when the sheet has been typewritten to prevent further use of the type-writer until a new sheet of paper is inserted, substantially as and for the purposes set forth.

11. In a type-writer, the combination, with the frame thereof, and a platen-roll, adapted to receive a sheet of paper, of a cam-disk in rotative engagement with said platen-roll, and a stylus or tongue adapted to be actuated by said cam-disk and to engage a part of the machine-frame when the sheet has been type-written to prevent further use of the type-writer until a new sheet of paper is introduced, substantially as and for the purposes set forth.

12. In a type-writer, the combination, with a movable carriage, the platen-roll, adapted to receive and feed a sheet of paper, and a paper table or guard having a slot or opening, of a stop, and means on said carriage held in its inactive position by contact with said sheet of paper, but adapted to engage with said stop and prevent the return of said carriage to its initial starting-point, consisting, essentially, of a stylus or tongue movably arranged in front of the slot or opening in the paper table or guard, and means for actuating said stylus or tongue for moving said stylus or tongue into and through the said slot or opening and causing said stylus to engage with said stop, when said stylus or tongue is disengaged from contact with the sheet of paper, substantially as and for the purposes set forth.

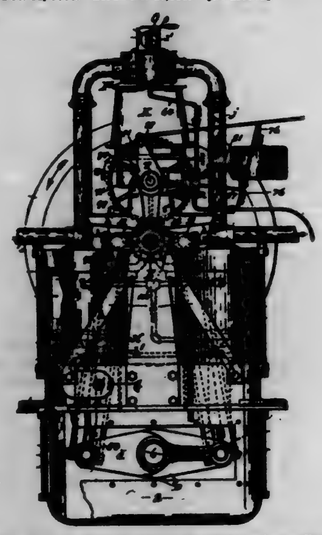
13. In a type-writer, the combination, with a movable carriage, the platen-roll, and a paper table or guard having a slot or opening, of a stop, and means on said carriage adapted to engage with said stop and prevent the return of said carriage to its initial starting-point, consisting, of a stylus or tongue movably arranged in front of the slot or opening in the paper table or guard, and a cam-disk in rotative engagement with said platen-roll for actuating said stylus or tongue for moving said stylus or tongue into and through the said slot or opening and causing said stylus or tongue to engage with said stop, substantially as and for the purposes set forth.

14. In a type-writer, the combination, with a movable carriage, the platen-roll, and a paper table or guard having a slot or opening, of a stop, a cam-disk in rotative engagement with said platen-roll, a stylus or tongue, and a spring-actuated rod on which said stylus or tongue is placed, so as to move in front of said slot or opening in the paper table or guard, and a means of connection between said cam-disk and said rod for moving said stylus or tongue into and through the said slot or opening and causing the stylus or tongue to engage with said stop, substantially as and for the purposes set forth.

703,510. SLEIGH-RUNNER. WILLIAM H. WILLIAMS, Wetonka, Minn. Filed Dec. 13, 1901. Serial No. 86,068. (No model.)

Claim.—The combination with a sled-runner, of a bow-spring having its opposite ends secured to the inner surface of the runner and having its body portion curved outwardly with one portion thereof projecting downwardly below the lower surface of the runner, whereby said downwardly-projecting portion is capable of being sprung inwardly toward the said runner when the sled to which it is attached is in the act of turning a curve, substantially as specified.

708,511. OIL-VAPOR ENGINE. GEORGE WEBB, Newark, N. J. Filed Feb. 16, 1901. Serial No. 47,089. (No model.)



Claim.—1. In a vapor-engine, a pair of independent cylinders each provided with an explosion-chamber and a piston, a rotary crank-shaft at the closed ends of the cylinders, means for supplying explosive gases to the chambers, electric means controlled by the engine for igniting said gases, a walking-beam journaled at the open ends of the chambers and composed of independently-movable sections each having an arm connected to one of the pistons and an additional oppositely-projecting arm connected to the crank-shaft.

2. A vapor-engine comprising a cylinder having an explosion-chamber and a piston, a walking-beam at the open end of the chamber and connected to the piston, a crank-shaft at the closed end of the chamber and connected to the walking-beam, inlet and exhaust valves in the closed end of the chamber, means for introducing vapor in the explosion-chamber, a second shaft at the closed end of the chamber rotated by the crank-shaft, sparking-terminals of an electric circuit in the explosion-chamber, a circuit-closer connected in the electric circuit and means provided on the second shaft for controlling the operation of the circuit-closer.

3. In a vapor-engine, in combination, a cylinder having an explosion-chamber and a piston, a walking-beam at the open end of the chamber and connected to the piston, a crank-shaft at the closed end of the chamber and connected to the walking-beam, means for introducing vapor into the explosion-chamber, inlet and exhaust valves in the closed end of the explosion-chamber, a second shaft rotated by the crank-shaft, sparking-terminals in the electric circuit in the explosion-chamber, means provided on the second shaft for closing the circuit through the sparking-terminals and additional means actuated by the second shaft for opening the exhaust-valves.

4. A vapor-engine comprising a cylinder having an explosion-chamber and inlet and exhaust valves, a piston movable in the chamber, a walking-beam at the open end of the chamber and connected to the piston, a crank-shaft at the closed end of the chamber and connected to the walking-beam, a second shaft at the closed end of the chamber rotated by the crank-shaft, an oil-vaporizing device connected to the explosion-chamber, a pump connected to an oil-supply conduit and to the vaporizing device for the purpose described and means provided on the second shaft for actuating the pump.

5. A vapor-engine comprising a cylinder having an explosion-chamber and inlet and exhaust ports, sparking-terminals of an electric circuit within the explosion-chamber, a piston movable in the chamber, a walking-beam at the open end of the chamber, and connecting to the piston, a crank-shaft at the closed end of the chamber and connected to the walking-beam, a vaporizing device connected to the inlet-port, a valve for the exhaust-port, a second shaft rotated by the crank-shaft, a lever for opening the exhaust-valve, means provided on the second shaft for operating the lever, a pump for supplying oil to the vaporizing device, and means provided on the second shaft for operating the pump.

6. In a vapor-engine, in combination, a cylinder having an explosion-chamber and inlet and exhaust ports, valves for the ports, sparking-terminals of an electric circuit in the explosion-chamber, a crank-shaft at the closed end of the chamber, connections between the piston and the crank-shaft for rotating the crank-shaft, a second shaft actuated by the crank-shaft, a circuit-closer connected in the electric circuit, means provided on the second shaft for operating the circuit-closer, a lever for opening the exhaust-valve, additional means provided on the second shaft for operating the lever and an oil-vaporizing device connected to the inlet-opening for the purpose set forth.

7. A vapor-engine comprising a cylinder having an explosion-chamber and inlet and exhaust ports, valves for the ports, a piston movable in the chamber, a crank-shaft at the closed end of the chamber, connections between the piston and the crank-shaft for rotating the latter, a second shaft rotated by the crank-shaft, an oil-vaporizing device connected to the inlet-opening, a pump for supplying oil to the vaporizing device, means provided on the second shaft for operating the pump, sparking-terminals of an electric circuit in the explosion-chamber, a circuit-closer connected in said circuit means provided on the second shaft for operating the circuit-closer, a lever for opening the exhaust-valve and additional means provided on the second shaft for operating the lever.

708,512. COMPOSITION FOR RUBY GLASS. RICHARD ERNSDUTZ, Jena, Germany. Filed Dec. 26, 1901. Serial No. 87,208. (No specimens.)

Claim.—1. A composition for ruby glass consisting of a barytiferous glass composition to which from 0.25 to 1.7 parts of gold are added for every ten thousand parts of quartzy sand, substantially as described.

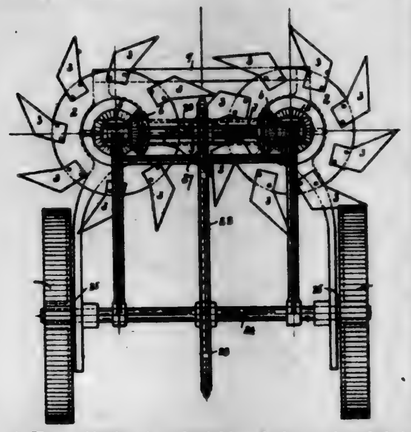
2. A composition for ruby glass consisting of a barytiferous glass composition which contains as substantial metallic oxide soda and baryta and to which from 0.25 to 1.7 parts of gold are added for every ten thousand parts of quartzy sand, substantially as described.

3. A composition for ruby glass consisting of a barytiferous glass composition which contains as substantial metallic oxide soda and baryta, this baryta being added as nitrate, and to which from 0.25 to 1.7 parts of gold are added for every ten thousand parts of quartzy sand, substantially as described.

708,513. MOWER. JOHN G. ADAMS and SAMUEL HOBBS, Alton, Ill. Filed July 31, 1900. Serial No. 24,955. (No model.)

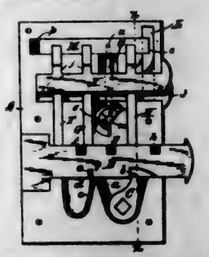
Claim.—1. The combination of a pair of drive-wheels, a horizontal shaft, ratchet mechanisms connecting said wheels to said shaft, disks revolving in a horizontal plane, knives secured to the upper side of the said disks and having their cutting edges inclined outwardly and in the direction of the disks' rotation, a driving mechanism between said disks and the said shaft, a straight cutter-bar located with its cutting edge substantially tangential to said disks, and extending transversely of the machine; substantially as described.

2. The combination of a pair of drive-wheels, a horizontal shaft, ratchet mechanisms connecting said wheels to said shaft, disks revolving in a horizontal plane, knives secured to the upper surface of said disks and having a cutting edge inclined outwardly and in the direction of the disks' rotation, connecting mechanism between said disks, sprocket-wheels on said connecting mechanism, and on said shaft, a drive-chain connecting said sprocket-wheels, and a straight cutter-bar with its cutter edge substantially tangential to the disks and extending across the machine substantially as described.



3. The combination of a pair of drive-wheels, a horizontal shaft, ratchet mechanisms connecting said wheels to said shaft, disks revolving in horizontal planes knives secured to the upper side of said disks and a portion of said knives lying in a plane parallel with but below the plane of revolution of said disks, and a straight cutter-bar located with its cutter edge substantially tangential to said disks and extending transversely of the machine; substantially as described.

708,514. LOCK. JOHN F. ALLEN, Portsmouth, Ohio, assignor of one-half to Frank B. Finney, Portsmouth, Ohio. Filed May 5, 1902. Serial No. 106,012. (No model.)



Claim.—1. In a lock, the combination of a spring-retracted bolt, means for projecting said bolt, a series of locking-tumblers adapted to engage said bolt and lock it when projected, a main key for positively actuating one of said tumblers, and a supplemental removable key which, when inserted, engages all of said tumblers, whereby the actuation of one of said tumblers through the main key is transmitted to the other tumblers through the supplemental key to release the bolt, substantially as described.

2. In a lock, the combination of a spring-retracted bolt, means for projecting said bolt, a series of locking-tumblers adapted to engage said bolt and lock it when projected, a main key for positively actuating one of said tumblers, a supplemental removable key which, when inserted, engages all of said tumblers, a ward-slide above said tumblers and means for actuating said ward-slide through the main key to lock said tumblers against action, substantially as described.

3. In a lock, the combination of a spring-retracted bolt, means for projecting said bolt, a series of locking-tumblers adapted to engage said bolt and lock it when projected, a main key for positively actuating one of said tumblers, a supplemental removable key which, when inserted, engages all of said tumblers, a ward-slide above said tumblers, means for actuating said ward-slide through the main key, a supplemental tumbler adapted to be engaged by said ward-slide and a second supplemental key for actuating said supplemental tumbler, substantially as described.

4. The herein-described lock comprising the bolt B, with its tumbler-notches *f g* A, the spring *c* and knob-crank C for said bolt, the tumblers F, G, H, the main key for actuating one of said tumblers, the supplemental keys J K, the ward-slide M, the lever O, and the supplemental tumbler L, the parts being constructed and arranged in the manner and for the purpose substantially as described.

708,515. ELECTRIC SWITCH. ANDREW P. ANDERSEN, New York, N. Y., assignor of one-half to John Dahlgren, New York, N. Y. Filed June 6, 1901. Serial No. 63,261. (No model.)

Claim.—1. In an electric switch, in combination, a contact-knife, a standard upon which said knife is pivotally mounted upon a bolt passing through said standard, an inwardly-extending flange upon the head of said bolt, a spring located in the recess formed by said flange and adapted to hold the knife yieldingly to its standard and a nut for said bolt.

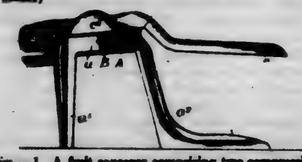
2. In an electric switch, in combination, the supporting-standards 1, 1, the bolt 2 having its head flanged at 6, spring 7 located in the recess formed by said flange and adapted to bear against one of said standards, nut 3 for said bolt, a contact-knife pivoted upon said bolt between said standards, and an anvil C, or other contact means, substantially as described.

3. In an electric switch, in combination, the supporting-standards 1 1, the bolt 2 having its head flanged at 6 and having a shoulder 5, a nut 3 adapted to bear against the shoulder 5 upon said bolt, spring 7 located in the recess formed by said flange 6 and adapted to bear against one of said standards, a contact-knife pivoted upon said bolt between said standards, and an anvil C or other contact means, substantially as described.

708,516. MINERAL COMPOUND. MCKENZIE AZEE, Bristol, Va. Filed Oct. 7, 1901. Serial No. 77,911. (No specimens.)

Claim.—The herein-described method of treating slag from furnaces, consisting of the addition to molten slag, of salt, lime, sulfuric acid, hydrochloric acid, coal-tar, pulverized mica, talc, kaolin, clay and water, the said ingredients being combined with slag substantially in the proportions and in the manner set forth, the separating out of the lighter portion of the mass and the subsequent pulverizing of the compound thus formed after the same has become cold and the mixing with each one hundred pounds of the pulverized mass thus produced, of five pounds of coal-tar, one pound of sulfuric acid and five ounces of hydrochloric acid and the mixing of the same with ordinary cement in the proportion of twenty per cent. of said product with eighty per cent. of ordinary cement as and for the purpose set forth.

708,517. LEMON-SQUEEZER. ALBERT RAMBAKETH, Prospect, Ill. Filed Mar. 3, 1899. Renewed July 13, 1901. Serial No. 68,261. (No model.)



Claim.—1. A fruit-squeezer comprising two compressing members movable relatively toward and from each other, and provided respectively with cup and cone, and connections between said compressing members for allowing longitudinal and lateral relative self-adjustment of said cup and cone during the squeezing operation in a plane substantially perpendicular to the direction of application of the compressing force.

2. A fruit-squeezer comprising two compressing members movable relatively toward and from each other, and provided respectively with a cup and cone, and pivotal connections between said compressing members for allowing longitudinal and lateral relative self-adjustment of said cup and cone during the squeezing operation in a plane substantially perpendicular in the direction of application of the compressing force.

3. A fruit-squeezer comprising two compressing members movable relatively toward and from each other, and provided respectively with a cup and cone, and pivotal connections comprising a pin and an elongated bearing between said compressing members for allowing longitudinally and laterally relative self-adjustment of said cup and cone during the squeezing operation in a plane substantially perpendicular to the direction of application of the compressing force.

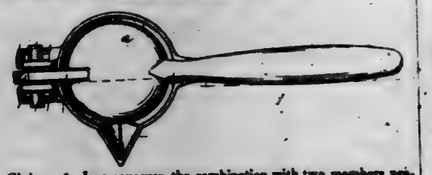
4. A fruit-squeezer comprising two compressing members movable relatively toward and from each other, and provided respectively with a cup and cone, and pivotal connections comprising a pin and an elongated bearing between said compressing members for allowing longitudinally and laterally relative self-adjustment of said cup and cone during the squeezing operation in a plane substantially perpendicular to the direction of application of the compressing force, said bearing being substantially parallel with the compressing members when in closed position.

5. A fruit-squeezer comprising two compressing members movable relatively toward and from each other and provided respectively with a cup and cone, and pivotal connections between said compressing members for allowing free relative self-adjustment of said cup and cone during the squeezing operation in a plane substantially perpendicular to the direction of application of the compressing force, said connections comprising a pin and an elongated bearing, said pin having limited lateral play in said bearing.

6. In a squeezer, the combination of two pivotally-connecting members and a lemon-supporting dish sustained in one of said members, the latter member being provided with a circular ring to receive said dish and a pair of lugs extending longitudinally therefrom upon the side opposite the handle, the metal of the ring being covered to permit them to spring apart, and the other member being provided with a pivot-stud extending laterally from each side thereof, and fitted to said ears, whereby said pivot may be sprung between and into the ears by reason of the elasticity of said ring.

7. A squeezer, comprising a supporting-dish, a supporting member therefor, having a dish-supporting ring, lugs upon one side of said ring, the material of the ring being separated between the lugs and a second member having pivot-studs fitted in said ears whereby the elasticity of the ring is utilized in springing the members into pivotal connection.

708,518. SQUEEZER. ALBERT BAUMGARTEN, Prospect, Ill. Filed July 13, 1901. Serial No. 66,182. (No model.)



Claim.—1. In a squeezer, the combination with two members provided respectively with a cup and a cone, of a pivotal connection between said members, comprising a pivot and apertured bearing-lugs with which said pivot engages, said bearing-lugs and pivot being integrally formed respectively with said members, said pivot and bearings being constructed and formed so the members can be connected together, or disconnected only when the members are shifted to an angle greater than forty-five degrees with respect to each other.

2. In a squeezer, the combination with two members, provided respectively with a cup and a cone, of a pivotal connection between said members, comprising a pivot and apertured bearing-lugs with which said pivot engages, said bearing-lugs and pivot being integrally formed respectively with the said members, said pivot and bearings being constructed and formed so the members can be connected together or disconnected by turning the parts laterally only when said members are shifted to an angle greater than forty-five degrees with respect to each other.

3. In a squeezer, the combination with two members, provided respectively with a cup and a cone, of a pivotal connection between said members, comprising a pivot and bearing-lugs having elongated apertures therein, said bearing-lugs and pivot being integrally formed respectively with the said members, said pivot and bearings being constructed and formed so the members can be connected or disconnected by turning the parts laterally only when said members are shifted to an angle greater than forty-five degrees with respect to each other.

4. In a squeezer, the combination with two members provided respectively with a cup and a cone, of a pivotal connection between said members, comprising a pivot and apertured bearing-lugs in which said pivot has a lateral play, said bearing-lugs and pivot being integrally formed respectively with the said members, said pivot and bearings being constructed and formed so the members can be connected or disconnected when the members are shifted to an angle greater than forty-five degrees with respect to each other.

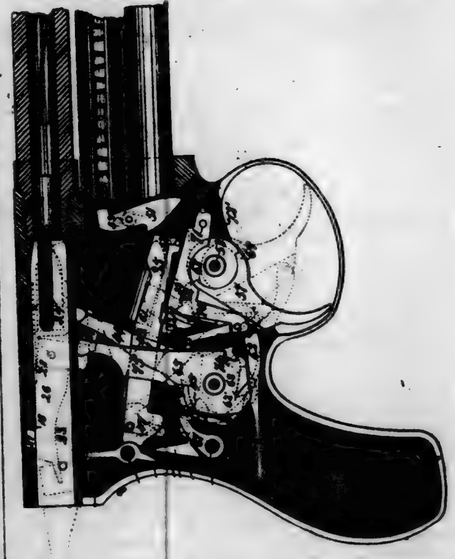
5. In a squeezer, the combination with two members, provided respectively with a cup and a cone, of a pivotal connection between said members and comprising an arm, a pivot-stud on said arm, and bearing-lugs between which said arm will be held, said lugs having elongated apertured bearings therein, and being formed at an angle to permit sufficient lateral play of the arm and pivot, to permit the members to be connected or disconnected when the members are swung out of working position.

708,519. RACKET. ARNOLD BECKER, Seattle, Wash. Filed Apr. 17, 1902. Serial No. 103,262. (No model.)

Claim.—1. A racket whereon is applied a granular substance whereby the blade-surface thereof is roughened, for the purpose described.

2. In a racket, the combination with the stock, of a sheet or sheets of paper, or the like, having a coating of granular substance applied thereto, and said coating, substantially as and for the purpose described.

708,520. MAGAZINE-FIREARM. ERICK P. BERGMAN and ARTHUR R. RICHARD, Concordia, Kans. Filed Dec. 9, 1901. Serial No. 85,255. (No model.)



Claim.—1. In a magazine-firearm, the combination with a frame having a recess above the breech-block, of a longitudinally-sliding breech-block, a breech-block-locking latch pivoted to the breech-block and entering the recess, a spring attached to the breech-block engaging the latch to move the same out of the recess, and a breech-block lever which moves the latch which enters the recess against the action of the spring.

2. In a magazine-firearm, a frame in which is mounted a sliding breech-block, a recess in the frame above the breech-block, a latch pivoted to the breech-block and entering the recess, a spring rigidly attached to the breech-block its free end engaging the latch above and to the rear of the pivot upon which the latch swings, a breech-block lever which engages the latch to move it against the action of the spring, mechanism

for oscillating the lever to reciprocate the breech-block and move the latch into engagement with the recess at the limit of its forward movement.

3. In an action for firearms, the combination of a longitudinally-sliding breech-block, an operating-lever having spurs, a trigger, pawls pivoted to the trigger to successively engage the spurs on the lever on opposite sides of its pivot, one of the pawls moving the lever rearward and the other forward as the trigger is swung on its pivot.

4. In an action for firearms, the combination of a longitudinally-sliding breech-block, a breech-block lever, a trigger, pawls pivoted to the trigger to successively engage the breech-block lever, one pawl moving the lever and the breech-block rearward, the other pawl moving the lever and the breech-block forward, the breech-block being engaged and locked by the lever at the limit of its forward movement, the movements being effected by a direct pull upon the trigger.

5. In an action for firearms, the combination of a sliding breech-block, a latch pivoted to the breech-block, projections on the latch which extend on opposite sides of the pivot of the latch above and below the breech-block, a lever which engages the forward and lower projection of the latch, spurs on the lever, a trigger, pawls pivoted to the trigger for successive engagement with the spurs on the lever as the trigger is moved rearward, means for disengaging one of the pawls from a spur on the lever, and a spring which engages one of the pawls to move the trigger forward.

6. In an action for firearms, the combination of a longitudinally-sliding breech-block, a latch pivoted to the breech-block, the latch having an integral portion which depends below the breech-block, a breech-block lever in engagement with said depending portion of the latch, spurs and an eccentric shoulder on the lever, a trigger, pawls pivotally attached to the trigger to successively engage the spurs, a hammer, a locking-lever raised by the trigger to cock the hammer, and a sear engaged by the shoulder of the breech-block lever when the lever reaches the limit of its forward movement to release the hammer.

7. In an action for firearms, a trigger having an offset or projecting portion, a cocking-lever having a shoulder which is engaged by said offset, a pawl carried by the cocking-lever, a hammer having a notch with which the pawl engages to cock the hammer, a sear, and a breech-block lever which engages the sear and disengages it from the hammer at the limit of the forward movement of the breech-block lever.

8. The combination, with a concealed hammer, a breech-block, and a breech-block lever which is mounted on the same stud as the hammer, the breech-block lever in its oscillating movement reciprocating the breech-block and locking the same at the limit of its forward movement, a sear which engages the hammer and is engaged by the breech-block lever, of a trigger, pawls attached to the trigger to oscillate the breech-block lever by engaging the spurs thereon, and a cocking-lever raised by the trigger to cock the hammer, substantially as shown.

9. In an action for firearms, a frame having studs or bearings for the oscillating parts of the action, a stud which projects from one side of the frame, a reciprocating breech-block, a breech-block lever, and a hammer mounted on the same stud or bearing that carries the breech-block lever, a trigger having pawls for oscillating the breech-block lever, the stud which projects from the side of the frame being in the path of the upper pawl on the trigger, a spring engaging the lower pawl of the trigger, a cocking-lever in line with the hammer which is engaged by the trigger to cock the hammer, and a sear which is disengaged from the hammer by the breech-block lever, substantially as set forth.

10. In an action for firearms, a frame having studs or bearings for the oscillating parts of the action and a projection or stud 21, a reciprocating breech-block, a breech-block lever and a hammer mounted on the same stud one alongside of the other, a sear for holding the hammer cocked, a projecting portion on the sear which is engaged by the breech-block lever to release the sear from the hammer, a trigger, two pawls on the trigger in the same plane as the breech-block lever, the upper pawl being in the path of the stud 21, a cocking-lever mounted in line with the hammer, the trigger raising the cocking-lever to cock the hammer, substantially as shown.

11. In an action for firearms, the combination of a trigger, a pawl pivoted to the upper portion of the trigger, a stud which projects from the frame in the path of the upper pawl, a reciprocating breech-block, a lever having a spur which is engaged by the pawl to oscillate or move rearward the upper end of the lever and thereby move rearward the breech-block, a second pawl pivoted to the trigger below the pawl which engages the stud, spurs on the lever and lower pawl which engage to effect a forward movement of the lever and breech-block, a spring engaging the lower pawl to move the trigger forward, a hammer mounted on the same stud as the lever, a cocking-lever which is raised to cock the hammer as the trigger is moved rearward, a sear with a laterally-projecting portion in the path of the lever to be engaged thereby when the lever reaches the limit of its forward movement, the parts being organized substantially as shown.

12. In an action for firearms, a longitudinally-movable breech-block, a latch, cartridge-extractor and firing-pin carried by the breech-block, a breech-block lever and a hammer both mounted on the same stud one alongside of the other, a cocking-lever having a self-releasing pawl which cocks the hammer, a spring in direct engagement with the hammer, a sear for holding the hammer cocked, a shoulder on the breech-block lever which raises the sear when the breech-block is locked, pawls pivoted to the trigger one below the other for oscillating the breech-block lever, a spring seated in the trigger to bear against the upper pawl, a stud on the frame for moving the upper pawl against the action of its spring, and a spring which engages the lower pawl to move the same and the trigger forward, substantially as shown.

13. In a magazine-firearm, the combination with two magazines positioned one below the other beneath the barrel, of a cartridge-carrier fulcrumed so that its forward end may be positioned below either of the magazines, and means actuated by a follower in the upper magazine to arrest the downward movement of the carrier.

14. In a magazine-firearm, the combination with magazines positioned one below the other and beneath the barrel, of an oscillating cartridge-carrier, a stud on the end of said carrier, a hook which is spring-actuated in the path of the stud, and a lug on the follower of the upper magazine which engages the hook to move the same out of the path of the stud on the carrier, substantially as shown.

15. In a magazine-firearm, the combination with magazines positioned one below the other beneath the barrel, a longitudinally-sliding breech-block having a portion which depends below the same, of a cartridge-carrier having a part in the path of the depending portion of the breech-block and a depending part below the fulcrum of the cartridge-carrier, a spring which engages the depending part of the cartridge-carrier, a cartridge-lifter pivoted to the cartridge-carrier, a breech-block lever, and a tang which is swung on its pivot by the lever to raise the cartridge-lifter when the cartridge-carrier has been raised by the breech-block.

16. In a magazine-firearm having two magazines one below the other beneath the barrel, a breech-block movable in line with the barrel, a latch pivoted to the breech-block and provided with a portion which extends below the breech-block, a breech-block lever operatively connected to the breech-block, a cartridge-carrier fulcrumed to be movable over each of the magazines, projecting portions on the cartridge-carrier adjacent to its fulcrum one of the projecting portions being in the path of the depending portion of the latch, a spring engaging the other projecting portion of the cartridge-carrier, and a hook movable in the path of the end of the cartridge-carrier to be engaged thereby when the upper magazine contains a cartridge, the hook being moved out of line with the carrier when engaged by the follower in the upper magazine.

17. In a magazine-firearm, having two magazines beneath the barrel, a spring-actuated follower having a laterally-projecting lug, a spring-actuated hook which is engaged by the follower to move the hook against the action imparted thereto by its spring, a cartridge-carrier operatively connected to the action and movable past the ends of the magazines, a stud on the carrier which engages the hook when moved by its spring, a projection on one side of the carrier, cartridge-restraining bars which are moved beyond the magazines by the carrier, substantially as set forth.

18. In a firearm, a hammer having notches with which a spring and a sear engage, a notch on its opposite side with which a pawl on a cocking-lever engages, a reciprocating breech-block, a breech-block lever on the same stud as the hammer, a shoulder on the lever for disengaging the sear from the hammer, a cocking-lever engaged by the trigger to move the hammer against the action of its spring, a stud on the frame, a knockoff-pawl carried by the trigger so that it will engage the stud and be released from the lever, a push-bar pivoted on the trigger, and a spring which engages the push-bar, for the purpose set forth.

19. In a firearm having magazines beneath the barrel, the combination of a longitudinally-reciprocating breech-block maintained in line with the barrel, a breech-block lever and a hammer both fulcrumed on the same stud, a cartridge-carrier fulcrumed so that its front end can be positioned opposite either of the magazines, a trigger, pawls actuated by the rearward movement of the trigger to oscillate the breech-block lever, a cocking-lever, and means carried by the breech-block to engage the cartridge-carrier and raise its forward end when the breech-block is moved rearward, substantially as set forth.

20. In a firearm having magazines one below the other, a frame having a spring-actuated hook one end of which is in line with the upper magazine, a lug on the follower in the upper magazine, a cartridge-carrier which is engaged by the hook to limit its downward movement when the lug on the follower is held away from the hook by a cartridge in the upper magazine, a pair of cartridge-restraining bars which converge from the ends of the magazines toward the stud upon which is pivoted the cartridge-carrier, and means on the cartridge-carrier for moving the ends of the bars beyond one side of the ends of the magazines.

21. In a firearm, two magazines maintained beneath a barrel one below the other, a breech-block slidable to and from the barrel in line with its axis, an oscillatory lever which engages the breech-block, an oscilla-

tery cartridge-carrier fulcrumed to have a range of movement from the lower magazine to the barrel, an oscillatory hammer mounted on the same stud as the breech-block lever, a cocking-lever fulcrumed forward of the trigger and provided with a pawl, a trigger pivoted below the cocking-lever, pawls on the trigger to oscillate the breech-block lever, and a sear positioned to be disengaged from the hammer by the breech-block lever, the parts being organized substantially as shown and for the purpose set forth.

22. In a magazine-firearm provided with magazines one below the other parallel with the barrel, a longitudinally-movable breech-block having a depending portion, a breech-block lever for reciprocating the breech-block, a concealed action therefor operated solely by the trigger, a cartridge-carrier engaged by the depending portion of the breech-block, the breech-block to effect an upward movement of the cartridge-carrier, a spring for moving the cartridge-carrier downward, a pivoted stop for the carrier which is moved out of its path by the follower in the upper magazine, and a fixed stop or projection on the frame which incloses the action with which the carrier engages to limit its downward movement when receiving cartridges from the lower magazine, substantially as shown.

708,521. BALL-COCK. CORNELIUS BERKEY, Hartford, Conn. Filed Feb. 15, 1902. Serial No. 94,198. (No model.)

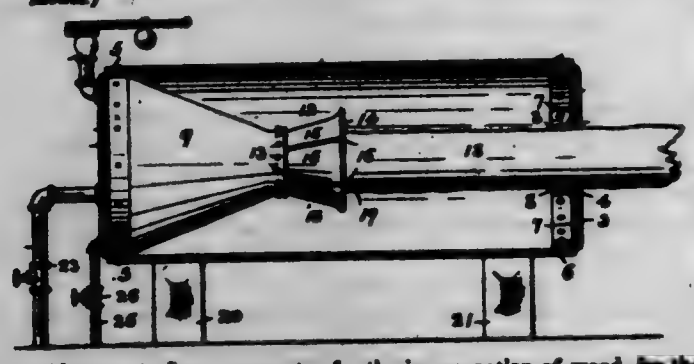
Claim.—1. A ball-cock having a valve-spindle, a spindle-lever engaging the valve-spindle, a float-lever pivoted to the spindle-lever, and an incline on the casing with the short arm of the float-lever engaging the incline, substantially as specified.

2. A ball-cock having a valve-spindle, a spindle-lever engaging the valve-spindle, a float-lever pivoted to the spindle-lever, a roller carried by the short arm of the float-lever, and an incline on the casing against which the roller runs when the float rises and drops, substantially as specified.

3. A ball-cock having a valve-spindle, a spindle-lever engaging the valve-spindle, a float pivoted to the spindle-lever, and a surface inclining away from the inner end of the spindle-lever and engaged by the short arm of the float-lever so that the lifting of the float causes the outer end of the float-lever to be forced away from the inclined surface, substantially as specified.

4. A ball-cock having a valve-spindle, a spindle-lever pivoted to the casing and having the inner arm on one side of the pivot engaging the valve-spindle, a pivoted float-lever engaging the casing also the outer arm on the other side of the pivot of the spindle-lever, an incline and a roller, the said roller and incline so engaged that when the level of the float changes the outer end of the spindle-lever is moved powerfully by the float-lever and the inner end of the spindle-lever caused to engage the spindle for moving the valve against the water-pressure, substantially as specified.

708,522. APPARATUS FOR IMPREGNATING WOOD. JOHN BOZZUTO, Rahway, N. J. Filed Jan. 17, 1902. Serial No. 90,140. (No model.)



Claim.—1. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture longitudinally through the said log or beam, consisting, essentially, of a funnel-shaped mixture-receiving device, having an outwardly-flaring and expansible delivery-throat into which a portion of the logs of different thicknesses may be placed, so that said throat encompasses said portion of the log and helps support the same, substantially as and for the purposes set forth.

2. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture into one end of the log or beam, consisting, essentially, of a funnel-shaped mixture-receiving device, having a mixture-chamber provided with a delivery-throat, and a perforated thimble having an expansible holding portion in which the one end of the log or beam is placed and held, the perforated portion of said thimble forming a part of the mixture-chamber and being arranged directly within the said delivery-throat, substantially as and for the purposes set forth.

3. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture into one end of the log or beam and distributing said mixture longitudinally through said log or beam, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat, a perforated thimble in which the one end of the log or beam is placed, and spring-plates forming a part of said thimble for holding the end of the log or beam in place, substantially as and for the purposes set forth.

4. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture into one end of the log or beam and distributing said mixture longitudinally through the said log or beam, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log or beam, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

5. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture into one end of the log or beam and distributing said mixture longitudinally through the said log or beam, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat in front of which the one end of the log or beam is placed, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log or beam, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

6. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture into one end of the log or beam and distributing said mixture longitudinally through said log or beam, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat, and a perforated thimble in which the one end of the log or beam is placed and held, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log or beam, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

7. In an apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, the combination, with means for supporting a log or beam which is to be impregnated, of means for forcing the impregnating mixture into one end of the log or beam and distributing said mixture longitudinally through said log or beam, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat, a perforated thimble in which the one end of the log or beam is placed, and spring-plates forming a part of said thimble for holding the end of the log or beam in place, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log or beam, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

8. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, substantially as and for the purposes set forth.

9. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and

distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat in front of which the one end of the log is placed, substantially as and for the purposes set forth.

10. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device having a delivery-throat, and a perforated thimble in which the one end of the log is placed, substantially as and for the purposes set forth.

11. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device having a delivery-throat, a perforated thimble in which the one end of the log is placed, and spring-plates forming a part of said thimble for holding the end of the log in place, substantially as and for the purposes set forth.

12. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

13. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially of a funnel-shaped mixture-receiving device, having a delivery-throat in front of which the one end of the log is placed, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

14. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device having a delivery-throat, and a perforated thimble in which the one end of the log is placed, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

15. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat in front of which the one end of the log is placed, a car, a centering or holding device connected with said car, adapted to be brought against the opposite end of said log, and means for locking said car in a fixed position, substantially as and for the purposes set forth.

16. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, a flexible gasket-like device provided with a central opening arranged against the inner surface of said open end plate, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, substantially as and for the purposes set forth.

17. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, a flexible gasket-like device provided with a central opening arranged against the inner surface of said open end plate, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device, having a delivery-throat in front of which the one end of the log is placed, substantially as and for the purposes set forth.

18. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, a flexible gasket-like device provided with a central opening arranged against the inner surface of said open end plate, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device having a delivery-throat, and a perforated thimble in which the one end of the log is placed, substantially as and for the purposes set forth.

19. An apparatus for the impregnation of wood, for the purpose of rendering it tenacious and resistible to pressure, or for fireproofing or waterproofing the same, comprising, a tank or boiler having a closed end plate and an end plate provided with a log-receiving opening, a flexible gasket-like device provided with a central opening arranged against the inner surface of said open end plate, and means within said tank or boiler for supporting the one end of said log and forcing a fluid impregnating mixture into said supported end of the log and distributing said mixture longitudinally through the said log, consisting, essentially, of a funnel-shaped mixture-receiving device having a delivery-throat, a perforated thimble in which the one end of the log is placed, and spring-plates forming a part of said thimble for holding the end of the log in place, substantially as and for the purposes set forth.

708,523. BOTTLE-STOPPER. HENRY S. BRYWINGTON, Baltimore, Md. Filed Aug. 27, 1901. Serial No. 73,451. (No model.)

Claim.—1. The combination with a bottle-neck formed with an internal annular rib adjacent to its upper end, said rib having a rounded surface, of a wooden stopper comprising a cap resting on the top edge of the bottle-neck, and a depending hollow plug formed at its juncture with the cap with an annular groove conforming to the rounded surface of the rib, and forming an annular shoulder to engage below said rib.

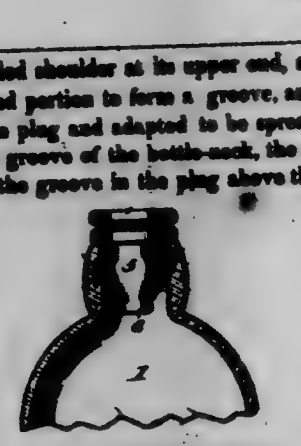
2. The combination with a bottle-neck formed with an annular rib adjacent to its upper end, said rib having a rounded surface, of a wooden stopper comprising a cap resting on the top edge of the bottle-neck, and a depending hollow plug formed at its juncture with the cap with an annular groove conforming to the rounded surface of the rib, and forming an annular shoulder to engage below said rib, said cap having a protecting-coating of some material impervious to liquids, the coating covering the top, the edge, and the under surface of the cap which rests on the bottle-neck.

3. The combination with a bottle-neck, provided with an internal annular rib adjacent to its upper end, of a wooden stopper comprising a cap adapted to rest on the top edge of the bottle-neck, and a depending hollow plug formed below the cap with an annular groove forming an annular shoulder engaging below the rib, said plug having a filling or packing of cork or other yielding material.

708,524. BOTTLE-STOPPER. HENRY S. BRYWINGTON, Baltimore, Md., assignor of one-half to William Sohn, Baltimore, Md. Filed Aug. 27, 1901. Serial No. 73,452. (No model.)

Claim.—The combination with a bottle-neck having an internal annular groove of a plug inserted into said neck and having upwardly-di-

verging sides, a rounded shoulder at its upper end, a head connected to the plug by a restricted portion to form a groove, and a resilient fastening-disk carried by the plug and adapted to be spread along the sides of the plug and into the groove of the bottle-neck, the superfluous material of said disk entering the groove in the plug above the rounded shoulder.



708,525. BOTTLE-STOPPER. HENRY S. BREWINGTON, Baltimore, Md. Filed Sept. 13, 1901. Serial No. 75,226. (No model.)

Claim.—The combination with a bottle-neck formed with an internal annular groove, of a stopper comprising a cork, and a fastener consisting of a resilient wire spanning the top of the cork, and having its ends bent to form prongs to enter the stopper, and shoulders to enter the groove of the bottle-neck, and having its central portion raised above the upper end of the cork to serve as an extracting-loop.

708,526. GARMENT-CLASP. HENRY S. BREWINGTON, Baltimore, Md. Filed Oct. 31, 1901. Serial No. 80,685. (No model.)

Claim.—1. A garment-clasp comprising a hook member consisting of a metallic plate bent upon itself to form a hook and slotted to form an outwardly-projecting central prong and inwardly-projecting prongs one on either side of the central prong, and a bar or loop member provided with oppositely-disposed struck-up tongues, and perforated ears.

2. A garment-clasp comprising a metallic plate bent upon itself to form a hook, and slotted to form an outwardly-projecting central prong, and inwardly-projecting prongs one on either side of the central prong, and having laterally-projecting perforated ears.

3. A bar or loop for a garment-clasp comprising a metallic plate bent transversely adjacent to its ends to form shoulders extending across the width of the bar, and said plate having attaching-ears and tongues struck up from the metal and lying in the plane of said ears, the said tongues being attached at their outer ends to said ears and extending therefrom toward each other.

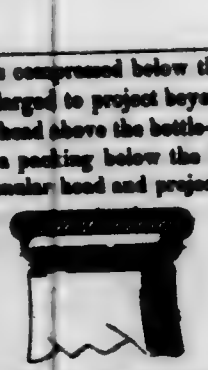
708,527. BOTTLE-STOPPER. HENRY S. BREWINGTON, Baltimore, Md. Filed Nov. 8, 1901. Serial No. 81,762. (No model.)

Claim.—1. The combination with a bottle-neck formed with an external annular shoulder, of a seal comprising a disk of sheet metal, and a depending flange formed with a series of slots to provide a continuous row of pendent fingers, said fingers and the portion of the flange between the fingers being compressed below the shoulder of the bottle-neck.

2. The combination with a bottle-neck formed with an external annular shoulder, of a seal comprising a disk of sheet metal and a depending flange formed with a series of slots to provide a continuous row of pendent fingers, said fingers being compressed below the shoulder of the bottle-neck, the portion of the flange between said fingers being projected downward and also compressed below the shoulder.

708,528. BOTTLE-STOPPER. HENRY S. BREWINGTON, Baltimore, Md. Filed Dec. 2, 1901. Serial No. 85,157. (No model.)

Claim.—1. The combination with a bottle-neck formed with an external annular shoulder, of a seal comprising a disk and a depending flange the lower edge of which is compressed below the shoulder while its upper portion is annularly enlarged to project beyond the mouth of the bottle to present a projecting head above the bottle-mouth adapted to be engaged by an opener, and a packing below the disk, the peripheral edge of which fits within the annular head and projects over the bottle-mouth.



2. The combination with a bottle-neck formed with an external annular shoulder, of a seal comprising a disk and a depending flange bent to form an annular head which is corrugated and projects beyond the bottle-mouth to present a surface adapted to be engaged by an opener, and a packing below the disk the peripheral edge of which is engaged and secured by the corrugations of the projecting head.

3. The combination with a bottle-neck formed with an external annular shoulder, of a seal comprising a disk, and a flange bent to form an annular corrugated head, and a depending portion adapted to be compressed under said shoulder to secure the seal in place, and a packing having its periphery fitted within the head of the cap and extending beyond the outer edge of the bottle-mouth, said annular head projecting above the bottle-mouth and beyond the outer edge thereof, and adapted to be engaged by an opener.

4. A bottle-cap comprising a disk, and a depending flange annularly enlarged to provide a projecting head, formed with vertical corrugations, and a packing within the cap having its peripheral edge engaging said corrugations, the lower portion of the flange being plain to adapt it to engage an annular shoulder on a bottle-neck by spinning or compressing said lower portion of the flange.

708,529. CORN-CRIB. JOSEPH M. BROLAW, Battlecreek, Mich. Filed Aug. 10, 1901. Serial No. 71,502. (No model.)

Claim.—A corn-crib comprising the upper and lower frames, and the side studding-timbers, and the legs supporting the lower frame above the ground, the perforated metallic bottom and inner side walls, the imperforate outer side walls, the imperforate roof provided with ventilators, and a door by which access is had to the crib substantially as shown and described.

708,530. SEALING DEVICE FOR BOTTLES. GUS A. BROCK, Covington, Ky. Filed Nov. 20, 1901. Serial No. 84,073. (No model.)

Claim.—1. In combination with a receptacle, a strip divided into sections by means of lines adapted to promote the severing of the sec-

tions, said strip being sealed at alternate sections to the plain exterior of the receptacle, the intermediate unattached sections being adapted to be severed or detached by the consumer to indicate the extent to which the original contents have been removed.

2. In combination with a receptacle, a strip of waterproof material divided into a series of sections by means of lines adapted to promote the severing of the sections and secured to the receptacle at alternate sections, the intermediate sections not being attached to the receptacle but adapted to be successively detached by the consumers to indicate the extent to which the original contents have been removed.

3. In combination with a receptacle, a sealed strip for the purpose specified divided into sections and having perforations in the alternate sections for the passage of the sealing material.

4. In combination with a receptacle, a sealed strip for the purpose specified divided into sections and having indentations at the edges, and perforations in the alternate sections for the passage of the sealing material.

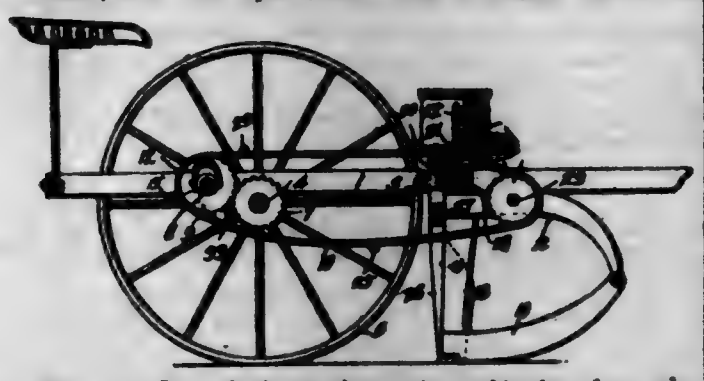
5. In combination with a receptacle, a sealed strip for the purpose specified divided into sections and having perforations in the alternate sections for the passage of the sealing material, the detachable sections of said strip being consecutively numbered.

6. In combination with a receptacle, a sealing-strip sealed in a vertical position to the exterior of said receptacle at short intervals, and adapted to be severed between the points at which it is sealed; and means for protecting said sealing-strip against damage in handling or shipment.

708,581. EYE-GUARD. HENRY W. BROWN, Baltimore, Md., assignor to James W. Strobel and Henry W. Brown, trading as Strobel & Brown, Baltimore, Md. Filed Oct. 31, 1901. Serial No. 80,651. (No model.)

Claim.—An eye-guard comprising a thin strip of sheet metal, having an integral central clip, an absorbent pad secured to the strip by said clip, a supplemental pad covering the inner surface of the clip, and cords serving the double purpose of securing the ends of the absorbent pad to the strip and attaching the guard to the head of the wearer.

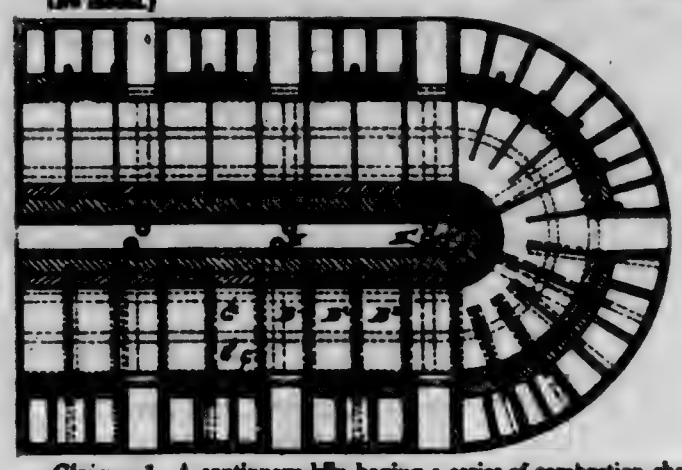
708,582. CHECK-ROW CORN-PLANTER. WESLEY R. BUCHTELA, Marion, Iowa. Filed Apr. 17, 1902. Serial No. 103,444. (No model.)



Claim.—1. In a check-row planter, the combination of an axle-shaft, having ground-wheels and a gear-wheel, a shiftable gear mounted for engagement with said axle-gear, means to shift said shiftable gear into and out of engagement with the axle-gear, a guide and carrier, an endless sprocket-chain connecting the shiftable gear and guide and carrier and having a tappet, a rock-shaft to actuate the seed-dropping mechanism and having a rock-arm adapted to be engaged by the tappet, to turn the rock-shaft in one direction, a spring to turn the rock-shaft in the reverse direction, a marker, and connections between the latter and the rock-shaft whereby said marker is operated by the rock-shaft, substantially as described.

2. In a check-row planter, the combination of an axle-shaft, having ground-wheels and a gear-wheel, a shiftable gear mounted for engagement with said axle-gear, means to shift said shiftable gear into and out of engagement with the axle-gear, a guide and carrier, an endless sprocket-chain connecting the shiftable gear and guide and carrier and having a tappet, a rock-shaft to actuate the seed-dropping mechanism, and having a rock-arm adapted to be engaged by the tappet, to turn the rock-shaft in one direction, a spring-retracted marker, and a flexible connection between the latter and the rock-arm whereby said rock-shaft and marker are simultaneously operated, substantially as described.

708,588. CONTINUOUS KILN. WILLIAM A. BUTLER and ADOLPH KNOBE, San Francisco, Cal. Filed Sept. 30, 1901. Serial No. 76,994. (No model.)



Claim.—1. A continuous kiln having a series of combustion-chambers extending crosswise below kiln-floor in which liquid or powdered fuel is burned in suspension, communicating directly with the kiln by means of openings in kiln-floor and combined with longitudinal flues or pipes below kiln-floor and between the longitudinal walls of the kiln, connecting said combustion-chambers, substantially as described.

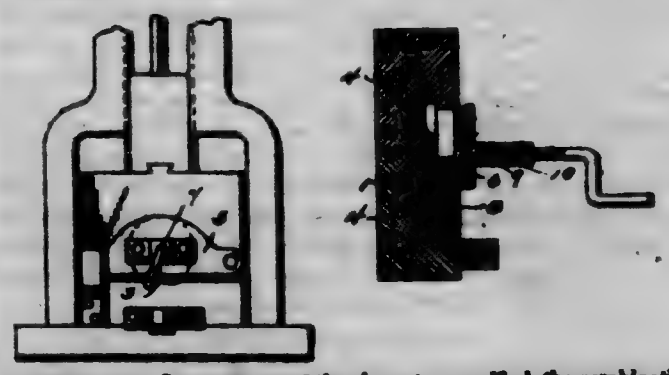
2. A continuous kiln comprising combustion-chambers extending crosswise and below kiln-floor, in which fuel is burned in suspension, connected with the kiln by means of openings across said floor and joined by flues or pipes running horizontally underneath said floor, connecting said combustion-chambers, and joining damper-controlled draft-flues, substantially as described.

3. A continuous kiln having a series of combustion-chambers extending transversely and below kiln-floor connected with the kiln by means of openings across said floor and joined by passages below said floor connecting said combustion-chambers and communicating with damper-controlled draft-flues; combined with fuel pipes or flues leading to the top and to the outside of the kiln, for the purpose of supplying fuel to the combustion-chambers, substantially as described.

4. A continuous kiln comprising combustion-chambers extending crosswise and below kiln-floor, in which fuel is burned in suspension; with a series of openings across kiln-floor connecting said combustion-chambers with the kiln, joined by flues or pipes below kiln-floor connecting combustion-chambers and communicating with damper-controlled draft-flues; combined with pipes flues and burners for the introduction of fuel, said pipes and flues running to the top and outside of the kiln through and between the kiln-walls substantially as described.

5. A continuous kiln having a series of combustion-chambers running across and below kiln-floor in which fuel is burned in suspension, joining one another by means of horizontal pipes or flues below said floor, said pipes or flues communicating with damper-controlled draft-flues; said combustion-chambers connected with the kiln by means of openings across kiln-floor combined with pipes and flues running to the top and outside of the kiln, for the introduction of fuel; means of controlling the supply of fuel from the top and outside of the kiln substantially as described.

708,584. APPARATUS FOR FORGING CAR-WHEELS. ALEXANDER H. GARTSHORE, Perth, Canada. Filed Apr. 10, 1901. Serial No. 55,262. (No model.)



Claim.—1. In apparatus of the character specified, the combination with a hammer-die and an anvil-die, of a combined support carried by said anvil-die, adapted to support the ingot against lateral movement.

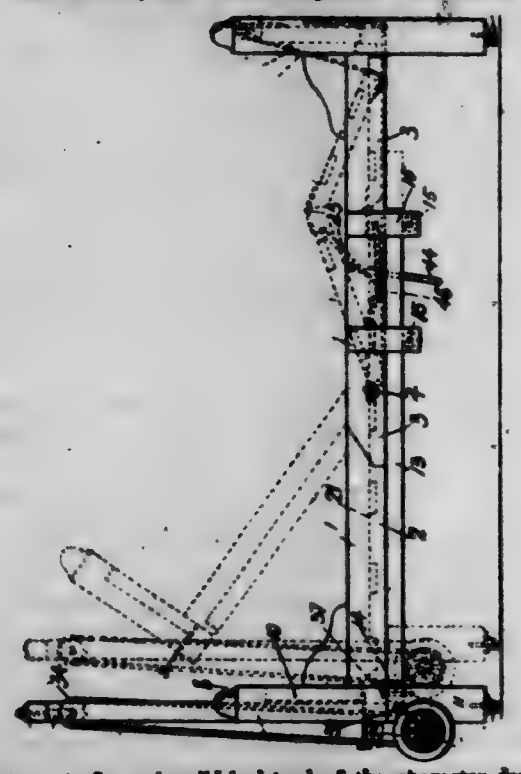
2. In apparatus of the character specified, the combination with a

hammer-die and an anvil-die, of a plate pivotally mounted on said anvil die and adapted to extend across the face of the ingot, and a cushioned pressure device carried by said plate adapted to retain said ingot against lateral movement.

3. In apparatus of the character specified, the combination with a hammer-die and an anvil-die, of a plate pivotally mounted on said anvil-die and adapted to extend across the face of the ingot, and a rod extending through said plate, said rod having cushioning means, the inner end of said rod abutting against the face of the ingot and preventing lateral movement thereof.

4. In apparatus of the character specified, the combination with a hammer-die and an anvil-die, of a plate pivotally mounted on said anvil-die and adapted to extend across the face of the ingot, a screw-threaded rod extending through said plate, a bracket for supporting said rod, a nut carried by said rod and positioned by said bracket, and a spring carried by said rod and adapted to form a pressure device when the inner end of said rod is brought into contact with the face of the ingot, to prevent lateral movement of the latter.

708,585. INVALID-BEDSTEAD. JAMES B. CANFIELD, Hillsville, Ky. Filed June 27, 1901. Serial No. 65,277. (No model.)



Claim.—1. In an invalid-bedstead of the character described, the combination with the hinged side rails and the headboard connected to the free upper ends of the side rails, and means for supporting the lower ends of said side rails, of bars slidably connected with the lower sections of the side rails, posts connected to the upper ends of said bars, and means for elevating the headboard and the side-rail sections to which it is secured, substantially as set forth.

2. In an invalid-bedstead of the character described, the combination with the side rails, each of which consists of a foot and head member pivoted together at their inner ends, a footboard secured to the free end of the foot member, and a headboard secured to the free end of the head member, of bars slidably connected to the foot members and underlying and parallel with both the foot and head members, and posts secured to the outer ends of said bars and adapted to support the headboard and outer ends of the head members of the side rails, and means for elevating the headboard and head members of the side rails, substantially as set forth.

3. In an invalid-bedstead of the character described, the combination with the foldable side rails comprising head members and foot members, the head members of the side rails being provided with a headboard and the foot members of the side rails being provided with a footboard, of bars underlying and engaging the lower edges of the members constituting the side rails, brackets secured to the foot members of the side rails and provided with frictional rollers upon which said bars are supported to slide, posts secured to the opposite ends of the bars and adapted to support the headboard when in its normal position, and means for elevating the headboard, substantially as set forth.

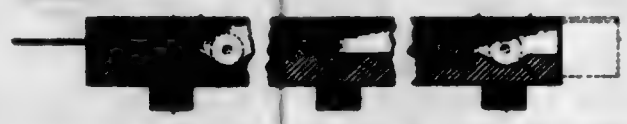
708,586. STREET-CAR FENDER. EDWIN F. CARRIER, Chicago Ill. Filed Sept. 21, 1901. Serial No. 76,081. (No model.)

Claim.—1. The fender-frame D; consisting of a series of parallel bars *d*, united at their front ends by the cross-plate E, and provided at their rear ends with eyes to receive the shaft C on which said bars are made to turn; the cross-plate K provided with hooks on its front edge for connection with the front portion of the fender-frame, and with the vertical plate *i*, for connection with the lever L, said lever and its pivotal supports on the platform B; all combined substantially as described.

2. The combination of the platform B'; the gudgeon-blocks F, secured to the top thereof; the elbow-supporting arms J, secured to the bottom thereof and carrying at their forward ends the shaft *j*; on which is pivotally supported the locking-plate L, with its locking-fingers 1, 2; lever I, means for connecting the lower end of said lever with the locking-plate L, and its fingers by which said locking-plate and its fingers may be lifted by the inward movement of the lower end of the lever, substantially as set forth.

3. The combination of the platform; the gudgeon-blocks, the shafts carried thereby; the pawl and its footpiece; the lever provided with a ratchet-surface for engagement with said pawl, and also a hook on its front side for engagement both with the locking-plate and the fender-frame; the cross-plate K; connecting-chains *m* the fender D, and the shaft C, all substantially as described.

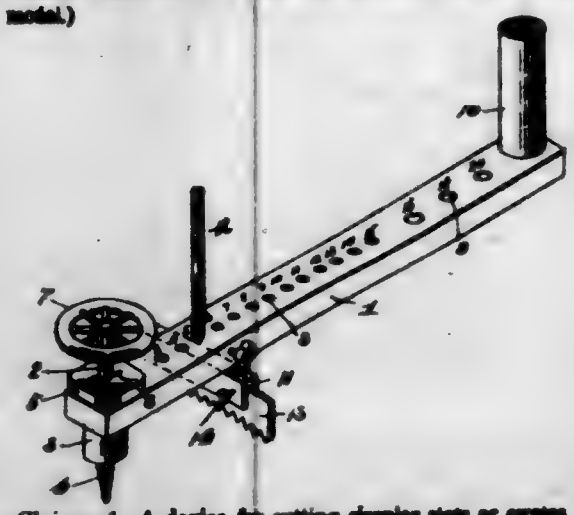
708,587. DETECTOR-BAR FOR RAILROAD-SWITCHES. LYMAN GARRIER, Joliet, Ill. Filed Apr. 24, 1902. Serial No. 104,522. (No model.)



Claim.—1. The combination with a rail; of a bar fixed at the side of the rail, a channeled bar movably mounted and inclosing the top and sides of the fixed bar, one of said bars having an undulating surface and the other rollers to traverse said fixed bar whereby the second bar is adapted to rise and fall when adjusted lengthwise of the fixed bar, and means for imparting an endwise movement to the upper bar, substantially as specified.

2. The combination with a rail, of a bar fixed at the side of the rail and having an undulating surface, a second bar movably mounted above the fixed bar and having rollers supporting it on said fixed bar, said second bar being channeled to inclose the rollers and top and sides of the fixed bar, and means for imparting an endwise movement to the upper bar, substantially as and for the purpose set forth.

708,588. DEVICE FOR CUTTING CIRCLES. ROBERT O. CARTWRIGHT, Augusta, Ark. Filed Mar. 12, 1902. Serial No. 98,098. (No model.)

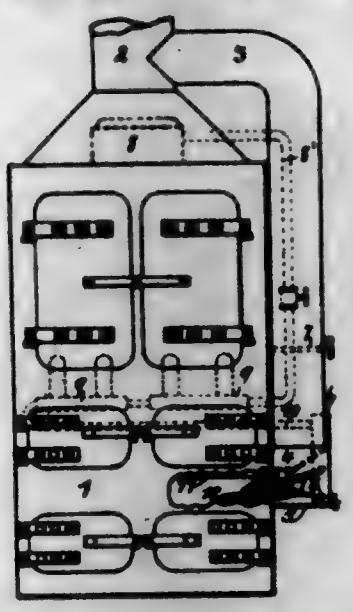


Claim.—1. A device for cutting circular slots or curves, consisting of a swinging arm, having secured in one end an axle 2, passing vertically through said arm, its lower end terminating in a gimlet-point; a spool 3, secured on the lower end of said axle, and against the lower face

of the arm; a hand-wheel 7, rigidly secured to the upper end of the said axle; said axle held in place by a nut 5, and a pin 6; a handle 10, secured on the swinging end of said arm; a cylindrical arm passing up through said swinging arm, and adjustably secured in said arm, by means of a nut; a clamping device secured to the lower end of said cylindrical arm, and a saw 13, adjustably secured in said clamping device, by means of thumb-nuts 14, substantially as shown and described and for the purpose set forth.

2. A device for cutting circular slats or circles, consisting of a swinging arm, having secured in one end, an axle, terminating in a gimlet-point; a hand-wheel rigidly secured to the upper end of said axle; a handle secured to the swinging end of said swinging arm; a threaded cylindrical arm passing down through said swinging arm; a clamping device secured to the lower end of said threaded circular arm; a saw secured in said clamping device; nuts passing through the walls of said clamping device, and adapted to curve said saw; a clamping-plate fitting against the upper edge of said clamping device, and the lower face of the swinging arm; a clamping-plate fitting against the upper face of said swinging arm, each plate provided with flanges grasping the edges of said swinging arm; a thumb-nut turning down on said cylindrical threaded arm, and adapted to clamp said clamping device and said plates to said swinging arm, substantially as shown and described and for the purposes set forth.

708,589. FORCED-DRAFT APPARATUS. JOHN S. CRAPHAM, Albany, N. Y. Filed Mar. 3, 1902. Serial No. 96,620. (No model.)



Claim.—1. In a steam-boiler a conduit leading from the smoke-stack into a receptacle in connection with the space under the grate-bars; a baffle-plate in proximity to the lower end of the said conduit; a steam-pipe in connection with the boiler discharging in the said receptacle and practically across the discharge-mouth of the conduit so as to converge the steam at a predetermined point and means for admitting air to said receptacle in predetermined quantities, in order that a portion of the hot gases from the smoke-stack and a portion of the steam from the boiler and some air may be forced into and through the fire on the grates substantially as described.

2. A superheated-steam-draft-forcing device consisting of a conduit leading from the smoke-stack of a boiler to and discharging into a receptacle; a steam-pipe leading from the boiler to and discharging into said receptacle and practically across the mouth of the conduit; said steam-pipe being connected with a superheater arranged to receive the heat from the furnace-fire and superheat the steam as it passes through the same; means whereby the steam is caused to make a circuitous path through the superheater and means for admitting air to the said receptacle and mix it with the steam from the boiler and the heated gases from the smoke-stack and discharge them under the fire-grate substantially as described.

3. In an apparatus for producing draft by superheated steam, heated gases and air, consisting of a conduit leading from the smoke-stack to a receptacle; a steam-pipe leading from the boiler to said receptacle through a superheater located at the fire-bridge and arranged to receive the heat of the furnace as it passes the fire-bridge; means for introducing air to the receptacle and means for producing a downdraft in the conduit and for forcing the contents of the receptacle under the grate-bars under pressure substantially as described.

708,540. HEAT-GENERATOR. GEORGE S. CRANE, Springfield, Mass. Filed Mar. 22, 1902. Serial No. 99,416. (No model.)

Claim.—1. A heater of the character described, consisting of upper and lower separated chambers having vertical connecting-flues, the upper chamber having an upwardly-leading opening, and the lower chamber having a downwardly-leading opening, and a support comprising an upright and a laterally-extending part on which the heater is sustained.

2. A heating apparatus of the character described, consisting of a heating-chamber, having upper and lower openings and having its top and bottom walls provided with the straps *a a* and a^2 a^2, combined with the support consisting of an upright member and a part G horizontally sustained thereby, comprising the two separated parallel horizontal members *f f*, to engagement with which either the upper or the lower pairs of said straps may be brought, for the purpose set forth.

3. In a heating apparatus of the character described, the combination with a base, an upright, and a part vertically adjustable on the upright, of a part G comprising separated members *f f*, hinge-connected to the part *g*, and a heater supported by the members *f f*, and having a heating-chamber provided with the bottom opening leading therefrom, and one or more openings leading upwardly therefrom.

4. In a heating apparatus of the character described, a heater comprising upper and lower separated heating-chambers *a* and *b*, the former having an upwardly-leading opening at its top, and the latter having a central opening at its bottom, said chambers being connected by the vertical flues A A, and the lower chamber having therewithin and supported slightly below, its top wall, with a space intervening, a depending cup-shaped part having therewithin a plurality of partitions to separate downwardly-opening spaces, and means for supporting the so-constructed heater in an elevated position.

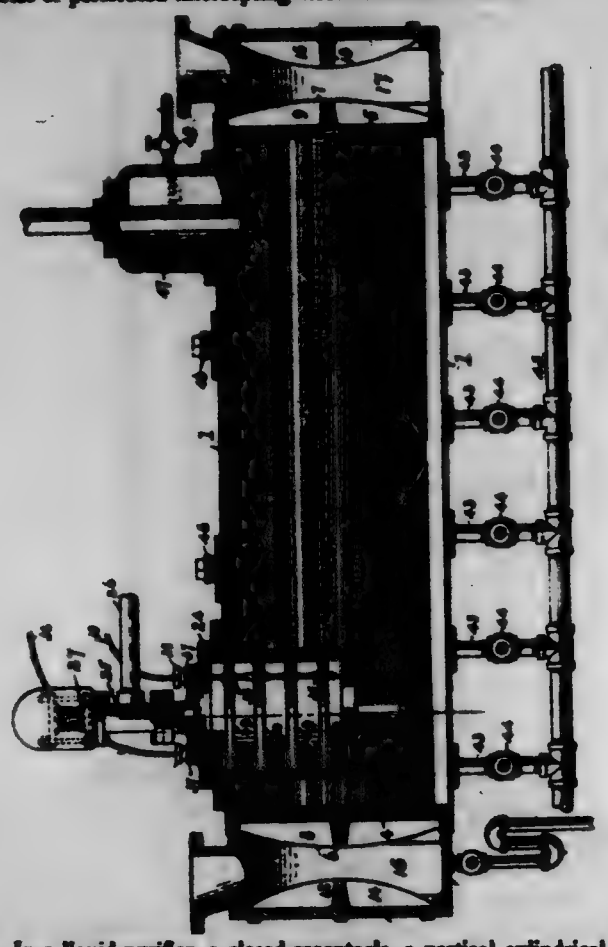
5. In a heating apparatus of the character described, the heater comprising the upper and lower separated chambers *a* and *b*, and the connecting vertical flues, the upper chamber having a top opening *g*, and the lower chamber having the depending annular wall with the opposite angular slots *y*, the contracting appliance consisting of an annular part having the radial studs w^2, and having the internal flange portion w^3, and means for supporting the heater in an elevated position.

6. In a heating apparatus of the character described, in combination, the base D, the uprights C which are screw-threaded, the nut *s* thereon, the above part *g*, having the lateral projection *r*, the part G comprising the portion f^2 hinge-connected to the part *r*, said the pair of separated parallel arms *f f*, the upper and lower heating-chambers *a* and *b*, the connecting-flues A and said chambers having the openings *g* and *d*, and provided with the loop-straps *a a*, and a^2 a^2, and the lower heater-chamber having therewithin the inverted-cup-shaped heat-arresting device, substantially as described.

708,541. WATER-PURIFIER. CHARNEY C. CLARK, Philadelphia, Pa., assignor of one-half to James S. Carson, Philadelphia, Pa. Filed Jan. 22, 1901. Serial No. 44,274. (No model.)

Claim.—1. In a liquid-purifier a horizontal cylindrical and inclosing receptacle, a vertical cylindrical inlet-chamber inserted within the receptacle, a series of perforated disk electrodes inserted therein, heads forming inclosed chambers at the ends of the receptacle, inlet and outlet passages to and from the chambers, and tubes extending from chamber to chamber through the receptacle.

2. In a liquid-purifier, a closed receptacle, chambers thereof at each end, tubes from chamber to chamber through the receptacle, an inlet-chamber inserted in the receptacle, an insulated lining for the chamber, and a series of perforated intercepting-electrodes fixed therein.



3. In a liquid-purifier, a closed receptacle, a vertical cylindrical insulated inlet-chamber partly within and partly without the receptacle, a series of perforated disk electrodes arranged across and within the chamber, insulated and liquid-retaining stuffing-boxes for the inlet-chamber, and means therethrough for positive and negative electric connection to alternate electrodes.

4. In a liquid-purifier, a closed receptacle, an inlet-chamber projecting from the exterior to the interior of the receptacle, an insulating-lining for the chamber, a series of electrodes in the chamber, means for electric connection from the exterior of the receptacle and the inlet-chamber, to the electrodes, through stuffing-boxes, followers for the stuffing-boxes, insulation for the stuffing-boxes and the followers, and liquid-retaining packing within the stuffing-boxes.

5. In a liquid-purifier, a receptacle, a chamber inserted into the receptacle from its exterior, and means thereto connected for conveying liquid, a series of perforated electrodes in the chamber, a closed bottom for the chamber, a delivery-pipe leading therefrom toward the bottom of the receptacle, a chamber at each end of the receptacle, inlets and outlets for the chambers, and a series of tubes connecting the end chambers, through the receptacle, and passing the sides and bottom of the inserted chamber.

6. In a liquid-purifier, a closed cylindrical receptacle, an inlet-chamber mounted upon one end of and entering the receptacle, an inlet thereto, a series of electrodes therein, electrical conductors thereto from a source of electrical energy exterior to the receptacle, a passage to pass the products of decomposition from the inlet-chamber to the bottom of the receptacle, a dome mounted on the end of the receptacle opposite the inlet-chamber, wherein the lighter impurities may arise above the purified liquid, and a pipe and valve for their withdrawal.

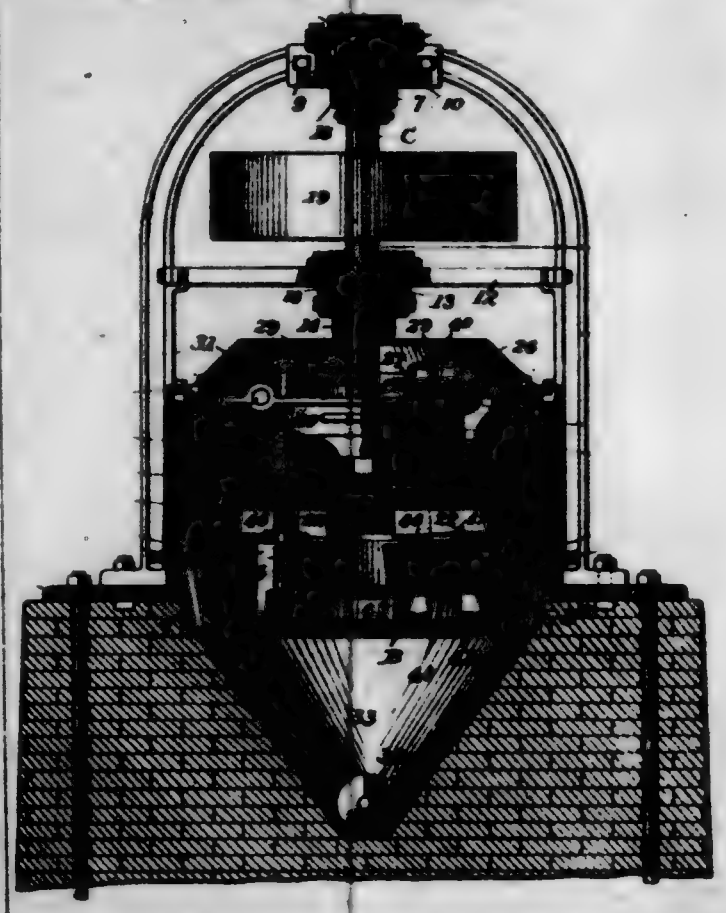
7. In a liquid-purifier, a closed horizontal cylindrical receptacle, a chamber supported upon and entering the receptacle near one end, an inlet thereto, a series of electrodes in the chamber, conductors from the electrodes to a source of electrical energy exterior to the receptacle, a passage from the chamber to the bottom of the receptacle, a dome located at the top of the receptacle at the opposite end from the chamber, for collecting the lighter impurities, and means to withdraw these impurities from the receptacle, through its dome, and at a point above the body of purified liquid in the receptacle.

8. In a liquid-purifier, an inclosing horizontal cylindrical receptacle, a chamber inserted within the receptacle near one end, a series of electrodes within the chamber, electrical conductors for the electrodes, a passage leading from the chamber toward the bottom of the receptacle, a dome near one end of the receptacle, and above the receptacle, and means entering the dome whereby to withdraw the purified liquid below the impurities arising within the dome.

9. In a liquid-purifier, an inclosing horizontal cylindrical receptacle, a cylindrical inlet-chamber inserted therein through the top, near one end, a series of perforated disk electrodes therein, electrical conductors therefor leading out of the receptacle and the chamber, a pipe extending from the chamber to the receptacle at its lower part, and a series of pipes and valves for the withdrawal of the products of decomposition from within the receptacle, at its lower part.

10. In a mechanism of the character described, a horizontal cylindrical fluid-receptacle, an inserted inlet-chamber, a series of electrodes therein, adapted to intercept the inflow, chambers at the ends of the receptacle, inlets and outlets for the chambers, a series of tubes from chamber to chamber through the receptacle, and from one of the chambers means to withdraw the products of condensation.

708,542. PULVERIZER. JOHN C. CLARK, Atlanta, Ga. Filed June 18, 1897. Serial No. 641,228. (No model.)



Claim.—1. In a pulverizing-machine, the combination with a radially-swinging shaft having a threaded end and a transverse slot and means for moving the shaft in a circular path, of a grinding-roll provided with a central conical opening and a slot transverse the upper end of the opening, a sectional conical sleeve within the opening of the grinding-roll provided with a central threaded bore for the reception of the threaded end of the shaft, a key extending through the slots in the shaft and roll, and an annular grinding-ring with which the roll coöperates, substantially as set forth.

2. In a pulverizing-machine, the combination with a radially-swinging shaft, having a threaded end and a transverse slot, means for revolving the shaft, of a grinding-roll provided with a central conical opening and upon its face with a channeled flange, a conical ring within the opening of the grinding-roll provided with a central threaded bore for reception of the threaded end of the shaft, a key passing through the slot of the shaft and channel of the flange and an annular grinding-ring with which the grinding-roll coöperates substantially as described.

3. The combination in a pulverizing-machine, of a rotatable shaft having an enlarged head, a journal-box for the shaft having an oil-chamber in its upper end, a shoulder upon which the head of the shaft bears, a cap for the upper end of the journal-box, and a bearing adjustable in said cap and projecting upwardly to maintain the head in engagement with the shoulder, an interior annular channel containing a series of rollers which bear upon the shaft, and a packing-gland at the lower end of the box, substantially as described.

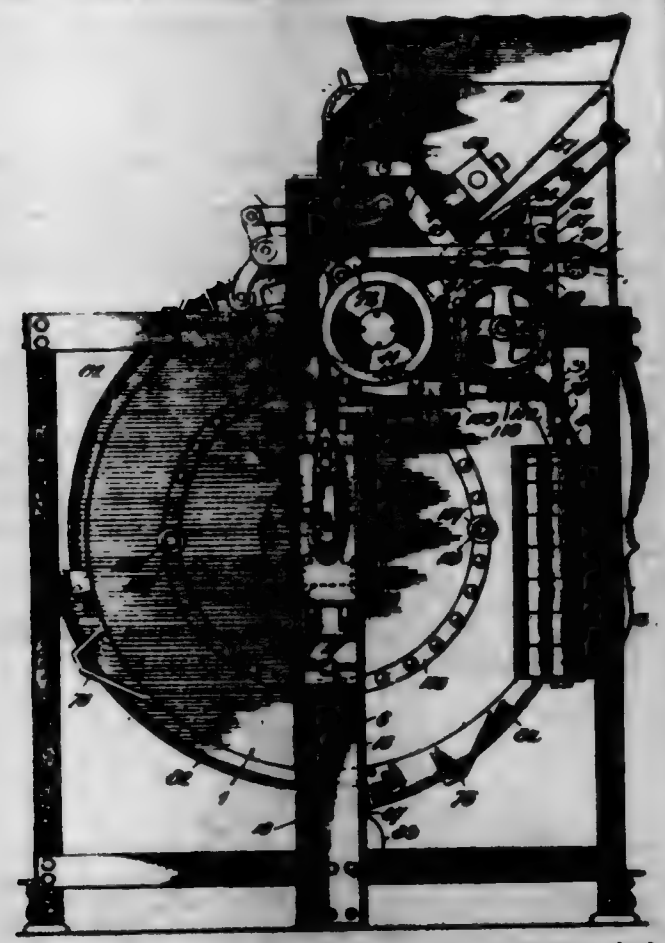
708,548. MANUFACTURE OF CRUCIBLE-STEEL. HENRY B. CLARKE, Pittsburg, Pa., assignor to Firth Sterling Steel Company, a Corporation of Pennsylvania. Filed Mar. 20, 1901. Serial No. 52,021. (No specimens.)

Claim.—1. The improved process of making crucible-steel, which consists in first introducing the materials for making crucible-steel in the required predetermined proportions into a receptacle and melting them in contradistinction to treating the materials with oxidizing or metallurgical agents, whereby changes in the proportions may be avoided, and then introducing the melted mass into a previously-heated crucible with carbon or other modifying substances and covering the crucible, and subjecting it to further heating for a limited time, substantially for the purposes described.

2. The improved process of making crucible-steel, which consists in first introducing the raw materials of steel or iron, or the like, in the cold state and in predetermined proportions into a suitable heating-receptacle and melting them without Bessemer or open-hearth reactions, and then immediately without other metallurgical treatment and before the formation of the finished crucible-steel takes place, introducing the melted mass into a crucible and closing the same, and subjecting the crucible and its contents to a continued heating while the crucible-steel is being produced therein, substantially for the purposes described.

3. The improvement in crucible-steel processes which consists in melting together the greater portions, at least, of the crucible-steel ingredients in predetermined proportions and without causing substantial change of proportions by chemical or metallurgical treatment, and thereafter introducing said ingredients into a crucible, covering them to protect them from oxidation, and thereafter subjecting them to heat during a limited time, substantially for the purposes described.

708,544. ROTARY WEIGHING-MACHINE. PERRY B. CLARKE, New York, N. Y. Filed Apr. 27, 1901. Serial No. 57,808. (No model.)



Claim.—1. The combination of a frame having vertical standards, a vertically-movable rotary load-receiver, the carriages arranged at opposite sides of the load-receiver and consisting of blocks, and upper and lower wheels arranged in pairs at opposite sides of the standards and located above and below the center of the load-receiver, and weights connected with the load-receiver, substantially as described.

2. The combination of a frame having opposite standards, a vertically-movable transverse shaft, a rotary load-receiver mounted on the shaft, the opposite carriages fixed to the shaft and consisting of blocks having openings to receive the shaft, and wheels arranged in pairs above and below the said shaft at the tops and bottoms of the blocks and located at the sides of the standards and adapted to run on the same, and weights connected with the load-receiver, substantially as described.

3. The combination of a frame provided at opposite sides with standards, a transverse shaft extending through the standards, a vertically-movable rotary load-receiver mounted on the shaft, scale-weights, flexible connections connected with the scale-weights and provided with hangers receiving the ends of the shaft and located beyond and spaced from the standards, the wheels 20 mounted on the hangers and projecting inwardly therefrom and located in the spaces between the same and the standards, the supplemental weights provided with projecting lugs, and the catches arranged to engage the lugs and provided with projecting portions to be engaged by the said wheels, substantially as described.

4. The combination with a frame provided with vertical standards, a transverse shaft extending through the standards, scale-weights connected with the shaft, the supplemental weights arranged on the exterior of the standards, the wheels projecting from the inner faces of the supplemental weights and arranged to run on the standards, the antifriction devices mounted on the standards and engaging the supplemental weights and holding the same in position, and means for supporting and tripping the supplemental weights, substantially as described.

5. The combination of a frame having standards, a transverse shaft, a vertically-movable rotary load-receiver mounted on the shaft, pulleys, flexible connections having hangers supporting the shaft, scale-weights attached to the flexible connections, the supplemental weights, the catches mounted on the frame and arranged to support the supplemental weights and provided with arms extending laterally beyond the standards, coiled springs connected with the arms for holding the catches in position for engaging the supplemental weights, and means for engaging the catches to release the supplemental weights, substantially as described.

6. The combination of a frame, a vertically-movable rotary load-receiver provided with partitions or divisions forming buckets and having slots at their outer edges, a supply-chute having sides extending into the load-receiver and arranged in the paths of the slots, an oscillating cut-off arranged at the bottom of the supply-chute and provided with means for actuating it to close it, a catch for holding the cut-off open, means operated by the load-receiver for opening the cut-off, and tripping mechanism for releasing the latter, substantially as described.

7. The combination of a frame, a vertically-movable rotary load-receiver provided with partitions or divisions forming buckets and having slots at their outer edges, a supply-chute having sides extending into the load-receiver and arranged in the paths of the slots, a movable cut-off arranged at the bottom of the supply-chute and adapted to close automatically when released, a catch for holding the cut-off open, means for opening the cut-off, and tripping mechanism for releasing the latter, substantially as described.

8. The combination of a load-receiver, a movable cut-off, a catch for holding the cut-off open, a shaft having an arm and provided with means for engaging the catch, a horizontally-disposed reciprocating bar engaging the arm of the shaft and adapted to partially rotate the same, a support receiving one end of the bar, a lever pivoted to and supporting the other end of the bar, and means for actuating the lever and for automatically disengaging the bar from the arm of the shaft, substantially as described.

9. The combination of a load-receiver, a movable cut-off, a catch for holding the cut-off open, a shaft having an arm and provided with means for engaging the catch, a reciprocating bar engaging the arm of the shaft and arranged on a suitable support and having an inclined edge for engaging the same, whereby the said bar will be automatically lifted out of engagement with the arm, and means for actuating the bar, substantially as described.

10. The combination of a frame, a load-receiver, a supply-chute, a movable cut-off, a catch arranged in the path of the cut-off and adapted to hold the same in its open position, a shaft having inner and outer arms, the inner arm being arranged to engage the catch, a bar arranged to engage the outer arm and arranged on a suitable support and having an inclined edge for engaging the same, whereby the said bar will be automatically lifted out of engagement with the outer arm, after the cut-off has been tripped, and means for actuating the said bar, substantially as described.

11. The combination of a frame, a vertically-movable load-receiver, scale-weights connected therewith, a supplemental weight, means for supporting and tripping the supplemental weight, a movable cut-off, a catch arranged in the path of the cut-off and adapted to hold the same open, a shaft having inner and outer arms, the inner arm being arranged to engage the catch to release the cut-off, a longitudinally-movable bar arranged to engage the outer arm, and connections between the bar and the supplemental weight, substantially as described.

12. The combination of a frame, a vertically-movable load-receiver, the supplemental and scale weights, a cut-off, a catch arranged to hold the cut-off open, a shaft having inner and outer arms, the inner arm being arranged to engage the catch to release the cut-off, the bar arranged to engage the outer arm and provided with an inclined edge arranged on a suitable support, whereby the bar is lifted out of engagement with the said outer arm, and a bell-crank connected with the bar and with the supplemental weight, substantially as described.

13. The combination of a frame, a vertically-movable load-receiver, supplemental and scale weights, a movable cut-off, a catch arranged to hold the cut-off open, a shaft having inner and outer arms, the inner arm

being arranged to engage the catch, and the outer arm being provided with a shoulder, a bar having a shoulder for engaging that of the outer arm and provided with an inclined edge, a wheel receiving the bar at the inclined edge thereof, and a loft-catch connecting the bar with the supplemental weight, substantially as described.

14. The combination of a frame, a vertically-movable lead-receiver, supplemental and scale weights, a cut-off, a bracket having an arm at the bottom, a catch movably mounted on the bracket at the top thereof and depending downward therefrom and supported by the arm in position for engaging the cut-off to hold the same open, and means for swinging the catch away from the arm to release the cut-off, substantially as described.

15. The combination of a frame, a movable cut-off provided with means for closing it, a rotary lead-receiver, a lever arranged in the path of the lead-receiver and adapted to be actuated by the same, and a bar connected with the lever and with the cut-off and adapted to close the latter and having a limited movement independently thereof to permit the cut-off to close quickly without actuating either the bar or the lever, substantially as and for the purpose described.

16. The combination of a frame, a movable cut-off provided with means for closing it, a rotary lead-receiver provided at intervals with lugs or projections, a lever arranged in the path of the lugs or projections, and means for connecting the lever with the cut-off, whereby the latter will be opened when the lever is actuated by the said lugs or projections, said means permitting the cut-off to have a limited movement independently of the lever to close quickly without actuating the said lever, substantially as described.

17. The combination of a frame, a rotary lead-receiver, a movable cut-off having means for closing it and provided with a projection, a bar having a slot or opening receiving the projection to permit the cut-off to close quickly without actuating the said bar, and a lever connected with the bar and arranged to be actuated by the lead-receiver to open the cut-off, substantially as described.

18. The combination of a rotary lead-receiver having beveled lugs or projections, a movable cut-off having a projection, a bar provided with a slot or opening receiving the projection of the cut-off to permit the latter to close quickly without actuating the bar, and a lever connected with the bar and arranged to be engaged by the beveled lugs or projections of the lead-receiver, substantially as described.

19. The combination of a frame, a rotary lead-receiver having a vertical movement, supplemental and scale weights, a movable cut-off, a catch arranged to hold the cut-off in its open position, a lever arranged to be engaged by the lead-receiver and connected with the cut-off and adapted to open the same, and tripping mechanism actuated by the supplemental weight for releasing the cut-off, substantially as described.

20. The combination of a frame, a rotary lead-receiver, supplemental and scale weights, an oscillatory cut-off provided with a weighted arm and having a pin or projection, a lever arranged to be engaged by the rotary lead-receiver, a bar connected with the lever, and having a slot or opening receiving the pin or projection of the cut-off, a catch arranged for holding the cut-off open, and tripping mechanism for disengaging the catch from the cut-off, substantially as described.

21. The combination of a frame, a rotary lead-receiver provided with peripheral cams forming shoulders, scale-weights, and the spring-actuated brake arranged to engage the cams to check the rotation of the lead-receiver, and provided with a cushioned buffer for engaging the shoulders to prevent backward movement and to throw the lead-receiver forward, substantially as described.

22. The combination of a frame, a rotary lead-receiver provided with cams, a bracket having a pivot, a brake detachably mounted on the pivot, an adjusting device for limiting the movement of the brake, and a spring engaging the brake and bracket and with the cams to retain the brake on the pivot of the bracket, substantially as described.

23. The combination of a frame, a rotary lead-receiver having cams, a pivoted brake provided with a casket and having a cushioned buffer mounted thereto, and a spring engaging the brake, substantially as described.

24. The combination of a frame, a rotary lead-receiver having cams, a brake pivotally connected at one end to the frame, a spring secured to the frame and engaging the other end of the brake to force the same against the cams, and an adjusting device extending from the inner side of the brake and engaging the frame for limiting the movement of the brake, substantially as described.

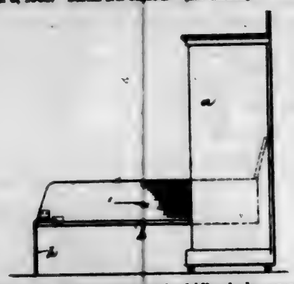
25. The combination of a frame, a rotary lead-receiver having cams, scale-weights, a bracket having a pivot, a brake detachably arranged on the pivot and having a head provided with opposite recesses, a wear-plate mounted in one of the recesses, and a spring secured to the frame and engaging the brake at the other recess, substantially as described.

26. The combination of a frame, a rotary lead-receiver having projections, scale-weights, and the combined stop and buffer having a cushioning-spring and provided with a pivoted portion arranged to engage the projections of the lead-receiver substantially as described.

27. The combination of a frame, a rotary lead-receiver having projections having the combined stop and buffer comprising the pivoted member arranged to engage the stops, the slidingly-mounted rod, the spring connected with the rod and forming the cushion, and a spring-actuated link connected with the pivoted bar, substantially as described.

28. The combination of a frame, a rotary lead-receiver having projections, and the combined stop and buffer comprising the substantially hook-shaped bar adapted to move upward and downward, a rod slidingly mounted and having the hook-shaped bar pivoted to it, a spring connected with the rod, a link or bar pivoted to the hook-shaped bar and having an opening, a pin or projection mounted on the frame and arranged in the said opening, and a spring connected with the pin or projection and with the link or bar, substantially as described.

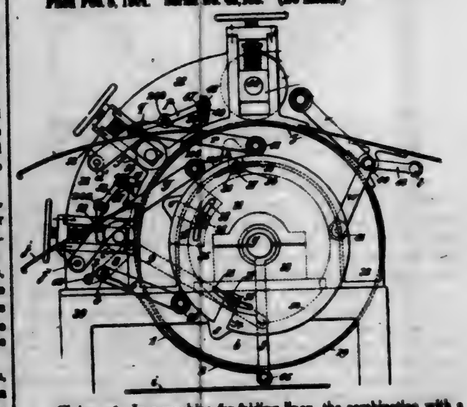
708,545. FOLDING BED. PETER GLAY, Sheboygan, Wis. Filed Feb. 6, 1902. Serial No. 92,504. (No model.)



Claim.—1. A leg or support for folding beds, comprising a rod having an intermediate portion, with one end bent at a right angle thereto and the other end bent at a right angle to both the intermediate portion and first-named end, in combination with stops secured to the inner surface of the bed for limiting the movement of said leg or support in opposite directions.

2. In a folding bed, the combination with the base or front piece and side rail of the bed, having a grooved step, and an adjacent shouldered block secured to the inner surface thereof, of a supporting device comprising a rod having an intermediate portion longitudinally movable in said groove, an outer bent end adapted to drop down and form a supporting-leg, when said part is pulled outward and an inner bent end adapted for engagement with said shouldered block, when said part is pushed inward, and the whole supporting device being adapted to be pushed inward out of sight, when the bed is to be folded.

708,546. FOLDING-MACHINE. BERTHE GILLET, CANNES, France. Filed Feb. 5, 1901. Serial No. 46,102. (No model.)



Claim.—1. In a machine for folding linen, the combination with a rotating cylinder, guide-plates, folding-knives, and levers to actuate said plates and knives; of a cam-wheel rotating with said cylinder to actuate said levers, and means timed to move the piece to be folded into engagement with the cylinder, substantially as and for the purpose set forth.

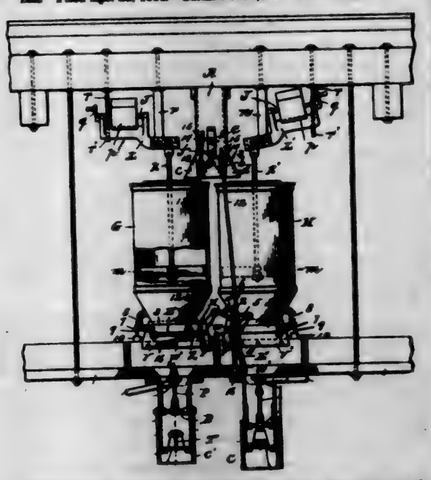
2. In a machine for folding linen, the combination with a shaft, a cylinder secured thereto, guide-plates, folding-knives, and levers to actuate said plates and knives; of a cam-wheel secured to said shaft to actuate the levers, and adjustable cam-surfaces on the wheel, substantially as and for the purposes set forth.

3. In a machine for folding linen, the combination with a shaft, a cylinder secured thereto, guide-plates, folding-knives, and levers to actuate said plates and knives; of a cam-wheel secured on the shaft to actuate said levers, a fixed table, a roller normally out of engagement with the cylinder, and a cam on said shaft to cause said roller to move in front of the table to feed the piece to be folded to the cylinder, substantially as and for the purposes set forth.

4. In a machine for folding linen, the combination with a shaft, a cylinder secured thereto, guide-plates, folding-knives, and levers to actuate said plates and knives; of a cam-wheel secured to said shaft, cam-surfaces adjustably secured thereto to actuate the levers, a plate, 1, a stripping-plate, 2, mounted to rotate around said shaft and cylinder, cam-operated lever mechanism to simultaneously actuate both of said plates 1 and 2, and cam-operated means to positively move the piece to be folded into engagement with the cylinder, substantially as and for the purpose set forth.

5. In a machine for folding linen, a shaft, a bevel-wheel, a cylinder thereon, guide-plates, folding-knives, and levers to actuate said plates and knives; of a cam-wheel on said shaft, adjustable cam-surfaces thereon to actuate the levers, a counter-shaft, a bevel-wheel to mesh with the aforementioned one, an endless carrier-apron driven from the counter-shaft beneath said cylinder, and similar means to fold linen at its end, substantially as and for the purposes set forth.

708,547. WEIGHING-MACHINE. DAVID S. COOK, Gallesburg, Ind. Filed Apr. 30, 1901. Serial No. 57,075. (No model.)



Claim.—1. In a weighing-machine, the weigh-beam, having the pivoted gates, the crank-arms of the gate-pivots, the rod connecting said arms, the double-mouthed spout having the valve, and means operating in connection with said gates for moving the spout-valve, substantially as specified.

2. In a weighing-machine, the weigh-beam, having the pivoted gates, the crank-arms of the gate-pivots, the rods connecting said arms, the double-mouthed spout, having the valve provided with the cross-arm upon its pivot, and the reciprocatory rods engaging said cross-arm, and operating in connection with said gates for moving the spout-valve, substantially as specified.

3. In a weighing-machine, the weigh-beam, the pivoted gates of said beam, the parallel crank-arms of the gate-pivots, and the rod connecting said crank-arms, and providing for a parallel movement thereof, whereby the gates open and close alternately, substantially as specified.

4. In a weighing-machine, the weigh-beam, the pivoted gates of said beam, the crank-arms of the gate-pivots, the rod connecting said arms, the pivoted catches for said gates, having the crank-arms, and the bearing-screws engaging said arms, substantially as specified.

5. In a weighing-machine, the weigh-beam, having the pivoted gates, the crank-arms upon the gate-pivots, the rod connecting said arms, the pivoted catches for said gates, having the crank-arms, the adjustable bearings carried by said arms, and the springs for maintaining said catches in engagement with said gates, substantially as specified.

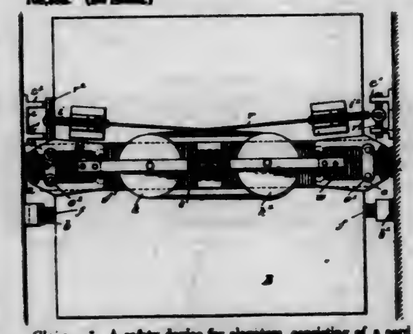
6. In a weighing-machine, having the gates, the catches for said gates having the crank-arms, the adjustable bearings carried by said crank-arms, and springs for maintaining said catches in engagement with said gates, substantially as specified.

7. In a weighing-machine, the weigh-beam, having the pivoted gates, the double cranks upon the pivot of each said gate, the rod connecting one pair of each cranks, the double-mouthed spout having the valve, and means connected with the other pair of said cranks for moving the spout-valve, substantially as specified.

8. In an automatic weighing-machine, the combination with the weigh-beam, and the lever device common thereto, of the gates, the automatic catches therefor, the double spout and its valve and cross-arm, the adjustable catches, and the rods connecting each catches to said lever device, substantially as specified.

9. In an automatic weighing-machine, the combination with the weighing-gates, and the automatic catches, of the elbow-levers or lever-arms rigidly connected to said gates, the right and left screws connected to said lever-arms, and the right and left threaded nut connecting said screws, substantially as specified.

708,548. SAFETY-STOP FOR ELEVATORS. ALLAN GOTTSCHALK, Brooklyn, N. Y., assignor to Walter L. Tyler, Brooklyn, N. Y., and Alonzo B. See, New York, N. Y. Filed Apr. 18, 1900. Serial No. 13,282. (No model.)



Claim.—1. A safety device for elevators, consisting of a cord carried by the car, means for automatically engaging said cord with the shaft when the speed of the car becomes abnormally great, stopping devices for the car and means whereby the tension then created on the cord by the moving car will operate the stopping devices for the car, substantially as described.

2. A safety appliance for elevators, consisting of a cord carried by the car, devices fixed in the shaft for engaging with the cord, automatic means for causing said engagement when the speed of the car becomes excessive, a gripping device actuated by the cord when it is thus engaged, said gripping device adapted to act upon the guide-rails of the car, for the purpose of stopping the car.

3. In a safety device for elevators, the combination of a pair of clamps adapted to engage with the guide-rails of the car, a pair of movable blocks adapted to actuate said clamps, a cord looped around said blocks and carried by the car, and means for attaching said cord to the side of the elevator-shaft when the speed of the car becomes abnormally high, substantially as described.

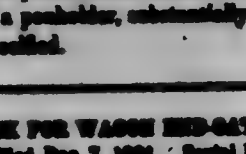
4. In a safety device for elevators, the combination of a pair of clamps adapted to engage with the guide-rails of the car, a pair of movable blocks adapted to actuate said clamps, a cord looped around said blocks and carried by the car, said cord being normally fixed at each end to the car and means whereby one end of the rope will be detached from the car and fixed to the side of the elevator-shaft when the speed of the car becomes abnormally high.

5. In a safety device for elevators, the combination of a car, a cord carried thereby and having its ends normally fixed thereto, stopping devices for the car operated by said cord when put under tension, stationary hooks fixed at intervals in the elevator-shaft, means carried at the extremities of the cord for engaging with said hooks and means whereby the overspeeding of the car will cause said engagement, substantially as described.

6. The combination of an elevator car and shaft, stopping devices for the car, a rope carried by the car and adapted when under tension to operate said stopping devices, a cam on the car for the end of the rope, a series of stationary cams fixed in the shaft and means for shifting the

end of the rope from its seat on the car to one of the seats in the shaft, for the purpose set forth.

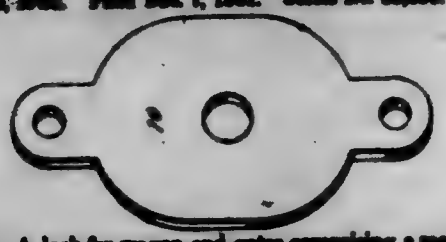
708,549. PEN. SAMUEL H. GOODWIN, London, England. Filed Mar. 5, 1902. Renewed Feb. 5, 1902. Serial No. 93,743. (No model.)



Claim.—1. A pen stamped from one piece of metal, having a portion of its stem extended at the side in such a manner that it can be clipped sidewise onto the outer surface of the penholder, substantially as described.

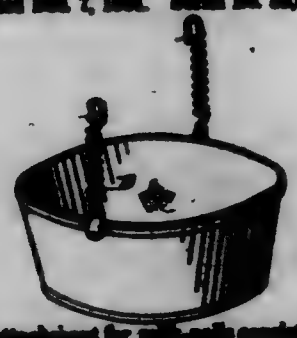
2. A pen, stamped from one piece of metal, having at the upper end of its stem two projecting wing-pieces continuing the curve of the stem through the greater part of a circle, and adapted to be clipped sidewise onto the outside of a penholder, substantially as described and shown and for the purposes specified.

708,550. LOCK FOR WAGON REAR-GATES. CHARLES S. CROW, Franklin, Iowa. Filed Dec. 7, 1901. Serial No. 85,603. (No model.)



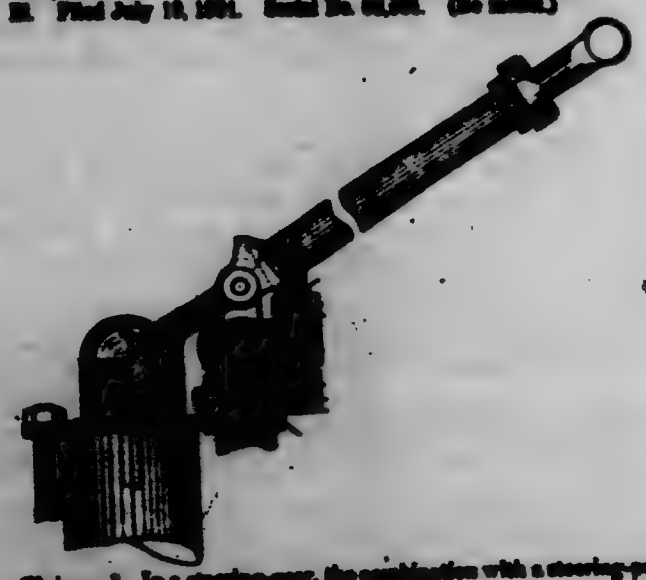
Claim.—A lock for wagon end-gates comprising a metal plate fixed to the outside of the end-gate, a metal disk having an integral handle and integral studs, rods pivotally connected with the studs and terminating in hooks at their free ends and eyebolts fixed in the side-boards of a wagon-box, as shown and described to operate in the manner set forth for the purposes stated.

708,551. BOTTOM FOR MILK-PAILS. CHARLES S. CROW, Franklin, Iowa. Filed Dec. 7, 1901. Serial No. 85,602. (No model.)



Claim.—An attachment for milk-pails consisting of an open-topped vessel adapted to inclose the bottom portion of a milk-pail and provided with extensible coil-springs fixed to its top-edge portion, and terminating in hooks adapted to engage the top edge of a milk-pail, in the manner set forth, for the purposes stated.

708,552. STEERING-GEAR. WALTER A. CROWTHER, Chicago, Ill. Filed July 10, 1901. Serial No. 67,091. (No model.)



Claim.—1. In a steering-gear, the combination with a steering-post, of a lock-bolt carried thereby, a fixed support, a groove therein adapted to be engaged by said lock-bolt and means to advance said lock-bolt into engagement with said groove, substantially as described.

2. In a steering-gear, the combination with a steering-post, of a lock-bolt carried thereby, a fixed support, a groove therein adapted to be engaged by said lock-bolt, said groove and lock-bolt being correspondingly tapered, and means to advance said lock-bolt into engagement with said groove, substantially as described.

3. In a steering-gear, the combination with a steering-post, of a lock-bolt carried thereby, a fixed support, a groove formed therein adapted to be engaged by said lock-bolt, a spring applied to said lock-bolt adapted to maintain the same normally retracted and means to advance said lock-bolt into engagement with said groove, substantially as described.

4. In a steering-gear, the combination with a steering-post, of a lock-bolt carried thereby, a fixed support, a groove formed therein adapted to be engaged by said lock-bolt, said lock-bolt and groove being correspondingly tapered, a spring applied to said lock-bolt adapted to maintain the same normally retracted and means to advance said lock-bolt into engagement with said groove, substantially as described.

5. In a steering-gear, the combination with a steering-post and a steering-lever pivoted thereto, of a lock-bolt carried by said steering-post beneath said steering-lever so as to be depressed thereby, a fixed support and a groove formed therein adapted to be engaged by said lock-bolt, substantially as described.

6. In a steering-gear, the combination with a steering-post and a steering-lever pivoted thereto, of a lock-bolt carried by said steering-post beneath said steering-lever so as to be depressed thereby, a fixed support and a groove formed therein adapted to be engaged by said lock-bolt, said lock-bolt and groove being correspondingly tapered, substantially as described.

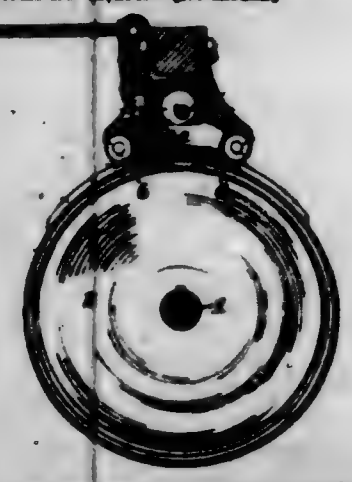
7. In a steering-gear, the combination with a steering-post and a steering-lever pivoted thereto, of a lock-bolt carried by said steering-post beneath said steering-lever and adapted to be depressed thereby, a fixed support, a groove therein adapted to be engaged by said lock-bolt and a spring applied to said lock-bolt adapted to maintain the same normally retracted, substantially as described.

8. In a steering-gear, the combination with a steering-post and a steering-lever pivoted thereto, of a lock-bolt carried by said steering-post beneath said steering-lever and adapted to be depressed thereby, a fixed support, a groove therein adapted to be engaged by said lock-bolt, said lock-bolt and groove being correspondingly tapered, and a spring applied to said lock-bolt adapted to maintain the same normally retracted, substantially as described.

9. In a steering-gear, the combination of a fixed support, a steering-post rovolubly mounted therein, a head on said steering-post, a steering-lever pivoted to said head, a lock-bolt mounted in said head beneath said steering-lever and adapted to be depressed thereby, and a groove in the fixed support in which said steering-post is mounted adapted to be engaged by said lock-bolt, said lock-bolt and groove being correspondingly tapered, substantially as described.

10. In a steering-gear, the combination of a fixed support, a steering-post rovolubly mounted therein, a head on said steering-post, a steering-lever pivoted to said head, a lock-bolt mounted in said head beneath said steering-lever and adapted to be depressed thereby, a groove in the fixed support in which said steering-post is mounted adapted to be engaged by said lock-bolt, said lock-bolt and groove being correspondingly tapered, and a spring applied to said lock-bolt and adapted to maintain the same normally retracted, substantially as described.

708,558. BRAKE. WALTER A. CROWTHER, Chicago, Ill. Filed Sept. 16, 1901. Serial No. 75,405. (No model.)



Claim.—1. A band-brake comprising a drum, a brake-band applied thereto, means relatively to which said brake-band is movable to throw the ends of said brake-band into frictional engagement with said brake-

drum and stops which limit the movement of said brake-band circumferentially of said drum, substantially as described.

2. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said drum, a support adjacent to said drum to which the ends of the brake-band are anchored by means of a movable connection, a shoe supported so as to be movable toward and from the brake-drum which overlaps the ends of the brake-band and means to impart movement to said shoe toward said brake-drum, substantially as described.

3. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said drum, a support adjacent to said drum to which the ends of the brake-band are anchored by means of a movable connection, a shoe supported so as to be movable toward and from the brake-drum, rollers mounted therein adapted to bear upon the ends of the brake-band and means to impart movement to said shoe toward the brake-drum, substantially as described.

4. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said drum, plates secured to the ends of said brake-band, a support adjacent to said drum to which the ends of the brake-band are anchored by means of a movable connection, a shoe supported so as to be movable toward and from the brake-drum, rollers mounted in said shoe adapted to bear upon the plates secured to the brake-band and means to impart movement to said shoe toward the brake-drum, substantially as described.

5. The combination with a revolvable shaft, of a brake-drum secured thereto, a brake-band applied to said drum, a support to which the ends of the brake-band are anchored by means of a movable connection, a shoe supported thereon so as to be movable toward and from the brake-drum, rollers mounted in said shoe and adapted to bear upon the ends of the brake-band and means to impart movement to said shoe toward the brake-drum, substantially as described.

6. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said drum, a support to which the ends of the brake-band are anchored by means of a movable connection, said support comprising webs or flanges which closely embrace the sides of the band, a shoe supported therein so as to be movable toward and from the brake-drum, rollers mounted in said shoe adapted to bear upon the ends of said brake-band and means to impart movement to said shoe toward said brake-drum, substantially as described.

7. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said drum, a support, stops thereon adapted to limit the movement of said brake-band, a shoe, rollers therein adapted to bear upon the ends of said brake-band, an eccentric mounted in said support and adapted to depress said shoe and means to throw said eccentric, substantially as described.

8. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said drum, a support, plates secured to said brake-band, stops on said plates adapted to engage rigid portions of said support, a shoe, rollers therein adapted to bear upon the plates on said brake-band, an eccentric mounted in said support adapted to depress said shoe and means to throw said eccentric, substantially as described.

9. The combination with a revolvable shaft, of a drum secured thereto, a brake-band applied to said brake-drum, a support, shoulders or ledges thereon, plates secured to said brake-band, projections on said plates adapted to engage the shoulders or ledges on said plates, a shoe, rollers therein adapted to bear upon the plates on said brake-band, an eccentric mounted in said support adapted to depress said shoe, a strap on said shoe which passes over said eccentric and means to throw said eccentric, substantially as described.

10. A band-brake comprising a drum, a brake-band applied thereto, rollers revolubly mounted above the ends of said brake-band so as to be movable toward and from the brake-drum, means to depress said rollers upon the ends of said brake-band, and stops which limit the movement of said brake-band circumferentially of said drum, substantially as described.

11. A band-brake comprising a drum, a brake-band applied thereto, plates secured to the ends of said brake-band, rollers revolubly mounted above said plates so as to be movable toward and from the brake-drum, means to depress said rollers upon the plates on said brake-band and stops adapted to limit the movement of said brake-band circumferentially of said drum, substantially as described.

708,554. CHRISTMAS-TREE HOLDER. PETER H. CRAIG, Yonkers-ville, N. Y., assignor of one-half to Conrad G. Siebelmann, New York borough of Brooklyn, N. Y. Filed Oct. 22, 1901. Serial No. 79,201. (No model.)

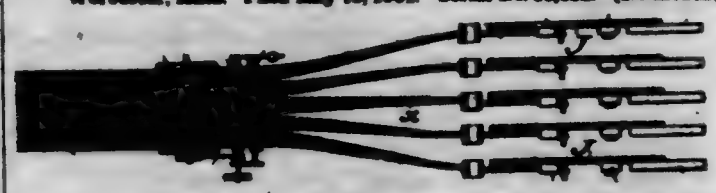
Claim.—1. A Christmas-tree holder, consisting of two sections arranged at right angles to each other, each section being composed of two legs and flat connecting-springs between the inner ends of said legs, said springs being provided with center holes for attaching the article to be supported, substantially as set forth.

2. A Christmas-tree holder, consisting of two sections arranged at right angles to each other, each section being composed of two legs and flat springs connecting the inner ends of the legs, and inclined holes in the upper ends of the legs for fastening nails or screws, substantially as set forth.

3. A Christmas-tree holder, consisting of two sections arranged at right angles to each other, each section being composed of two concaved legs and flat springs connecting said legs at their inner and lower ends, said legs being provided with concaved faces forming sharp upper edges, and inclined holes through the upper parts of the legs below the sharp edges, substantially as set forth.

4. A section of the Christmas-tree holder, consisting of two curved legs, said legs being provided with concaved faces at their inner ends, and flat metallic springs connecting the inner ends of said legs, said metallic springs having their ends upturned, to fit in grooves provided in the under surface of said curved legs, substantially as set forth.

708,555. METHOD OF MAKING BALE-TIES. FRED H. DANIELS, Worcester, Mass. Filed May 13, 1901. Serial No. 60,032. (No model.)



Claim.—1. In the art of making wire ties for bales of hay, cotton, and the like, the herein-described improvement consisting in continuously passing the wire through an annealing-furnace as it is unwound from the coils, drawing it under tension through said furnace so as to stretch and straighten it while hot, maintaining it in straightened condition and allowing it to set and cool in transit thence to a cutting-machine, cutting it into lengths appropriate to the particular kind of tie required, and delivering it without handling to the end-fastenings machine.

2. In the art of making wire ties for bales of hay, cotton, and the like, the herein-described improvement consisting in continuously passing a series of wires concurrently and simultaneously through an annealing-furnace as they are unwound from their coils, drawing the wires under tension through said furnace so as to stretch and straighten them while hot, maintaining them in straightened condition and allowing them to set and cool in transit thence to a cutting-machine, simultaneously cutting a plurality of the wires into a bunch or bunches of the appropriate length for the particular kind of tie required, delivering the bunch or bunches to a machine or machines for forming the end fastenings, and forming said fastenings on the ties one at a time.

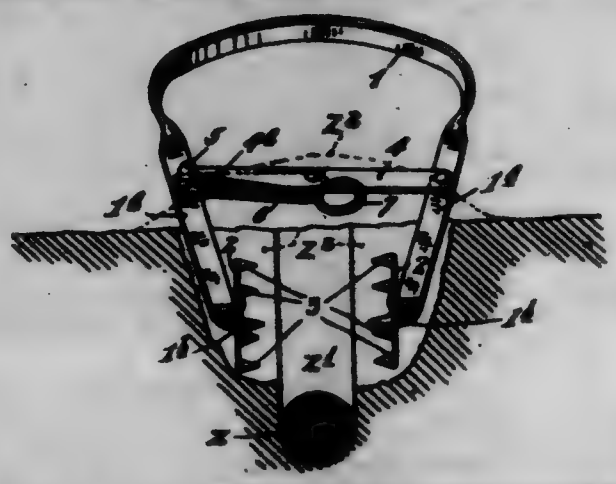
3. In the art of making wire ties for bales of hay, cotton, and the like, the herein-described improvement consisting in simultaneously and continuously passing a series of wires through an annealing-furnace as they are unwound from their coils, drawing the wires under tension through said furnace so as to stretch and straighten them while hot, maintaining said wires in straightened condition and allowing them to set and cool in transit, dividing the series into bunches and conducting each bunch to a separate cutting-machine, simultaneously cutting the wires of each bunch into lengths appropriate to the particular kind of tie required, and delivering said bunches without handling to separate end-fastenings machines.

4. In the art of making wire ties for bales of hay, cotton, and the like, the herein-described improvement consisting in continuously passing the wire through an annealing-furnace, drawing it under tension through said furnace so as to stretch and straighten it while hot, galvanizing the wire while passing between the furnace and the drawing apparatus, allowing it to set and cool in transit thence to a cutting-machine, cutting it into lengths appropriate to the particular kind of tie required, and delivering it without handling to the end-fastenings machine.

5. In the art of making wire ties for bales of hay, cotton, and the like, the herein-described improvement consisting in continuously passing the wire through an annealing-furnace as it is unwound from the coils.

drawing it under tension through said furnace-area to stretch and straighten it while hot, maintaining it in straightened condition and allowing it to cut and cool in transit thereto to a machine for making a fastening on the front end, cutting the wire at a point sufficiently removed from the machine to make ties of the desired length, passing the cut lengths endwise from said machine to and past another end-fastenings machine, and forming a fastening on the rear end of the wire to cooperate with the one previously formed on the front end.

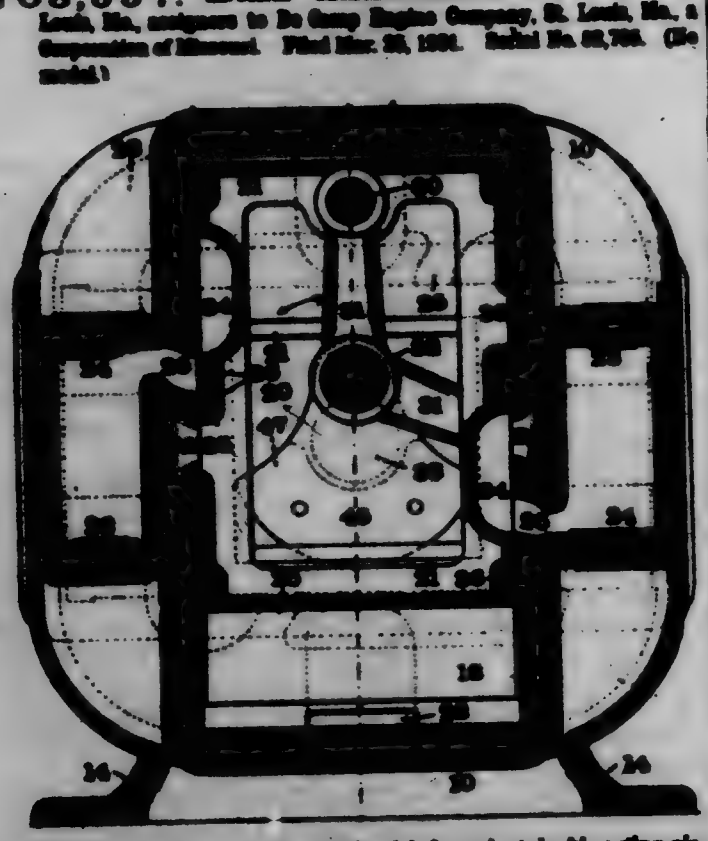
708,556. TRAP FOR POCKET-GOPHERS. JOHN J. DANIELS, New London, Minn. Filed Sept. 21, 1901. Serial No. 76,060. (No model.)



Claim.—1. A trap comprising the spring 1 with arms 1^a and jaws 2 secured to the free ends of said arms 1^a, the toggle 4 for holding said jaws separated, one of said toggle members having the extended arm 4^a, and a device applicable to the arm 4^a for holding the trap set and releasing the same.

2. A trap comprising the spring 1 with arms 1^a, the toothed jaws 2 secured to the free ends of said arms 1^a and extending transversely thereof, the toggle 4 for holding said jaws separated, one of the toggle members having an arm 4^a, and the pivoted trigger 6 having the detent 5, which latter engages said arm 4^a and is adapted to be released therefrom by pressure on said trigger, substantially as described.

708,557. ENGINE. GEORGE DE GAMP and OTHO A. HAAS, St. Louis, Mo., assignors to De Gamp Engine Company, St. Louis, Mo., a Corporation of Missouri. Filed Mar. 20, 1901. Serial No. 52,703. (No model.)



Claim.—1. In an engine, a pair of independent double-acting pistons, opposite chambers in which said pistons move, and suitable passages connecting said chambers, each of said pistons being provided with supply and exhaust ports and acting as a valve to control the supply of motive fluid to and exhaust it from both ends of the chamber containing the other piston.

2. In an engine, a pair of chambers, a piston in each chamber, a passage leading from each side of each chamber to one end of the other chamber, a passage communicating with each side of both chambers, and supply and exhaust ports in said pistons controlling the supply and exhaust of the motive fluid through said passages.

3. In an engine, a pair of chambers arranged at right angles and adjacent to each other, a piston in each of said chambers, a passage leading from each side of each chamber to the adjacent end of the other chamber, a passage communicating with both sides of each chamber, and supply and exhaust ports in said pistons controlling the supply and exhaust of the motive fluid from said passages.

4. In an engine, a pair of chambers, a piston in each of said chambers, a passage leading from each side of each chamber to one end of the other chamber, a passage communicating with each side of both chambers, a port in each side of each piston adapted to place one of said first-named passages in communication with said second passage, and an exhaust-port in each side of said piston adapted to be put in communication with one of said first-named passages.

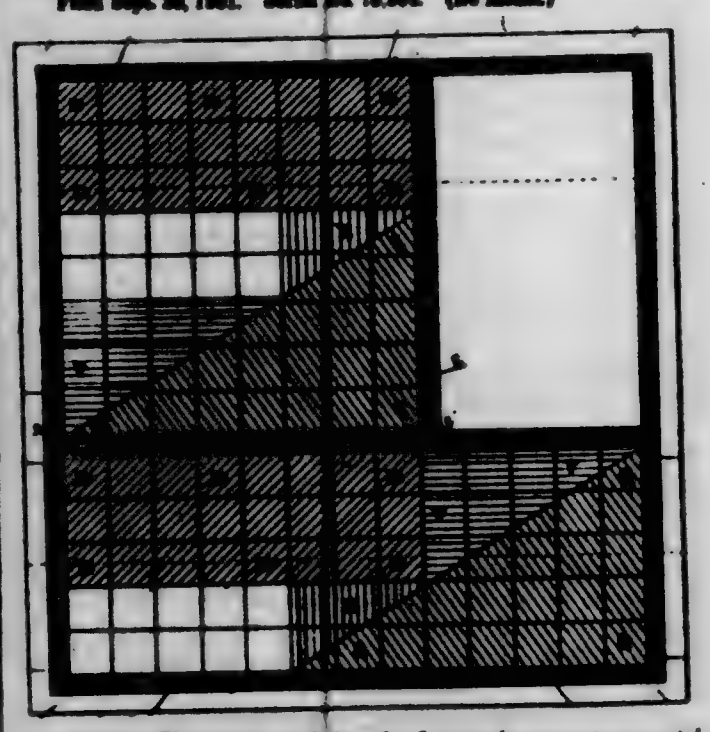
5. In an engine, a pair of chambers, a piston in each of said chambers, a passage leading from each side of each chamber to one end of the other chamber, two passages each in communication with each side of both chambers, and supply and exhaust ports in said pistons controlling the supply and exhaust of the motive fluid through said passages.

6. In an engine, a casing, a pair of chambers formed in said casing, a passage leading from each side of each chamber to one end of the other chamber, said passages being formed in said casing, a passage formed in said casing and communicating with each side of both chambers, and a pair of pistons in said chambers provided with supply and exhaust ports controlling the said passages.

7. In an engine, a casing, a pair of chambers formed in said casing at right angles to each other, a passage leading from each side of each chamber to one end of the other chamber, an annular passage formed in said casing and communicating with each side of both chambers, and a pair of pistons working in said chambers and provided with ports controlling the supply and exhaust through said passages.

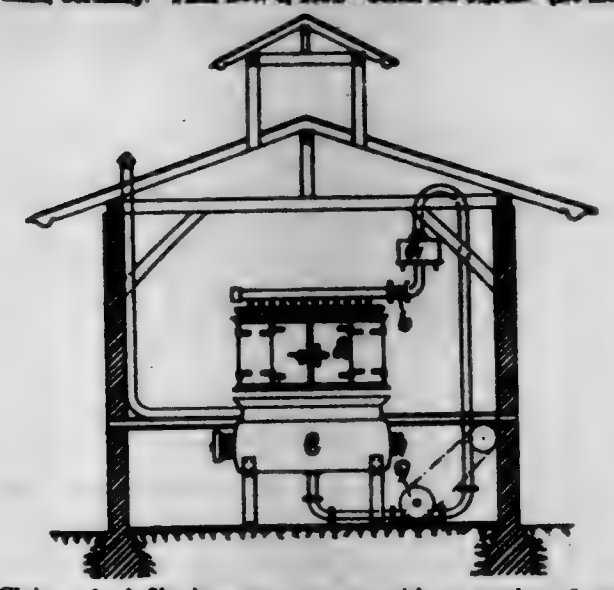
8. In an engine, a casing, a pair of chambers formed in said casing at right angles to each other, a passage leading from each end of each chamber to one side of the other chamber, two annular passages formed in said casing and each communicating with each side of both chambers, and a pair of pistons working in said chambers and provided with ports controlling the supply and exhaust through said passages.

708,558. PUZZLE DEVICE. PAUL F. DE PENN, Pasadena, Cal. Filed Sept. 20, 1901. Serial No. 75,901. (No model.)



Claim.—The device consisting of a flat, nearly square tray, containing within it two receptacles, one of which receptacles has its length to its breadth in the ratio of thirteen to five equal parts and the other of which receptacles has its length to its width in the ratio of eight and one-eighth to eight of the same equal parts, which device also has sixty-five equal-sided square blocks of hard material, the sixty-five equal-sided square blocks twelve of which blocks are divided in a vertical plane by diagonally-drawn straight vertical cuts through the blocks, extending from the left lower angle of the eighth square, counting from right to left of the bottom row of squares upon either long side of the thirteen by five rectangular figure, to the right upper angle of the same side of the said rectangular figure, in the manner and for the purposes substantially as set forth.

708,559. **FILTERING APPARATUS.** EMILE DE MEULEMEESTER, Brussels, Belgium, assignor to Bernhard Möller-Ras, Frankfort-on-the-Main, Germany. Filed Nov. 9, 1901. Serial No. 81,962. (No model.)



Claim.—1. A filtering apparatus, comprising a number of porous filter-cells arranged adjacent to each other, a vat or tank containing said cells, and movable clamping-bars located in the tank and arranged to engage the lower ends of the cells between them, to open or close said ends as the bars are moved apart or together.

2. A filtering apparatus comprising a frame, a tubular filter carried thereby and open at the bottom, said filter being made of flexible or compressible material at said open end, and a clamping device carried by the frame and arranged to engage the compressible material of the filter and thus close the lower end thereof.

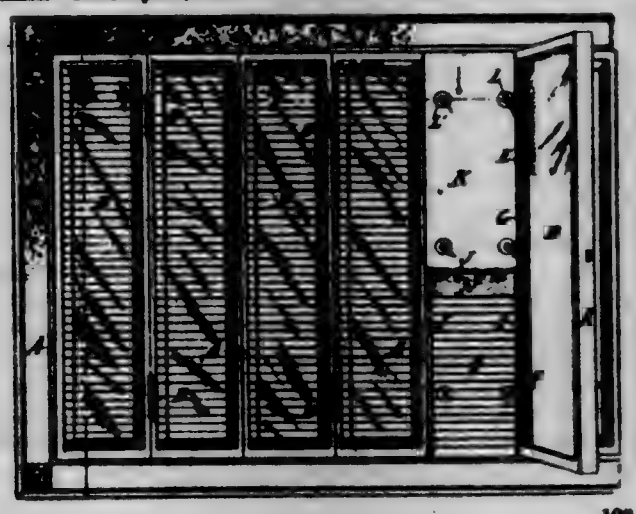
3. A filtering apparatus comprising a frame, a tubular filter carried thereby and open at the bottom, said filter being made of flexible or compressible material at said open end, clamping-bars supported on said frame and located on opposite sides of said filter to engage the compressible material, and means for clamping the filter between said bars, or releasing it therefrom.

4. A filtering apparatus comprising a plurality of upright filters open at the bottom and made of flexible or compressible material, clamping mechanism comprising two sets of clamping members, the members of one set being connected to move in unison, and means for bringing the members of the two sets together to clamp the filters between them, thus closing the lower ends of the filters.

5. A filtering apparatus comprising a plurality of upright filters open at the bottom and made of flexible or compressible material, clamping mechanism comprising parallel clamping-bars arranged in two sets, at each side of the respective filters, rods each connected with the bars of the same set, and mechanism for moving said bars toward and from each other.

6. A filtering apparatus comprising a frame, a plurality of filters carried thereby and open at the bottom, a clamping mechanism carried by the frame, for closing the lower ends of the filters, a tray located beneath the filters and arranged to receive the liquid matter passing therethrough, said tray being movable, so that it may be taken away from under the filters, and a vessel located beneath the tray and arranged to receive the dregs or residue from the filters when the tray has been removed and the lower ends of the filters have been opened.

708,560. **VESTIBULE-DIRECTORY.** FRANK DE SILVA, Boston, Mass. Filed Apr. 8, 1902. Serial No. 101,948. (No model.)

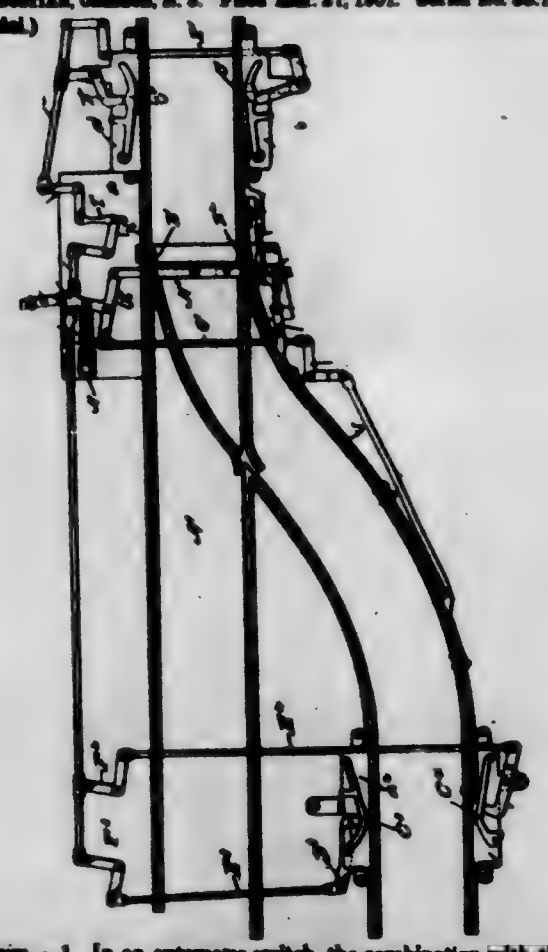


Claim.—1. In a vestibule or hall directory, the glass panel having a bevel formed on each of its longitudinal rearward edges, the adjustable back board provided with reflexed retaining-strips on their longest edges adjacent to said bevels adapted to support the flexible tablets, and means to regulate the distance of the back boards to or from said glass panels substantially in the manner specified.

2. A vestibule or hall directory, comprising individual glass panels provided with bevels on their rearward longest edges, the adjustable back boards having their longitudinal edges provided with means for retaining temporarily curtain name-plates, the fixed backing coacting with said adjustable back boards, and means as hereinbefore described to frontally adjust and secure said back boards with their assembled name-tablets with gentle pressure against the glass frontage substantially in the manner and for the purpose set forth.

3. In combination, the glass panels provided with bevels on their rear longitudinal edges, the reflexed retaining-strips lying contiguous to said bevels in a manner to collectively or singly sustain the name-tablets, the adjustable back boards adapted to support said reflexed strips and means to restrain sliding of said tablets, the fixed backing coacting with the back boards and the adjusting-screws having a circular bearing to regulate the distance intervening between said back boards and the rear faces of the glass panels forming the front of the organized bulletin substantially as specified.

708,561. **AUTOMATIC SWITCH.** NORMAN E. DELL and MERRELL E. BOSTIAN, Camden, N. J. Filed Mar. 27, 1901. Serial No. 53,146. (No model.)

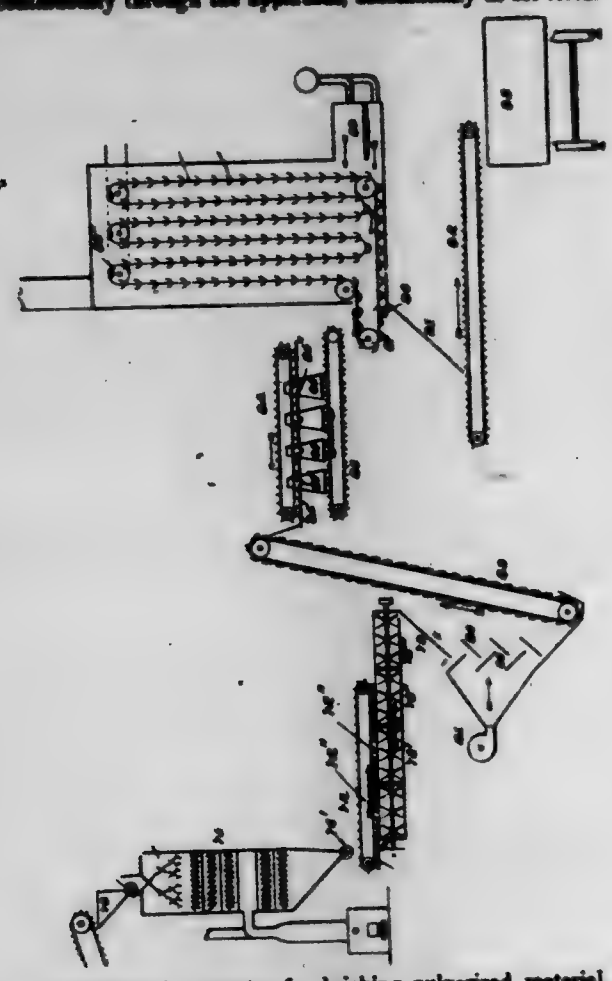


Claim.—1. In an automatic switch, the combination with the main and siding rails, and a movable locking-rail on one of said siding-rails, of a lever, a switch-bar pivotally connected thereto, and spring-actuated pins arranged on opposite sides of the switch-bar, the pins being also pivoted to the said locking-bar to permit of a longitudinal movement of the same and to lock said bar, and means for actuating said lever whereby the switch may be shifted and locked in its shifted position, substantially as specified.

2. In an automatic switch, the combination with the main and siding rails, of a lever, a switch-bar pivotally connected to said lever, and actuated thereby, locking-apertures in said bar, a locking-rail mounted upon one of the siding-rails and having an operating connection with said spring-actuated lever, locking-pins pivotally connected with said locking-rail and located upon opposite sides of the switch-bar, said pins designed to enter the locking-apertures of said bar to lock the same and means for operating said lever whereby the switch may be shifted and locked in its shifted position, substantially as described.

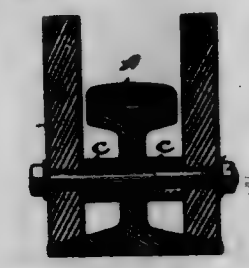
708,562. **APPARATUS FOR REDUCING PULVERIZED MATERIAL.** THOMAS A. EDISON, Llewellyn Park, N. J. Filed May 20, 1898. Serial No. 681,679. (No model.)

Claim.—1. An improved apparatus for bricking pulverized material, comprising a heater for heating the pulverized material, a mixer in which the heated pulverized material is admixed with a binding agent, a cooling device for reducing the temperature of such mixture, a bricking-machine for bricking the mixture, an oven for baking the finished briquets, and means connecting such devices for automatically progressing the material continuously through the apparatus, substantially as set forth.



2. An improved apparatus for bricking pulverized material, comprising a heater for heating the pulverized material, a series of mixers arranged in line, means for feeding a binding agent to the first of said mixers, means for distributing the pulverized material to a plurality of said mixers, a bricking-machine for bricking the pulverized material, an oven for baking the finished briquets, and means connecting such devices for automatically progressing the material continuously through the apparatus, substantially as set forth.

708,563. GUARD FOR THIRD-RAIL SYSTEMS. STERLING ELLIOTT, Boston, Mass. Filed Apr. 3, 1902. Serial No. 101,214. (No model.)



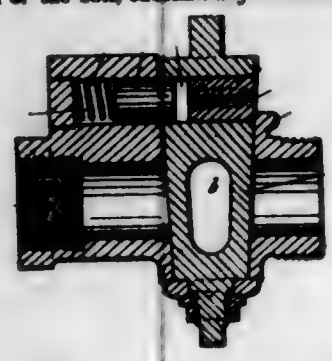
Claim.—1. In combination with the third or electrically-charged rail of an elevated railway, guards resting on the rail-flanges, and extending above the said rail and means for holding said guards in place, substantially as described.

2. In combination with the third or electrically-charged rail of an elevated railway, guards resting on the flanges of said rail and extending above the said rail, bolts, and distance-pieces securing said guards in place, all substantially as described.

708,564. STOP-VALVE. JAMES A. ELLISON, Wilmington, Del. Filed Nov. 26, 1901. Serial No. 83,722. (No model.)

Claim.—1. The combination, with a valve-casing, and a plug journaled therein and provided with a single hole formed transversely through its upper part, of a spring-actuated bolt carried by the said casing and engaging with one end portion of the said hole, and a keyhole-plug in the other end of the said hole, substantially as set forth.

2. The combination, with a valve-casing provided with a keyhole-shield at its top, and a plug journaled in the said casing and provided with a hole in its upper part, of a spring-actuated bolt carried by the said casing and engaging with one end portion of the said hole, and a keyhole-plug closing the other end of the said hole and working against the said shield and the end of the bolt, substantially as set forth.



708,565. CAR-WHEEL. GEORGE B. FARRELL, Wilkesbarre, Pa. Filed Jan. 20, 1902. Serial No. 90,493. (No model.)

Claim.—1. A wheel comprising a rim having integral spokes, and a hub having integral sockets adapted to receive spokes and means for securing said spokes within the sockets, as set forth.

2. A wheel consisting of a rim having integral spokes, and the hub having integral sockets adapted to receive the said spokes, the ends of the spokes bearing upon the exterior of the hub, substantially as shown and described.

3. A wheel comprising a rim having the integral spokes, the inner ends of which are curved upon the arc of a circle and a cylindrical hub having integral sockets adapted to receive the said spokes, the curved ends of said spokes resting upon the cylindrical surface of the hub, and means for securing the spokes within the sockets, substantially as shown and described.

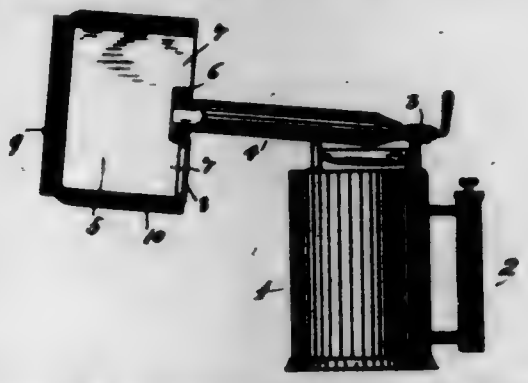
708,566. OIL-BURNER. ADAM H. FOX, Wissahickon, Pa. Filed Sept. 11, 1900. Serial No. 29,701. (No model.)

Claim.—1. A burner comprising a nozzle containing a mixing-chamber, a diaphragm constituting one end of the mixing-chamber and having a conical face and peripheral perforations, a controlled inlet-pipe closing the other end of the mixing-chamber, for admitting air or steam into the mixing-chamber, and a controlled inlet-pipe connected to a port of the nozzle in front of the air or steam port for admitting oil to the mixing-chamber, substantially as and for the purposes set forth.

2. A burner comprising a nozzle containing a mixing-chamber, an integral diaphragm constituting one end of the mixing-chamber and having a conical face and outwardly-divergent peripheral perforations, an integral, open chamber exterior to the diaphragm, a controlled inlet-pipe closing the other end of the mixing-chamber, for admitting air or steam into the mixing-chamber, and a controlled inlet-pipe connected to a port of the nozzle in front of the air or steam port for admitting oil to the mixing-chamber, substantially as and for the purposes set forth.

3. A burner comprising a nozzle containing a mixing-chamber, a diaphragm constituting one end of the mixing-chamber and having a conical face and peripheral perforations, a controlled inlet-pipe closing the other end of the mixing-chamber, for admitting air or steam into the mixing-chamber, and a controlled inlet-pipe connected to a port of the nozzle in front of the air or steam port for admitting oil to the mixing-chamber, in combination with a brick having a tapering aperture, substantially as and for the purposes set forth.

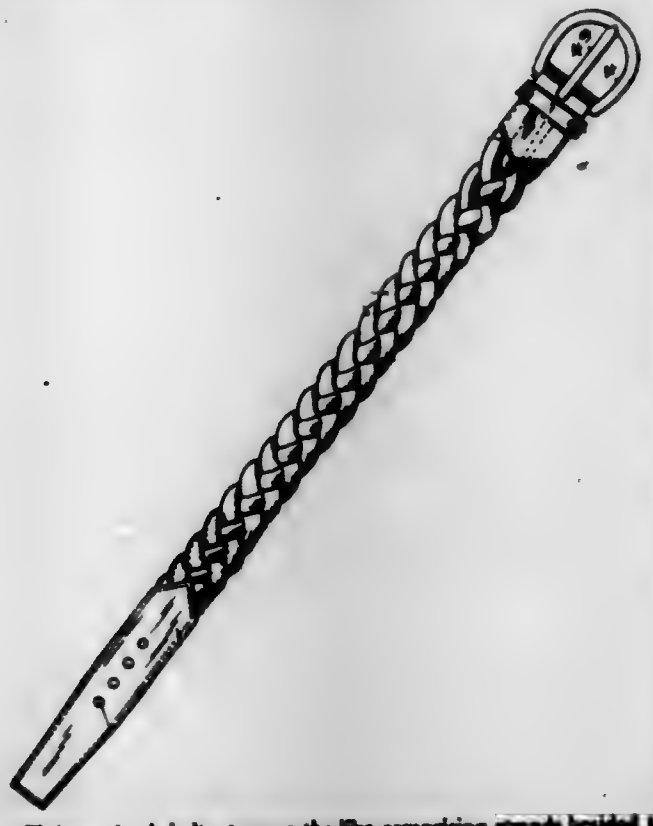
708,567. BRANDING-IRON. FRANK FRAHM, Fargo, N. D. Filed Aug. 26, 1901. Serial No. 73,243. (No model.)



Claim.—1. The combination with a burner of the character described, having a suitable headpiece and provided with a projecting flame-tube 4, of the branding-head 5 having the centrally-located hub 6 and backturned flame-passage 7 located above said tube 4, the side walls of said head 5 being imperforate, substantially as described.

2. The combination with the burner of the character described having a suitable headpiece and horizontally-projecting flame-tube 4, of the branding-head 5 having a centrally-located hub 6 and backturned flame-passages 7 on opposite sides of said hub, and the removable cap or stopper 8 fitting both of the said passages 7 to close one or the other thereof, at will, said head 5 having imperforate side walls, substantially as described.

708,568. WAIST-BELT. HENRY J. GARRIAN and JOSEPH ROSS, New York, N. Y.; said Ross assignor to said Garrian and Ferdinand S. H. Rau, New York, N. Y. Filed Sept. 7, 1901. Serial No. 74,661. (No model.)

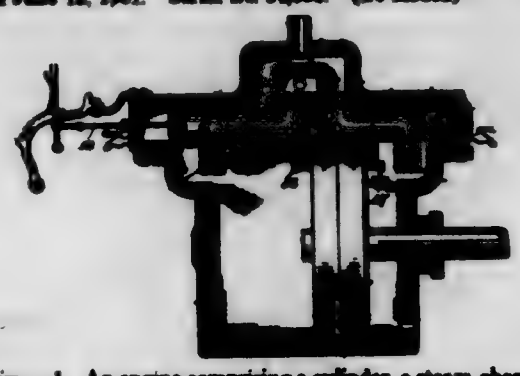


Claim.—1. A belt, strap or the like comprising strands braided together, the material of the strands being folded upon itself in a longitudinal direction so that the edges face each other, and portions secured to said strands, and means for attaching the end portions together, substantially as described.

2. A belt, strap or the like comprising strands braided together, the material of the strands being folded upon itself in a longitudinal direction and the longitudinal edges secured together, and portions comprising material forming a space in which the ends of the strands are located and secured, and means for attaching the end portions together, substantially as described.

3. A belt, strap or the like comprising strands braided together, the material of the strands being folded in a longitudinal direction upon itself providing rounded edges, the abutting edges of the material being secured together, and portions composed of material folded in a longitudinal direction and its edges secured together forming bores in which the ends of the strands are located and secured, and a buckle secured to one of the end portions, substantially as described.

708,569. VALVE-GEAR. KASIMIRO C. GEBLE, Finley, N. D. Filed June 12, 1901. Serial No. 64,332. (No model.)

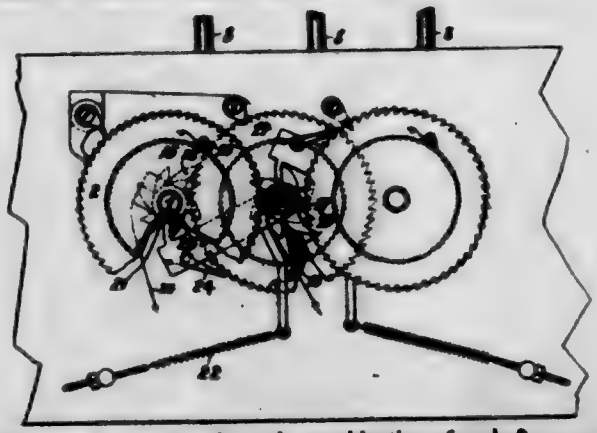


Claim.—1. An engine comprising a cylinder, a steam-chest, a valve-chamber between the cylinder and chest and communicating with the ends of the cylinder, a valve in the chamber and having studs projecting into the cylinder, inlet and outlet ports for the chest, said valve having passages for registration with the ports to communicate the chest with the ends of the cylinder alternately, a piston in the cylinder having strikers for engagement with the studs to shift the valve, and a stem for the valve passed outwardly through the chamber for shifting the valve manually, the stem having a degree of lost motion with respect to the valve.

2. An engine comprising a steam-chest, a valve-chamber between the cylinder and chest and communicating with the ends of the cylinder, a valve in the chamber and having studs projecting into the cylinder, passages formed through the valve for communicating the ends of the cylinder alternately with the chest, a piston in the cylinder, strikers carried by the piston for engagement with the studs to shift the valve, and means for manually shifting the valve initially.

3. An engine comprising a cylinder, a steam-chest, a valve-chamber between the cylinder and chest and communicating with the ends of the cylinder, a valve in the chamber and having studs projecting into the cylinder, inlet and outlet ports for the chest, said valve having passages for registration with the ports to communicate the chest with the ends of the cylinder alternately, a piston in the cylinder having strikers for engagement with the studs to shift the valve, a stem for the valve passed outwardly through the chamber for shifting the valve manually, the stem having a degree of lost motion with respect to the valve, and means for manually shifting the valve initially.

708,570. CASH-REGISTER. ADOLF GERDES, Berlin, Germany. Filed Oct. 22, 1901. Serial No. 79,573. (No model.)

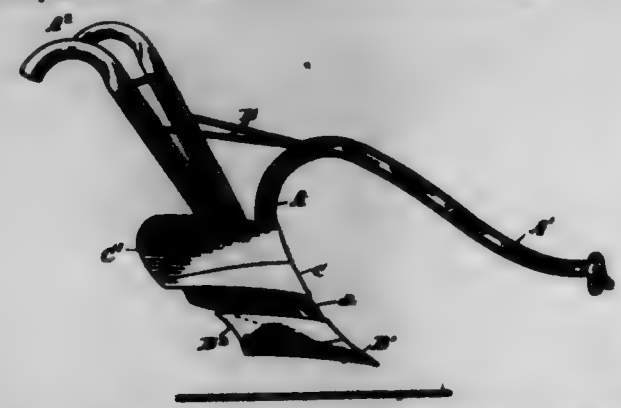


Claim.—In a cash-register the combination of a shaft, a cross-rod parallel therete and connected therewith and adapted to partially rotate therewith, key-plungers, arms on said plungers adapted to engage said rod and rotate said shaft by pressing down said key-plungers, a spring on each of said plungers, a ratchet rigidly mounted on said shaft, a train-wheel loosely mounted on said shaft and adjacent to said ratchet, a pawl on said wheel, a second ratchet on said wheel, a spring-actuated arm engaging said second ratchet, a pawl on said arm, a tens-wheel adapted to be operated by said arm and pawl, a second shaft carrying said tens-wheel, a ratchet rigidly mounted on said second shaft and a pawl on said tens-wheel engaging said latter ratchet, substantially as described.

708,571. PLOW. ALFRED K. GOODNOW, San Francisco, Cal., assignor to George H. Bahrs, San Francisco, Cal. Filed Aug. 7, 1901. Serial No. 71,139. (No model.)

Claim.—In a plow, the combination with a gooseneched beam A' and standard A continuous from end to end, a subsoil-share B' secured to the lower end of the standard, a wing B² carried by said share, a surface-share C secured to said standard near the upper portion thereof so as to leave a space between the same and said first-mentioned share, a moldboard C'

carried by said surface-shave, separated operating-handles projecting rearwardly from said shaves, and braces B, B, one between each handle and the rear portion of the beam A'; substantially as described.

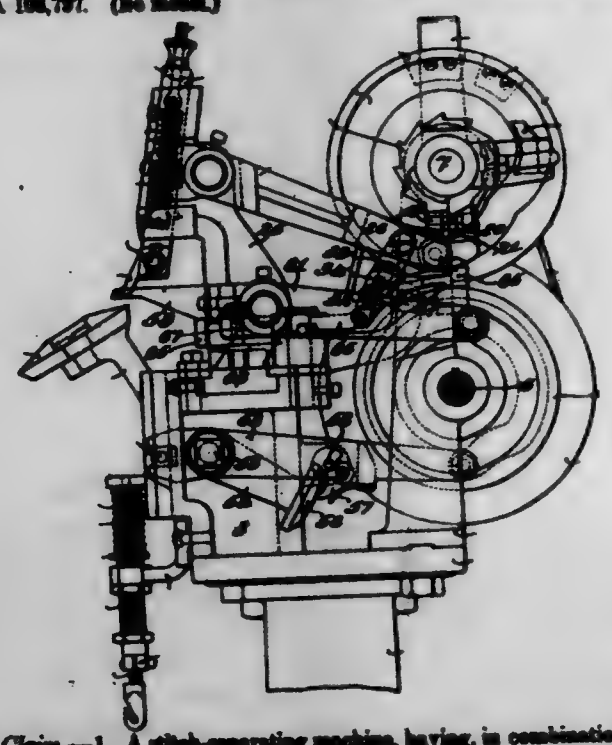


708,572. STRINGED MUSICAL INSTRUMENT. KARL GRIENAUER, New York, N. Y. Filed Mar. 22, 1902. Serial No. 100,590. (No model.)

Claim.—1. A stringed musical instrument provided with a resonating-chamber, transversely-arranged threaded braces traversing said chamber, and adjusting-nuts on the outer side of the chamber that engage said braces, substantially as specified.

2. A stringed musical instrument provided with a resonating-chamber, a slotted head extending along one edge of said chamber, a pair of transverse diagonal braces, and oblong nuts engaging said braces and fitted within the head-slots, substantially as specified.

708,573. STITCH-SEPARATING MACHINE. JOHN B. HADAWAY, Brockton, Mass. Filed Sept. 30, 1901. Renewed May 24, 1902. Serial No. 108,797. (No model.)



Claim.—1. A stitch-separating machine, having, in combination, an indenting-tool, and means controlled by the stitch intervals for actuating the indenting-tool to indent the stitch intervals, substantially as described.

2. A stitch-separating machine, having, in combination, an indenting-tool, means for relatively moving the work and tool to locate the tool in the stitch intervals, and means controlled by the stitch intervals for actuating the indenting-tool when so located to indent the stitch intervals, substantially as described.

3. A stitch-separating machine, having, in combination, an indenting-tool, means for feeding the work, and means controlled by the stitch intervals for actuating the indenting-tool to indent the stitch intervals when brought into position to be acted upon by the tool, substantially as described.

4. A stitch-separating machine, having, in combination, an indenting-tool, means for feeding the work, means for holding the tool in contact with the work and causing it to enter the stitch intervals, and means thrown into operation by the movement of the tool into a stitch interval for actuating the tool to indent the stitch intervals, substantially as described.

5. A stitch-separating machine, having, in combination, an indenting-tool, means for holding the tool in contact with the work and causing it to enter the stitch intervals, and means thrown into operation by the movement of the tool into a stitch interval for actuating the tool to indent the stitch intervals, substantially as described.

6. A stitch-separating machine, having, in combination, an indenting-tool, a spring for holding the tool in contact with the work and causing it to enter the stitch intervals, and means thrown into operation by the spring when the tool enters a stitch interval for actuating the tool to indent the stitch intervals, substantially as described.

7. A stitch-separating machine, having, in combination, an indenting-tool, a cam for actuating the tool, driving mechanism for the cam, means controlled by the stitch intervals for connecting the cam to its driving mechanism, and means to disconnect the cam from its driving mechanism, substantially as described.

8. A stitch-separating machine, having, in combination, an indenting-tool, a cam for actuating the tool, driving mechanism for the cam, means for holding the cam in position, means controlled by the stitch intervals for releasing the cam and connecting it to its driving mechanism, and means to disconnect the cam from its driving mechanism, substantially as described.

9. A stitch-separating machine, having, in combination, an indenting-tool, a cam for actuating the indenting-tool, driving mechanism for the cam, means for holding the cam in position, means controlled by the stitch intervals for releasing the cam and connecting it to its driving mechanism, means to disconnect the cam from its driving mechanism, and a brake for retarding the motion of the cam when disconnected, substantially as described.

10. A stitch-separating machine, having, in combination, an indenting-tool, an actuating-lever therefor, a cam for actuating the lever, driving mechanism for the cam, a clutch for connecting the cam to its driving mechanism, means for holding the indenting-tool in contact with the work and for moving its actuating-lever to actuate the clutch to connect the cam to its driving mechanism when a stitch interval has been brought beneath the indenting-tool, and means acting automatically to actuate the clutch to disconnect the cam from its driving mechanism, substantially as described.

11. A stitch-separating machine, having, in combination, an indenting-tool, an actuating-lever therefor, a cam for actuating the lever, driving mechanism for the cam, a clutch for connecting the cam to its driving mechanism, a step for holding the cam in position, means for holding the indenting-tool in contact with the work and for moving its actuating-lever to actuate the step to release the cam and to actuate the clutch to connect the cam to its driving mechanism when a stitch interval has been brought beneath the indenting-tool, and means acting automatically to actuate the clutch to disconnect the cam from its driving mechanism, substantially as described.

12. A stitch-separating machine, having, in combination, an indenting-tool, actuating mechanism therefor and two four-motion feed devices acting alternately to feed the work past the indenting-tool, substantially as described.

708,574. STITCH-SEPARATING MACHINE. JOHN B. HADAWAY, Brockton, Mass. Filed Sept. 30, 1901. Renewed May 24, 1902. Serial No. 108,798. (No model.)

Claim.—1. A stitch-separating machine, having, in combination, an indenting-tool, a finder arranged to enter the stitch intervals, and means controlled by the finder for actuating the indenting-tool to indent the stitch intervals, substantially as described.

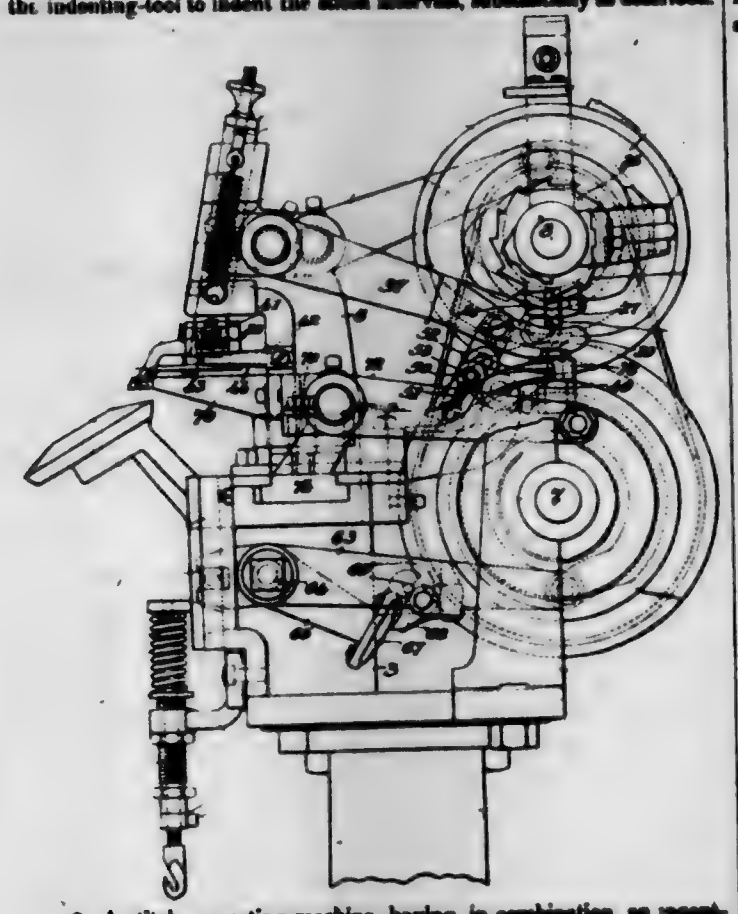
2. A stitch-separating machine, having, in combination, an indenting-tool, mechanism for actuating the tool, a finder arranged to enter the stitch intervals, and connections between the finder and the mechanism for actuating the tool acting to throw said mechanism into operation when the finder enters a stitch interval, substantially as described.

3. A stitch-separating machine, having, in combination, an indenting-tool, a finder, means for holding the finder in contact with the work and causing it to enter the stitch intervals, and means thrown into operation by the movement of the finder into a stitch interval for actuating the indenting-tool to indent the stitch intervals, substantially as described.

4. A stitch-separating machine, having, in combination, an indenting-tool, a finder, means for holding the finder in contact with the work and causing it to enter the stitch intervals, means for feeding the work, and means thrown into operation by the movement of the finder into a stitch interval for actuating the indenting-tool to indent the stitch intervals, substantially as described.

5. A stitch-separating machine, having, in combination, an indent-

ing-tool, a finder, a spring for holding the finder in contact with the work and causing it to enter the stitch intervals, and means thrown into operation by the spring when the finder enters a stitch interval for actuating the indenting-tool to indent the stitch intervals, substantially as described.



6. A stitch-operating machine, having, in combination, an indenting-tool, a finder arranged to enter the stitch intervals, and means controlled by the finder for withdrawing the finder from the stitch intervals and for actuating the indenting-tool to indent the stitch intervals, substantially as described.

7. A stitch-operating machine, having, in combination, an indenting-tool, a finder, means for holding the finder in contact with the work and causing it to enter the stitch intervals, and means thrown into operation by the movement of the finder into a stitch interval for withdrawing the finder from the stitch intervals and for actuating the indenting-tool to indent the stitch intervals, substantially as described.

8. A stitch-operating machine, having, in combination, an indenting-tool, a finder, means for holding the finder in contact with the work and causing it to enter the stitch intervals, means for feeding the work, and means thrown into operation by the movement of the finder into a stitch interval for withdrawing the finder from the stitch intervals and for actuating the indenting-tool to indent the stitch intervals, substantially as described.

9. A stitch-operating machine, having, in combination, an indenting-tool, a finder, cams for actuating the finder to withdraw from the stitch intervals and for actuating the indenting-tool to indent the stitch intervals, driving mechanism for the cams, a clutch for connecting the cams to their driving mechanism, means for holding the finder in contact with the work and for causing it to enter the stitch intervals, and connections between the finder and the clutch for actuating the clutch to connect the cams to their driving mechanism when the finder enters a stitch interval, substantially as described.

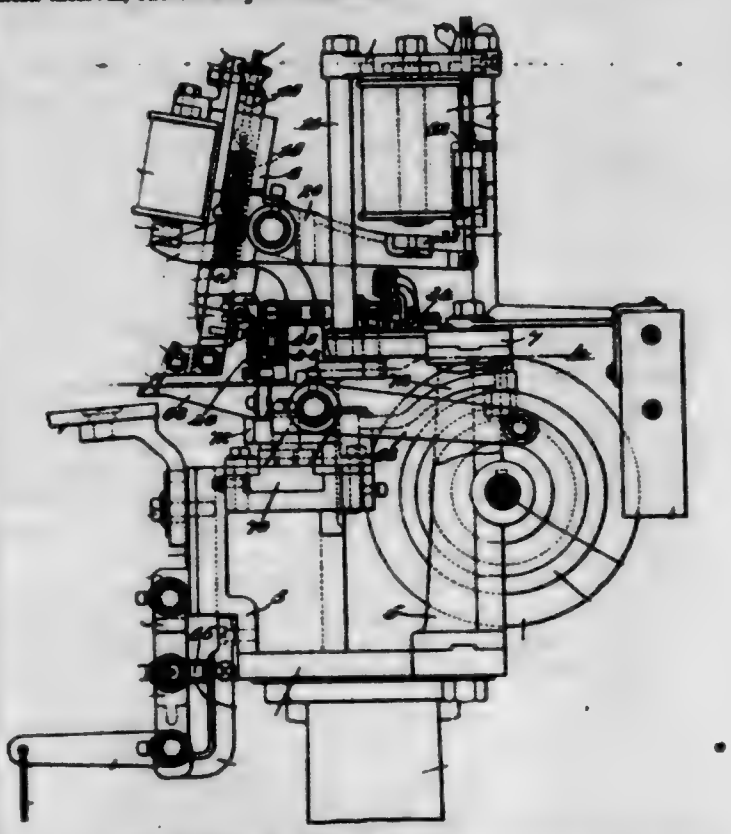
708,575. STITCH-SEPARATING MACHINE. JOHN B. HARAWAY, Brockton, Mass. Filed Nov. 4, 1901. Serial No. 81,971. (No model.)

Claim.—1. A stitch-operating machine, having, in combination, an indenting-tool and electromechanical means controlled by the stitch intervals for actuating the indenting-tool to indent the stitch intervals, substantially as described.

2. A stitch-operating machine, having, in combination, an indenting-tool, electromechanical means for actuating the indenting-tool to indent the stitch intervals, and a circuit-controller for said means controlled by the stitch intervals, substantially as described.

3. A stitch-operating machine, having, in combination, an indenting-tool, electromechanical means for actuating the indenting-tool to indent the stitch intervals including a pressure-magnet and a retracting-magnet, means controlled by the stitch intervals for closing a circuit through the pressure-magnet, and means for breaking said circuit and for closing a circuit through the retracting-magnet, substantially as described.

4. A stitch-operating machine, having, in combination, an indenting-tool, means for holding the tool in contact with the work and causing it to enter the stitch intervals, electromechanical means for actuating the indenting-tool to indent the stitch intervals, and a circuit-controller for said means thrown into operation by the movement of the tool into a stitch interval, substantially as described.



5. A stitch-operating machine, having, in combination, an indenting-tool, electromechanical means for actuating the indenting-tool to indent the stitch intervals including a pressure-magnet, and means controlled by the stitch intervals for closing the circuit of said magnet, substantially as described.

6. A stitch-operating machine, having, in combination, an indenting-tool, electromechanical means for actuating the indenting-tool to indent the stitch intervals including a pressure-magnet and a retracting-magnet, means controlled by the stitch intervals for closing a circuit through the pressure-magnet, means for breaking said circuit and for closing a circuit through the retracting-magnet, and means for retarding the retracting movement of the tool, substantially as described.

7. A stitch-operating machine, having, in combination, an indenting-tool, means for holding the indenting-tool in contact with the work and causing it to enter the stitch intervals, electromechanical means for actuating the indenting-tool to indent the stitch intervals including a pressure-magnet, and means thrown into operation by the movement of the tool into a stitch interval for closing the circuit of said magnet, substantially as described.

8. A stitch-operating machine, having, in combination, an indenting-tool, means for holding the indenting-tool in contact with the work and causing it to enter the stitch intervals, electromechanical means for actuating the indenting-tool to indent the stitch intervals including a pressure-magnet and a retracting-magnet, means thrown into operation by the movement of the tool into a stitch interval for closing the circuit of the pressure-magnet, and means thrown into operation by the indenting movement of the tool for breaking said circuit and for closing the circuit of the retracting-magnet, substantially as described.

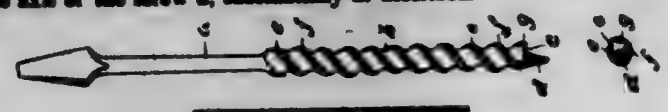
9. A stitch-operating machine, having, in combination, an indenting-tool, means for relatively moving the work and tool to locate the tool in the stitch intervals, electromechanical means for actuating the indenting-tool to indent the stitch intervals and a circuit-controller for said means thrown into operation when the tool has been located in a stitch interval, substantially as described.

10. A stitch-operating machine, having, in combination, an indenting-tool, means for feeding the work, electromechanical means for actuating the indenting-tool to indent the stitch intervals, and a circuit-controller for said means controlled by the stitch intervals acting to throw said means into operation when a stitch interval is brought into a position to be acted upon by the indenting-tool, substantially as described.

708,576. TWISTED AUGER. GUSTAV HALLERMEIER, Remscheid, Germany. Filed Aug. 8, 1901. Serial No. 71,307. (No model.)

Claim.—A twisted auger with screw-thread disposed eccentrically to the cutting edge and characterized by having the edge *e* of the worm

b run out into a screw *d*, the edge *f* into a cutter *g*, between which the worm *b* is extended into a cutting edge *c*, formed at any desired angle to the axis of the screw *d*, substantially as described.

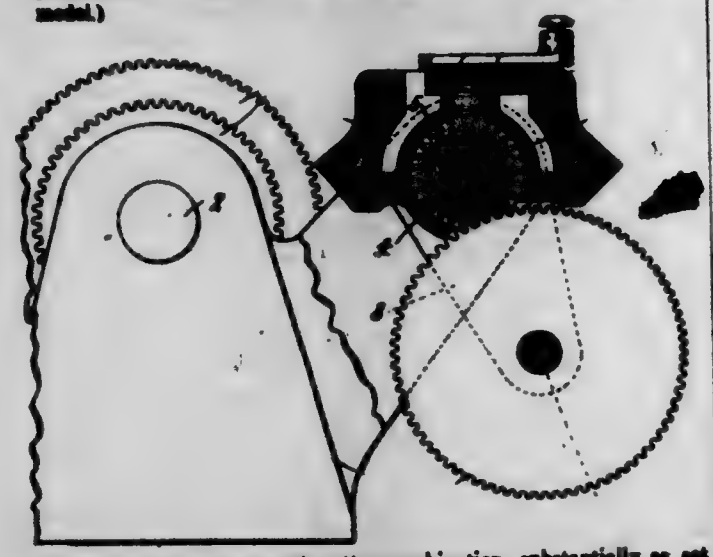


708,577. MILLING-CUTTER. ROBERT H. W. HASSER, Hartford, Conn., assignor to Pratt & Whitney Company, Hartford, Conn., a Corporation of New Jersey. Filed July 5, 1901. Serial No. 67,110. (No model.)

Claim.—1. A contour-milling cutter having one or more teeth of the full contour to be cut, and having some of the remaining teeth relieved below the contour at different portions of succeeding teeth.

2. A thread-milling cutter, provided with closely-adjacent integral teeth, having the contour of a truncated V, the succeeding teeth being relieved slightly below the cutting contour on alternately opposite sides, whereby the chips are cleared out of the cut by each tooth while providing for the flow of oil directly to the cutting edges of the succeeding teeth.

708,578. GEAR-TUMBLER. ROBERT H. W. HASSER and FREDERICK W. SOMMER, Hartford, Conn., assignors to Pratt & Whitney Company, Hartford, Conn. Filed Mar. 24, 1902. Serial No. 99,590. (No model.)



Claim.—In a gear-tumbler, the combination, substantially as set forth, of a shaft, a long pinion carried thereby, a slotted guideway disposed parallel with said shaft and partly inclosing said pinion, journal-bearings at the ends of the guideway and supporting same on an axis coincident with that of said shaft, a tube encircling said long pinion and having wings engaging the guideway, arms projecting from said tube, a gear journaled in said arms and engaging said long pinion, and means for locking the tube and guideway in adjusted positions.

708,579. TROUSERS-GUARD. JAMES H. HARDY, Waco, Tex. Filed Aug. 28, 1901. Serial No. 73,737. (No model.)

Claim.—1. In a device of the character described, a strip of spring metal bent to form the body portion, as shown and described, a V-shaped front portion, each prong of the V-shaped portion adapted to be adjusted longitudinally of the guard upon the ends of the body portion, and pins secured to the outside of the guard for the purpose of securing the trousers-leg to the same, substantially as and for the purpose specified.

2. In a device of the character described, an interior circular portion adapted to embrace the foot above the ankle, a throat extending outward from the interior of the circular portion to the exterior of the guard, parallel portions forming the sides of said throat and adapted to connect the circular portion with the exterior rim, the front portion of the exterior rim adapted to be formed independent of the rear portion, means for adjusting the front portion longitudinally relative to the rear portion, both the front and rear portions adapted to be formed of spring metal, and means secured to the exterior rim for securing the trousers-leg to the guard, substantially as and for the purpose set forth.

708,580. LOOM FOR WEAVING VELVETS. WILLIAM S. HARTLEY, Lowell, Mass. Filed Mar. 9, 1901. Serial No. 50,413. (No model.)

Claim.—In a loom for weaving loop or pile fabrics the combination of a reed, one or more wires held at their back ends and extending through between the dents of the reed parallel with the warp-threads with their front ends resting on the woven cloth, one or more deep-heddles, and an auxiliary heddle to control a pile-warp, substantially as described.

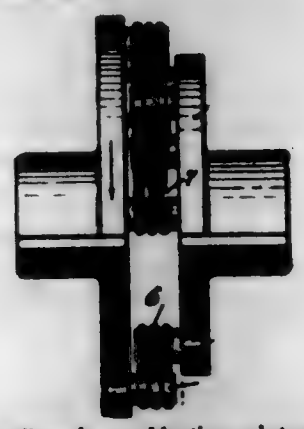
708,581. METALLIC SHOE-HEEL. HENRY HELLWIG, Milwaukee, Wis. Filed Oct. 28, 1901. Serial No. 80,176. (No model.)

Claim.—1. As a new manufacture, a shoe-heel comprising a cast-metal shell, provided with a plurality of transverse strengthening-trusses cast integral with, and connecting, the opposing walls of said shell; malleable fastening-plates, provided with a plurality of fastening-barbs, formed integral therewith, embedded at their ends in said walls, and throughout their lengths in said trusses, as set forth.

2. As a new manufacture, a shoe-heel comprising a cast-metal shell, provided with a plurality of transverse strengthening-trusses cast integral with, and connecting, the opposing walls of said shell; malleable fastening-plates, provided with a plurality of fastening-barbs, formed integral therewith, embedded at their ends in said walls, and throughout their lengths in said trusses; horizontal fastening-pieces cast integral with the lower end of said shell, provided with a plurality of screw-threaded apertures; a plurality of double-pointed fastening-screws, located in said apertures; and a non-metallic tread-piece secured to the heel by said screws, all substantially as and for the purpose specified.

708,582. FLEXIBLE SHAFT-COUPLING. GEORGE C. HIGHT, Jr., Connersville, Ind., assignor to the P. H. & F. M. Roots Company, Connersville, Ind. Filed Feb. 26, 1902. Serial No. 96,051. (No model.)

Claim.—1. In a shaft-coupling, the combination, substantially as set forth, of a pair of flanges adapted to be secured to the shafts to be coupled, circumferentially-grooved studs projecting from the face of each flange toward the face of the other flange, the studs being arranged in a circular series upon each flange and the two series being concentric with each other, and a rope engaging grooves of all of the studs, zigzagging from within the smaller circle of studs to without the larger circle of studs and free of the faces of the flanges.

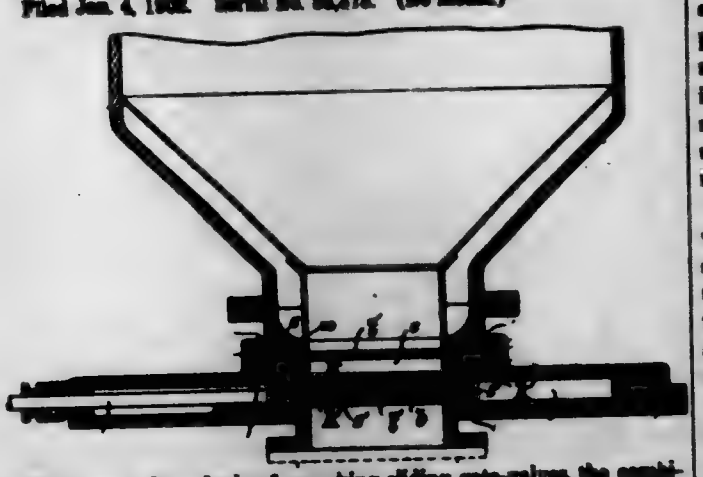


2. In a shaft-coupling, the combination, substantially as set forth, of a pair of flanges adapted to be secured to the shafts to be coupled, studs provided with a plurality of circumferential grooves and projecting in circular series from one of the flanges toward the other, a similar series of studs arranged in a smaller circle upon the second flange and projecting toward the first flange, and an endless rope arranged in zigzag course and engaging all of the grooves of all of the studs and free of the faces of the flanges.

3. In a shaft-coupling, the combination, substantially as set forth, of a pair of flanges adapted to be secured to the shafts to be coupled, studs provided with a plurality of circumferential grooves and projecting in circular series from one of the flanges toward the other, a similar series of studs arranged in a smaller circle upon the second flange and projecting toward the first flange, an endless rope arranged in zigzag course and engaging all of the grooves of all of the studs, and double-eyed links applied to the crossings in said rope where it diverges from one set of stud-grooves to the other.

4. In a shaft-coupling, the combination, substantially as set forth, of a pair of flanges adapted to be secured to the shafts to be coupled, studs projecting from the face of each flange toward the face of the other flange, the studs being arranged in a circular series upon each flange and the two series being concentric with each other, a rope engaging all of the studs, zigzagging from within the smaller circle of studs to without the larger circle of studs and free of the faces of the flanges, and means carried by said studs and engaging the rope and serving to prevent its sidewise displacement upon the studs.

708,588. DEVICE FOR PACKING SLIDING GATE-VALVES. LEOPOLD HIRT, Grevenbrück, Germany, assignor to Maschinenfabrik Grevenbrück, vormals Langen & Hundhausen, Grevenbrück, Germany. Filed Jan. 4, 1902. Serial No. 88,272. (No model.)



Claim.—1. In a device for packing sliding gate-valves, the combination with a slide situated in a casing, of an insertion-piece provided with packing-diaphragms and removably arranged in the slide-casing, with the object set forth.

2. In a device for packing sliding gate-valves, the combination with a slide situated in a casing, of an insertion-piece removably arranged in the slide-casing, which insertion-piece has two rings connected with one another by means of bars, which rings form a channel or passage adapted to be filled with a pressure medium, and closed above and below by packing-diaphragms.

708,584. ADJUSTABLE CLASP-BUCKLE AND COMBINATION. FREDERICK F. HOSKIN, Battlecreek, Mich. Filed Feb. 10, 1902. Serial No. 93,463. (No model.)

Claim.—1. The combination of a suitable strap with a transverse loop secured thereto; a clasp-plate with a transverse aperture to receive the loop on the said strap; and a tuck-strap connected with the clasp-plate adapted to extend through the projecting loop of the main strap and retain the clasp in position, as specified.

2. The combination of a clasp-plate C containing a transverse aperture; a tuck-strap connected thereto and extending beyond the said transverse aperture to extend through a suitable loop and retain the clasp in position thereon, as specified.

3. The combination of a clasp-plate C having a transverse slot in the end thereof; means of suitably securing the same to the tuck-strap, the end of which projects beyond the transverse aperture for use in connection with a loop adapted to extend through the transverse slot and be engaged by the tuck-strap as specified.

4. The combination of a clasp-plate containing an aperture; a part adapted to be secured to a strap and project through said aperture; and a tuck-strap connected with a clasp-plate to retain the clasp part in position, as specified.

708,585. FISHING-REEL. JULIUS VON HOFE, Brooklyn, N. Y. Filed Dec. 4, 1901. Serial No. 84,681. (No model.)

Claim.—1. In a fishing-reel, the combination with the spool of a click-plate bearing a pawl and its spring and movable edgewise, a drag movable with said plate, means for moving said plate and therewith said pawl and said drag into effective position, and means for retracting the same; the whole being so organized that when and while the line is withdrawn from the spool both the pawl and the drag simultaneously oppose such withdrawal, whereas when and while the line is reeled in the pawl and drag are simultaneously and automatically withdrawn from action.

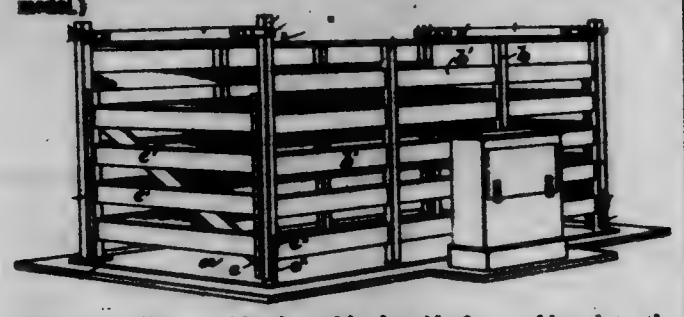
2. In a fishing-reel, the combination with the spool of a pivoted click-plate, bearing a pawl and its spring and movable edgewise, a drag attached to said plate and movable therewith, a spring for moving said plate and therewith said pawl and said drag into effective position and means for automatically retracting the same; the whole being so organized that both the pawl and the drag simultaneously and automatically resist the withdrawal of the line, yet automatically and simultaneously move out of action and offer practically no resistance when the line is reeled in.

3. In a fishing-reel, a click-plate pivoted near one side and provided with a pawl and its spring, in combination with a drag attached thereto and superimposed thereon; a spring bearing upon said click-plate and tending to move its pawl toward the center of the reel; and a movable finger acting upon said click-plate; the whole so combined that the click and drag may simultaneously be put and retained in action, or withdrawn from action and so retained, at the will of the user.

4. In a fishing-reel, the combination with the spool having a concave frictional surface of a drag movable edgewise on a pivot eccentric to the spool's axis and having a frictional free end, and means for moving said drag into frictional contact with the spool to resist the withdrawal of the line; the organization being such that the drag is automatically retracted to free the spool when the line is reeled in.

5. In a fishing-reel, the combination with the spool having a concave frictional surface of a drag movable edgewise on a pivot eccentric to the spool's axis and having a frictional free end, and a spring for moving said drag into frictional contact with the spool to resist the withdrawal of the line; the organization being such that the drag is automatically retracted to free the spool when the line is reeled in.

708,586. STOCK-RACK FOR PLATFORM-SCALES. CHARLES B. EDMAN, Chillicothe, Ohio. Filed Mar. 28, 1902. Serial No. 99,454. (No model.)



Claim.—1. The combination with the side frames hinged to the scale-platform, cross-bars connecting said frames, of means connecting said frames and platform adapted to incline and tighten said frames to said cross-bars, substantially as specified.

2. The combination with the side frames hinged to the scale-platform and cross-bars connecting said frames, of means engaging said frames and platform adapted to incline and tighten said frames to said cross-bars in their closed position and to form an adjustable stop for said frames when said cross-bars are released, substantially as specified.

3. The combination with the side frames hinged to the scale-platform, the cross-bars connecting the side frames and the end gates hinged to said side frames, of means engaging said side frames and platform adapted to spread and incline the side frames outwardly, thereby tightening them to the cross-bars and lifting the outer ends of the gates, substantially as specified.

4. The combination with the side frames hinged to the scale-platform, legs on said side frames, and cross-bars connecting said side frames, of hasps, one end of said hasps being secured to said platform and the other end adapted to engage said legs to form stops to hold said side frames when the cross-bars are released.

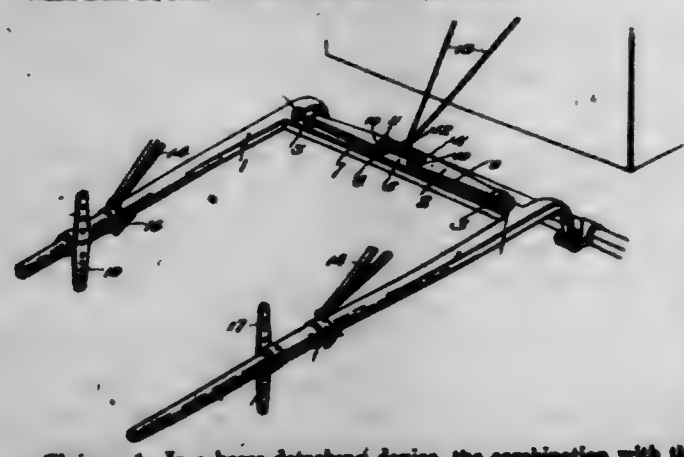
5. The combination with the side frames hinged to said platform, legs on said side frames and cross-bars connecting said side frames, of hasps, one end of said hasps being secured to said platform, and means on the other end to engage said legs to tighten said side frames and cross-bars in their closed position, substantially as specified.

6. The combination with the side frames hinged to the scale-platform, legs on said side frames, cross-bars connecting said side frames, and end gates hinged to said side frames, of hasps, one end of said hasps being secured to said platform, and means on the other end to engage said legs and spread and incline the side frames outwardly, thereby tightening them to the cross-bars and lifting the outer ends of the gates, substantially as specified.

7. The combination of the side frames hinged to the scale-platform, cross-bars connecting said frames, and means, including a screw-threaded connection, between said frames and platform, to form an adjustable stop for said frames, substantially as specified.

8. The combination with the side frames hinged to the platform, an adjustable connection between said frames and platform, the cross-bars, and means to tighten and lock said cross-bars in their closed position against the tension of said adjustable connection, substantially as specified.

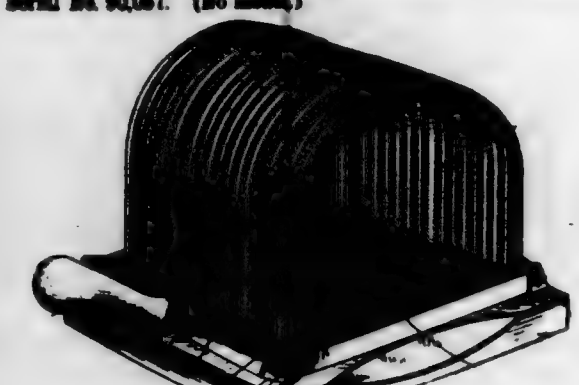
708,587. HORSE-DETACHER. ELIJAH D. IRWIN, Purcell, I. T. Filed Dec. 12, 1901. Serial No. 85,994. (No model.)



Claim.—1. In a horse-detaching device, the combination with the singletree formed with grooves in its forward side, sleeves secured to the ends of the singletree and provided with stop-lips, a spring-casing secured to the forward side of the singletree and a coiled spring located within said casing, of plunger-rods mounted to slide in said grooves and through the sleeves at the ends of the singletree and having their inner ends doubled upon themselves and projecting into the ends of the coiled spring and terminating in vertical posts against which the ends of the coiled spring abut and by means of which the outer ends of said plunger-rods are adapted normally to engage the stop-lips aforesaid, and means for moving the posts toward each other, substantially as set forth.

2. In a horse-detaching device the combination with the singletree formed with grooves in its forward side, sleeves secured to the ends of the singletree and provided with stop-lips, a spring-casing secured to the forward side of the singletree, and a coil-spring located within said casing, plunger-rods mounted to slide in said grooves and through the sleeves at the ends of the singletree and having their inner ends doubled upon themselves and projecting into the ends of the coil-spring and terminating in vertical posts against which the ends of the coil-spring abut and by means of which the outer ends of said plunger-rods are adapted normally to engage the stop-lips aforesaid, and means for moving the posts toward each other; of shafts provided with stops, and sleeves having a sliding removable engagement with said shafts and adapted to contact with said stops.

708,588. VEGETABLE-CUTTER. JOEL C. IVEY, Sr., Augusta, Ga., assignor of one-third to Curtis Ivey, Augusta, Ga. Filed Jan. 16, 1902. Serial No. 90,087. (No model.)



Claim.—In a vegetable cutter or slicer, the combination with a base formed at its opposite ends with longitudinal parallel recesses, of a gang of bow-shaped comb-strips arranged in parallel order and having their lower ends extending horizontally and seating in said recesses and secured thereto, standards consisting of angle-plates, the lower ends of which are seated in the recesses at the rear end of the base, a shaft mounted in said standards, a gang of knives mounted upon said shafts, washers interposed in series between said knives, shafts extending through the forward ends of said knives, washers mounted on said shafts in series between said knives, a handle-bail connected to the outer ends of said shafts and projecting upwardly from the knives at an angle thereto, and a handle secured to said bail, substantially as set forth.

708,589. TROLLEY FOR ELECTRIC CARS. CHARLES J. JOHNSON and CHARLES W. BEHRENDT, St. Louis, Mo. Filed Sept. 23, 1901. Serial No. 76,256. (No model.)

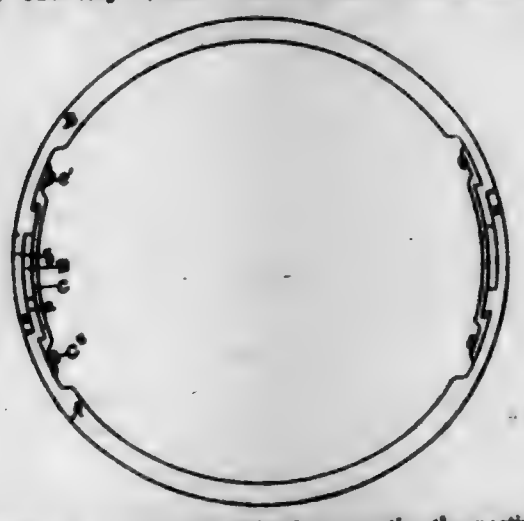
Claim.—1. In a trolley, the combination with a support, of a swinging spring-controlled member mounted in said support, a pole-carrying lever pivotally carried by said swinging member, a detent carried by said swinging member and adapted to engage said lever, a stop mounted on said support adapted to receive the impingement of said detent, and a rope connected at one end to said swinging member and loosely positioned on said lever and having its opposite end suitably held, substantially as described.

2. In a trolley, the combination with a support, of a swinging spring-controlled member mounted in said support, a pole-carrying lever pivot-

ally carried by said swinging member, a detent carried by said swinging member and adapted to engage said lever, an adjustable stop mounted on said support and adapted to receive the impingement of said detent, and a rope connected at one end to said swinging member and loosely positioned on said lever and having its opposite end suitably held, substantially as described.

3. In a trolley, the combination with a support, of a swinging spring-controlled member mounted in said support, a pole-carrying lever pivotally carried by said swinging member, a detent carried by said swinging member and adapted to engage said lever, a stop carried by said support adapted to receive the impingement of said detent, sheaves carried by said swinging member, a pulley carried by said lever, and a rope connected at one end to said swinging member and mounted on the pulley carried by lever and having its opposite end suitably held, substantially as described.

708,590. EXTENSIBLE PISTON-RING. Otto Johnson, Brooklyn, N. Y. Filed May 25, 1901. Serial No. 61,827. (No model.)



Claim.—1. A rabbeted slip-joint for connecting the meeting ends of a circumferentially-extensible piston-ring, the said joint composed of a relatively long overlapping member provided with an inwardly-projecting boss; and an inward offset forming a relatively shorter underlapping member; an expanding-spring system interposed between said boss and the opposed end of the said inward offset forming said underlapping member; a locking-bar provided upon its radially-outward face with a recess for receiving said boss and said inward offset; a system of liners appropriately introduced into said recess for limiting to a prescribed extent the circumferentially-expanding influence of said spring system upon the members of said joint.

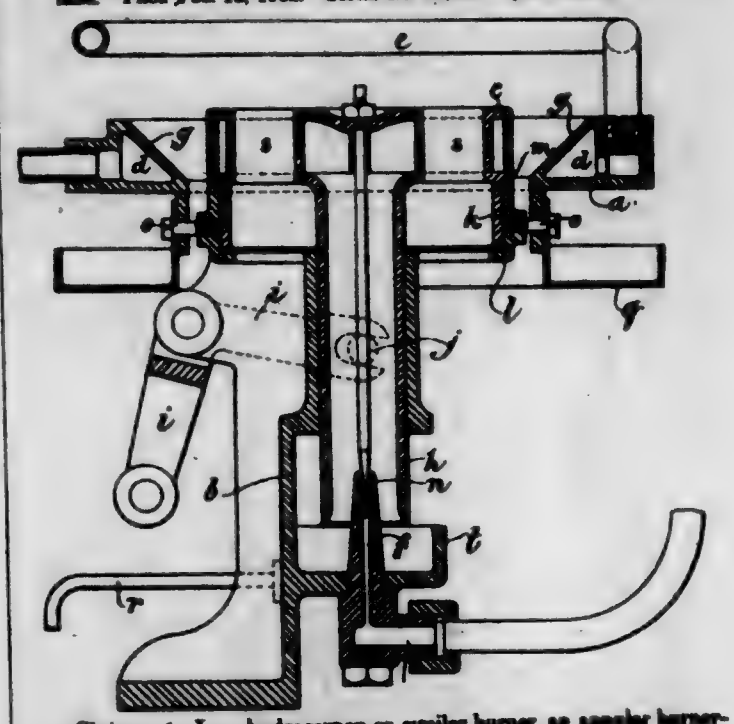
2. In a circumferentially-extensible piston-ring, a rabbeted slip-joint; an expanding-spring system tending to separate the members of said rabbeted joint in such direction as to circumferentially extend said piston-ring; a locking-bar provided upon its radially-outward side with a recess having oppositely-undercut ends, presenting bearing-faces parallel with correspondingly undercut faces formed respectively upon the inwardly-offset underlapping member of said joint and upon a boss projecting inwardly from the overlapping member of said joint, and a prescribed number of liners introduced into one or both ends of said recess for the purpose of taking up the elastic pressure of said expanding-spring system and thereby relieving the piston-ring therefrom.

3. In a piston-packing, the combination of a divided and circumferentially-expansible piston-ring, means for exerting elastic pressure on said ring to expand the same to fit a surrounding surface, a locking-bar joining the ends of the divided ring, and means adapted to be interposed between the locking-bar and an end of the expansible piston-ring to limit the action of the elastic expanding means and relieve the surface of further expanding pressure when the fit between the ring and surface has been secured.

4. In a piston-packing, the combination of a divided and circumferentially-expansible piston-ring, means for exerting elastic pressure on said ring to expand the same to fit a surrounding surface, a locking-bar joining the ends of the divided ring, and removable liners adapted to be interposed between the locking-bar and an end of the expansible piston-ring to limit the action of the elastic expanding means and relieve the surface of further expanding pressure when the fit between the ring and surface has been secured.

5. A piston-packing comprising a circumferentially-expansible piston-ring having a slip-joint, an expanding-spring system interposed between the abutments of said joint to circumferentially expand the ring to fit a surrounding surface, a locking-bar secured to both members of the slip-joint, and removable liners coacting with said locking-bar to limit the expanding action of the spring system and lock the ring against further expansion when the fit between the ring and the surrounding surface is secured.

708,591. HYDROCARBON-VAPOR BURNER. John Johnson, London, England, assignor to Archibald Edward Dobbs, London, England. Filed Feb. 18, 1902. Serial No. 94,503. (No model.)



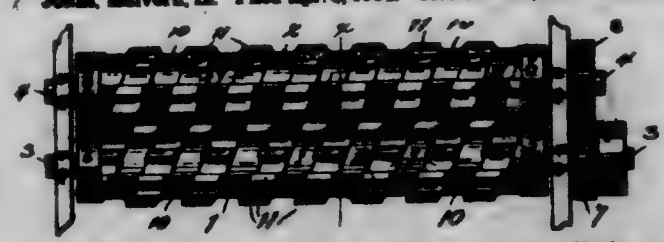
Claim.—1. In a hydrocarbon or similar burner, an annular burner-head, a stationary annular vaporizing-chamber surrounding the burner-head, the face of said chamber adjacent to the burner-head being arranged to deflect the flame from said burner-head, a vapor-nozzle located below the burner-head, a needle-cone carried by said burner-head and entering the vapor-nozzle, and means for elevating the burner-head to simultaneously lift the burner-surface above the deflecting-face of the vaporizer and to elevate the needle-cone from the vapor-nozzle.

2. In a hydrocarbon or similar burner, a vapor-nozzle, a needle-valve controlling said nozzle, a burner-head carrying said needle-valve, an inclined deflector-plate surrounding the burner-head, and means for elevating the burner-head to thereby simultaneously elevate the needle-valve and cause the burner-head to clear the deflector-plate.

3. A hydrocarbon or similar burner, comprising a movable annular burner-head, a stationary annular vaporizing-chamber surrounding said head and having a flame-deflecting surface on that side adjacent to the burner-head, a vaporizing-coil passing from the chamber in a convolution above the burner-head, a vapor-supply nozzle located below the burner-head and connected with said coil, a hollow stem supporting the burner-head and surrounding the vapor-nozzle, a stationary guide for said stem, a needle-regulator carried by the burner-head and entering and engaging the opening in the vapor-nozzle, and means for imparting vertical movement to the hollow stem, burner-head and needle-regulator.

4. A hydrocarbon or similar burner, comprising a movable annular burner-head, a stationary annular vaporizing-chamber surrounding said head and having a flame-deflecting surface adjacent to the burner-head, a vaporizing-coil passing from the chamber in a convolution above the burner-head, a vapor-supply nozzle located below the burner-head and connected with said coil, a hollow stem supporting the burner-head and surrounding the vapor-nozzle, a stationary guide for said stem, a needle-regulator carried by the burner-head and entering and engaging the opening in the vapor-nozzle, means for imparting vertical movement to the hollow stem, burner-head and needle-regulator, and a drip-trough surrounding the base of the vapor-nozzle.

708,592. SNAPPING-ROLLS FOR SHREDDERS. Edward E. Joseph, Malvern, Ill. Filed Apr. 8, 1901. Serial No. 54,893. (No model.)



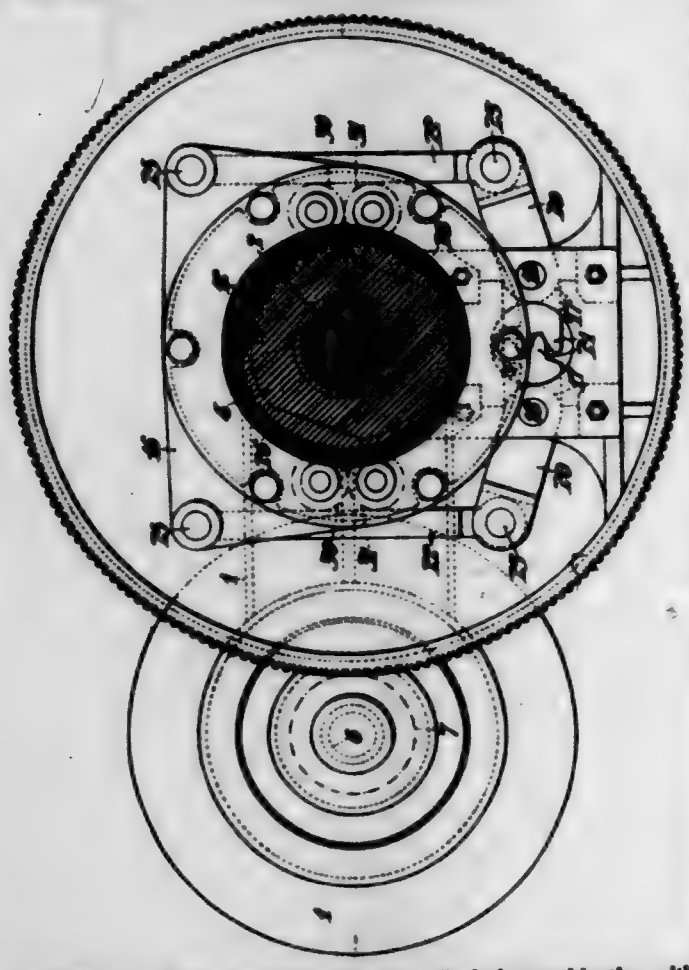
Claim.—1. A pair of snapping-rolls, having longitudinal corrugations, the corrugations of one roll being adapted to mesh with those of the other roll; said rolls being further provided with spiral grooves, which,

in operation, appear to travel from end to end of such rolls; the arrangement of such spirals being such that the groove on one roll moves in a direction opposite to that of the groove on the other roll; and means for operating said rolls; substantially as set forth.

2. The combination of the roll 1, provided with the heads 5, and having longitudinal grooves 9, and a spiral groove 10; the roll 2, provided with a head 6, and having similar longitudinal grooves 9, and a spiral groove 10; means of support for such rolls; and means of operation thereof; substantially as described.

3. In a device of the character described, a pair of rolls each being provided with longitudinal grooves and spiral grooves forming spiral series of teeth, the teeth of each roll meshing with the teeth of the other roll and the direction of the spiral arrangement of teeth being the same on both rolls, and means for rotating the rolls in opposite directions.

708,593. GEARING. LEWIS JESSE, JR., Philadelphia, Pa. Filed Apr. 12, 1902. Serial No. 102,596. (No model.)



Claim.—1. In gearing of the class described, the combination with a driving element; of a driven element; a link intermediate of said elements; a lever pivotally connected to said link; and, pivotal joints respectively connecting said link and said lever with said elements, whereby; continuous rotary motion may be transmitted from one to the other of said elements, irrespective of the relative gyration of their axes, substantially as set forth.

2. In gearing of the class described, the combination with a driving element; of a driven element; a pair of levers fulcrumed upon one of said elements and intengaged; and, links respectively connecting said levers with the other of said elements, whereby; continuous rotary motion may be transmitted from one to the other of said elements, irrespective of the relative gyration of their axes, substantially as set forth.

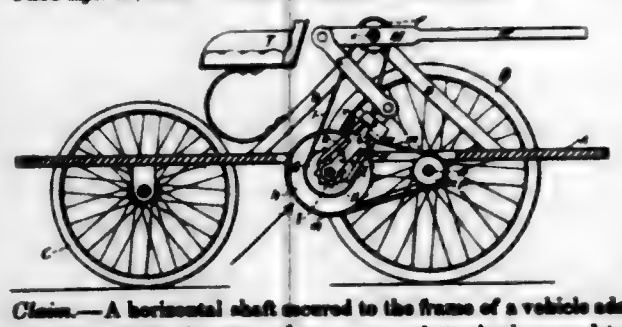
3. In gearing of the class described, the combination with a driving element provided with a central opening; of an axle extending through said opening and arranged to gyrate therein; a driven element mounted upon said axle in concentric relation therewith; a link intermediate of said driving and driven elements; a pivotal connection between said link and one of said elements; and, a lever pivotally connecting the other extremity of said link with the other of said elements; whereby, rotary motion may be transmitted from one to the other of said elements, irrespective of the relative gyration of their axes, substantially as set forth.

4. In gearing of the class described, the combination with a driving-gear provided with a central opening; of a vehicle-supporting-wheel axle extending through said opening and arranged to gyrate therein; a gear-casing mounted to rotate independently of said axle in concentric relation therewith; a link and lever connected to each other and respectively connected to said driving and driven elements; two vehicle-supporting wheels mounted on said axle; two gears respectively connected with said vehicle-supporting wheels in concentric relation with said gear-casing; two planetary gears mounted in said gear-casing in engagement with each other and respectively in engagement with said gears connected to said vehicle-supporting wheels; whereby, said vehicle-supporting wheels, may be rotated contemporaneously and independently, substantially as set forth.

5. In gearing of the class described, the combination with a driving-gear provided with a central opening; of a vehicle-supporting-wheel axle extending through said opening and arranged to gyrate therein; a gear-casing mounted to rotate independently of said axle in concentric relation therewith; a pair of intengaged levers fulcrumed upon said driving-gear; a pair of links respectively pivoted to said levers and pivoted to said gear-casing; and means operatively connecting said gear-casing and said axle; whereby, rotary motion may be transmitted from said driving-gear to said gear-casing, irrespective of the relative gyration of their axes, substantially as set forth.

6. In gearing of the class described, the combination with a driving-gear provided with a central opening; of a vehicle-supporting-wheel axle extending through said opening and arranged to gyrate therein; a vehicle-supporting wheel fixed to said axle; a vehicle-supporting wheel loose on said axle; a gear-casing mounted to rotate independently of said axle in concentric relation therewith; a pair of connected levers fulcrumed upon said driving-gear; a pair of links respectively pivoted to said levers and pivoted to said gear-casing; whereby, continuous rotary motion may be transmitted from said driving-gear to said gear-casing, irrespective of the relative gyration of their axes; two gears respectively fixed to said axle and to said loose wheel; and, a pair of planetary gears mounted in said casing in engagement with each other and in respective engagement with said two gears connected to said vehicle-supporting wheels; whereby, said vehicle-wheels may be rotated contemporaneously and independently, substantially as set forth.

708,594. HAND-MOTOR. PAUL J. KAHPER, Sioux City, Iowa. Filed Apr. 19, 1901. Serial No. 56,000. (No model.)



Claim.—A horizontal shaft secured to the frame of a vehicle adapted to revolve in suitable bearings thereon, a ratchet-wheel secured to said shaft, pawls abutting against the teeth of said ratchet-wheel, an operating-lever pivotally secured in bearings supported by the frame of the vehicle, levers connecting said operating-lever with said horizontal shaft, said pawls being pivotally secured to the lever connected to said shaft, the end of said connecting-lever freely encircling said shaft, in combination with chain-wheels firmly secured to said operating-lever, chain-wheels freely encircling said horizontal shaft, said last chain-wheels having ratchet-clutches adapted to engage with ratchet-clutches secured to said horizontal shaft and adapted to slide thereon, springs for pressing said ratchets into engagement with each other, chains connecting the wheels on said horizontal shaft with the wheels secured to said operating-lever, and means for imparting the motion of said horizontal shaft to the axle of the vehicle when the shaft is turned, substantially as described.

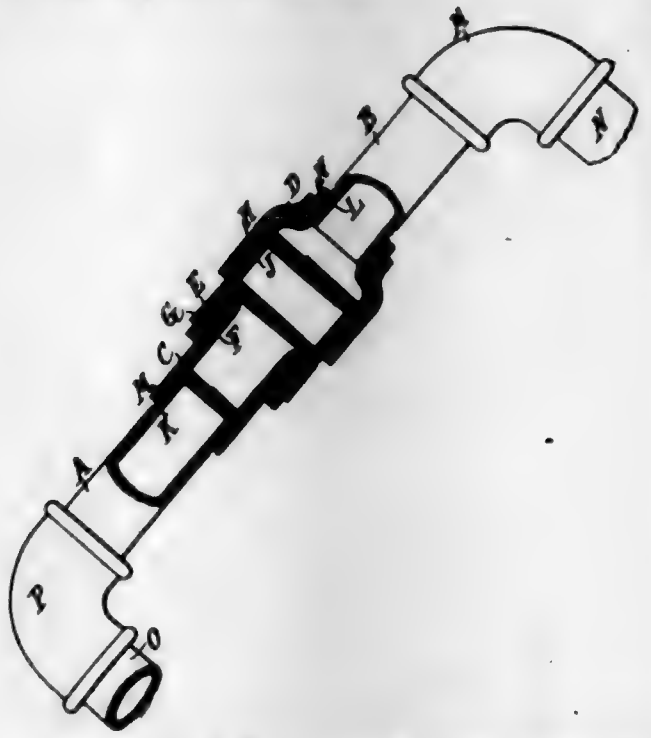
708,595. PIPE-JOINT. WILLIAM KENNEALLY, New York, N. Y. Filed Feb. 13, 1902. Serial No. 93,978. (No model.)

Claim.—1. A pipe-joint comprising in combination a pair of tailpieces adapted for attachment to the ends of pipes, and one of said tailpieces adapted to enter the other, and a follower adapted for attachment to said tailpieces and limited in its movement on each of said tailpieces so as to substantially avoid longitudinal movement of said pipes, and said follower being of a diameter sufficient to slide over the body of one of said tailpieces.

2. A pipe-joint comprising in combination a pair of tailpieces adapted for attachment to the ends of pipes, and one of said tailpieces adapted to enter the other, and a follower, said follower and tailpieces being provided with tapered screw-threads whereby said follower is adapted for screwing on said tailpieces, but is limited in its movement toward the free end of one and the pipe end of the other of said tailpieces to substantially avoid longitudinal movement of said pipes, and said follower being of a diameter sufficient to slide over the body of one of said tailpieces.

3. A pipe-joint comprising in combination a pair of tailpieces adapted for attachment to the ends of pipes and limited in their movement

thereon, and one of said tailpieces adapted to enter the other, and a follower adapted for attachment to said tailpieces and limited in its movement on each of said tailpieces so as to substantially avoid longitudinal movement of said pipes, and said follower being of a diameter sufficient to slide over the body of one of said tailpieces.



4. A pipe-joint comprising in combination a pair of tailpieces adapted for attachment to the ends of pipes and limited in their movement thereon, and one of said tailpieces adapted to enter the other, and a follower, said follower and tailpieces being provided with tapered screw-threads whereby said follower is adapted for screwing on said tailpieces but is limited in its movement toward the free end of one and the pipe end of the other of said tailpieces to substantially avoid longitudinal movement of said pipes, and said follower being of a diameter sufficient to slide over the body of one of said tailpieces.

5. A pipe-joint comprising in combination a pair of tailpieces adapted for attachment to the ends of pipes and having tapered screw-threads whereby to limit their movement thereon, and one of said tailpieces adapted to enter the other, and a follower, said follower and tailpieces being provided with tapered screw-threads whereby said follower is adapted for screwing on said tailpieces, but is limited in its movement toward the free end of one and the pipe end of the other of said tailpieces to substantially avoid longitudinal movement of said pipes, and said follower being of a diameter sufficient to slide over the body of one of said tailpieces.

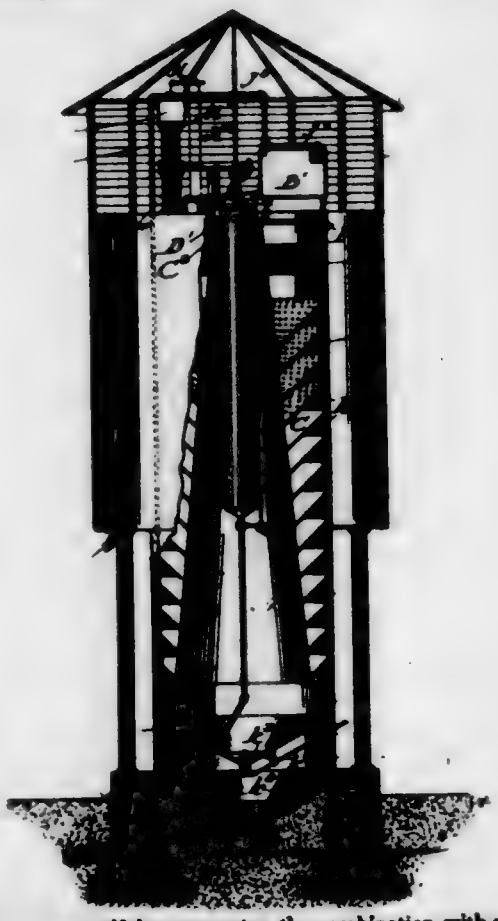
6. A pipe-joint comprising in combination male and female tailpieces C and D adapted for attachment to the ends of pipes, and the free end of the tailpiece C adapted to enter the free end of the tailpiece D, and a follower E adapted for attachment to said tailpieces and limited in its movement on each of said tailpieces so as to substantially avoid longitudinal movement of said pipes, and said follower E being of a diameter sufficient to slide over the body of said tailpiece C.

7. A pipe-joint comprising in combination a pair of tailpieces adapted for attachment to the ends of pipes and one of said tailpieces adapted to enter the other, and a follower, said follower and tailpieces being provided with tapered screw-threads whereby said follower is adapted for screwing on said tailpieces, but is limited in its movement toward the free end of one and the pipe end of the other of said tailpieces to substantially avoid longitudinal movement of said pipes, the screw-threads of said follower coming into engagement with the screw-threads on one of said tailpieces before they come into engagement with the threads on the other of said tailpieces.

708,596. APPARATUS FOR PURIFYING WATER. CARL L. KEMMOTT, Chicago, Ill. Filed Aug. 20, 1901. Serial No. 72,665. (No model.)

Claim.—1. In water-purifying apparatus, the combination of an annular soft-water tank, intercommunicating precipitating and chemical-solution tanks inclosed by said annular tank, said precipitating-tank having communication at its upper portion with said annular tank, a vertically-disposed stirrer in said chemical-solution tank, a water-wheel geared to said stirrer and having a discharge leading to the upper portion of said precipitating-tank, and a hard-water-supply source for said water-wheel, substantially as described.

2. In water-purifying apparatus, the combination of a precipitating-tank, a chemical-solution tank within said precipitating-tank, a source of hard-water supply above said precipitating-tank, a stirrer in said chemical-solution tank, a water-wheel geared to said stirrer and operated by the hard water and having a discharge leading to said precipitating-tank, and an overflow for supplying liquid from said chemical-solution tank to said precipitating-tank.



3. In water-purifying apparatus, the combination with a precipitating-tank having a downtake-conduit located therein, of a chemical-solution tank within said conduit, said last-named tank having communication near its upper end with the upper portion of said conduit.

4. In water-purifying apparatus, the combination of a precipitating-tank provided at its bottom with a valved discharge-opening, a chemical-solution tank within said first-named tank, a discharge-passage leading from said last-named tank through a wall of said first-named tank, and a valve controlling the discharge from the lower end of said chemical-solution tank.

5. In water-purifying apparatus, the combination of a precipitating-tank provided with a downtake-conduit, a chemical-solution tank located in the upper portion of said conduit and provided near its upper end with an overflow-port, a stirrer within said last-named tank, a stirrer-shaft, a water-wheel, a discharge-passage leading therefrom to the upper portion of said conduit adjacent to said overflow-port, a hard-water-supply source communicating with said water-wheel, and gear connections between said water-wheel and stirrer-shaft.

6. In water-purifying apparatus, the combination of a precipitating-tank provided with a downtake-conduit, a chemical-solution tank within said conduit and provided at its upper end with an overflow-port, a water-supply source for said last-named tank, a water-wheel, a discharge-passage leading therefrom and communicating with the upper portion of said conduit adjacent to said overflow-port, a chemical-solution tank provided with a discharge-passage communicating with the passage leading from said water-wheel, and a hard-water tank communicating with said water-wheel.

7. In water-purifying apparatus, the combination of a precipitating-tank provided with a downtake-conduit, a lime-water tank located in the upper portion of said conduit and provided with a lime-basket having a discharge-passage leading to the lower portion of said lime-water tank, a soft-water tank located above said precipitating-tank, a water-lift for supplying water thereto from the upper portion of said precipitating-tank, a pipe connecting said soft-water tank with said lime-basket, means for automatically controlling the discharge of water through said pipe, an overflow-port for said lime-water tank opening into the upper portion of said conduit, a soda-solution tank, a supply source therefor, means for automatically regulating the height of liquid in said soda-solution tank, a discharge-pipe for said soda-solution tank, means for automatically regulating the discharge therethrough, a water-wheel, a discharge-passage leading therefrom and communicating with the upper portion of said con-

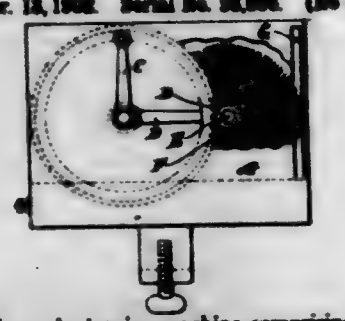
duit adjacent to said overflow-port, the discharge from said soda-solution tank passing to the same point, and a hard-water-supply source for said water-wheel.

8. In water-purifying apparatus, the combination with a precipitating-tank, of a lime-water tank within said precipitating-tank provided at its lower end with a discharge-pipe passing through a wall of said precipitating-tank, a valve extending transversely of said pipe, an actuating-rod for said valve having its upper end located at the upper portion of the apparatus, and connections between said rod and valve through the medium of which said valve is operated.

9. In apparatus of the character described, the combination with a precipitating-tank having a downtake-conduit, and provided beneath the lower end of said conduit with a conical bottom, of an inclosed chemical-solution tank having a conical bottom and a pipe leading therefrom and extending through the bottom of said precipitating-tank, a centrally-located valve at the bottom of said precipitating-tank, a valve at the lower end of said chemical-solution tank, and inclosed operating means for said last-named valve extending to the upper portion of the apparatus.

10. In water-purifying apparatus, the combination with a precipitating-tank having a downtake-conduit, of a lime-water tank located in said conduit, a stirrer in said last-named tank, a vertical stirrer-shaft, a water-wheel having a transverse shaft geared to said stirrer-shaft, a water-lift wheel having an axis parallel to said water-wheel shaft geared thereto, a soft-water tank supplied by said water-lift wheel and provided with an overflow, a lime-basket in the upper portion of said lime-water tank, a pipe leading from said soft-water tank to said lime-basket, an overflow-port for said lime-water tank communicating with the upper portion of said conduit, a passage leading from said water-wheel to the upper portion of said conduit adjacent to said overflow-port, a soda-solution tank, a discharge-pipe therefor communicating with said last-named passage, a source of supply for said soda-solution tank, means for automatically regulating the admission therefrom into said soda-solution tank, a hard-water tank at the upper portion of said water-wheel, a supply source therefor, means for maintaining the water in said last-named tank at a given height, a float in said last-named tank, and means connected with said float for automatically controlling the passage of liquid from said soft-water tank and said soda-solution tank.

703,597. COMB-CLEANER. SAMUEL L. KEITLER, Los Angeles, Cal. Filed Mar. 13, 1902. Serial No. 98,696. (No model.)



Claim.—1. A comb-cleaning machine comprising a closed receptacle; a driving and a smaller driven gear mounted on said receptacle the shaft of the driven gear passing into the interview of the receptacle; a brush within said receptacle mounted upon the shaft of the driven gear; a slot in said receptacle adapted for the passage of a comb therethrough to bring the teeth thereof in contact with the periphery of the brush; and means to impart motion to the driving-gear.

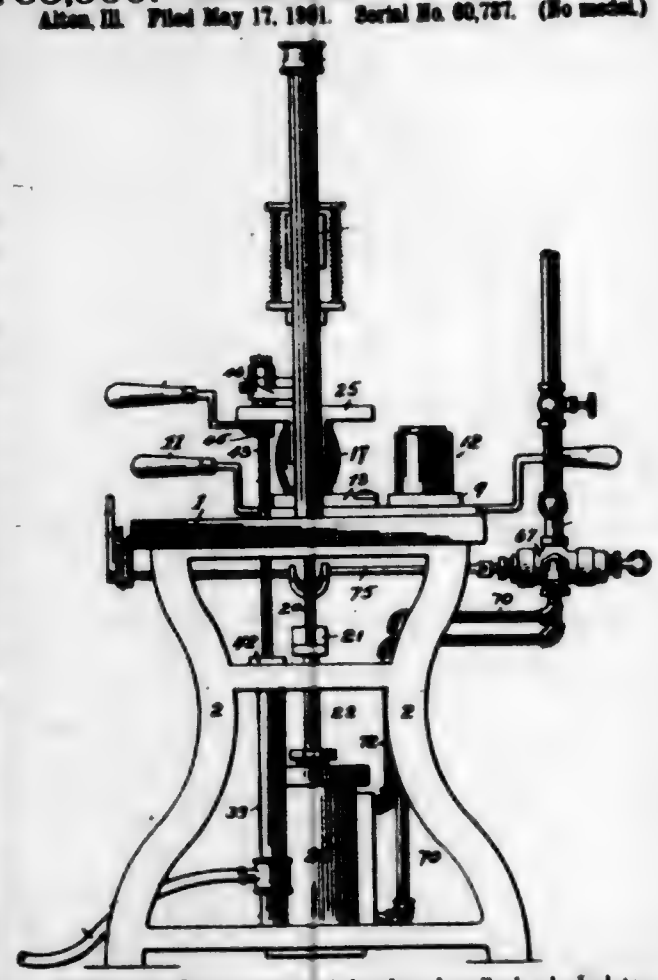
2. A comb-cleaning machine comprising a closed receptacle; a driving and a smaller driven gear mounted within said receptacle the shaft of the driving-gear projecting through the side of the receptacle and being provided with an operating-lever; a cleaning-brush within the receptacle mounted on the shaft of the driven gear; slots in the side of the receptacle adapted for the passage of the comb therethrough in contact with the brush.

3. A comb-cleaning machine comprising a closed receptacle; a driving and a smaller driven gear mounted on shafts within said receptacle; a brush within the receptacle mounted upon the shaft of the driven gear; oppositely-disposed slots in the sides of the receptacle adapted to permit the passage therethrough of a comb in contact with the periphery of the brush; means to impart motion to the driving-gear; a removable drawer in the bottom of the receptacle adapted to receive the dirt removed from the comb.

703,598. COMPOUND TOOL. JOSEPH F. KOELSER, Crookston, Minn. Filed Mar. 8, 1902. Serial No. 98,977. (No model.)

Claim.—The combination with a spring-bow, one end of which is formed with a ball, against one of the sides of which the opposite end of said bow has a spring contact or engagement, of a tool pivoted between the sides of said ball, and a shield covering the sides and top of said ball and serving to prevent the expansion of the same, substantially as set forth.

708,599. GLASS-BLOWING MACHINE. CHRISTIAN J. KOSING, Alton, Ill. Filed May 17, 1901. Serial No. 60,737. (No model.)



Claim.—1. In a machine of the class described, a bed-plate; mold-bases arranged to slide upon said bed-plate; a press-mold, carried by one of said bases; mating sections forming a blow-mold, carried by the opposite base; means whereby said mating sections are automatically swung apart when the mold-bases are moved backwardly upon the bed-plate; blow-valves operating above the blow-molds, cylinders, pistons and piston-rods beneath the bed-plate; means carried by the piston-rods of the cylinders for operating the blow-valves; tubular connections to the cylinders for conveying compressed air to the ends thereof; and controlling-valves located in said tubular connections; substantially as specified.

2. In a machine of the class described, a bed-plate; blow-molds upon said bed-plate; blow-valves operating above said blow-molds; cylinders beneath the bed-plate; pistons operating in said cylinders; means carried by said pistons for actuating the blow-valves; tubular connections for conveying compressed air to the tops and bottoms of the cylinders; operating-valves located in said tubular connections for controlling the flow of the compressed air above and below the pistons in the cylinders; and operating-handles for said valves; substantially as specified.

3. In a machine of the class described, a bed-plate; blow-molds upon said bed-plate; blow-valves operating above said blow-molds; cylinders beneath the bed-plate pistons operating in said cylinders; means carried by said pistons for actuating the blow-valves; tubular connections for conveying compressed air to the top and bottom of the cylinders; operating-valves located in said tubular connections for controlling the flow of the compressed air above and below the pistons in the cylinders; operating-handles for said valves; exhaust-valves located at different heights in the cylinders; and means carried by the piston-rods for actuating these exhaust-valves; substantially as specified.

4. In a machine of the class described, a bed-plate; in which is formed a plurality of slideways; mold-bases arranged to slide in said slideways; a press-mold carried by one of said bases; mating sections forming a blow-mold; carried by the opposite base; means whereby said mating sections are automatically swung apart when moved with the bases backwardly through the slideway; a blow-valve operating above the blow-mold; mechanism for actuating the blow-valve, and means operated by said last-mentioned mechanism for automatically moving the mold-bases through

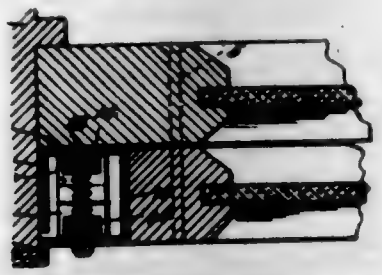
the slideway whenever said mechanism is operated, substantially as specified.

5. In a machine of the class described, a bed-plate; blow-molds sliding thereon; tubes beneath the bed-plate to which compressed air is supplied; second tubes telescoping in the first-mentioned tubes; blow-valves carried by said second tubes, and operating above the blow-molds, cylinders beneath the bed-plate; pistons and piston-rods operating in said cylinders; means carried by the piston-rods for operating the blow-valves; tubular connections for conveying compressed air to the tops and bottoms of the cylinders, and operating-valves located in said tubular connections for controlling the flow of compressed air to the cylinders above and below the piston, substantially as specified.

6. In a machine of the class described a bed-plate having a slideway, mold-bases arranged to slide in said slideway, a press-mold carried by one of said bases, mating sections forming a blow-mold carried by the opposite base; means whereby said mating sections are automatically swung apart when moved backwardly with the bases through the slideway; a blow-valve operating above the blow-mold; bed-plate arms extending downwardly from the press-mold base through a slot in the front part of the bed-plate; a curved and slotted blow-valve arm connected to said blow-valve and a blow-valve connecting-rod connecting said bed-plate arm to said blow-valve arm so that the blow-valve is moved into and out of operative position by sliding the mold-bases back and forth.

7. In a machine of the class described a bed-plate, a press-mold and a blow-mold mounted to slide upon the bed-plate, a blow-valve mounted to swing above blow-mold; a bed-plate arm extending downwardly from the mold through a slot in the bed-plate; a curved and slotted blow-valve arm connected to the blow-valve and a blow-valve connecting-rod connecting the bed-plate arm to the blow-valve arm so that the blow-valve is moved into and out of operative position by sliding the mold back and forth.

708,600. **WINDOW.** EDWARD KRAFT, Hudson, Pa. Filed Oct. 24, 1901. Serial No. 79,868. (No model.)



Claim.—1. In a window, the combination of a frame having a parting-strip, the upper and lower sashes arranged in pairs, the outer member of each pair being narrower than the inner member, and the outer member of the upper pair being provided with lateral extensions or flanges, and the window-strips interposed between the side edges of the narrow sashes and the window-frame and composed of fixed sections secured to the window-frame, and movable sections yieldingly engaging the other members of the sashes, substantially as described.

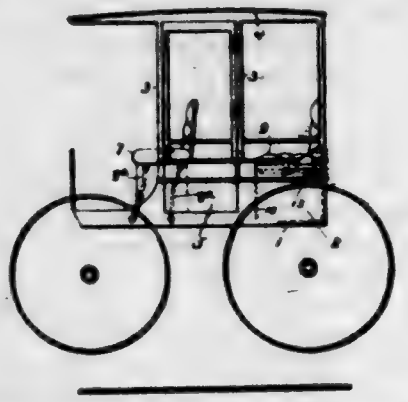
2. In a window, the combination of a frame, a sash, and a window-strip composed of fixed and movable sections provided with sockets, coiled springs disposed horizontally and fitted in the sockets and interposed between the sections, and an adjustable device for limiting the separation of the sections for varying the pressure on the sash, substantially as described.

3. In a window, the combination of a frame, a sash, a window-strip composed of fixed and movable sections angular in cross-section provided with tubular sockets and having overlapping supporting-arms, springs fitted in the sockets, and means for limiting the movement of the movable section, substantially as described.

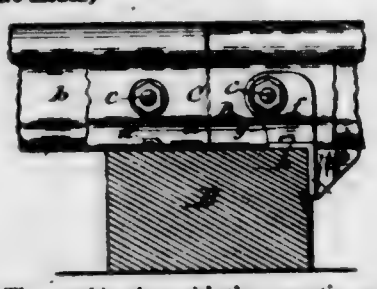
4. In a window, the combination of a window-frame provided with parting-strips, expansible window-strips located at opposite sides of the parting-strips, and the upper and lower sashes arranged in pairs, the outer sash of the upper pair being provided with laterally-extending flanges arranged on the outer faces of the adjacent window-strips, substantially as described.

708,601. **VEHICLE.** JACOB KRAMM, Lexington, Ky. Filed Nov. 6, 1900. Serial No. 35,567. (No model.)

Claim.—In a vehicle, the combination with a body having guides in the sides of its rear portion, a door and a jump-seat mounted on pivoted supports and normally projecting partially across the door-space, of a rear seat mounted to slide on the guides in the body, clamps secured to the bottom of the rear seat and engaging said guides, a back for the rear seat and having an exposed lower edge, rigid brackets securing said back to the rear seat, and a prop hinged at its lower edge to the rear end of the body and engaging at its upper edge, the exposed lower edge of the back of the rear seat, said back and prop being in the same vertical plane.



708,602. **RAILWAY-RAIL STAY.** EDWARD LAAS, Elgin, and HIRAM H. SPOONEMORE, Wadsworth, Ill. Filed Oct. 21, 1901. Serial No. 79,416. (No model.)



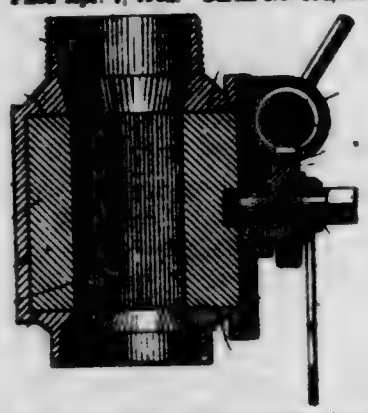
Claim.—1. The combination with the cross-tie and rail seated directly thereon, of a clamping-plate rigidly secured to the web of the rail and formed with an outwardly-extending base-plate, and a flange depending from said base-plate and bearing against the side of the cross-tie and formed with an extension bearing with its top edge on the under side of the rail as set forth.

2. The combination with a railway-rail and cross-tie, of a rail-stay formed in one piece and comprising a clamping-plate rigidly secured to the web of the rail by a bolt passing transversely through said parts, and a brace extending lengthwise the rail and bearing with one end against the cross-tie and its upper edge against the under side of the rail substantially as described.

3. The combination with the railway-rail and cross-tie, of a rail-stay formed in one piece and comprising a clamping-plate bolted to the web of the rail, a depending flange bearing flatwise against the side of the cross-tie and extending under the rail-base, a projection on the flange entering into the side of the cross-tie, and a brace projecting from said flange lengthwise of the rail and bearing against the under side of said rail substantially as described.

4. The combination with the rail and cross-tie, of a rail-stay formed in one piece and comprising a clamping-plate bolted to the web of the rail, a base-plate bearing on top of the cross-tie, a flange depending from the base-plate and bearing against the side of the tie, and a brace projecting at right angles from said flange and bearing against the under side of the rail substantially as described.

708,603. **CINDER-HOPPER.** MATHIAS LAUX, Little Rock, Ark. assignor of two-thirds to Thomas R. Glynn and John E. Coates, Little Rock, Ark. Filed Apr. 7, 1902. Serial No. 101,702. (No model.)



Claim.—1. The combination of a locomotive-barrel, a cinder-hopper secured thereto and comprising a casing having a cylindrical portion, a cylindrical plug or valve rotatably mounted within and entirely inclosed by said cylindrical portion of the casing and provided with a passage-way, the exterior walls of the plug and interior cylindrical and end walls of the casing forming an air-tight bearing on which said plug or valve may turn and a stem connected to the plug or valve and projecting to the

exterior of the casing, and means connected to said stem for operating the plug.

2. The combination of a locomotive-barrel, a cinder-hopper secured thereto and comprising a casing having a cylindrical portion, a cylindrical plug or valve rotatably mounted within said cylindrical portion of the casing and provided with a passage-way, said plug or valve being entirely inclosed by the cylindrical and end walls of the casing, the exterior walls of the plug forming an air-tight joint with the interior walls of the casing, a stem connected to the plug or valve and projecting to the exterior of the casing, operating means mounted on said stem, a cylinder and piston disposed transversely to said stem and connections between the said means and piston for operating the plug.

3. The combination of a locomotive-barrel, a cinder-hopper secured thereto and comprising a casing having a cylindrical portion, a cylindrical plug or valve rotatably mounted within said cylindrical portion of the casing and provided with a passage-way, the exterior walls of the plug forming an air-tight joint with the interior walls of the said cylindrical portion of the casing, a stem connected to the plug or valve and projecting to the exterior of the casing, operating means for said plug or valve mounted on said stem, a cylinder having a slot in the cylindrical wall thereof through which the said operating means projects, a piston movably mounted within the cylinder and connections between the said operating means and the said piston for operating the plug from said piston.

4. The combination of a locomotive-barrel, a cinder-hopper secured thereto and comprising a casing having a cylindrical portion, a cylindrical plug or valve rotatably mounted within said cylindrical portion of the casing and provided with a passage-way, the exterior walls of the plug forming an air-tight joint with the interior walls of the said cylindrical portion of the casing, a stem connected to the plug or valve and projecting to the exterior of the casing, a pinion mounted on said stem, a cylinder disposed transversely of said stem and having a slot in the cylindrical wall thereof through which the pinion projects, a piston movably mounted within the cylinder and provided with a series of circular rings or projections in engagement with the teeth of the pinion for operating the plug from said piston.

5. In combination, a casing having a cylindrical central portion and end extensions, a cylindrical plug fitted to have bearing in the said cylindrical portion of the casing, a stem projecting from one side of the cylindrical plug and provided with a pinion, a cylinder disposed transversely to the said stem and provided with an elongated slot in the cylindrical wall thereof through which the pinion projects, a double-ended piston movable within said cylinder and having a series of rings or circular projections disposed between the two heads and in engagement with the said pinion and means for introducing air or other fluid pressure to either end of the piston as desired.

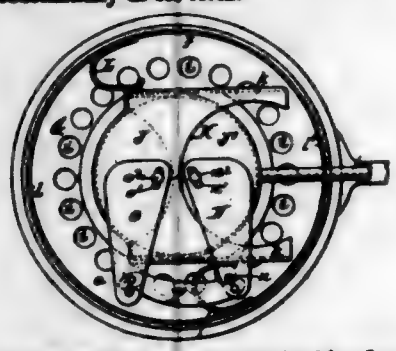
6. In a locomotive, the combination of the locomotive-barrel, a casing having a cylindrical portion and end extensions, a cylindrical plug provided with a central opening and having its exterior surface fitted air-tight to the interior walls of said central portion of the casing, a stem projecting from one side of the cylinder-plug and provided with a pinion, a cylinder disposed transversely to said stem and having a piston movable therein, said piston being in operative engagement with said pinion, means operative from the locomotive-cab for moving the piston lengthwise of the cylinder, a marker movable with the plug to indicate the open or closed position thereof.

7. In a locomotive, the combination of the locomotive-barrel, a casing having a cylindrical central portion and end extensions, one of the side walls of said cylindrical central portion being removable, a cylindrical plug provided with a central passage-way and having its exterior surface bearing air-tight upon the interior walls of the cylindrical central portion of the casing, a stem secured to said plug and provided with an operating means for said plug, a cylinder disposed transversely of said stem and carried by said removable side wall of the casing, a piston within said cylinder and connection between the piston and operating means.

8. In a locomotive, the combination with the barrel, a cinder-hopper secured thereto and comprising a casing having a cylindrical central portion, a cylindrical plug provided with a passage-way and having an air-tight bearing between the exterior of the plug and the interior of the cylindrical central portion of the casing, an operating-cylinder mounted on said casing, gearing connections between the cylinder and plug, and a series of pipes disposed within the locomotive-barrel to inject steam or compressed air into the accumulation of cinders to dislodge the same while the cylindrical plug is closed and enable the cinders to be discharged without dust when the plug is moved to open position.

708,604. SPIRIT-LAMP. WILLIAM J. D. HAAS, Buffalo, N. Y., assignor to the Buffalo Manufacturing Company, Buffalo, N. Y. Filed Aug. 17, 1901. Serial No. 72,374. (No model.)

Claim.—1. The combination of a lamp provided with a flame-opening and with an air-supply, of a flame-regulator for more or less obstructing said flame-opening, means for regulating the air-supply, and connections whereby one of said regulating means is operated upon the operation of the other, substantially as set forth.



2. The combination with a lamp provided with a flame-opening and an air-supply opening, of a flame-regulator for more or less obstructing said flame-opening, and means operated by the flame-regulator for controlling said air-supply opening, substantially as set forth.

3. The combination with a lamp provided with a flame-opening and an air-supply opening, of a flame-regulator for more or less obstructing said flame-opening, and means carried by said flame-regulator for more or less obstructing said air-supply opening, substantially as set forth.

4. The combination with a lamp provided with a flame-opening and air-supply opening, of a sectional flame-regulator for more or less obstructing said flame-opening, and parts carried by said regulator-sections and controlling said air-openings, substantially as set forth.

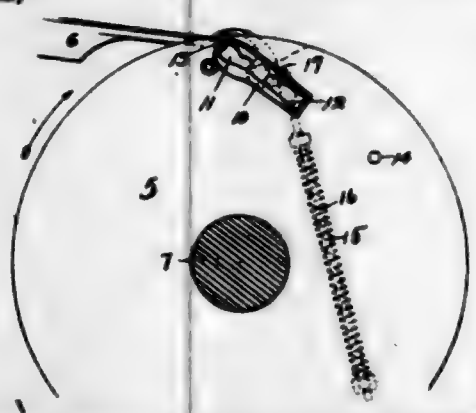
5. The combination with a lamp provided with a flame-opening surrounded by a wall provided with air-supply openings, of a sectional flame-regulator provided with flanges for controlling said air-supply opening, substantially as set forth.

6. The combination with a lamp having a flame-opening and a wall surrounding the same and provided with air-openings, of an annular plate surrounding said wall below said air-supply openings and provided with air-openings, and a sectional flame-regulator provided with flanges adapted to be moved to a position between said air-supply openings in the wall and said air-openings in the annular plate to regulate the air-supply, substantially as set forth.

7. The combination with a lamp having a flame-opening, and a wall surrounding the same and provided with air-supply openings, of an annular plate located below said air-supply openings in the wall and having air-openings, and a sectional flame-regulator provided with vertical flanges adapted to be moved to a position between said air-supply openings and the openings in the annular plate, and horizontal flanges extending outwardly from the lower ends of said vertical flanges, substantially as set forth.

8. The combination with a lamp having a flame-opening, of a sectional regulator-cap the sections of which are slidable toward and from each other, an operating-rod for said regulator arranged radially relative to said lamp and connected to one of said cap-sections and movable lengthwise to operate the same, means for guiding said rod, and connections between said regulator-cap sections for causing the operation of both regulator-cap sections when said operating-rod is actuated, substantially as set forth.

708,605. GRIPPER MECHANISM FOR PRINTING-PRESSES. ROBERT MIEHLE, Chicago, Ill. Filed June 15, 1901. Serial No. 64,651. (No model.)



Claim.—1. The herein-described tumbler for gripper mechanisms, having a pin-engaging slot, provided with a concavity in its side adapted to cause the grippers to dwell momentarily in closing just prior to nipping the sheet, substantially as and for the purpose described.

2. In a gripper mechanism for printing-presses, the combination of the cylinder, gripper-shaft and tumbler-engaging pin, with a tumbler on the gripper-shaft having a slot adapted to engage the pin in closing the

grippers, and said slot having its side so shaped or concaved at the point traversed by the pin in closing that the motion of the grippers is arrested or retarded just prior to nipping the sheet and the grippers closed thereon without rebound, substantially as described.

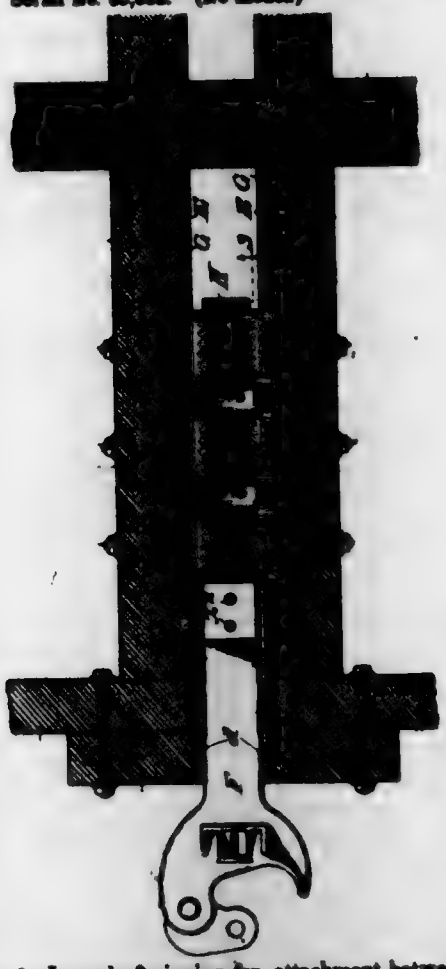
708,606. CAP. JOHN E. McLOUGHLIN, Utica, N. Y. Filed Mar. 17, 1902. Serial No. 98,542. (No model.)

Claim.—1. A cap, comprising a body portion, a visor connected to said body portion, and a sliding yielding band with its normally lower edge extending entirely around, and connected to, the outer lower edge of said body portion, and arranged independently of, and above, said visor, the free longitudinal edge of said band, itself, practically being continuous and, when pulled down, extending below said visor, substantially as described.

2. A cap, comprising a body portion, a visor connected to said body portion, and a sliding band, with its normally lower edge extending entirely around, and connected to, the outer lower edge of said body portion and arranged independently of, and above, said visor, the free longitudinal edge of said band, itself, practically being continuous and, when pulled down, extending below said visor, said band having a transverse slit, with its edges normally in contact and an elastic or yielding gore secured at said slit to said band, substantially as described.

3. As a new article of manufacture, a cap comprising a body portion, a visor fixed to the latter, and a sliding band, with its normally lower edge extending entirely around, and connected to, the outer lower edge of said body portion and arranged independently of, and above, said visor, the free longitudinal edge of said band, itself, practically being continuous, and, when pulled down, extending below said visor, said band having a transverse slit, its edges normally in contact and with an elastic gore secured at said slits to said band, and adapted to fold upon itself when out of use, as around said body portion, substantially as described.

708,607. DRAFT-RIGGING. HERMAN C. PRIESS, Bradford, Ill., assignor of one-half to Frank J. Reichmann, Chicago, Ill. Filed Dec. 12, 1901. Serial No. 85,632. (No model.)

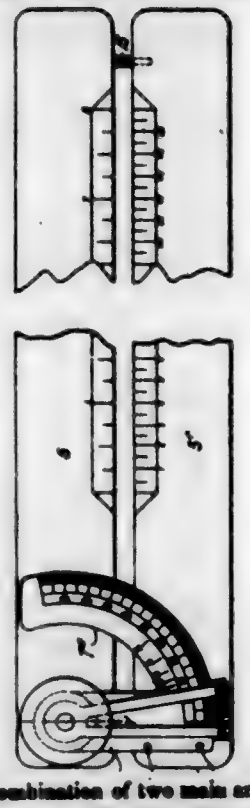


Claim.—1. In a draft-rigging for attachment between the center sills of a freight-car, comprising, in combination, draw-bars extended through openings in the front sills and dead-woods, flanged draft-plates secured to the inner sides of the center sills said draft-plates extending the full length of the car and having reduced ends passed through the openings in the front sills and dead-woods to reinforce the latter, and yielding connections between the draw-bars and draft-plates.

2. In a draft-rigging, the combination with a draw-bar of a stirrup-frame thereon having a series of pockets formed by cross-plates having socket connection with the stirrup-frame, two follower-plates and a separating buffer-spring between the said plates in each pocket, draft-plates secured to the inner sides of the center sills on opposite sides of the stirrup-frame and having coincident sockets, registering with said pockets, into which the follower-plates extend at opposite sides, the sockets presenting stops to limit movement of the follower-plates, substantially as described.

3. In a draft-rigging, the combination of the draft-plates secured to the inner sides of the center sills and having sockets, the draw-bar, stirrup-frame on the draw-bar, pockets in the stirrup-frame formed by cross-plates having socket connection with the stirrup-frame, follower-plates in the pockets extending at opposite sides into said sockets, simultaneously-acting buffer-springs in the pocket between the follower-plates and operating normally to press the follower-plates against the ends of the pockets and sockets, the said sockets presenting shoulders which limit the movements of the follower-plates in each direction and relieve the pressure against the springs when compressed, substantially as described.

708,608. PROTRACTOR. WILLIAM GRATER, Denver, Colo., assignor to Joseph H. Harrison and Meyer Harrison, Denver, Colo. Filed Sept. 9, 1901. Serial No. 74,861. (No model.)



Claim.—1. The combination of two main arms or members, a plate made fast to one arm and extending therefrom, the opposite extremity of the plate being provided with an opening registering with an opening formed in the other member, a screw-stud having an enlarged base inserted in the registering openings, the base of the screw-stud having a bottom flange engaging a recess formed in the member through which it passes, the plate being provided with a quadrant which extends toward the member connected with the screw-stud, a vernier-arm through which the shank of the screw-stud passes, the vernier-arm being made fast to the base of said stud, the vernier being arranged in suitable proximity to the graduated edge of the quadrant, and a nut applied to the threaded shank of the stud, whereby the stud and the member through which its base passes, are clamped together for the purpose set forth.

2. The combination of two arms or members, a plate made fast to one arm and extending therefrom, the opposite extremity of the plate being provided with an opening registering with an opening formed in the other member, a screw-stud inserted in the registering openings, a vernier-arm made fast to said screw-stud, a quadrant connected with the plate, the quadrant and vernier being arranged in suitable proximity to each other; the vernier-arm, the screw-stud and the arm through which it passes being arranged to move together when the other member or arm is relatively stationary, and suitable means for locking the parts in any desired position of adjustment.

3. The combination of two arms or members, a plate made fast to

one arm and extending therefrom, the opposite extremity of the plate being provided with an opening registering with an opening formed in the other member, a screw-stud having an enlarged base inserted in the registering openings, the plate being provided with a quadrant which extends toward the member connected with the screw-stud, the base of the screw-stud having a bottom flange engaging a recess formed in the member through which it passes, a vernier-arm through which the shank of the screw-stud passes, the said arm being made fast to the base of the stud, the vernier being arranged to move around a center common to the arc of the quadrant, and arranged to travel in the plane of and in suitable proximity to the quadrant, and a nut applied to the threaded shank of the stud whereby the stud and the member through which the base passes, are clamped together for the purpose set forth.

4. In an instrument of the class described, the combination of two main arms 5 and 5^a, a plate made fast to the arm 5^a and provided with an opening registering with the opening in the arm 5, a screw-stud inserted in the said registering openings, a vernier-arm applied to said stud and made fast thereto, a vernier attached to said arm, a quadrant connected with the plate adjacent the vernier, a washer applied to the stud above the vernier-arm, and recessed to receive the same, and a nut applied to the stud above the washer, substantially as described.

5. In an instrument of the class described, the combination of two main arms or members, a plate made fast to one arm and extending therefrom, the opposite extremity of the plate being provided with an opening registering with an opening formed in the other member, a screw-stud having an enlarged base inserted in the registering openings, the base of the stud having a bottom flange engaging a circular recess or groove formed in the member through which it passes, the plate being provided with a quadrant which extends toward the member connected with the screw-stud, a vernier-arm through which the shank of the screw-stud passes, the said arm being made fast to the base of the stud, the vernier being arranged to travel in suitable proximity to the graduated edge of the quadrant, a washer applied to the stud above the vernier-arm, and recessed to receive the latter, and a nut applied to the stud above the washer, substantially as described.

708,609. CAR-BOLSTER. GILBERT P. RITTER, Chicago, Ill. Filed Apr. 24, 1902. Serial No. 104,516. (No model.)

Claim.—1. A trussed car-bolster, provided with spanners for the support of the car-sills, substantially as and for the purposes specified.

2. A trussed car-bolster, provided with spanners for the support of the car-sills, said spanners interposed between the tension members, substantially as and for the purposes specified.

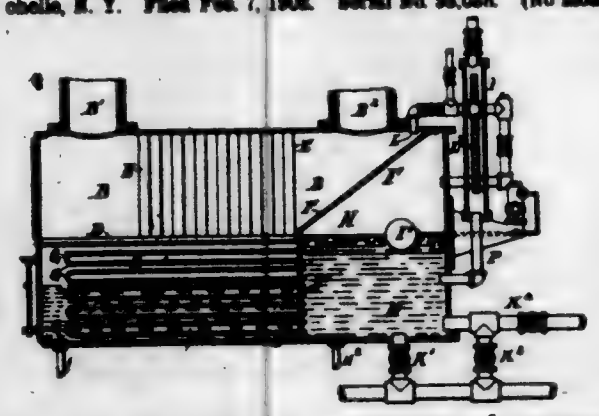
3. A trussed car-bolster, provided with spanners interposed between the tension members and in alinement with the compression members of the bolster, substantially as and for the purposes specified.

4. A trussed car-bolster, comprising in combination, a strut, tension and compression members, spanners, and end caps, the end caps having vertically-alined sockets for the compression members and spanners, substantially as and for the purposes specified.

5. A trussed car-bolster, comprising in combination, a strut, tension and compression members, spanners, end caps, and side bearings, the end caps having inward extensions for the reception of the side bearings, and the side bearings arranged to straddle the compression members, substantially as and for the purposes specified.

6. In a trussed bolster, the combination with the tension and compression members thereof, of an end cap having an inward extension, a spanner which engages the inward extension of the end cap, and a side bearing which straddles the compression members and is secured to the inward extension of the end cap, substantially as and for the purposes specified.

703,610. TRAP OR SEPARATOR. GEORGE I. ROBERTS, New Rochelle, N. Y. Filed Feb. 7, 1902. Serial No. 93,088. (No model.)



Claim.—1. The combination, in a steam-trap, of a grease-extracting compartment provided with steam inlet and outlet openings, a drip-receiving compartment, and a return-water compartment provided with a plurality of branch bent tubes extending from the walls of said return-water compartment into said drip-receiving compartment, substantially as and for the purposes set forth.

2. The combination, in a steam-trap, of a grease-extracting compartment provided with steam inlet and outlet openings; a drip-receiving compartment; a return-water compartment, and controlled means for admitting steam from said grease-extracting compartment into said return-water compartment, substantially as and for the purposes set forth.

3. The combination, in a steam-trap, of a grease-extracting compartment, provided with steam inlet and outlet openings; a drip-receiving compartment; a return-water compartment provided with branch water-heating compartments extending into said drip-receiving compartment; means for admitting steam from the grease-extracting compartment, and controlled means for admitting reinforce live steam and reinforce-water, substantially as and for the purposes set forth.

4. The combination, in a steam-trap, of a grease-extracting compartment, provided with steam inlet and outlet openings; a drip-receiving compartment; a return-water compartment; a reinforce-admission pipe connecting with said return-water compartment, a perforated steam-jet inclosed within said reinforce-admission pipe, for heating the reinforce water as it passes through substantially as set forth.

5. The combination, in a steam-trap, of a grease-extracting compartment, provided with steam inlet and outlet openings; a drip-receiving compartment; a return-water compartment, means for admitting reinforce-water to the said return-water compartment, and a steam-jet connection between the grease-extracting compartment and an enlarged portion of the reinforce-water connection, substantially as and for the purposes set forth.

708,611. ATOMIZING APPARATUS. JOHN ROBERTSON, Cincinnati, Ohio. Filed Apr. 11, 1898. Serial No. 677,191. (No model.)

Claim.—1. A vaporizing or atomizing apparatus, comprising a tank or reservoir for holding air under pressure, a standard extending up from

said tank or reservoir and provided with an air duct or passage communicating with the tank or reservoir and vaporizing or atomizing devices supported on said standard above the air tank or reservoir by the air and vapor pipes radiating from the standard communicating with the respective atomizing devices and supplied from the air duct or passage of the standard with air for the formation of vapor, substantially as set forth.

2. A vaporizing or atomizing apparatus comprising a standard having an air duct or passage adapted for communication with an air tank or reservoir and mounted thereon, a series of pipes radiating from said standard, atomizing-flasks arranged in annular series about said standard, and having vaporizing-tubes supplied from said pipes, means to carry the vapor from said flasks and valves controlling the flow of air and vapor through said pipes, substantially as set forth.

3. A vaporizing or atomizing apparatus comprising a series of flasks each having a vaporizing-tube, a pipe to supply air to each tube, a valve to control the passage of air to each flask independent of the other flasks in the series, a pipe to carry the vapor from each flask and a valve to control the passage of vapor from each flask independent of the other flasks, substantially as set forth.

4. A vaporizing or atomizing apparatus comprising a series of atomizing-flasks each having a vaporizing-tube and means to supply air to said tube, a valve to control the passage of air to each flask, a mixing flask or chamber to receive the vapors from the several flasks, means to administer the vapors from the mixing flask or chamber, a pipe to carry the vapor from each atomizing flask or chamber, and a valve, to control the passage of the vapor, interposed between the mixing-flask and each atomizing-flask, substantially as set forth.

5. A vaporizing or atomizing apparatus comprising a standard having an air duct or passage, adapted for communication with an air tank or reservoir, a series of atomizing-flasks having vaporizing-tubes connected to the air duct or passage of the standard, said standard having a vapor-passage surrounding said air duct or passage, pipes to carry the vapor from the atomizing-flasks to said vapor-passage, valves in said pipes, and means to administer the vapor, substantially as set forth.

6. A vaporizing or atomizing apparatus comprising a standard having an air duct or passage adapted for communication with an air tank or reservoir, a series of atomizing-flasks each having a vaporizing-tube, a pipe connecting the vaporizing-tube of each flask with the air duct or passage of the standard, said standard having a vapor-passage surrounding its air duct or passage, a pipe to carry the vapor from each flask to said vapor-passage, a valve in each of said pipes and means to administer the vapor, substantially as set forth.

7. A vaporizing or atomizing apparatus, comprising a series of atomizing-flasks having vaporizing-tubes and means to supply air to said tubes, a mixing flask or chamber to receive the vapors from said atomizing-flasks, means to administer the vapor from said mixing flask or chamber, and means to supply air under pressure to said mixing flask or chamber independent of the atomizing-flasks and tubes, for the purposes specified, substantially as set forth.

8. A vaporizing or atomizing apparatus comprising a support having an air duct or passage, adapted for communication with an air tank or reservoir, a series of atomizing-flasks each having a vaporizing-tube, a pipe connecting each vaporizing-tube to the air duct or passage of the support, a mixing flask or chamber, pipes connecting the several atomizing-flasks with said mixing flask or chamber, valves in said pipes, means to administer the vapor from the mixing flask or chamber, and a valved pipe leading from the air duct or passage of the support to the mixing flask or chamber, substantially as set forth.

9. A vaporizing or atomizing apparatus comprising a standard having an air duct or passage adapted for communication with an air tank or reservoir, and provided with a vapor-passage surrounding said air duct or passage, a plurality of atomizing-flasks, pipes radiating from the standard and supporting at their outer ends said flasks, vaporizing-tubes in the flasks and supplied with air through said pipes from the air duct or passage in the standard, vapor-pipes radiating from the vapor-passage and communicating between said passage and the atomizing-flasks, valves in said vapor-pipes, a mixing-flask having a pipe connecting it to the vapor-passage and means to administer the vapor from said mixing-flask, the said flasks being arranged in annular series around said standard, substantially as set forth.

10. In a vaporizing or atomizing apparatus, the combination of a series of atomizing-flasks, a mixing flask or chamber to receive the vapors from said atomizing-flasks, a hose or the like through which to administer the vapor from the mixing flask or chamber, and a rotative valve controlling the flow of vapor through said hose, said valve being provided with a plurality of transverse openings and acting when rotated to produce a pulsating flow of vapor through said hose, substantially as set forth.

11. In an atomizing or vaporizing apparatus, the combination of a plurality of atomizing-flasks, a mixing flask or chamber to receive the vapors from said atomizing-flasks, a hose or the like through which to administer the vapor from the mixing flask or chamber, a rotative valve controlling the flow of vapor through said hose and provided with a plurality of openings adapted to register with the opening in the hose and acting, when rotated, to produce a pulsating flow of vapor through said hose, and means to limit the rotatory movement of the valve, substantially as set forth.

12. In an atomizing or vaporizing apparatus, the combination of a plurality of atomizing-flasks, a mixing flask or chamber to receive the vapors from said atomizing-flasks, a hose or the like through which to administer the vapor from the mixing flask or chamber, a rotative valve for controlling the flow of vapor through said hose and provided with a plurality of openings adapted to register with the openings in the outlet, and acting when rotated, to produce a pulsating flow of vapor through said hose, means to limit the rotatory movement of the valve, and a pressure-gage to indicate the tension of the vapor in the mixing flask or chamber, substantially as set forth.

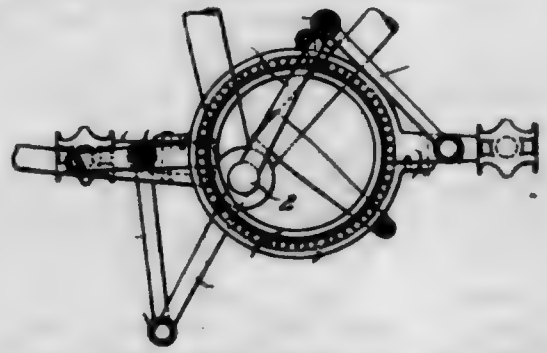
13. In a nebulizer, the combination with an air-tube receiving air under pressure, of a nebula-tube, a flask connected to said nebula-tube, a stop-cock between the flask and nebula-tube, a connecting-pipe between the flask and air-tube, and an independent stop-cock controlling said pipe, substantially as described.

14. In a nebulizer, the combination with an air-tube receiving air under pressure, of a nebula-tube, a plurality of flasks independently connected to the nebula-tube each having an independent cock controlling the passage from the flask to the nebula-tube, and a plurality of connecting-pipes each connecting a flask with the air-tube and each pipe being provided with an independent cock, substantially as described.

708,612. NUT-LOCK. JAMES F. ROBINSON, WACO, TEX. Filed Dec. 31, 1901. Serial No. 87,904. (No model.)

Claim.—In a nut-locking device, longitudinal grooves formed in the threaded portion of the bolt, an opening formed through from the outside of the nut to the interiorly-threaded opening, a locking-pin adapted to reciprocate within said opening and engage the grooves formed in the bolt when the nut is in certain positions, a flat spring, one end of which is secured to the nut and the other secured to the locking-pin so as to be raised and lowered with the same and hooked against the pin so to hold it in its locked position, a turn-button pivoted to the nut and adapted to be turned underneath the spring so as to hold the locking-pin out of engagement with the grooves, an enlargement formed upon the upper end of the pin for the purpose of withdrawing the same, substantially as and for the purpose set forth.

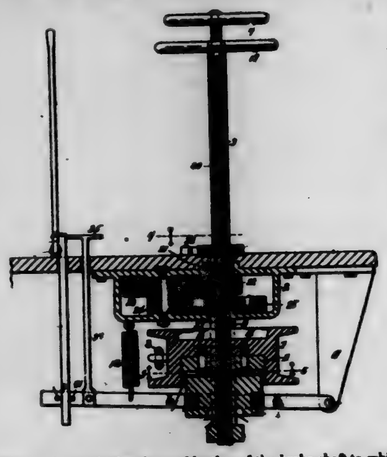
708,618. BICYCLE DRIVING MECHANISM. THOMAS C. ROBINSON, Boston, Mass., assignor of one-half to E. Baker Welch and H. Augusta Welch, Cambridge, Mass. Filed Dec. 26, 1899. Serial No. 741,587. (No model.)



Claim.—1. In a bicycle driving mechanism, the combination of a driving-shaft, a crank attached thereto, a pedal, and means for guiding said pedal in a path eccentric to the driving-shaft, and a compensating connection between the pedal and the crank, said connection being located on the opposite side of the center of the pedal-path from the said pedal and adapted to diminish the upstroke velocity of the pedal relatively to its downstroke velocity.

2. In a bicycle driving mechanism, the combination of a frame, a driving-shaft journaled thereon, a crank attached to said shaft, an eccentric affixed to said frame and having a strap, a pedal attached to said strap, and a link pivotally attached to the crank, and to the eccentric-strap at a point on the opposite side of the center of the eccentric from said pedal, whereby the upstroke velocity of the pedal is diminished.

703,614. CAR-BRAKE. FREDERICK W. BOST, Detroit, Mich., assignor of three-fourths to Rollin C. Sprague, Edward H. Patterson, and James A. H. Hewton, Detroit, Mich. Filed Oct. 19, 1901. Serial No. 79,358. (No model.)



Claim.—1. In a brake, the combination of the brake-shaft to which the brake-chain is connected, means for rotating said shaft to make a direct application of power to the brake-chain and a train of gear-wheels continuously in gear connected to the brake-shaft whereby the power may be indirectly applied to the brake-shaft in a manner to obtain an increased leverage thereon independently of the direct means for rotating said shaft.

2. In a brake, the combination of a brake-shaft upon which the brake-chain is adapted to wind, said shaft carrying a hand-wheel, or other means of rotating it, to wind up the brake-chain, a train of gears connected with the brake-shaft and means for operating said gears to rotate the brake-shaft independently of the operating means connected directly thereto.

3. In a brake, the combination of a shaft adapted to wind up the brake-chain, means for rotating said shaft by a direct application of power thereto, a train of gears connected with said shaft whereby the power which is applied to the shaft may be compounded, a hollow shaft connected with said gears embracing the brake-shaft and means for rotating said hollow shaft.

4. In a brake, the combination of a brake-shaft adapted to wind the brake-chain thereon, means directly connected with said shaft for rotating it, a ratchet-wheel on said shaft, a gear-wheel loosely mounted on the shaft and carrying a pawl which engages said ratchet, a gear and pinion engaging said ratchet-carrying gear-wheel and means for operating said gears to impart a rotation to said shaft through said ratchet.

5. In a brake, the combination of a brake-shaft, means connected directly with said shaft for rotating it, a hollow shaft embracing the brake-shaft, a ratchet-wheel fixed on the brake-shaft, a series of gear-wheels connecting said hollow shaft with said ratchet and means for rotating said hollow shaft.

6. In a brake, the combination of a brake-shaft, a ratchet fixed on said brake-shaft, an independent shaft carrying a pinion, gears interposed between said pinion and said ratchet and means for rotating said independent shaft to apply movement to the brake-shaft through said ratchet and gears.

7. In a brake, the combination of a brake-shaft, a spool loose upon said shaft adapted to be connected with the brake-chain, a clutch splined upon said shaft and normally engaging said spool, means for rotating the shaft directly to wind the brake-chain upon the spool, a series of gear-wheels connected with said shaft whereby it may be rotated indirectly to obtain an increase of power, means for rotating said gears and means for releasing said clutch.

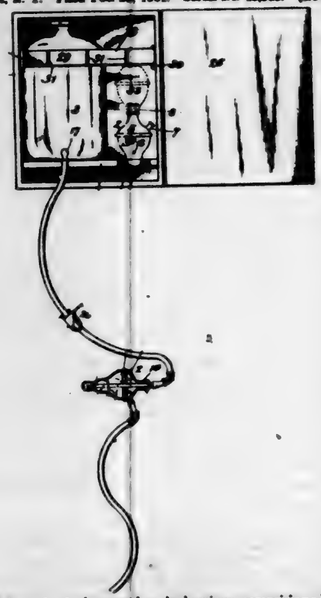
8. In a brake, the combination of a brake-shaft, means for rotating the shaft directly to wind the brake-chain thereon, a ratchet-wheel fixed on the brake-shaft, a gear-wheel loose on the shaft and connected by a spring-pawl with said ratchet, a hollow shaft embracing the brake-shaft, a pinion on said hollow shaft, gears connecting said pinion with the gear carrying the pawl, and means for rotating said hollow shaft.

9. In a brake, the combination of the brake-shaft, a spool loosely mounted thereon adapted to wind up the brake-chain, a clutch-collar splined on said shaft normally in engagement with said spool, means for rotating said spool directly and indirectly a vertically-movable lever connected with said clutch and means for depressing said lever to disengage the clutch from the spool.

703,615. VAGINAL SYRINGE. NICOLAUS C. H. SCHWARTZ, New York, N. Y. Filed Feb. 23, 1901. Serial No. 48,304. (No model.)

Claim.—The herein-described vaginal syringe, comprising a hollow pear-shaped body portion having a contracted portion intermediate its ends and a series of perforations adjacent to the line of contraction, the smaller end of said body portion terminating in a perforated bulbous nozzle portion and the larger end in a neck, said body portion being provided in the plane of its substantially greatest diameter with a groove, a packing-ring seated in said groove and adapted to close the valve, a detachable inlet-tube adapted for insertion through said body portion and provided at its outer end with a groove and a packing-ring seated in the last-named groove and adapted to form a tight joint between the tube and the contracted portion between the nozzle portion and the body portion.

703,616. VAGINAL SYRINGE. NICOLAUS C. H. SCHWARTZ, New York, N. Y. Filed Feb. 23, 1901. Serial No. 48,305. (No model.)



Claim.—1. An improved vaginal syringe, comprising a hollow bulbous body portion having a contracted portion intermediate its ends and a series of perforations adjacent to the line of contraction and provided at its smaller end with a perforated bulbous nozzle portion and at its larger end with a projecting neck, said body portion being provided in its upper rear part with an air-vent and in its lower rear part with a discharge-opening, and an injection-tube adapted to be inserted in the body portion and provided with means for forming a tight joint with the nozzle portion and with the projecting neck.

2. An improved vaginal syringe, comprising a hollow, bulbous portion having a contracted portion intermediate its ends and a series of perforations adjacent to the line of contraction and provided at its smaller end with a perforated bulbous nozzle portion and at its larger end with a projecting neck, said body portion being provided in its upper rear part with an air-vent and in its lower rear part with a discharge-opening, an injection-tube adapted to be inserted in the body portion and provided with means for forming a tight joint with the nozzle portion and with the projecting neck, a water-reservoir, a flexible connection-tube extending between the reservoir and the injection-tube, a flexible tube connected with the discharge-opening, rigid tubular elbows interposed between the connection-tube and the water-reservoir and the injection-tube respectively and between the discharge-opening and the discharge-tube.

3. An improved vaginal syringe, comprising a hollow, bulbous body portion having a contracted portion intermediate its ends and a series of perforations adjacent to the line of contraction and provided at its smaller end with a perforated bulbous nozzle portion and at its larger end with a projecting neck, said body portion being provided in its upper rear part with an air-vent and in its lower rear part with a discharge-opening, an injection-tube adapted to be inserted in the body portion and provided with means for forming a tight joint with the nozzle portion and with the projecting neck, a water-reservoir, a flexible connection-tube extending between the reservoir and the injection-tube, a flexible tube connected with the discharge-opening, rigid tubular elbows interposed between the connection-tube and the water-reservoir and the injection-tube respectively and between the discharge-opening and the discharge-tube, and means for regulating the inflow and outflow.

4. An improved vaginal syringe, comprising a hollow, bulbous body portion having a contracted portion intermediate its ends and a series of perforations adjacent to the line of contraction and provided at its smaller end with a perforated bulbous nozzle portion and at its larger end with a projecting neck, said body portion being provided in its upper rear part with an air-vent and in its lower rear part with a discharge-opening, an injection-tube adapted to be inserted in the body portion and provided with means for forming a tight joint with the nozzle portion and with the projecting neck, a water-reservoir, a flexible connection-tube extending between the reservoir and the injection-tube, a flexible tube connected with the discharge-opening, rigid tubular elbows interposed between the connection-tube and the water-reservoir and the injection-tube respectively and between the discharge-opening and the discharge-tube, and means of regulating the inflow and outflow, the formation and organization of the parts being such that the water-reservoir may be supported at a point above the point of operation and a supply of water may be uninterruptedly passed to and discharged from the vagina during the operation.

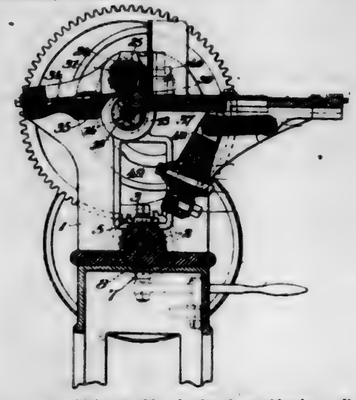
5. An improved vaginal syringe, comprising a hollow, bulbous body portion having a contracted portion intermediate its ends and a series of perforations adjacent to the line of contraction and provided at its smaller end with a perforated bulbous nozzle portion and at its larger end with a projecting neck, said body portion being provided in its upper rear part with an air-vent and in its lower rear part with a discharge-opening, an injection-tube adapted to be inserted in the body portion and provided with means for forming a tight joint with the nozzle portion and with the projecting neck, a water-reservoir, a flexible connection-tube extending between the reservoir and the injection-tube, a flexible tube connected with the discharge-opening, rigid tubular elbows interposed between the connection-tube and the water-reservoir and the injection-tube respectively and between the discharge-opening and the discharge-tube, and a cabinet secured above the point of operation and adapted to contain the water-reservoir and, when not in use, the other parts.

703,617. COUNTER-SKIVING MACHINE. JAMES R. SCOTT, Boston, Mass., assignor to United Shoe Machinery Company, Paterson, N. J., a Corporation of New Jersey. Filed Sept. 21, 1900. Renewed Oct. 5, 1901. Serial No. 77,736. (No model.)

Claim.—1. A counter-skiving machine, having, in combination, a die-roller provided with a die-cavity whose greatest length extends longitudinally of the roller, a pressure device, and mechanism for feeding a counter-blank sidewise to the die-roller and pressure device, substantially as described.

2. A counter-skiving machine, having, in combination, a die-roller provided with a die-cavity whose greatest length extends longitudinally of the roller, and a pressure device, substantially as described.

3. A counter-skiving machine, having, in combination, a die-roller provided with a die-cavity whose greatest length extends longitudinally of the roller, a pressure device, and mechanism for feeding a counter-blank sidewise to the die-roller and pressure device comprising a feed-slide provided with a blank-carrier engaging one side and both ends of the blank and forming a guide for the blank in passing to the roller and means for actuating the slide to move the carrier in proximity to the roller, substantially as described.



4. A counter-skiving machine, having, in combination, a die-roller provided with a die-cavity whose greatest length extends longitudinally of the roller, a pressure device, a feed-slide engaging one side of the blank, guides engaging the ends of the blank, and means for actuating the feed-slide, substantially as described.

5. A counter-skiving machine, having, in combination a die-roller, a pressure device, a feed-table extending in close proximity to the line of contact of the die-roller and pressure device, a hopper above said table provided with a flange also extending in close proximity to the line of contact of the die-roller and pressure device, a feed-slide movable over said table beneath the hopper arranged to feed a blank over the table and beneath the flange of the hopper to the die-roller and pressure device, and means for actuating the feed-slide, substantially as described.

6. A counter-skiving machine, having, in combination, a die-roller, a pressure device, a feed-table extending in close proximity to the line of contact of the die-roller and pressure device, a hopper above said table provided with a flange also extending in close proximity to the line of contact of the die-roller and pressure device, a feed-slide movable over said table beneath the hopper provided with a blank-carrier engaging one side and both ends of the blank and forming a guide for the blank in passing to the die-roller, and means for actuating the slide to feed a blank over the table and beneath the flange of the hopper to the die-roller and pressure device, substantially as described.

7. A counter-skiving machine having, in combination, a die-roller, a pressure device, a hopper provided with an open rear side, a guard-plate at the rear of the hopper, a feed-slide movable beneath the hopper and guard-plate, and means for actuating the feed-slide, substantially as described.

8. A counter-skiving machine, having, in combination, a die-roller provided with a die-cavity whose greatest length extends longitudinally of the roller, a pressure device, mechanism for feeding a counter-blank sidewise to the die-roller and pressure device, and guides above and below and at each end of the blank for guiding the blank in its passage to the die-roller and pressure device, substantially as described.

703,618. METHOD OF PRODUCING HOLLOW GLASS BODIES. PAUL T. RIEVERT, Dresden, Germany. Filed Mar. 21, 1902. Serial No. 98,833. (No specimens.)

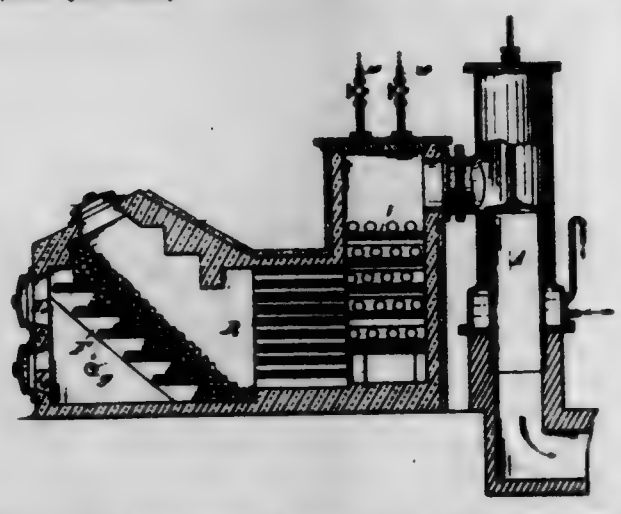
Claim.—1. The herein-described improvement in the process of producing hollow glass bodies, which consists in first obtaining a partly-formed hollow body from a mass of liquid glass and afterward while said body remains plastic distributing an undesirable accumulation of glass which may occur in any part of said partly-formed body by producing an indentation therefrom the exterior thereof, and finally allowing the indentation to bulge outward.

2. The herein-described improvement in the process of producing hollow glass bodies, which consists in first obtaining a partly-formed hol-

low body from a mass of liquid glass, next for the purpose of distributing such undesirable accumulation of glass as may occur in any part of said partly-formed body, producing an indentation into such part thereof from its exterior and allowing the glass while still plastic to sag at the sides of such indentation, and finally allowing the said indentation to bulge outward.

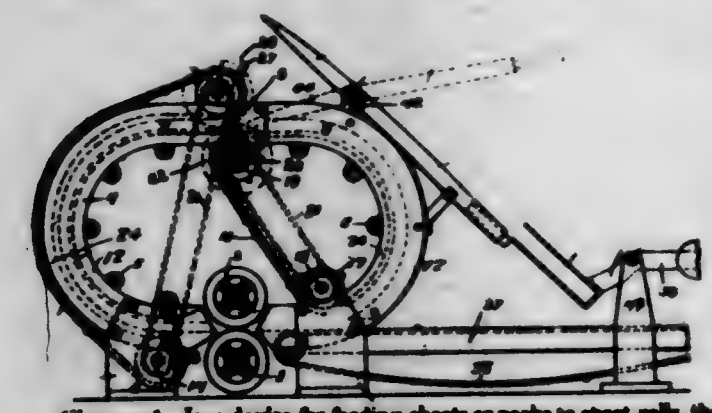
3. The herein-described improvement in the process of producing hollow glass bodies, which consists in first obtaining a partly-formed hollow body from a mass of liquid glass, next for the purpose of distributing such undesirable accumulation of glass as may occur in any part of said partly-formed body, producing an indentation into such part thereof from its exterior and at the same time blowing said body from its interior, and finally bulging out the so-indented part by continued blowing.

708,619. APPARATUS FOR GENERATING WATER-GAS. Hugo Strache, Vienna, Austria-Hungary. Filed Oct. 31, 1900. Serial No. 35,008. (No model.)



Claim.—In a gas-generating apparatus, the combination, with a horizontally-attenuated inclosure having a fuel-supply inlet and an outlet for the generated gas, of an inclined fuel-support and an evaporator, means for introducing into the inclosure the fluid to be evaporated, and a reticulated heat-storing medium comprising a series of horizontally-extending tubes disposed longitudinally of said inclosure, said fuel-support having a relatively large supporting area and the heat-storing medium being disposed in close proximity to the top or fuel side thereof, said fuel-support, the heat-storing medium and the evaporator being arranged relatively horizontal in said inclosure, substantially as described.

708,620. APPARATUS FOR ROLLING SHEET METAL. Peter O. Stevenson, Braddock, Pa. Filed Nov. 13, 1901. Serial No. 82,137. (No model.)



Claim.—1. In a device for feeding sheets or packs to sheet-rolls, the combination of the rolls, and a conveyer extending from the rear of the rolls around to the front thereof and out of contact therewith, said conveyer having its ends in line with the same pass of the rolls and in position to receive the sheet or pack from, and feed the same to, said pass.

2. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in line with the same pass of the rolls and in position to receive the sheet or pack from, and feed the same to, said pass, and positively-driven feeding mechanism in said conveyer, said feeding mechanism being out of contact with the rolls.

3. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof and out of contact therewith, said conveyer having its ends in line with the same pass of the rolls and in position to receive the sheet or pack from, and feed the same to, said pass, and positively-driven feeding-chains in said conveyer.

4. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in line with the same pass of the rolls and in position to receive the sheet or pack from, and feed the same to, said pass, positively-driven feeding-chains in said conveyer, said chains being out of contact with the rolls, and projections or fingers on said chains for engaging the sheet or pack.

5. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in line with the same pass of the rolls and in position to receive the sheet or pack from, and feed the same to, said pass, positively-driven feeding-chains in said conveyer and out of contact with the rolls, guides on the conveyer and means on the chains engaging said guides.

6. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in line with the same pass of the rolls and in position to receive the sheet or pack from, and feed the same to, said pass, positively-driven feeding-chains forming one side of said conveyer, and guide-bars forming the opposite side of said conveyer.

7. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in position to receive the sheet or pack from, and feed the same to, said rolls, and mechanism for extracting the sheets or packs from said conveyer and reversing the same endwise.

8. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in position to receive the sheet or pack from, and feed the same to, said rolls, positively-driven feeding means in said conveyer, and mechanism for extracting the sheets or packs from the conveyer, reversing the same endwise and returning the same to the rolls.

9. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in position to receive the sheet or pack from, and feed the same to, said rolls, a frame adjacent to said conveyer, and means for moving said frame to project one end thereof into the conveyer.

10. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in position to receive the sheet or pack from, and feed the same to, said rolls, a frame in proximity to the conveyer in position to have one end enter said conveyer, and mechanism operating in connection with said pivoted frame adapted to receive the pack therefrom and present the same to the rolls rear end first.

11. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls over the same to the front thereof, positively-driven means in said conveyer, a frame pivoted adjacent the conveyer in position to have one end enter the conveyer and receive the pack or sheet therefrom, a pivoted fork adapted to receive the pack from the frame and to return the same to the rolls rear end first.

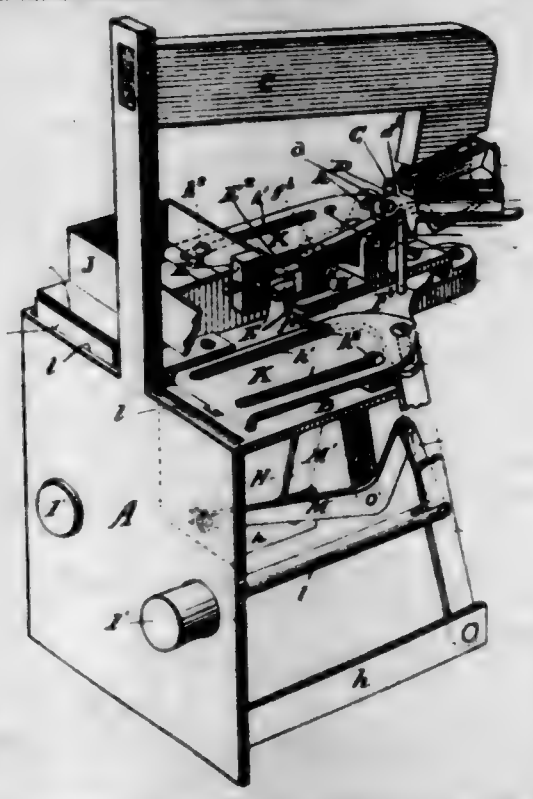
12. In a device for feeding plates or packs to sheet-rolls, the combination with the rolls, of a conveyer extending from the rear of the rolls around to the front thereof, said conveyer being out of contact with the rolls and having its ends in position to receive the sheet or pack from, and feed the same to, said rolls, and a feed-table in front of the rolls below the front end of the conveyer in position to feed a sheet or bar to said rolls.

13. In a device for feeding sheets or packs to sheet-rolls, the combination with the rolls, of a positively-driven conveyer extending from the rear of the rolls around to the front thereof, said conveyer having its ends in position to receive the sheet or pack from, and feed the same to, said pass, a feed-table in front of the rolls below the front end of the conveyer in position for feeding sheets or bars to the rolls, a frame pivoted in proximity to the conveyer and adapted to enter the conveyer and receive the sheet or pack therefrom, and a pivoted fork adapted to receive the pack therefrom from the pivoted frame and to be then rocked to deliver the sheet or pack to the feed-table.

708,621. COIN-CONTROLLED DEVICE. Henry G. Sweeney, Chicago, Ill., assignor to Frank G. Kammerer, Chicago, Ill. Filed July 8, 1901. Serial No. 67,446. (No model.)

Claim.—1. A coin-controlled mechanism comprising two manually-operable actuating members, a tilting detent-lever adapted to be moved

from the weight of a coin, means operated by the detent-lever for holding both actuating members from movement, a coin-holder having two coin-receiving slots and a coin-chute, said coin-holder and coin-chute being movable one with respect to the other and means actuated by the movement of either of said manually-operable members for shifting the position of the coin holder and chute with respect to each other, so as to bring either slot of the coin-holder beneath the chute.



2. A coin-controlled mechanism comprising two manually-operable actuating members, a tilting detent-lever adapted to be moved by the weight of a coin, means operated by the detent-lever for holding the actuating members from movement, a coin-holder having two coin-receiving slots and a coin-chute, said coin-holder and coin-chute being movable one with respect to the other, means actuated by the movement of either one of said manually-operable members for shifting the position of the coin holder and chute so as to bring either slot of the coin-holder beneath the chute, and a stop-plate for confining a coin in the slot of the coin-holder which is beneath the chute.

3. A coin-controlled mechanism comprising two manually-operable members, a locking-plate, a tilting detent-lever adapted to engage said locking-plate, a coin-chute and a coin-holder which is connected with and gives movement to the detent-lever and is provided with two coin-slots, said coin-chute and coin-holder being movable one with respect to the other, so that either of the slots of the coin-receptacle may be brought into position beneath the chute.

4. A coin-controlled mechanism comprising two manually-operable actuating members, a locking-plate, a tilting detent-lever adapted to engage said locking-plate to hold said manually-operable members from movement, a coin-chute, and a coin-holder which is connected with and gives movement to the detent-lever and is provided with two coin-slots, said coin-holder and coin-chute being movable one with respect to the other, so that either slot of the coin-holder may be brought beneath the chute, and means operated through said manually-operable members for producing such relative movement of the coin-holder with respect to the coin-chute.

5. A coin-controlled mechanism comprising two manually-operable members, a locking-plate, a tilting detent-lever constructed to engage said locking-plate for holding the manually-operable parts from movement, and adapted to be actuated by the weight of the coin, a coin-chute and a coin-holder which is connected with and gives movement to the detent-lever and is provided with two coin-receiving slots, said chute and stop-plate being movable one with respect to the other, so that either slot of the coin-holder may be brought beneath the chute, and a stop-plate adapted to hold a coin in that one of the two coin-receiving slots which is at any time beneath the chute, and means operated by the said manually-operable parts constructed to effect such relative movement of the coin holder and chute.

6. A coin-controlled mechanism comprising two manually-operable actuating members, a locking-plate connected and movable with both members, a tilting detent-lever adapted to be moved by the weight of a coin and which is constructed to engage the locking-plate to hold the actuating members from movement, a coin-holder which is connected with and gives movement to the detent-lever and is provided with two coin-receiving slots and a coin-chute, said coin-holder and coin-chute being movable one with respect to the other and means actuated through the movement of either one of said manually-operable members for shifting the position of the coin holder and chute with respect to each other.

7. A coin-controlled mechanism comprising two manually-operable actuating members, a locking-plate connected and moving with both members, a tilting detent-lever adapted to be moved by the weight of the coin and which is constructed to hold the actuating members from movement, a coin-holder mounted on said tilting lever and movable laterally with respect thereto, said coin-holder having two coin-receiving slots, a coin-chute, and means operated through the movement of said locking-plate for shifting the position of the coin-holder with respect to the chute.

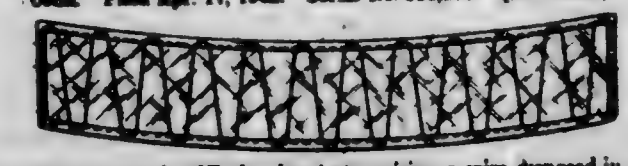
8. A coin-controlled mechanism, comprising two manually-operable actuating members, a locking-plate connected and moving with both members, a tilting detent-lever adapted to be moved by the weight of the coin and which is constructed to hold the actuating members from movement, a coin-holder mounted on said tilting lever and movable laterally with respect thereto, said coin-holder having two coin-receiving slots, a coin-chute and means operated through the movement of said locking-plate for shifting the position of the coin-holder with respect to the chute and a stop-plate carried by said detent-lever.

9. A coin-controlled mechanism comprising two manually-operable actuating members, a locking-plate connected with both of said members, a tilting detent-lever adapted to be moved by the weight of a coin and which is constructed to hold the actuating members from movement, a coin-holder pivoted on the detent-lever and provided with two coin-receiving slots, a coin-chute, an actuating-arm on said locking-plate adapted to engage the coin-holder for shifting it laterally upon the detent-lever.

10. A coin-controlled mechanism comprising an oscillatory plate provided with two actuating-arms, two push-buttons connected with the actuating-arms of said locking-plate, a tilting detent-lever adapted to be moved by the weight of a coin and constructed to hold the locking member from movement, a coin-holder which is connected with and gives movement to the detent-lever and is provided with two coin-receiving slots and a coin-chute, said coin-holder and coin-chute being movable one with respect to the other and means actuated by the movement of the locking-plate for shifting the position of the coin holder and chute with respect to each other.

11. A coin-controlled vending device comprising two manually-operable actuating members, a tilting detent-lever adapted to be moved by the weight of the coin and which is constructed to hold both actuating members from movement, a coin-holder which is connected with and gives movement to the detent-lever and is provided with two coin-receiving slots and a coin-chute, said coin-holder and coin-chute being movable one with respect to the other, means actuated by the movement of either of said manually-operable actuated members for shifting the position of the coin holder and chute with respect to each other to bring either slot of the coin-holder beneath the chute, two receptacles to contain the articles to be vended, and two ejecting-slides working in said receptacles, said slides being connected and moving with said manually-operable members.

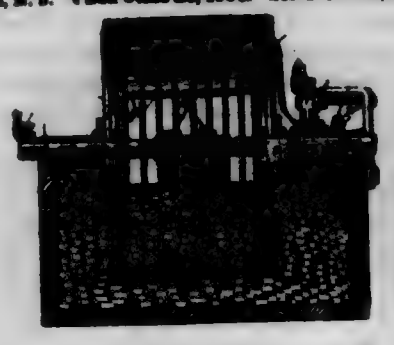
708,622. STIFFENING-BAND. HENRY H. TAYLOR, Bridgeport, Conn. Filed Apr. 17, 1902. Serial No. 103,390. (No model.)



Claim.—1. A stiffening-band comprising a wire disposed in zigzag fashion to form alternate loops and openings at the top and bottom, said band being bound with tapes along the top and bottom and at the ends, substantially as set forth.

2. A stiffening-band comprising a wire disposed in zigzag fashion to form alternate loops and openings at the top and bottom, and a cloth facing secured to said band by tapes, substantially as set forth.

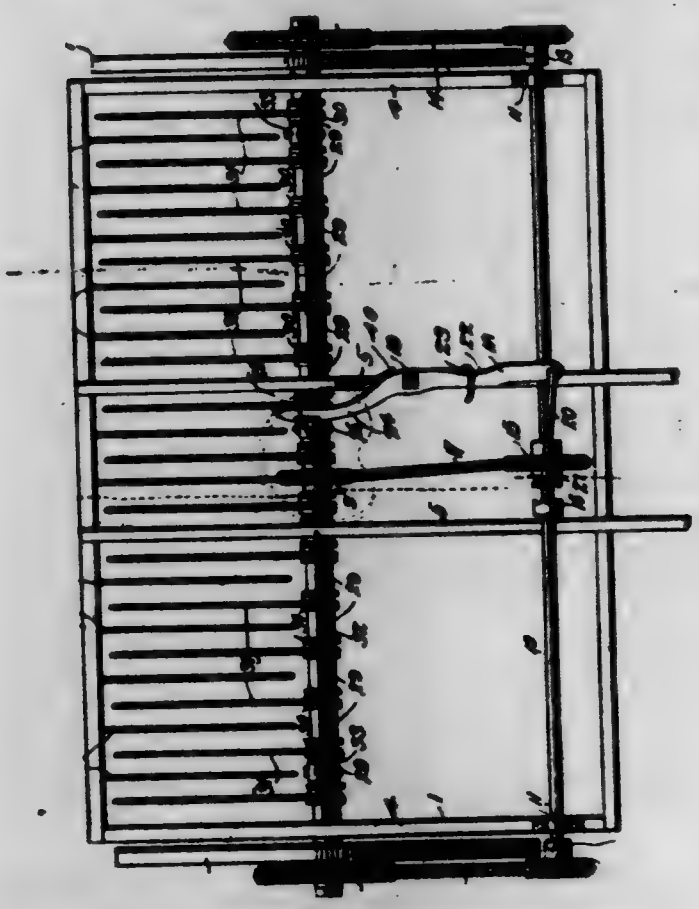
708,623. ELECTROPLATING APPARATUS. THEODORE F. TAYLOR, Camden, N. J. Filed June 26, 1901. Serial No. 66,065. (No model.)



Claim.—1. In an electroplating apparatus, a tank, an axle suitably supported over the tank, a receptacle on the axle; said receptacle having openings in its ends, wire rings on the interior surface of the receptacle, said rings being electrically connected with the negative pole of a generator; an anode secured within the receptacle, a binding-post secured to the axle, electrically connected with the anode through said axle.

2. In an electroplating apparatus, a tank for containing an electrolyte, a stationary axle supported by the tank, a receptacle mounted upon the axle, means for rotating the receptacle on the axle, said receptacle having openings in its ends to admit the electrolyte, a fibrous lining on the inner surface of the receptacle, metallic rings on the lining, a contact-ring carried by and insulated from the receptacle, all of the rings in the receptacle being electrically connected to the contact-ring, a brush in contact with the contact-ring, said brush being in electrical connection with the negative poles of a generator, an anode on the axle depending into the electrolyte, and a binding-post on the axle, electrically connected with the anode through said axle, substantially as described.

708,624. SULKY HAY-RAKE. JOHN J. THOMPSON, Louistown, Mont. Filed Feb. 14, 1902. Serial No. 94,535. (No model.)



Claim.—1. In a horse hay-rake, the combination of a frame, a revolvable axle-shaft having rake-teeth, supporting-wheels revolvable on and independently of the axle-shaft, a counter-shaft, power connections between the same and one of the supporting-wheels, whereby the counter-shaft is rotated, and power connections including a clutch, between the counter-shaft and the axle-shaft, whereby the latter and the rake-teeth carried thereby may be rotated at will by power from the counter-shaft, substantially as described.

2. In a horse hay-rake, the combination of a frame, a revolvable axle-shaft having rake-teeth, supporting-wheels revolvable on and independently of the axle-shaft, a counter-shaft, power connections between the same and one of the supporting-wheels, whereby the counter-shaft is rotated, power connections, including a clutch, between the counter-shaft and the axle-shaft and a lever to operate the clutch, the lever and the axle-shaft having coacting stops to lock the axle-shaft against rotation when the power connections are unclutched from the counter-shaft, substantially as described.

3. In a horse hay-rake, the combination of a frame, a revolvable axle-shaft having rake-teeth, supporting-wheels revolvable on and independently of the axle-shaft, a counter-shaft, power connections between the same and one of the supporting-wheels, whereby the counter-shaft is rotated, power connections, including a clutch, between the counter-shaft and the axle-shaft and a lever to operate the clutch, said lever having a notched arm, and a lock-arm, carried by the axle-shaft and engaged with the notched arm, to lock the axle-shaft against rotation when the power connections are unclutched from the counter-shaft, substantially as described.

4. In a horse hay-rake, the combination of a frame, a revolvable axle-shaft having rake-teeth, supporting-wheels revolvable on and independently of the axle-shaft, a counter-shaft, power connections between the same and one of the supporting-wheels, whereby the counter-shaft is rotated, power connections, including a clutch, between the counter-shaft and the axle-shaft and a lever to operate the clutch, and a stop element carried by the axle-shaft, coacting with the lever to lock the axle-shaft against rotation when the power connections are unclutched from the counter-shaft, substantially as described.

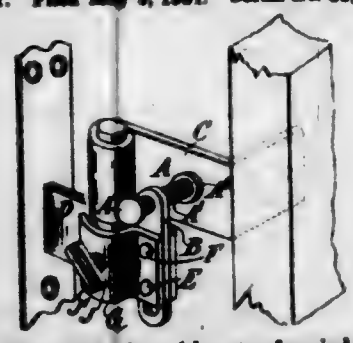
5. In a horse hay-rake, the combination of a frame, a revolvable axle-shaft having rake-teeth, supporting-wheels revolvable on and independently of the axle-shaft, a counter-shaft, power connections between the same and one of the supporting-wheels, whereby the counter-shaft is rotated, power connections, including a clutch, between the counter-shaft and the axle-shaft and a lever to operate the clutch, a stop element carried by the axle-shaft, coacting with the lever to lock the axle-shaft against rotation when the power connections are unclutched from the counter-shaft, and a foot-lever to operate the first-mentioned lever, substantially as described.

6. In a horse hay-rake, the combination of a shaft, a lock-bar in fixed relation thereto, a rake-tooth pivotally connected to the shaft and having its upper end extended above the shaft, and a connection, including a spring, between the lock-bar and the said extended upper end of the tooth, whereby the latter is adapted to turn on the shaft against the tension of the spring, for the purpose set forth, substantially as described.

708,625. GAS-BURNER. SIDNEY R. TERRY, Chicago, Ill. Filed Dec. 4, 1901. Serial No. 84,617. (No model.)

Claim.—In a gas-burner, the combination of a gas-discharge tip placed in an open space, with a short inlet-pipe in front of the tip and a short distance therefrom, a series of large but gradually-contracting mixing-chambers at the end of the short inlet-pipe, a series of secondary air-inlets immediately around the short inlet-pipe and opening into the first and largest of said mixing-chambers, a contracted passage beyond the mixing-chambers, and an enlarged discharge end.

708,626. STOP FOR WINDOW-BLINDS. THOMAS A. URQUHART, Brooklyn, N. Y. Filed May 9, 1901. Serial No. 59,457. (No model.)



Claim.—1. The combination with a stop for window-blinds of means for attaching the same to one member of the hinge, a swinging and reciprocating arm B carrying said stop and adapted to swing said stop into and out of the path of the other member of the hinge, said arm being provided with a slot B', and a pin F in position to be engaged by said slot to lock said stop in each path.

2. The combination with a stop for window-blinds, of a pair of plates G^2 carried by the fixed member of the hinge, a pin E between said plates, and a swinging arm carried by said pin and carrying said stop.

3. The combination with a stop for window-blinds, of a pair of plates G^2 carried by the fixed member of the hinge, pins E and F between said plates, and a swinging and reciprocating arm B carried by said pin E and provided with a slot B' in position to engage said pin F to lock said arm.

4. The combination with a stop for window-blinds, of a sleeve for attaching the same to the hub of the fixed portion of the hinge, said sleeve comprising a pair of members adapted to surround said hub and being extended to form plates G^1, and said stop being carried between said plates.

5. The combination with a stop for window-blinds, of a sleeve carrying said stop and adapted to surround the hub of the fixed member of the hinge, a fillet K adapted to bear at its edge K' against such fixed member, and a screw passing through the sleeve and having a flat end

adapted to bear against the flat face K³ of said fillet, whereby the sleeve may be prevented from turning on the hub.

6. The combination with a stop for window-blinds of means for attaching the same to a window-frame, means for swinging said stop into and out of the path of the blind, and means for adjusting said stop laterally.

7. The combination with a stop for window-blinds of means for attaching the same to one member of the hinge, means for swinging said stop into and out of the path of the other member of the hinge, means for locking said swinging means in position, and means for adjusting said stop laterally.

708,627. **ANTISEPTIC BANDAGE.** CARL F. UTERMÖHLEN, Amsterdam, Netherlands. Filed Nov. 13, 1901. Serial No. 82,720. (Specimens.)

Claim.—1. The herein-described surgical package, consisting of a bandage folded upon itself to completely cover and protect the surface adapted to be applied to a wound, a binder attached to said bandage, for the purpose of securing the bandage in place when in use, being exposed and providing means for unfolding and applying the bandage, and a retainer holding the bandage in its folded position.

2. The herein-described surgical package consisting of a bandage folded upon itself to completely cover and protect the surface adapted to be applied to a wound, a binder secured to and having its free ends coiled upon the bandage, and a retaining means extending around the folded bandage and over said coils, whereby when said retaining means are removed the bandage can be unfolded and applied by means of said binder.

708,628. **ANIMAL-TRAP.** THOMAS D. VARATA, Washington, D. C., assignor of one-half to William W. Grant, Washington, D. C. Filed Mar. 7, 1902. Serial No. 97,602. (No model.)

Claim.—1. An animal-trap having a baiting-compartment provided with a pivotally-supported door, a prison-compartment provided with a vertically-movable hood, a transverse partition between said compartments, a vertically-movable rod and an oscillatory rod forming connections between said door and said hood for releasing the door and resetting the trap, and means connected to the pivoted support of the door for opening and closing said door.

2. An animal-trap having vertical door-jambs, a vertical and revolvable door supported between said jambs and provided with notches in the edges thereof, an oscillatory rod supported in one of said jambs and having a latch thereon engaging said door, and the rod provided with a curved and slotted lever, a movable hood having a rod thereon engaging said slotted lever, and a spring connected to rod extending from the hood.

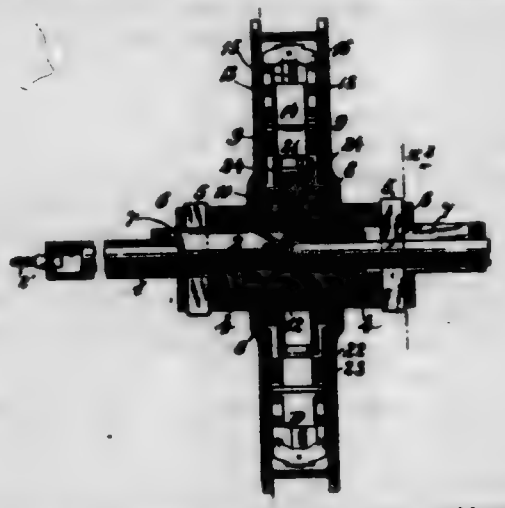
3. An animal-trap provided with a door, a latch engaging said door outside the trap, a vertically-movable hood having a vertically-movable rod attached thereto and connected to said latch to lock the door on one side and release the door and reset the trap, a spring engaging said rod, and means for opening and closing the door.

4. An animal-trap provided with a revolvable door, a stud projecting through the bottom of the trap for locking the door in open position, a movable section in the bottom of the trap to which said stud is connected to release the door by the weight of an animal, a movable hood, and a latch engaging the door outside the trap and operated by the animal to release the door and reset the trap.

5. An animal-trap having a revolvable door, a latch on one side of the center thereof operated by an animal, a spring-catch in the bottom of the trap and on the opposite side of the center, a stop in the bottom of the trap to hold the door open, a movable section in the bottom of the trap to which said stop is connected to release the door by the weight of an animal, a runway formed by a movable hood, and connections with said hood to reset the trap.

6. An animal-trap provided with a movable hood forming a runway and having barbs at the outer end thereof, barbs secured to the floor of the trap at the outer end of the runway, and flanges secured to the bottom of the trap on the outer sides of the hood to prevent raising or lateral displacement thereof.

708,629. **VARIABLE-SPEED GEARING.** LOUIS T. WEISS, Flatbush, N. Y. Filed Apr. 6, 1901. Serial No. 54,761. (No model.)



Claim.—1. In a variable-speed gearing, the combination with a driving-shaft, an inner eccentric sleeve 2 slidable longitudinally but non-rotative thereon, said sleeve having a spiral groove in its face, an outer eccentric sleeve 4, mounted on the sleeve 2, keyed to the driving-shaft and having an outer surface concentric therewith, wheels or parts, to be driven, mounted rotatively on the sleeve 4 as a journal, said wheels or parts having gripping flanges, an operating-eccentric 10, mounted rotatively on the sleeve 2 and having a stud or key 11 engaging the spiral groove in said sleeve 2, and a yoke 12, on said eccentric, of a dog, adapted to grip on the flanges of the driven wheels and rotate the same, and means operatively coupling together the said yoke and dog.

2. In a variable-speed gearing, the combination with a rotating driving-shaft, an inner eccentric sleeve 2, slidable longitudinally along said shaft but rotatable therewith, said sleeve having in it a spiral groove, two like outer eccentric sleeves 4 keyed to the shaft and embracing the inner eccentric sleeve, the outer surfaces of the said outer sleeves being concentric with the driving-shaft, two wheels 9, mounted rotatively on the respective sleeves 4 and provided on their inner faces each with a gripping-flange 13, an operating-eccentric 10, mounted rotatively on the inner sleeve 2 between the sleeves 4, and having a stud or key 11 engaging the spiral groove in the sleeve 2, and a yoke 12 on the said eccentric, of two or more dogs D, having jaws which grip the flanges on the wheels 9 for rotating the latter in opposite directions, and means operatively coupling said dogs with the yoke 12.

3. In a variable-speed gearing, the combination with a rotatable driving-shaft, a longitudinally-slidable inner eccentric sleeve 2, mounted on and rotatable with said shaft, said sleeve having in it a spiral groove, an operating-eccentric mounted rotatively on said sleeve 2 and having a stud or key engaging the spiral groove therein, a yoke embracing said eccentric, and two wheels 9 to be driven, mounted rotatively and provided with gripping-flanges 13 on their adjacent faces, of a dog D between said wheels, with jaws to grip the flanges thereon, and means operatively coupling the eccentric-yoke with said dog, the latter comprising a body, two

outer jaws, and two inner jaws, the pair of jaws at one side being set to bite when the dog is moved in one direction, and the pair at the other side to bite when the dog is moved in the opposite direction.

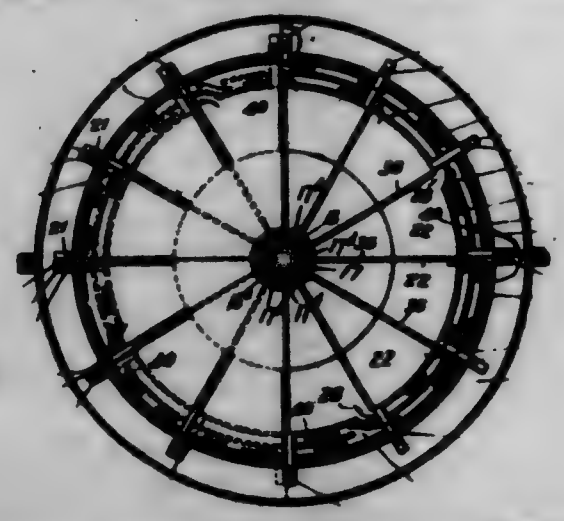
4. In a variable-speed gearing, the combination with a rotatable driving-shaft, an operating-eccentric and its yoke, and means for gradually varying the throw of said eccentric without varying the speed of the driving-shaft, of a flanged wheel or part to be rotated, a dog adapted to grip on the opposite faces of the flange of said wheel and impart intermittent rotative impulses thereto, means operatively coupling together said eccentric-yoke and dog, and means for shifting the jaws of the dog for reversing the driving motion.

5. In a variable-speed gearing, the combination with a rotatable driving-shaft, an operating-eccentric and its yoke, and means for gradually varying the throw of said eccentric without varying the speed of the driving-shaft, of a wheel or part to be rotated, a dog adapted to grip on some part of said wheel and impart intermittent rotative impulses thereto, means operatively coupling together said eccentric-yoke and dog, and means for automatically shifting the jaw of said dog for reversing the driving motion when the operating-eccentric is rotated to a position concentric with the driving-shaft.

6. In a variable-speed gearing, the combination with rotative parts 9, having each a flange 13, the driving-shaft, an operating-eccentric 10, its yoke, and means between said shaft and eccentric for varying the throw of the latter, of a dog D, said dog comprising a body 14, a spindle 15, rotative therein and provided with a crank-arm 21 on its inner end and a head 16 on its outer end, inner jaws 17, mounted on the said body and adapted to bear on the inner faces of the respective flanges 13, and outer jaws 18, mounted on said head and adapted to bear on the outer faces of the respective gripping-flanges, means for automatically rocking the shaft 15, so as to shift the outer jaws, at the moment the throw of the operating-eccentric is neutralized, and means operatively coupling the eccentric-yoke with the said dog, whereby the driving movement may be reversed.

7. In a variable-speed gearing, the combination with a rotatable driving-shaft, an inner eccentric sleeve 2, slidable thereon, sleeves 4 keyed to and rotating with the shaft and each provided with a flange 8, having ribs 27 on its inner face, an operating-eccentric 10, rotatable on the sleeve 2, and having a stud or key 11 engaging a spiral groove in the said sleeve, said eccentric being situated between the sleeves 4, and having lateral movement between the same, the disks 24, embracing the eccentric 10 laterally and rotatable therewith, said disks having ribs 26 on their outer faces adapted to be moved into and out of register with the ribs 27, by rotation of said disks, the yoke 12 of the operating-eccentric, and the driven wheels 9, rotatable concentrically with the driving-shaft, of the dogs D, between the wheels 9, and means operatively coupling the said dogs with the yoke of the eccentric, each of said dogs having a body 14, inner jaws 17 to bear on the inner faces of gripping-flanges on the respective wheels 9, a rocking spindle 15, provided with a crank-arm 21, embraced between the disks 24, whereby lateral movement of the said disks serves to rock the spindle 15, a head 16 on said spindle, and outer jaws 18, carried by said head and bearing on the outer faces of the said gripping-flanges, substantially as and for the purpose set forth.

703,680. CENTRIFUGAL SEPARATOR. ARTHUR TEE WERKE, Denver, Colo. Filed May 21, 1901. Serial No. 61 283. (No model.)



Claim.—1. In a centrifugal ore-separator, the combination of a revolvable tank, radial partitions located therein and forming sector-shaped compartments, circular partitions surrounding the radial partitions and forming a concentric compartment, the outer extremities of the radial partition engaging the inner circular partition, whereby the sector-shaped compartments have no communication with each other, outlets from the sector-shaped compartments to the concentric compartment, for the mineral, and mineral-outlets from the concentric compartment but not in line with the corresponding outlets from the sector-shaped compartments.

2. In a centrifugal separator, the combination of a revolvable tank having a number of sector-shaped compartments having no communication with each other, a feed-pipe arranged to discharge simultaneously into all of said compartments the feed-pipe having a distinct outlet to each sector-shaped compartment, circular partitions surrounding the sector-shaped compartments, and forming a concentric compartment, outlets from the sector-shaped compartments to the concentric compartment, and an outlet from the concentric compartment but remote from the corresponding outlets from the sector-shaped compartments.

3. In a centrifugal separator, the combination of a revolvable tank, a central sleeve attached to the tank, a feed-pipe projecting downwardly into said sleeve, radial partitions extending outwardly from the sleeve and dividing the tank into a number of sector-shaped compartments into which the material issuing from the feed-pipe passes, circular partitions surrounding the radial partitions and forming a concentric compartment in communication with the sector-shaped compartments, the radial partitions extending to the inner circular partition, whereby the sector-shaped compartments have no communication with each other and outlets from the concentric compartments for the mineral passing thereto from the sector-shaped compartments.

4. In a centrifugal separator, the combination of a revolvable tank, a feed-pipe located at the center of the tank, a sleeve secured to the tank and into which the feed-pipe projects, radial partitions arranged around the said sleeve and dividing the tank into sector-shaped compartments, into which the feed-pipe discharges, and a mineral-outlet from each sector-shaped compartment, the said compartments having no communication with each other.

5. The combination of a revolvable tank, a central sleeve attached thereto, a feed-pipe projecting into said sleeve, radial partitions arranged around the sleeve and dividing the space within the tank into a number of sector-shaped compartments having no communication with each other, each compartment being provided with an outlet for the mineral, said outlet being located remote from the feed-pipe and a circular compartment surrounding the sector-shaped compartments, and into which the mineral-outlets from the sector-shaped compartments discharge.

6. The combination of a revolvable tank, a central sleeve attached to the tank, a feed-pipe projecting into the sleeve, radial partitions surrounding the sleeve and dividing the tank into sector-shaped compartments having no communication with each other, provided with two outlets, one being for the mineral and the other for the gangue, the mineral-outlet being located below the gangue-outlet, and a circular compartment surrounding the sector-shaped compartments, and into which the mineral-outlets from the sector-shaped compartments discharge.

7. The combination of a revolvable tank, a central feed-pipe, radial partitions surrounding the feed-pipe and dividing the tank into sector-shaped compartments provided with two outlets, one being for the mineral and the other for the gangue, the mineral-outlet being located below and in the rear of the gangue-outlets, the sector-shaped compartments having no communication with each other, and a circular compartment surrounding the sector-shaped compartments, and into which the mineral-outlets from the sector-shaped compartments discharge.

8. The combination of a revolvable tank, a central feed-pipe, a sleeve attached to the tank and into which the feed-pipe projects, partitions dividing the tank into sector-shaped compartments having no communication with each other, a horizontal partition closing said compartments at the top except for a short distance around the sleeve, a top for the tank said top being located above the horizontal partition and closing the tank above, and a water-outlet between the top of the tank and the horizontal partition, the sector-shaped compartments being provided with outlets for the mineral and separate outlets for the gangue.

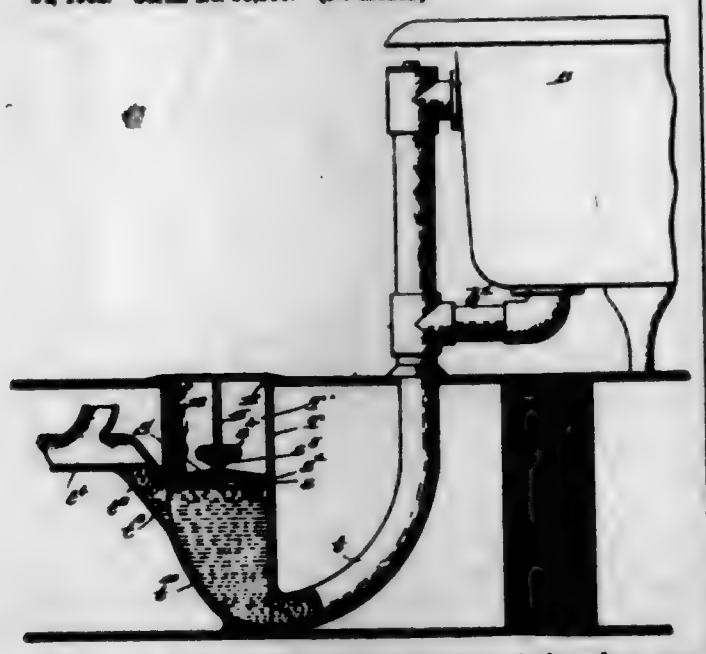
9. The combination with a suitable frame, of a vertical shaft journaled therein, a tank mounted to rotate with said shaft and closed at the top, radial partitions dividing the tank into a number of sector-shaped compartments having no communication with each other, a central feed-pipe communicating with all the said compartments, circular partitions dividing the space around the radial partitions into two concentric compartments, outlets from the sector-shaped compartments to the inner concentric compartment, outlets from the inner concentric compartment to the outer circular compartment, cut-offs located at said last-named outlets, and outlets for the mineral, leading from the outer concentric compartment.

10. In a centrifugal separator, the combination of a revolvable tank, a vertical shaft to which said tank is secured, a sleeve attached to the tank and surrounding the shaft, another sleeve attached to the tank outside of the first-named sleeve, a feed-pipe projecting into the tank between the two sleeves, a plate attached to the bottom of the outer sleeve, and projecting below the feed-pipe to the inner sleeve to which it is at-

tached, said plate having openings below the feed-pipe, and nozzles leading from said openings into the tank.

11. In a centrifugal separator, the combination of a revoluble tank, radial partitions dividing the tank into sector-shaped compartments, a vertical shaft to which said tank is secured, a sleeve attached to the tank and surrounding the shaft, another sleeve attached to a tank above and outside of the first-named sleeve, a feed-pipe projecting into the tank between the two sleeves, a plate attached to the bottom of the outer sleeve and extending below the feed-pipe, to the inner sleeve to which it is attached, said plate having openings below the feed-pipe, and nozzles or discharge-pipes directed outwardly from said openings into the tank, there being a nozzle for each sector-shaped compartment.

708,681. TRAP. JOHN W. ZIMMERMAN, Boston, Mass. Filed Mar. 24, 1902. Serial No. 99,599. (No model.)



Claim.—1. A trap comprising an upright tubular body or drum open at its upper end and having an inlet-port in its side wall adjacent its permanently-closed bottom, a discharge-port located above and opposite the inlet-port, a removable cover for the upper end of said body and a clean-out closure independent of the cover and detachably secured wholly within the upright body below the water-line of the trap and between the inlet and discharge ports thereof.

2. A trap comprising an upright tubular body or drum open at its upper end and having an inlet-port in its side wall adjacent its bottom, a discharge-port located above and opposite the inlet-port, an annular, interiorly-threaded seat in the body below the water-line of the trap and between the ports, a removable cover for the upper end of said body, a clean-out closure wholly within the body and independent of the cover, said closure having an external thread to engage the thread of the seat, and a device on the upper side of the closure to turn it.

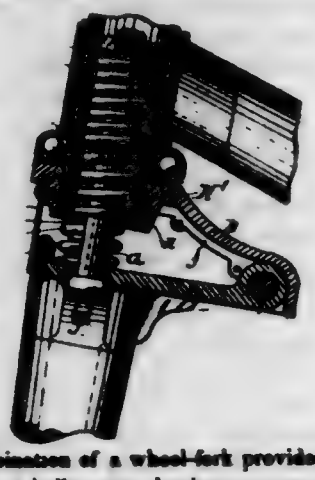
3. A trap comprising an upright tubular body having inlet and discharge branches at different heights above its bottom, an annular seat in the body below the discharge and above the inlet, and below the water-line of the trap, a clean-out closure detachably connected with the seat, to close the body thereat, a removable cover for the upper, open end of the body, and means to detachably connect the cover with the closure, to retain the former in place.

4. A trap comprising an upright tubular body having an inlet-port in its side wall adjacent the bottom and having its bottom and side wall opposite the inlet-port upwardly curved, a discharge-port at the upper end of the curved portion, and a clean-out closure detachably mounted in the body below the water-line of the trap and below the discharge-port.

5. A trap comprising an upright tubular body or drum having diametrically opposite inlet and discharge branches, one above the other, the wall of the body opposite to the inlet branch being upwardly curved to the discharge branch, to provide for an uninterrupted sweep of the water through the lower part of and to scour the body, and a clean-out closure detachably mounted in the body below the water-line of the trap and between the inlet and discharge branches.

708,682. CUSHIONED BICYCLE-FRAME. ROSHAM B. ZIMMERMAN, North Tonawanda, N. Y. Filed Dec. 14, 1901. Serial No. 86,267. (No model.)

Claim.—1. The combination of a wheel-fork and a hollow stem, each carrying a hinge leaf or plate, a pintle connecting said leaves on the rear side of the fork, a tie-bolt passing centrally through said leaves on the front side of said pintle and extending into the stem, a cushioning and return spring applied to said bolt within the stem, and main cushioning-springs arranged between said hinge-leaves on opposite sides of said tie-bolt, substantially as set forth.



2. The combination of a wheel-fork provided at its crown with a hinge leaf or plate, a hollow stem having a corresponding hinge-leaf provided centrally with a socket which is depressed below the under side thereof, a pintle connecting said hinge-leaves on the rear side of the fork, a tie-bolt loosely connecting said leaves on the front side of said pintle and extending into said hollow stem, a main cushioning-spring interposed between said hinge-leaves, and a cushioning and return spring applied to said tie-bolt within the stem and resting upon the bottom of said depressed socket, substantially as set forth.

3. The combination of a hollow stem provided with a hinge leaf or plate, a fork having at its crown a corresponding hinge-leaf provided with sockets which are located on opposite sides of its center and depressed below its upper surface, main cushioning-springs interposed between said hinge-leaves and having their lower ends seated in said sockets, a tie-bolt loosely connecting said hinge-leaves and extending into said hollow stem, and a cushioning and return spring applied to said bolt, substantially as set forth.

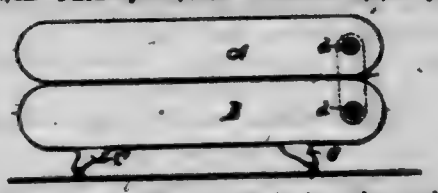
4. The combination of a wheel-fork and a stem each carrying a hinge leaf or plate, a pintle connecting said leaves, a main cushion interposed between said leaves, and a return-cushion arranged to act upon said hinge-leaves and having sections of differential tension constructed to come into action successively, substantially as set forth.

5. The combination of a wheel-fork and a stem each carrying a hinge leaf or plate, a pintle connecting said leaves, a main cushion interposed between said leaves, a tie-bolt loosely connecting said hinge-leaves and extending into said stem and provided within the stem with a step, and heavy and light return-springs applied one above the other to the tie-bolt, the lower return-spring resting upon an abutment at the lower end of the stem and the step of the tie-bolt bearing against the top of the upper return-spring, substantially as set forth.

6. The combination of a wheel-fork and a stem, each carrying a hinge leaf or plate, a pintle connecting said leaves, a cushioning-spring interposed between the leaves, and a dust-shield depending from the hinge-leaf of the stem and overlapping the leaf of the fork, substantially as set forth.

7. The combination of a wheel-fork and a stem, each carrying a hinge leaf or plate, a pintle connecting said leaves, a cushioning-spring interposed between the leaves, and a dust-shield depending from the leaf of the stem and overlapping the edge of the fork-leaf, and extending around the front and sides of said leaves and over the ends of said pintle, substantially as set forth.

708,683. COMBINED LADDER AND SETTEE. FLETCHER D. ALLISON, Chicago, Ill. Filed Sept. 26, 1901. Serial No. 76,594. (No model.)



Claim.—1. In a device of the described class, the combination of a ladder formed in sections; a link connecting the meeting ends of said sections, and a seat secured to one of the sections in the rear of the steps or rungs of the ladder, said connecting-link being adapted to permit the sections to be folded in a position with the seat uppermost.

2. In a device of the described class, the combination of a ladder formed in sections; legs secured to one of said sections in the rear of the steps or rungs; a seat secured to the other of said sections in the rear of the steps or rungs, and a link connection between adjacent ends of said

sections adapted to permit one of said sections to swing freely around the end of the other section.

3. In a device of the described class, the combination of a ladder formed in sections, and having channels in the side bars of said sections; a seat-frame slidably mounted in said channels and adapted to be adjusted to cross the meeting ends of said sections and engage in the channels of both sections; a link connecting the meeting ends of said sections and adapted to permit one of said sections to be swung around the end of the other section.

4. In a device of the described class, the combination of a ladder formed in sections; a link connecting the meeting ends of said sections, and a seat secured to one of the sections in the rear of the steps or rungs of the ladder, said connecting-link being adapted to permit the sections to be folded in a position with the seats uppermost, and a step or platform pivotally connected with both sections by pivots common to said platform and link.

5. In a device of the described class, the combination of a ladder formed in sections; a link connecting the sections and adapted to permit one section to be rotated, end to end, around the other section; legs formed on the rear side of one of said sections and a seat formed on the rear side of the other of said sections, together with a catch adapted to hold said sections in a divergent position of adjustment with the rear surfaces of the two sections opposed to each other.

708,684. SASH-LOCK. HOWARD A. BAKER, Clarksville, Tex. Filed Oct. 25, 1901. Serial No. 79,503. (No model.)

Claim.—1. In a device of the class described, the combination with a ratchet-strip having apertures and provided with an enlarged opening, of means for engaging the apertures for supporting a sash in an elevated position, and the automatically-operated locking-pawl normally resting against the ratchet-strip and arranged to ride over the apertures without engaging the same and adapted to be dropped into the enlarged opening, whereby the sash is locked against upward movement, substantially as described.

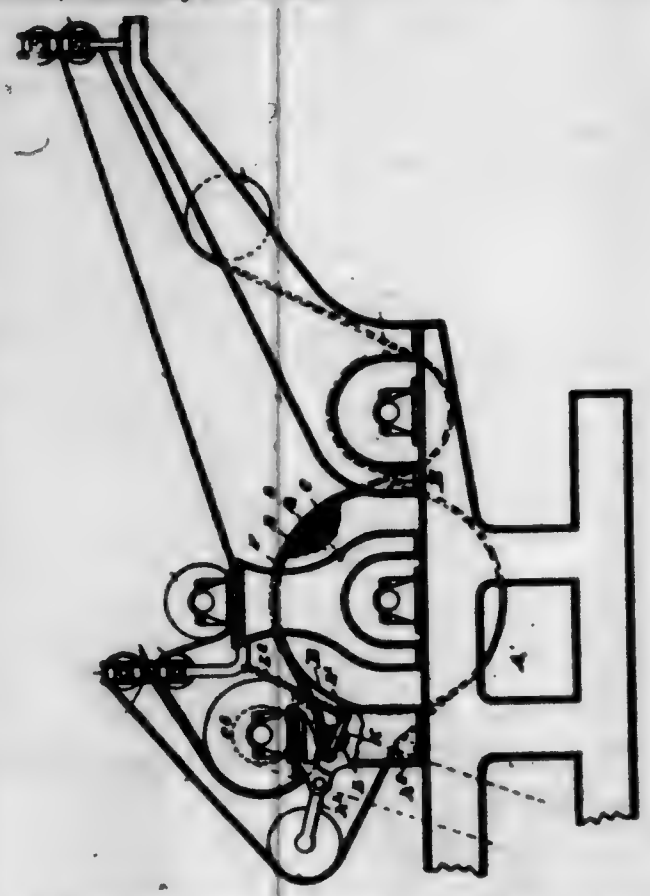
2. In a device of the class described, the combination of a ratchet-strip provided with apertures and having a slot, a sash-supporting dog or pawl arranged at an inclination and extending downward and having a weighted arm adapted to throw it into engagement with the apertures, and the upwardly-extending inclined locking pawl or dog adapted to fit in the slot of the ratchet-strip and provided with a convex face forming a bulging portion arranged to ride over the apertures, substantially as described.

3. In a device of the class described, the combination with a ratchet-strip having apertures and provided with an enlarged slot or opening, of a sash-supporting pawl or device arranged to engage the apertures to hold the sash in an elevated position, and the sash-locking dog or pawl extending upward at an inclination and adapted to fit in the said slot and provided adjacent to its engaging end with an enlarged or projecting portion arranged to ride over the apertures to prevent the sash-locking pawl or dog from catching therein when the sash is raised, substantially as described.

708,685. PAPER-BAG MACHINE. WILLIAM I. BALDWIN and SYDNEY A. KLEIN, Glenville Falls, Ohio. Filed Jan. 15, 1900. Serial No. 1,492. (No model.)

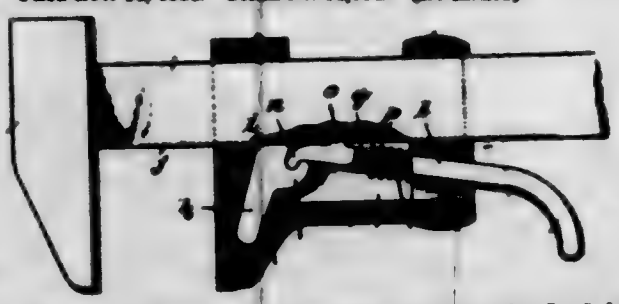
Claim.—1. In a paper-bag machine, the combination with the cylinder B, pulleys at opposite ends thereof, and two carrying-belts running one above the other on each of said pulleys, a driving-roll for the belts, and means for tensioning said belts.

2. In a paper-bag machine, the combination with the cylinder B and pulleys at opposite ends thereof, of a driving-roll, carrying-belts running on said pulleys and passing around said driving-roll, and a spring-actuated pressure-roll adjacent to said driving-roll and actuating against the same, substantially as described.



3. In a bag-machine, the combination with the cylinder, of pulleys at opposite ends thereof of less diameter than the cylinder, two carrying-belts running one above the other on each of said pulleys, the outer face of the inner belt being substantially flush with the periphery of the cylinder, and means to drive the belts.

708,686. WRENCH. GEORGE W. BOZEMAN, San Antonio, Tex. Filed Nov. 11, 1901. Serial No. 81,806. (No model.)



Claim.—1. In a wrench, the combination with the fixed jaw and shank, of a hollow movable jaw having an enlarged recess in the upper portion thereof extending into the projecting lip of said movable jaw, a locking-plate loosely mounted in said movable jaw engaging at one end said enlarged recess and at its other end said shank, and a lever engaging said locking-plate and movable transversely of said movable jaw for disengaging said locking-plate and shank.

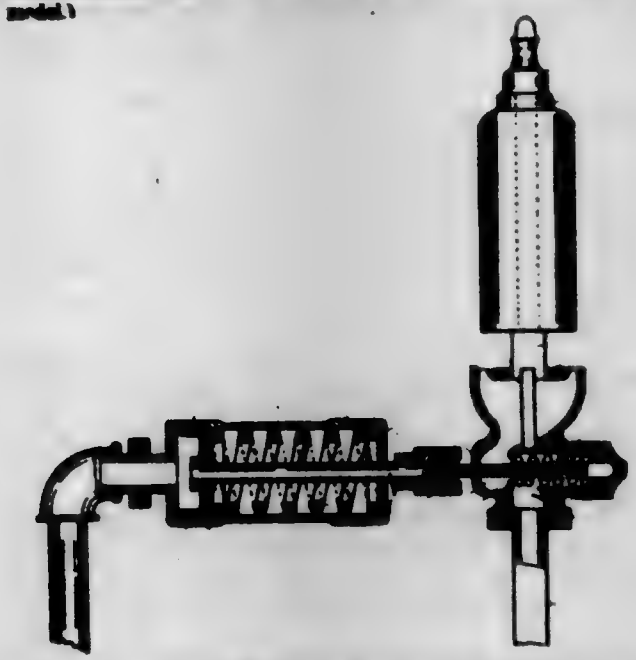
2. In a wrench, the combination with the fixed jaw and milled shank, of a hollow movable jaw provided with an enlarged recess in the upper portion thereof, a locking-plate, loosely carried in said hollow movable jaw, engaging at one end the wall of said enlarged recess and at its other end provided with a milled angular surface engaging said milled shank, and a lever engaging said locking-plate and movable transversely of said hollow jaw for disengaging said locking-plate and shank.

3. In a wrench, the combination with the shank and fixed and movable jaws, of a locking-plate carried by said movable jaw and engaging said shank, a curved lug formed on said locking-plate, and a spring-controlled lever provided with a curved shoulder engaging said curved lug and movable transversely of said movable jaw for releasing said locking-plate.

4. In a wrench, the combination with the fixed jaw and shank, a shallow groove disposed longitudinally of said shank, a hollow movable jaw provided with an enlarged recess, a locking-plate mounted in said enlarged recess and engaging said shank, a lever engaging said locking-plate and a lug on said lever engaging said shallow groove and adapted to act as the fulcrum of said lever when the lever is moved transversely of the hollow jaw for releasing the locking-plate.

5. In a wrench the combination with the fixed jaw and milled shank, of a hollow jaw provided with an enlarged recess at the upper portion thereof, a locking-plate loosely mounted in said enlarged recess and engaging said milled shank, a curved lug formed on said locking-plate, a lever carried by said movable jaw, provided at one end with a curved finger or handle portion and at its other end with a curved shoulder adapted to engage said curved lug on the locking-plate, lugs formed transversely of said lever, and a spring engaging said transverse lugs and said movable jaw for retaining said lever in position.

708,687. PNEUMATIC SIGNALING APPARATUS. JAMES H. BRADY, Kansas City, Mo. Filed Dec. 28, 1901. Serial No. 87,349. (No model.)



Claim.—1. A pneumatic signaling apparatus comprising an air-storage receiver, separate outgoing distributing-pipes for the compressed air, a detonating fluid signaling device connected with one of said pipes, and a fluid-cylinder upon the end of the other outgoing pipe, a piston and a piston-rod and coacting with the detonating fluid signaling device, and a combined back-pressure relief and cut-off valve in the pipe leading to the cylinder, and a spring extending around the piston-rod, within said cylinder and bearing upon the opposite side of the piston subject to the pressure of the fluid.

2. A pneumatic signaling apparatus comprising an air-compressor and an air-storing receiver for the compressed air, outgoing air-distributing pipes for the compressed air in pairs, a combined cut-off and back-pressure relief-valve in one of said pipes and a detonating air-whistle, receiver connected with the other pipe having an opening for the escape of the air, a valve-chamber in said receiver, a spring-actuated valve, and a valve-rod extending through the side of said receiver, a cylinder connected with the other pipe, a piston in said cylinder operated in the direction of the said receiver by the compressed air, a piston-rod extending through said cylinder and contacting with the valve-rod in the said receiver, and a spring in said cylinder operating upon the other side of the piston and against the air admitted through the combined cut-off and back-pressure relief-valve.

708,688. SCREW-DRIVER. JOHN D. CAMPBELL and JUNIUS K. GUNN, Newton, N. J. Filed May 2, 1901. Serial No. 58,426. (No model.)

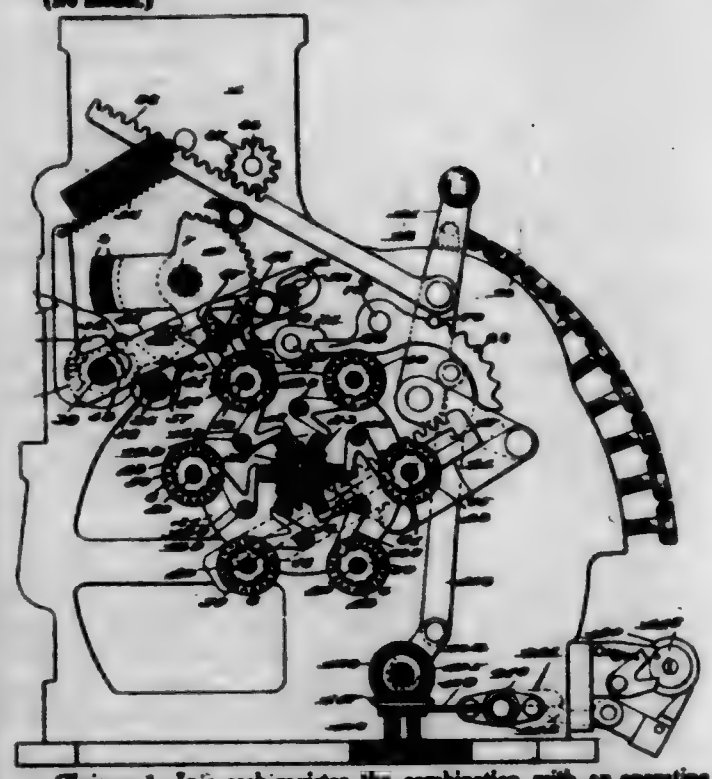
Claim.—1. An improved screw-driver, comprising a shank provided with an elongated longitudinal slot and with a stop positioned below the slot, clamping-levers provided at one end with jaws adapted to engage the head of the screw and pivoted intermediate their ends through the slot, and a spring coiled around the shank and bearing at one end against the pivot and at the other end against the stop, the organization being such that the spring normally holds the jaws in a retracted position on the shank.

2. An improved screw-driver, comprising a shank provided with an elongated longitudinal slot and with a stop positioned below the slot, clamping-levers provided at one end with jaws adapted to engage the head of the screw and pivoted intermediate their ends through the slot, a spring coiled around the shank and bearing at one end against the pivot and at the other end against the stop the organization being such that the spring normally holds the jaws in a retracted position on the shank, and a spring slidably mounted on the shank above the slot and normally pressing the jaws toward each other.

3. An improved screw-driver, comprising a shank provided with an elongated longitudinal slot and with a stop positioned below the slot, clamping-levers provided at their outer ends with opposing jaws and at their inner ends with handle portions and pivoted intermediate their ends through the slot, and a spring coiled around the shank and bearing at one end against the pivot and at the other end against the stop the organization being such that the spring normally holds the jaws in a retracted position on the shank, and a collar provided with two spring-arms normally forcing the handle portions apart and slidably mounted on the shank above the slot.

4. An improved screw-driver, comprising a shank member, a clamping member embodying pivoted levers carried by the shank and provided at one end with jaws for engaging the head of the screw and at the other end with handle portions, a pin carried by one of said members and working in an elongated slot in the other of said members, a spring coiled around said shank member and bearing at one end against said pin and at the other end against a stop carried by one of said members, and a spring embodying two arms secured to the handle portions and normally pressing them apart and a body portion connecting said arms and provided with a central opening to receive the shank member.

708,689. CASH-REGISTER. THOMAS CARROLL, Dayton, Ohio, assignor to the National Cash Register Company, Jersey City, N. J., a Corporation of New Jersey. Filed Sept. 23, 1899. Serial No. 731,462. (No model.)



Claim.—1. In a cash-register the combination with an operating mechanism of counter-operating devices, a movable frame carrying a series of independent counters any one of which may be brought into connection with the counter-operating devices, means for moving the frame and a single series of transfer-pawls for actuating the counters independently of the counter-operating devices and arranged to coact with any one of said counters.

2. In a cash-register, the combination with an operating mechanism of counter-operating devices, a movable frame carrying a series of independent counters each of which comprises a series of counter-wheels which may be brought to position to be actuated by the counter-operating devices, and a single series of transfer-pawls mounted independently of the movable frame and arranged to be operated independently of the counter-operating devices and to actuate the counter-wheels of any one of the counters which is brought to operative position by the movement of the frame.

3. In a cash-register, the combination with an adjusting-lever, a special indicator, arranged to be set thereby, a flash for said indicator, a movable member carrying a latch for the flash and means connected to the lever for tripping the latch.

4. In a cash-register, the combination with an adjusting-lever, of an indicator arranged to be set thereby, a spring-drawn flash for said indicator, a movable member carrying a latch for said flash and means connected to the lever for tripping the latch.

5. In a cash-register, the combination with a lever, a special indicator arranged to be set by said lever, a spring-drawn flash for said indicator, a movable member carrying a pivoted latch for the flash and means operated by the lever for rocking the latch to release the flash.

6. In a cash-register the combination with an operating mechanism of a movable frame carrying a series of independent counters, a series of slides mounted independently of the frame and transfer-pawls mounted on said slides so as to move therewith and arranged to coact with any one of the counters which may be brought to operative position.

7. In a cash-register, the combination with an operating mechanism, of a series of independent counters, means for moving a desired counter into and out of connection with the operating mechanism, transfer devices mounted independently of the counters and adapted to coöperate with the counter in operative position and means for moving the transfer devices to cause them to follow the movements of a counter toward and away from the actuating mechanism.

8. In a cash-register the combination with an operating mechanism of a series of independent counters, a series of transfer-slides, mounted independently of the counters, transfer-pawls mounted on said slides and arranged to coact with the counter which is in operative position and trip-pawls mounted on the slides and controlling the positions of the transfer-pawls.

9. In a cash-register the combination with an operating mechanism, of a movable frame carrying a series of independent counters, means for moving the frame toward and away from the actuating mechanism, transfer devices mounted independently of the frame, and adapted to coöperate with the counter in operative position, and mechanism for moving the transfer devices to cause them to follow the movements of the frame toward and away from the actuating mechanism.

10. In a cash-register the combination with an operating mechanism, of a movable frame carrying a series of independent counters, means for moving said frame toward and away from the operating mechanism, devices for moving the frame to bring any desired counter to operative position, and transfer means mounted independently of the movable frame but arranged to move with said frame as the latter is adjusted to bring any counter out of operative connection with the operating mechanism.

11. In a cash-register the combination with an operating mechanism, of a movable frame carrying a series of independent counters, means for moving the frame toward and away from the operating mechanism, and a movable aligning device arranged to correct any misalignment of the frame in moving toward the operating mechanism.

12. In a cash-register the combination with an operating mechanism, of a movable frame carrying a series of independent counters, and arranged to be moved toward and away from the operating mechanism, devices mounted independently of the frame for moving the same, and movable aligning devices for the frame arranged to be brought into connection therewith when the frame is disengaged from the devices for adjusting the same.

13. In a cash-register the combination with a register-operating mechanism, of a movable frame carrying a series of independent counters, a manually-operated adjusting-lever for moving said frame to bring the desired one of said counters into position for operative connection with the operating mechanism, actuating means for bringing said counter into operative engagement with the operating mechanism and locking means controlled by said adjusting-lever for preventing movement of the said operating mechanism until said lever has been moved.

14. In a cash-register the combination with a register-operating mechanism, of a movable frame carrying a series of independent counters, a setting or adjusting lever for moving said frame, a pivoted lever arranged to be operated every time the setting-lever is moved, and a lock for the machine operated by the pivoted lever.

15. In a cash-register the combination with a register-operating mechanism, of a movable frame carrying a series of independent counters, a setting-lever for moving said frame and a lock arranged to lock the machine until the setting-lever is operated.

16. In a cash-register the combination with an operating mechanism, of a movable frame carrying a series of independent counters, a series of transfer-bars mounted independently of the frame, transfer-pawls mounted on said bars, a pivoted frame for supporting said bars, and means connected to the movable parts of the machine for operating the pivoted frame.

17. In a cash-register the combination with register-operating mechanism, of a movable frame carrying a series of independent counters, a series of slidable transfer-bars capable of being raised or lowered, transfer-pawls mounted on said bars and means for successively sliding the transfer-bars to effect the transfer.

18. In a cash-register the combination with a register-operating mechanism, of a rotary drum carrying a series of independent counters, a lever for moving said drum to bring the desired counter to operative position, an index-plate and a pointer on said lever arranged to travel over said plate.

19. In a cash-register the combination with a register-operating mechanism, of a movable frame carrying a series of independent counters, a lever for moving said frame, a series of special counters, operating means for said latter counters and devices connecting said lever and operating means to adjust the latter to operate a special counter corresponding to the position indicated by the lever.

20. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, a single lever for bringing the proper counter to operative position, a series of special counters, and operating means for said latter counters arranged to be set by said lever.

21. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, a single lever for moving the desired counter to operative position, a series of special counters, a rock-shaft carrying arms for operating said special counters and means connected to the lever for moving said shaft longitudinally to bring the proper arm into position to operate its counter.

22. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, a lever for bringing said counters into operative relation with the aforesaid mechanism, a series of special counters, a rock-shaft having arms arranged to operate the special counters and provided with a rack, and gearing connected to said lever and arranged to coöperate with the rack to move the rock-shaft longitudinally.

23. In a cash-register the combination with a register-operating mechanism, of a movable frame carrying a series of independent counters, an adjusting-lever for moving said frame to bring the desired counter to operative position, a series of special counters, a rock-shaft carrying a number of arms for operating the special counters, and means connected to the lever for moving said shaft.

24. In a cash-register the combination with a register-operating mechanism, of a movable frame carrying a series of independent counters, a single lever for moving said frame to bring the desired counter to operative position, an indicator, and means connecting said lever to the indicator.

25. In a cash-register the combination with a register-operating mechanism of a series of nested sleeves operated by the same, a series of yokes connected to said sleeves, a series of gears carried by said yokes, a movable frame carrying a series of independent counters, and a single lever for adjusting said frame to bring the desired counter into operative position in relation to the gears.

26. In a cash-register the combination with a register-operating mechanism, of a series of nested sleeves connecting therewith, a series of yokes connected to said sleeves, a series of gears connected to said yokes, and a movable frame carrying a plurality of independent counters arranged to be brought into connection with said gears.

27. In a cash-register the combination with a register-operating mechanism, of a series of nested sleeves connecting therewith, a series of yokes connected to the said sleeves, operating-gears connected to said yokes, and a counter arranged to be brought into mesh with and disengaged from said gears.

28. In a cash-register the combination with a register-operating mechanism, of a rotary drum, a series of independent registers, a pivoted hand-lever for moving said drum to bring the desired register to operative position, an index-plate over which said lever operates, a special indicator for the respective registers, gearing for operating said indicator, and means for connecting said lever to said gearing

29. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, an adjusting-lever for moving any one of said counters to operative position at will, a second lever arranged to be actuated upon a movement of said adjusting-lever, and a latch for the machine adapted to be actuated by said second lever.

30. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, a setting-lever for moving any one of said counters to operative position, a stud or projection mounted on said lever, an aligning-lever engaging said stud, and a latch arranged to be operated by said aligning-lever.

31. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, a single lever for bringing any one of said counters to operative position, and means for locking said lever against movement after the operation of the machine has commenced.

32. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, an adjusting-lever for moving any one of said counters to operative position, a second lever arranged to be actuated by the setting-lever, a latching-arm connected to the second lever and a notched disk coöperating with said arm to prevent movement of the adjusting-lever after the operation of the machine has commenced.

33. In a cash-register the combination with a register-operating

mechanism, of a series of independent counters, a lever for bringing any one of said counters to operative position, a special indicator connected to said lever, a shutter or flash for said indicator, a latch for said shutter, and means connected to the lever for operating said latch.

34. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, an adjusting-lever for bringing any one of said counters to operative position, a second lever arranged to be moved upon the movement of the setting-lever, a special indicator, a flash for the same, a latch for the flash and means connected to said second lever for tripping the latch.

35. In a cash-register the combination with a register-operating mechanism, of a main or totalizing counter, a series of independent counters, a lever for moving any one of said independent counters to operative position, a slide arranged to be set by said lever, throw-out devices for the main counter and means connecting said slide and throw-out devices.

36. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, a special indicator for said counters, a shutter or flash for said indicator, a latch for said shutter, an adjusting-lever for moving the desired counter to operative position, and means coöperating with said lever for tripping said latch.

37. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, an adjusting-lever for moving any one of said counters to operative position, a stud mounted on said lever, a serrated lever arranged to engage said stud, a rock-shaft adapted to be operated by said latter lever, a latch-lever on said shaft and a latching member carrying a spring-pressed plunger which coöperates with said latch-lever.

38. In a cash-register the combination with an operating mechanism, of a movable frame carrying a series of independent counters all of which are normally disconnected from the operating mechanism, means for connecting at will any one of the said counters with the operating mechanism, a single series of transfer devices arranged to coöperate with any counter that may be brought into operative connection with the operating mechanism, and means whereby said transfer devices coöperate with said counter whether the latter is in operative or inoperative connection with said operating mechanism.

39. In a cash-register the combination with a register-operating mechanism, of a series of independent counters mounted in a movable frame, a lever for adjusting the frame to bring any desired one of said counters into engagement with the register-operating mechanism and an aligning-lever coöperating with a stud or projection carried or moved by said adjusting-lever.

40. In a cash-register the combination with a register-operating mechanism, of a series of independent counters mounted in a movable frame, a lever for adjusting the frame to bring any desired one of said counters into engagement with the register-operating mechanism, an aligning-lever coöperating with a stud or projection carried or moved by said adjusting-lever and locking means for the register-operating mechanism which is controlled by said adjusting-lever.

41. In a cash-register the combination with a register-operating mechanism, of a main or totalizing counter, a series of independent counters, an adjusting-lever for bringing any one of said independent counters into operative relation with the register-operating means, means for disestablishing operative relation between said totalizing-counter and said operating mechanism, and a slide operated by said adjusting-lever to set said last-mentioned means so as to be operated when the register-operating mechanism is actuated.

42. In a cash-register the combination with a register-operating mechanism, of a plurality of counters, of a plurality of special counters one for each of the first-mentioned counters, and an adjusting-lever for simultaneously establishing an operative relation between one of the first-mentioned counters, its corresponding special counter and the register-operating mechanism substantially as described.

43. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, an adjusting-lever for bringing any one of said counters into operative relation with the operating mechanism, actuating means, devices for locking said actuating means until after the adjusting-lever has been moved, and mechanism for locking said adjusting-lever after movement of the actuating means has commenced.

44. In a cash-register the combination with a register-operating mechanism, of a series of independent counters, an adjusting-lever for establishing an operative relation between one of said independent counters and the operating mechanism, the totalizing-counter and means controlled by the adjusting-lever to disestablish an operative relation between said totalizing-counter and the operating mechanism.

45. In a cash-register the combination with the register-operating mechanism, of a totalizing-counter, a series of independent counters, an adjusting-lever for bringing any one of the independent counters into operative relation with the operating mechanism, means for disestablishing operative relation between the operating mechanism and said totalizing-register, devices for setting said means by the movement of said adjusting-lever and means for operating said devices when so set, upon the movement of the machine.

46. In a cash-register the combination with a register-operating mechanism, of a totalizing-counter, a series of independent counters, an adjusting-lever for bringing any one of said independent counters into operative relation with the register-operating means, means for disestablishing operative relation between said totalizing-register and said operating mechanism and a slide operated by said adjusting-lever for actuating said means.

47. In a cash-register the combination with a register-operating mechanism, of a totalizing-counter, a series of independent counters, an adjusting-lever for moving any of said independent counters into operative relation with the register-operating mechanism, means for disestablishing operative relation between the main or totalizing counter and the register-operating mechanism, a rock-shaft, a cam rocking with said shaft, and devices connected to the lever for moving said means into operative relation with the cam.

48. In a cash-register the combination with the operating mechanism, of a frame carrying a series of independent registers, of a pinion carried by the frame; a rack-bar engaging the pinion, an adjusting-lever and a link pivoted at one end to the rack-bar and at the other to the adjusting-lever.

49. In a cash-register the combination with the operating mechanism, of the special counters, a shiftable shaft 110 carrying counter-actuating arms 111, the adjusting-lever arranged to shift the shaft and means for rocking the said shaft when the operated mechanism is actuated.

50. In a cash-register the combination with a register-operating mechanism, of the frame carrying a series of independent counters, a series of special counters, an adjusting-lever and means controlled thereby for simultaneously bringing one of said independent counters and one of the special counters into operative relation with the operating mechanism.

51. In a cash-register the combination with the operating mechanism, of a frame carrying a series of independent counters, an indicator corresponding to said independent counters and an adjusting-lever having connections with both said frame and the said indicator for simultaneously adjusting them.

52. In a cash-register, the combination with a counter-operating mechanism, of a totalizing-counter, a series of independent counters, a lever for moving any one of said independent counters to operative position and throw-out devices for the main counter arranged to be operated by said lever when moved to certain positions.

53. In a cash-register, the combination with an indicator, of a lever for setting the same, a flash for said indicator, a handle for operating said flash, and a lock arranged to lock the handle until the lever has been operated to set the indicator.

54. In a cash-register, the combination with a registering mechanism, of an indicator, a lever for adjusting said indicator, an operating-handle, and a lock arranged to lock the handle when the lever is in any of its adjusted positions and only unlock said handle when the lever is moved.

55. In a cash-register, the combination with a register-operating mechanism, of a series of independent counters, a setting-lever for bringing any one of the counters into coöperative relation with the operating mechanism, and a lock arranged to lock the machine when the lever is in any of its adjusted positions and only unlock the same when the lever is moved.

56. In a cash-register, the combination with a counter-operating mechanism, of a totalizing-counter, a series of independent counters, a hand device for moving all of the independent counters simultaneously to bring the desired one to operative position, and a throw-out device for the main totalizing-counter arranged to be operated by said hand device when the latter is moved to bring certain counters into operative position.

57. In a cash-register, the combination with a counter-operating mechanism, of a lock for the same, a totalizing-counter, a series of independent counters, a hand-lever for simultaneously moving all of the independent counters to bring one of the same to operative position, means operated by the lever for actuating the said lock, and throw-out devices for the main counter arranged to be operated by said lever when the same is moved to bring certain of the counters into operative position.

58. In a cash-register, the combination with the counter-operating mechanism, of a totalizing-counter, a series of independent counters, means for simultaneously moving all of the independent counters to bring a desired one of the same to operative position, and throw-out devices for the main counter arranged to be set by said counter-adjusting means so as to be subsequently operated by the regular movement of the machine.

59. In a cash-register, the combination with a counter-operating mechanism, of a totalizing-counter, a series of independent counters, a lever for moving any one of said independent counters to operative posi-

tion, and throw-out devices arranged to be set by said lever for operation during the regular movement of the machine.

60. In a cash-register, the combination with a counter-operating mechanism, of a totalizing-counter, a series of independent counters, a pivoted lever for bringing any one of the independent counters to operative position, a throw-out device for the totalizing-counter arranged to be set by said lever, and cam means connected to the operating mechanism for actuating the throw-out devices during the regular movement of the machine.

61. In a cash-register, the combination with a counter-operating mechanism, of a series of independent counters any one of which may be brought into connection with said operating mechanism, and a single series of transfer-pawls for actuating the counter which is brought to operative position independently of its actuation in connection with the counter-operating mechanism.

62. In a cash-register, the combination with an operating mechanism, of a series of independent counters, any one of which may be brought into connection with said operating mechanism, a series of slides mounted independently of the counter, and transfer-pawls mounted on said slides so as to move therewith and arranged to coact with any one of the counters which may be brought to operative position.

63. In a cash-register, the combination with an operating mechanism, of a counter, means for moving the counter into and out of connection with the operating mechanism, transfer devices mounted independently of the counter, means for moving the transfer devices to cause them to follow the movement of the counter toward and away from the actuating mechanism, and means for actuating the transfer devices to effect a transfer when the counter is moved out of engagement with its operating mechanism.

708,640. PROCESS OF MAKING ARTIFICIAL STONE AND FORMING ARTICLES THEREFROM. GEORGE P. CHAPPELL, New York, N. Y. Filed Feb. 23, 1901. Serial No. 48,420. (No specimens.)

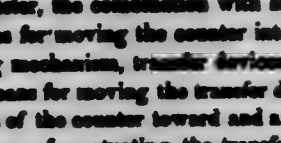
Claim.—1. The herein-described process of producing cement, which consists in forming a mixture of oxid and chlorid of magnesium, water and a filling material, and mixing such ingredients thoroughly and continuing the working of the pasty mass thereby formed until it acquires a putty-like consistency.

2. The herein-described process of producing cement, which consists in producing a pasty mass by the union of oxid and chlorid of magnesium and water, adding to such mass a filling material and thoroughly mixing the same therewith and continuing the working of the pasty mass thereby formed until it has acquired a putty-like consistency.

3. The herein-described process of producing cement, which consists in forming a pasty mass by the union of oxid and chlorid of magnesium, and water, in the proportion of about one part of chlorid of magnesium and of water, each, to two parts of oxid of magnesium, adding to such mass a filling material, and mixing the same thoroughly therewith and continuing the working of the mass so formed until it has acquired a putty-like consistency.

4. The herein-described process of producing molded cement articles, which consists in producing a pasty mass by mixing and working oxid and chlorid of magnesium, water, and a filling material, and continuing the working of the pasty mass thereby formed until it has acquired a putty-like consistency, and then placing such a mass in molds and subjecting it to pressure in the molds.

708,641. PENHOLDER. SAMUEL H. CROCKER, London, England. Filed July 6, 1900. Serial No. 22,710. (No model.)



Claim.—1. A penholder consisting of a barrel provided with spring pen retaining and ejecting pieces, substantially as specified.

2. A penholder having two spring wings or clips stamped up from the barrel adapted to secure the pen on the outside of the holder by engaging with and bearing upon the pen and allowing it to be detached by an upward pressure, substantially as herein described.

708,642. LATCH. JOHN W. CRENSHAW and JOHN TROXLER, Fort Chester, N. Y. Filed Sept. 14, 1901. Serial No. 75,458. (No model.)

Claim.—An improved latch-releasing device, comprising, in combination, a door-frame, a door, keepers secured to the lintel and the threshold of said frame, bell-cranks pivoted near the top and bottom of the door and provided with a shoulder adapted to automatically engage the keepers, springs adapted to hold said bell-cranks in operative position, a shaft formed in sections connected to each other and to one arm of the bell-crank for movement in a plane at right angles to the plane of the door, the end sections being telescopic and slidably mounted in sleeves and means for operating the shaft from a single point.

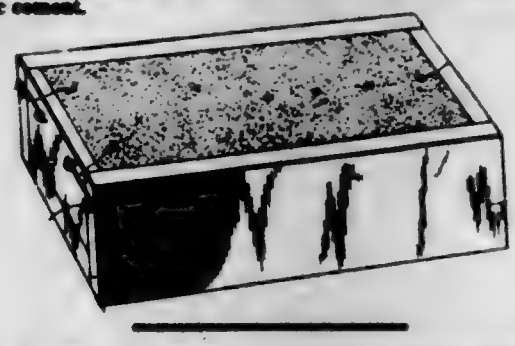
708,643. HUB-ATTACHING DEVICE. CHARLES R. DAVIDSON, Greenville, Ill. Filed Aug. 28, 1901. Serial No. 73,234. (No model.)

Claim.—In a device of the class described, the combination with an axle having a reduced portion at the outer end of the spindle, provided with screw-threads and forming a shoulder, and a hub having an axle-box, of an axle-nut closed at its outer end and provided with interior screw-threads to engage those of the axle and abutting at its inner end against the shoulder of the said axle and being of greater diameter than the adjacent bearing portion of the spindle, said axle-nut consisting of an outer polygonal wrench-receiving portion, an exteriorly-threaded cylindrical portion and an intermediate flange 6, the interiorly-threaded sleeve arranged on the cylindrical extension of the nut and provided with an enlarged end extending beyond the shoulder of the axle and arranged on the bearing portion of the latter and projecting inward beyond the exterior screw-threads of the axle-nut to form a flange and provided with an annular recess of a width substantially equal to the thickness of the axle-box of the hub, the washer 13 located within the recess beyond the shoulder against which the nut abuts and supported by the bearing portion of the axle and fitting against the outer end of the axle-box, and an intermediate washer interposed between the flange 6 and the sleeve, substantially as described.

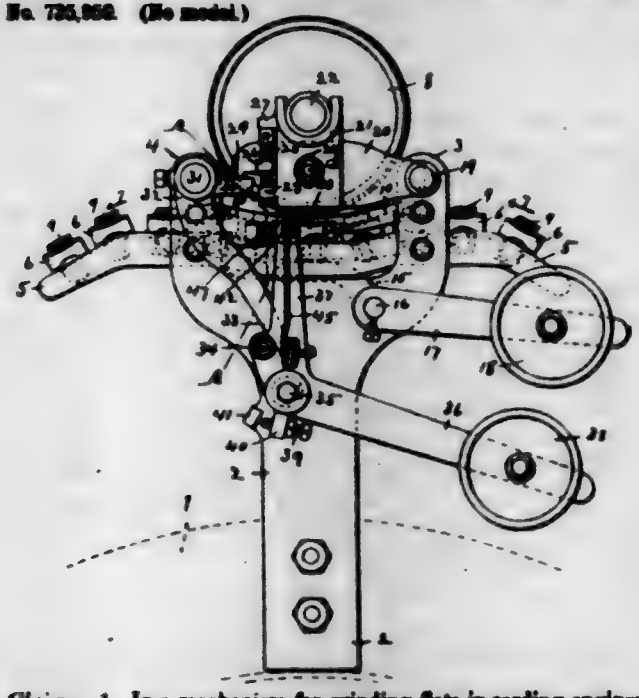
708,644. METHOD OF MAKING CEMENT FENCE-POSTS. EDWARD DAVIES, Reading, Mich. Filed May 29, 1901. Serial No. 62,385. (No specimens.)

Claim.—The herein-described method of making fence-posts, consisting in placing plastic material in a mold, permitting the same to remain therein until it has become hard enough to handle without breaking, then

removing the molded material from the mold before it has become entirely set, and finally dipping the article one or more times in a bath of liquid hydraulic cement.



708,645. MECHANISM FOR GRINDING FLATS IN CARDING-ENGINES. JAMES FERRIS, Boston, Mass. Filed Nov. 6, 1900. Serial No. 735,959. (No model.)



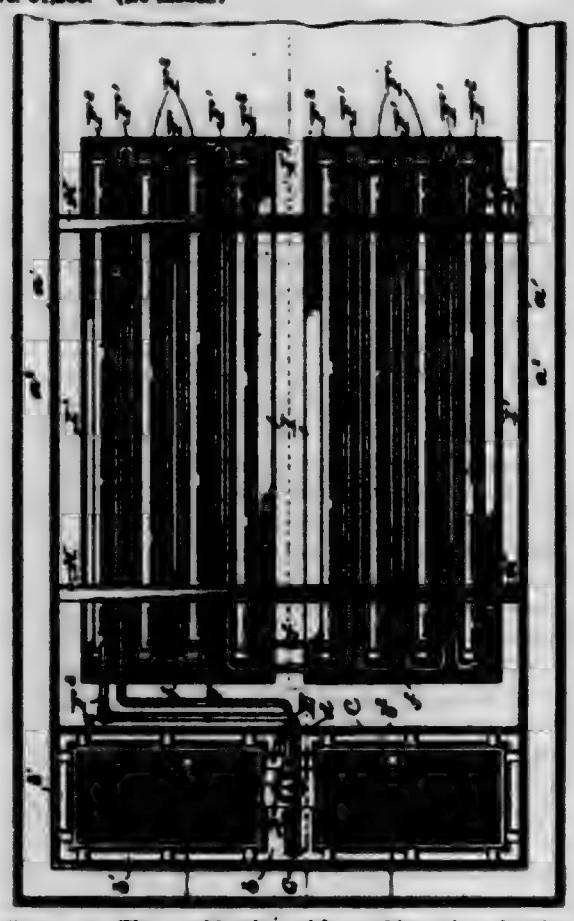
Claim.—1. In a mechanism for grinding flats in carding-engines, a grinding-roll, fixed guide-bars, tracks having central, depressed sections opposite said guide-bars and horizontal supporting-sections beyond the ends of said guide-bars, projecting flanges on said guide-bars arranged to bear against the working seats of the flats, said flanges being depressed corresponding to said central depressed sections of the tracks, whereby the flats, as they are drawn from one of said horizontal supporting-sections to the other of said horizontal supporting-sections, are slightly deflected and brought into close contact with said flanges, substantially as described.

2. In mechanism for grinding flats in carding-engines, a track over which the flats to be ground are moved, a guide-bar by which the position of a flat is controlled during the operation of grinding, a swinging bell-crank, a sliding bolt carried by said bell-crank and arranged to engage the flats as they are moved beneath the grinding-roll, whereby said bell-crank lever is rocked, a stud carried by said bell-crank lever, a pair of pivoted levers, a grinding-roll supported by said pivoted levers, a rocking shaft, arms carried by said shaft and supporting the free ends of said pivoted levers, a lever carried by said rocking shaft and having its free end bearing on said stud, whereby the working of said bell-crank will carry the grinding-roll toward the flat, and means for reversing said bell-crank during the operation of grinding, substantially as described.

3. In mechanism for grinding flats in carding-engines, the combination of a grinding-roll and means for controlling the position of the flats during the operation of grinding, consisting of a bent track and a flange guide-bar, said bent track having a depressed section and said guide-bar having a flange parallel with the depressed section of the track, whereby a series of flats moved over said track are slightly deflected and turned against the flange of the guide-bar as they pass beneath the grinding-roll, substantially as described.

4. In mechanism for grinding flats in carding-engines, the combination of a grinding-roll, means for controlling the flats as they pass in contact with said grinding-roll, a pivoted bell-crank carrying a sliding bolt 42 arranged to engage the flats as they are moved beneath the grinding-roll and having a bevel surface 46, a fixed bevel surface 47 arranged in the path of the bevel surface of the bolt 42, whereby said bolt is pushed out of engagement with the flats, a stud carried by said bell-crank, a rocking shaft having a lever bearing against said stud and having a pair of arms 30, a pair of levers pivoted at one end to the framework and having their free ends resting on said arms 30, a journal-bearing for said grinding-roll supported on said pivoted levers, substantially as described.

708,646. REFRIGERATING APPARATUS. JOHN C. FOX, Colorado Springs, Colo., assignor of two-thirds to Edgar J. Ulbrich and Charles F. Paige, Colorado Springs, Colo. Filed Nov. 6, 1901. Serial No. 81,280. (No model.)



Claim.—1. The combination with a refrigerating-chamber, of a receptacle for refrigerating liquid, a discharge-conduit for the liquid leading from said receptacle and extended through an elongated course in the upper part of said chamber, siphoning means for circulating said liquid throughout said conduit, a controlling-valve for the liquid in said conduit, and means for opening and closing said valve actuated by the rise and fall of the liquid in said receptacle.

2. The combination with a refrigerating-chamber, of a receptacle for refrigerating liquid, a discharge-conduit for said liquid, leading from said receptacle, and comprising a pipe extended through an elongated course in the upper part of said chamber, a pipe of larger diameter in the upper part of said chamber to which the first said pipe leads, the pipes being exposed to the atmosphere in said chamber, means for circulating said liquid through said conduit, and a valve in said conduit governing the flow of liquid therethrough.

3. The combination with a refrigerating-chamber, of an ice-holding receptacle exposed to the atmosphere in said chamber, a discharge-conduit for the waste water produced by the ice in melting leading from said receptacle and extended through an elongated course in said chamber, means for circulating said water through said conduit, an outlet-valve toward the discharge end of said conduit, and means for opening and closing said valve actuated by float mechanism at the inlet end of said conduit, substantially as and for the purpose set forth.

4. The combination with a refrigerating-chamber, of an ice-holding bunker exposed to the atmosphere in said chamber, a receptacle communicating with said bunker for the water produced by the ice in melting, a conduit leading from said receptacle and extended through an elongated course in said chamber, siphoning means for circulating said water through said conduit, an outlet-valve toward the discharge end of said conduit, and means for opening and closing said valve actuated by float mechanism in said receptacle, substantially as and for the purpose set forth.

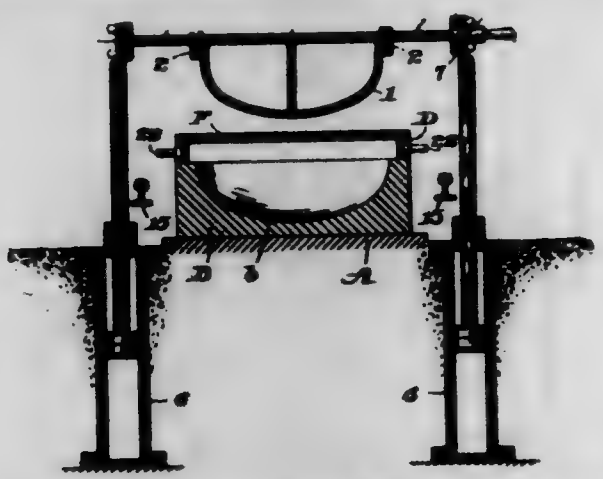
708,647. MOLDING-MACHINE. BENJAMIN A. FRANKLIN, Philadelphia, Pa. Filed Mar. 6, 1901. Serial No. 50,937. (No model.)

Claim.—1. In a molding-machine, the combination with a pattern, of a rammer, means for effecting a relative movement between the rammer and the pattern, and devices for connecting the rammer and the pattern when the rammer is moved toward said pattern.

2. In a molding-machine, the combination with a pattern, of a rammer, means for effecting a relative movement between the rammer and the pattern, and devices carried by the rammer for engaging the pattern.

3. In a molding-machine, the combination with a pattern, of a rammer having a former complementary with the shape of the pattern, means for effecting a relative movement between the rammer and the pattern,

and devices for connecting the rammer and the pattern when the rammer is moved toward said pattern.



4. In a molding-machine, the combination with a pattern, of a rammer having a former complementary with the shape of the pattern, means for effecting a relative movement between the rammer and the pattern, and connecting devices carried by the rammer for engaging the pattern.

5. In a molding-machine, the combination with a pattern, of a rammer comprising a plate having a former projecting from one of its faces, means for effecting a relative movement between the rammer and the pattern, and devices carried by said plate for engaging the pattern.

6. In a molding-machine, the combination with a pattern, of a rammer comprising a plate having a former projecting from one of its faces, means for effecting a relative movement between the rammer and the pattern, and devices hinged to said plate for engaging the pattern.

7. In a molding-machine, the combination with a rotatable pattern, of a rammer comprising a plate having a former projecting from one of its faces, means for effecting a relative movement between the rammer and the pattern, means carried by said plate and forming bearings for said pattern, and means for rotating said plate to permit rotation of the pattern.

8. In a molding-machine, the combination with the pattern-support, of a rotatable rammer, and means for effecting a relative movement between the rammer and the pattern-support.

9. In a molding-machine, the combination with the pattern-support, of a rotatable rammer, means for effecting a relative movement between the rammer and the pattern-support, and movable means whereby the pattern may be pivotally suspended from the rammer.

10. In a molding-machine, the combination with the pattern-support, of a rammer, means for effecting a relative movement between the rammer and the pattern-support, and suspension devices carried by said rammer whereby the pattern may be pivotally suspended from the rammer.

11. In a molding-machine, the combination with the pattern-support, of a rotatable rammer, means for effecting a relative movement between the rammer and the pattern-support, and means whereby the pattern may be connected with and disconnected from the rammer.

12. In a molding-machine, the combination with the pattern and the flask thereon, of a rammer, means for effecting a relative movement between the rammer and the pattern, means whereby the pattern may be pivotally suspended from the rammer, and means whereby the flask and pattern may be connected with and disconnected from the rammer.

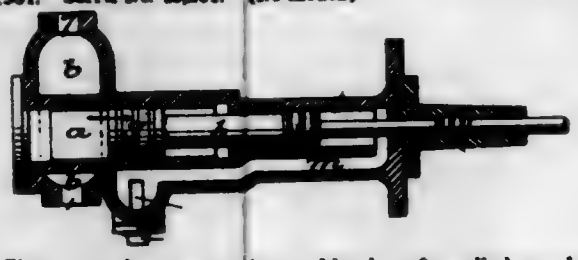
13. In combination a pattern, a flask adapted to be mounted thereon, and a rammer comprising a plate and former, means depending from the side of the plate providing turning supports for said pattern, and devices depending from the corners of the plate for supporting either said flask or said pattern.

14. In a molding-machine, the combination with a pattern, of a rammer comprising a plate having a former projecting from one of its faces, said plate being provided with a series of filling-openings arranged around the former and discharging into the pattern when the rammer is positioned relatively thereto.

15. In a molding-machine, the combination with a pattern, a rammer, and means for effecting a relative movement between said pattern and rammer, of a trackway arranged adjacent to the pattern and rammer, carriers mounted thereon and provided with vertically-adjustable supports, and a flask adapted to be engaged by said supports and transported by the carriers to and from the pattern.

16. In a molding-machine, the combination with a pattern, a rammer, and means for effecting a relative movement between said pattern and rammer, of a trackway arranged adjacent to the pattern and rammer and provided with laterally-movable rail-sections adjacent to the pattern, carriers mounted on said trackway and provided with vertically-adjustable supports, and a flask adapted to be engaged by said supports and transported by the carriers to and from the pattern.

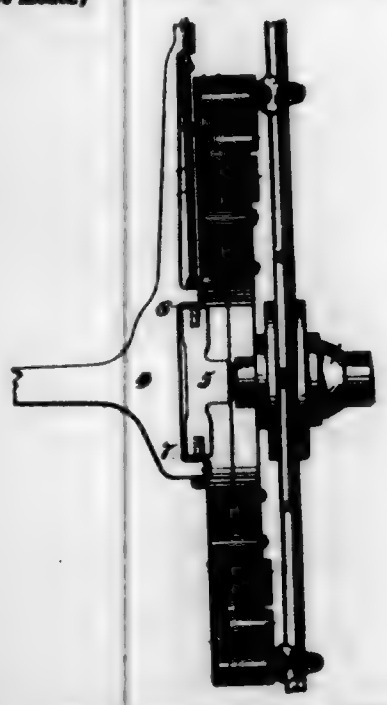
703,648. PUMP. WILLIAM F. GARRISON, Brooklyn, N. Y., assignor to Guild & Garrison, Brooklyn, N. Y., a Firm. Filed Feb. 23, 1901. Serial No. 48,201. (No model.)



Claim.—1. In a pump, the combination of a cylinder and a piston and piston-rod working therein, a cylindrical extension at one end of the cylinder, a second piston on said rod working in said extension, a packing for said piston-rod beyond said second piston, a suction-chamber and a discharge-chamber and a suction-valve and a discharge-valve at the other end of the cylinder, an intermediate chamber in free communication with said other end of the cylinder between the suction and discharge chambers and valves, a leakage-passage leading from the space within said cylindrical extension between said second piston and said packing to said intermediate chamber, and a self-opening and self-closing discharge-valve between said passage and said intermediate chamber, substantially as herein described.

2. In a pump, the combination of a cylinder and a piston and piston-rod working therein, a cylindrical extension at one end of the cylinder, a second piston on said rod working in said extension, a packing for said piston-rod beyond said second piston, a suction-chamber and a discharge-chamber and a suction-valve and a discharge-valve at the other end of the cylinder, an intermediate chamber in free communication with said other end of the cylinder between the suction and discharge chambers and valves, a leakage-passage leading from the space within said cylindrical extension between said second piston and said packing to said intermediate chamber and having a branch leading to the suction-chamber, a self-opening and self-closing valve between said passage and said intermediate chamber, and a hand-controlled stop-valve in said branch, substantially as herein described.

703,649. SELF-PROPELLED VEHICLE. EDWIN R. GILL, Englewood, N. J. Filed Nov. 11, 1899. Renewed Nov. 15, 1901. Serial No. 82,411. (No model.)



Claim.—1. As an article of manufacture, a vehicle-wheel and a rotary motor having its rotating part carried on said wheel and its fixed part supported on said wheel in fixed rotary relation to said rotating part.

2. As an article of manufacture, a vehicle-wheel and a rotary motor having its rotating part fixed to said wheel and its fixed part supported in ball-bearings by said rotating part.

3. As an article of manufacture, a vehicle-wheel, a ring-shaped armature fastened thereto, a bearing-ring on the face of said armature-ring, a ring-shaped field-magnet adapted to rotate within said armature-ring, a bearing-ring fixed to the face of said field-magnet ring, and ball-bearings between said bearing-rings for supporting said field-magnet.

4. As an article of manufacture, a common spoke-wheel adapted to turn upon a journal, a rotary driving-motor having its two members supported upon said wheel and clamps for fastening said motor to the spokes thereof.

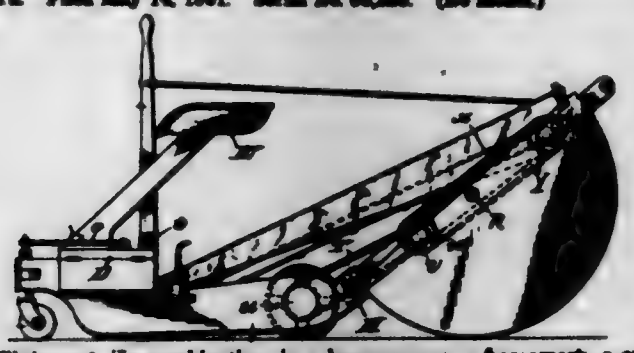
5. In a vehicle, a wheel, a ring-shaped armature fixed thereto, a ring-shaped field-magnet adapted to rotate within said armature, a bearing-ring on said armature, and a bearing-ring on said field-magnet, said rings being concentric and one of said rings overlapping the circle separating said armature and field-magnet.

6. In a self-propelled vehicle, a wheel adapted to turn normally out of the median plane of traction, a rotary motor attached to said wheel, means adapted to restrain rotary movement of one member of said motor and a device for attaching said restraining means permitting of vertical play.

7. In a self-propelled vehicle, a wheel adapted to turn normally out of the median plane of traction, a rotary motor attached to said wheel, a vertically-pivoted body carrying said wheel, restraining means for one member of said motor and a device for fixing said restraining means while permitting vertical play and pivotal movement thereof.

8. In a self-propelled vehicle, a wheel and axle on a vertical pivot, a rotary motor fixed on said wheel, bars pivoted to the opposite sides of the fixed member of said motor, a pin pivoted at a common point to said bars, and a socket immovable with relation to the vehicle-body and substantially in line with said vertical pivot of the wheel, for receiving said pin.

708,650. LAWN-MOWER ATTACHMENT. WILLIAM J. GLEASON, Philadelphia, Pa., assignor of one-half to James Magonigal, Philadelphia, Pa. Filed May 14, 1901. Serial No. 60,980. (No model.)



Claim.—1. In combination, in a lawn-mower, a framework, a cylindrical cutter journaled in said framework, a stationary cutter-blade also secured in said framework, two caster-wheels journaled in the forward end of the machine and adapted to support said forward end, a roller journaled in the rear end of the framework and adapted to support the rear of the machine, side bars extending upward and rearward at an angle from the main frame, a grass-receiving receptacle pivoted to said side bars and depending therefrom, a roll journaled in the framework of the machine at a point near and in the rear of the cylindrical cutter, a roll journaled between the side bars near their upper ends, means for communicating power from the traction-roller to the last-named roll for the purpose of revolving the same, an endless apron adapted to pass around the two rolls, a link connected to the rearward end of the receptacle, a lever pivoted at the forward end of the machine to which the forward end of the link is connected for the purpose of inverting the receptacle, a small roller journaled in the framework of the machine between the cylindrical cutter and the rear traction-roller, and means adapted to be operated by the foot of the rider for turning the caster-wheels to steer the machine, substantially as described and for the purpose specified.

2. In combination with a lawn-mower, side bars secured to the framework of the lawn-mower and extending upwardly and rearwardly at an angle therefrom, a semicircular grass-receiving receptacle pivoted to and depending from said side bars, means extending to the forward end of the machine for the purpose of inverting the grass-receiving receptacle for the purpose of emptying the same, a roller journaled in the upper end of the side bars, a sprocket-wheel journaled loosely upon the same shaft as the said roller, a chain adapted to pass around said sprocket-wheel and communicate motion to the same from a suitable source of power, a ratchet-wheel secured upon the same shaft as the roller, a pawl pivoted upon the sprocket-wheel and adapted to engage the teeth of the ratchet-wheel when the sprocket-wheel is revolved in one direction, a spring adapted to hold the pawl in engagement with the ratchet-teeth and allow the pawl to slip over the ratchet-teeth when the sprocket-wheel is revolved in the opposite direction, a roller journaled in the framework of the machine at a point near to and in the rear of the rotary cutters of the mower, an endless apron adapted to pass around these two rollers and be driven by friction with the upper rearward roller, side guards arranged upon each side of the endless apron and supported by the framework of the machine, substantially as described and for the purpose specified.

708,651. SPRAY-NOZZLE FOR URINALS. WILLIAM U. GUTTERSON, Philadelphia, Pa. Filed Oct. 4, 1901. Serial No. 77,502. (No model.)

Claim.—1. A spray nozzle for urinals, &c., consisting of a body or wall having an inclined lower portion terminating in a lip adapted to form, with a wall or fixture on which the structure may be mounted, a narrow delivery mouth, and means for supplying water to the space between said lip and said wall or fixture, said means having a water discharge opening of diameter in excess of the breadth of the delivery mouth beneath it, substantially as set forth.

2. A spray pipe nozzle including a body having an inclined lower portion terminating in a lip adapted to form, with a wall on which the structure may be located, a narrow delivery mouth, a rear wall connected with the body above said lip to form with said body a receiving chamber, the structure including an aperture of breadth or diameter in excess of that of the delivery mouth referred to, opening from said receiving chamber to discharge water from the receiving chamber upon said inclined lower portion, substantially as set forth.

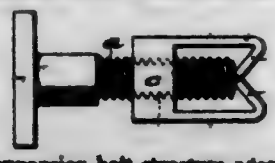
3. A spray pipe nozzle including a body having an inclined lower portion terminating in a lip adapted to form with a wall on which the structure may be located a narrow delivery mouth, a rear wall connected with the body above said lip to form with said body a receiving chamber, the structure including a discharge opening in the base of said receiving chamber, and apertures adapted to discharge water from the respective sides of the receiving chamber, substantially as set forth.

4. A spray pipe nozzle including a front wall having an inclined lower portion terminating in a lip adapted to form with a wall on which the structure may be located a narrow delivery mouth, a rear wall the lower edge of which is of arched form and is connected to the front wall above the lower edge of the latter to form a receiving chamber, a discharge aperture, of breadth in excess of the mouth referred to, formed in the central portion of the bottom of said chamber, and discharge apertures opening through the lower portions of the respective sides of the structure, substantially as set forth.

5. A spray nozzle including the front plate having the sides, the inclined lower portion, and the lip, said sides terminating above the lower edge of said lip, a rear plate, an arched bottom plate connected to the lower edge of the rear plate, and the inner face of the front plate, respectively, and embodying an aperture in its central portion, substantially as set forth.

6. A spray nozzle including the front plate having the sides, the inclined lower portion, and the lip, said sides terminating above the lower edge of said lip, a rear plate, an arched bottom plate connected to the lower edge of the rear plate, and the inner face of the front plate respectively, and embodying an aperture in its longitudinal central portion, the respective ends of said bottom plate extending beyond the respective lower edges of the rear plate below the lower ends of the side walls, substantially as set forth.

708,652. EXPANSION-BOLT. WILLIAM U. GUTTERSON, Philadelphia, Pa. Filed Feb. 17, 1902. Serial No. 94,437. (No model.)



Claim.—1. An expansion bolt structure adapted to be self secured in a hole or recess, comprising a head, embodying an opening, a longitudinally movable member adapted to extend through said opening, a structure formed of plate or sheet metal, carried by said head, having portions adapted to present against the opposing walls of a hole or recess in which it may be entered, and a transversely extending portion adapted, in the travel of the longitudinally movable member, to be moved by said member and thereby occasion the radial thrust or expansion of a portion which presents against a wall of the hole or recess.

2. An expansion bolt member adapted to be inserted in and secured against withdrawal from a hole or recess, and comprising a head embodying an opening, a forwardly extending wing carried by said head, and a bearing plate carried on said wing and extending transversely into position to be encountered by a longitudinally movable member introduced through the opening in the head, said plate and wing being formed of plate or sheet metal, substantially as set forth.

3. An expansion bolt member comprising a head embodying an opening, a forwardly extending wing carried by said head, a bearing plate carried on said wing and extending inwardly and rearwardly into position to be encountered by a longitudinally movable member introduced through the opening in the head, substantially as set forth.

4. An expansion bolt device consisting of a head embodying an

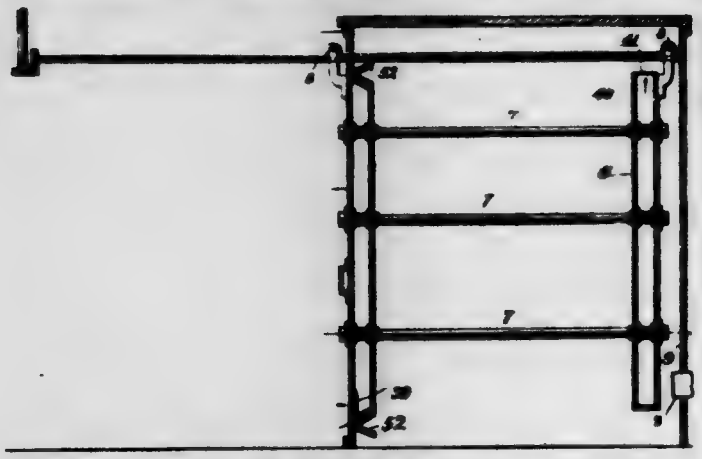
opening, a plurality of wings permanently affixed to said head and extending forward from it, and an approximately V-shaped structure carried on said wings, said structure being arranged transversely with respect to the axis of said opening and with its apex facing said opening so as to be encountered by a longitudinally movable member introduced through said opening, substantially as set forth.

5. An expansion bolt member consisting of a head having an opening, and a pair of wings, each provided with an inwardly and rearwardly extending bearing device adapted to be encountered by a member extending through said opening.

6. An expansion bolt member consisting of a head having a tapped opening, and a pair of wings each provided at its extremity with an inwardly and rearwardly extending bearing plate, said wings and plates being formed of sheet or plate metal.

7. In an expansion bolt member, in combination, a threaded bolt, an expansion member embodying a head having a tapped opening through which said bolt extends, a plurality of wings extending forward from said head, and bearing plates carried on the ends of said wings and extending toward the axis of the structure into position to be encountered by the end of the bolt, said wings and plate being formed of sheet or plate metal.

708,653. VENTILATED CLOTHES-DRIER. LOUIS F. H. GUNDLACH, Mariner Harbor, N. Y., assignor of one-half to John R. Evans, New York, N. Y. Filed Oct. 17, 1901. Serial No. 78,907. (No model.)



Claim.—1. The combination of a drying-compartment, a suitable opening in the side of said compartment, a sliding rack adapted to be moved in and out of said compartment through said opening, the said rack comprising a closed hollow front upright having an air-inlet at or near its base, a back upright, and one or more tubular suspending-bars connecting said uprights and communicating with the interior of said front upright and being provided at their inner ends with means for discharging therefrom the air received through the bars from the front upright, substantially as and for the purpose set forth.

2. The combination of a drying-compartment, a suitable opening in the side of said compartment, a sliding rack adapted to be moved in and out of said compartment through said opening, the said rack comprising a closed hollow front upright having an air-inlet at or near its base, a back upright, and one or more tubular suspending-bars connecting said uprights and communicating with the interior of said front upright and being provided at their inner ends with means for discharging therefrom the air received through the bars from the front upright, each suspending-bar being provided with a tubular member having lateral perforations and fixed across the interior of the said hollow front upright and provided near each end with a flange for bearing against the interior wall of the opposite sides of said upright, and having the inner end thereof threaded for receiving the thread on the corresponding suspending-bar, substantially as and for the purpose set forth.

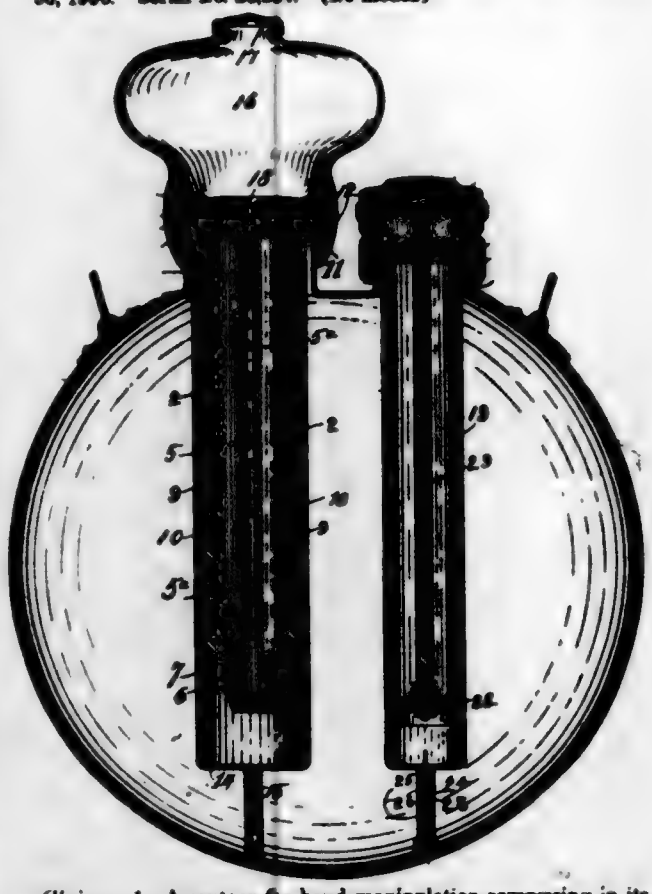
3. The combination of a drying-compartment, a suitable opening in the side of said compartment, a sliding rack adapted to be slid in and out of said compartment through said opening, the said rack comprising two hollow uprights and one or more horizontal tubular suspending-bars placed between the uprights and having the interior thereof communicating with the interior of the hollow uprights, the upright at the inner end of the rack being open at its upper end for the exit of the air and the upright at the outer end of the rack being open at its lower end for the admission of the exterior air, the said upright at the outer end of the rack serving also as a door for closing the opening at the side of the compartment through which the rack is operated, substantially as and for the purpose set forth.

4. The combination of a drying-compartment, a suitable opening in the side of said compartment, a sliding rack adapted to be slid in and out of said compartment through said opening, the said rack comprising two hollow uprights, the inner one of which is open at its upper end for the exit of the air and the outer one of which is open at its lower end to admit thereto the exterior air and serving as a door to close the opening through which the rack is operated, a tubular member provided with lateral openings and secured across the interior of each of said hollow uprights, and a tubular suspending-bar connected at one end with one of said tubular members and at the other end with the other to permit the air to circulate from the interior of one of said hollow uprights through the tubular suspending-bar into the other hollow upright, substantially as and for the purpose set forth.

5. The combination of a drying-compartment, a suitable opening in the side of said compartment, a sliding rack adapted to be slid in and out of said compartment through said opening, the said rack comprising two hollow uprights, the inner one of which is open at the upper end for the exit of the air while the other one is open at its lower end for the admission of the exterior air, a tubular member having lateral perforations and fixed horizontally across the interior of each of said hollow uprights and in alinement with each other, each of said tubular members being provided near each end with a flange for taking against the interior wall of the opposite sides of the upright and having the inner end of each threaded, and a tubular suspending-bar threaded at each end and connected by such ends with the threaded ends of the said tubular members respectively, whereby the outer air taken in at the lower end of said outer upright may be circulated through the interior of the same, thence through the tubular suspending-bar into the upright at the rear end of the rack and discharged from the upper end of said latter upright, substantially as and for the purpose set forth.

6. The combination of a drying-compartment made of comparatively light material and provided with one or more doorways through which the racks are operated, angle-irons 52 fixed around the doorway and constituting the door-frame and acting as strengthening members for bracing the structure, the said angle-irons being arranged with the apices pointing outwardly so as to provide a beveled surface against which the door closes, and one or more sliding racks each having at its outer end an upright constituting a door for closing the doorway through which the rack is operated, said door having its edges beveled at 53 to fit against the beveled surface of the door-jamb for sealing the joints around the door, substantially as and for the purpose set forth.

708,654. CANTEEN. ALSON HALL, Toledo, Ohio. Filed Aug. 30, 1900. Serial No. 28,597. (No model.)



Claim.—1. A canteen for hand manipulation comprising in its construction a body portion, two chambers inclosed within the cavity of the body portion, one of said chambers being for unfiltered water and the other chamber being for filtered water, a filtering-body interposed between and in communication with said two chambers, and an air-pump connected to the chamber for unfiltered water.

2. In a canteen, a filtering-body, a casing inclosing the filtering-body, a chamber for unfiltered water, a chamber for filtered water, connections between the interior of said casing and the lower part of the chamber for

unfiltered water, and an air-pump adapted to compress air in said latter chamber.

3. A canteen having a body portion provided with a cavity for holding water and an air-pump having its discharge-outlet extended into the cavity of said canteen to a point near the bottom thereof to force air into the cavity of the canteen below the water-level therein to thereby purify the water by the upward passage of air through the water.

4. A canteen provided with a body portion having a cavity, a nozzle or neck and an air-pump extended through said nozzle or neck and supported thereby within the cavity of the canteen to force air into the cavity of the canteen below the water-level therein to thereby purify the water by the passage of air through the water.

5. A canteen provided with a body portion having a cavity, a nozzle or neck secured to the body portion, and an air-pump supported by said nozzle or neck and extended into the cavity of the canteen, the discharge-outlet of said air-pump being extended to near the bottom of the cavity of the canteen to force air into and through the water contained in the cavity.

6. In a canteen two nozzles or necks, a filter supported in one of said nozzles or necks, and an air-pump supported in the other of said nozzles or necks.

7. In a canteen, a filter, a screw-cap, a cup or chamber in the screw-cap, connections between the filter and said cup or chamber combined with an air-pump connected with the cavity of the canteen outside the filter.

8. In a canteen, a nozzle or neck, an air-pump supported therein, a separable screw-cap for the nozzle, having in its interior a chamber, a plunger for the air-pump, and a handle for the plunger inclosed in said separable screw-cap.

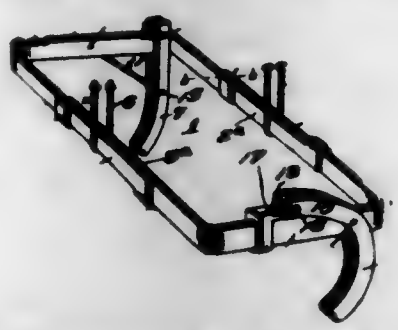
9. A canteen provided with a body portion having a cavity, a nozzle or neck secured to the body portion, an air-pump extended through the nozzle or neck and extended within the cavity, and means for detachably connecting said air-pump with the nozzle or neck.

708,655. FOCUSING-HOOD FOR PHOTOGRAPHIC CAMERAS. HENRY C. HAFFOLD, New York, N. Y. Filed Apr. 16, 1902. Serial No. 103,084. (No model.)

Claim.—1. A focusing-hood composed of a flexible cover, a bail, a slide having an abutment and movable upon the bail, and a spring-influenced hook movable upon the slide, substantially as specified.

2. A focusing-hood composed of a flexible cover, a bail, a two-armed slide, means for guiding one arm of said slide along the bail, a spring-influenced hook movable upon the other arm of the slide, and a perforated abutment on the slide engaging the hook, substantially as specified.

708,656. CULTIVATOR PLOW ATTACHMENT. ROBERT W. HAZLEBROOK, Maysville, Ga. Filed Apr. 5, 1902. Serial No. 101,560. (No model.)

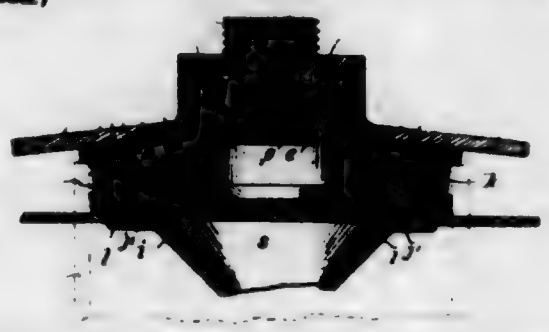


Claim.—1. A plow attachment of the class described, comprising a standard-carrying frame having a pair of U-shaped sections with the arms thereof overlapping each other, slidably related and provided with mutually-engaging connecting and guide devices, whereby said sections are permanently connected together and said frame is adapted to be lengthened and shortened, substantially as described.

2. A plow attachment of the class described, comprising a standard-carrying frame having a pair of U-shaped sections with the arms thereof overlapping each other, slidably related, and provided with mutually-engaging lugs bent respectively on the lower and upper edges of the free and rear arms of said sections, substantially as described.

3. A plow attachment of the class described comprising a standard-carrying frame having a pair of U-shaped sections with the arms thereof overlapping each other, slidably related, and provided with mutually-engaging connecting devices, in combination with clip-bolts to engage said overlapping arms and clamp said frame to the under side of a plow-beam, substantially as described.

708,657. ATTACHMENT FOR PLUMBERS' PUMPS. JOSEPH HOEH, Philadelphia, Pa. Filed Aug. 31, 1901. Serial No. 73,906. (No model.)



Claim.—1. In combination, a metallic holder furnished with a flange and perforated wings and with a central passage threaded to receive a pipe or coupling and a flexible rubber cup adapted to be cast upon said holder, the lower end of said cup being bifurcated.

2. In combination, a metallic holder furnished with a central passage threaded to receive a pipe or coupling, a flexible rubber cup adapted to be held by said holder, and detachable rubber rings concentric with said cup, adapted to be carried upon the outer side thereof to increase its diameter.

3. In combination, a metallic holder furnished with a threaded central passage adapted to receive a pipe or coupling at either end and with a flange and perforated wing, a flexible rubber cup, the upper end of which is cast upon said holder and the lower end of which is bifurcated and which is furnished upon its outside with a ring or shoulder A', detachable concentric rubber rings carried by said cup, means for locking said rings one to the other, and a detachable flat washer adapted to bear upon the tops of said rings.

708,658. MATTRESS-STUFFING MACHINE. CLEMENT W. JOHANSEN, Everett, Pa. Filed Aug. 23, 1901. Serial No. 73,063. (No model.)

Claim.—1. The combination of the belt forming a feed-table, a compressing-roll provided under the belt at the delivery end thereof, a delivery-chute extending from the end of the belt, a feed and compression roll situated above the first roll and adapted to act upon the stuffing material in advance of its entrance to the chute, and mechanism operatively connecting the upper portion of the chute to the upper roll and for effecting the simultaneous adjustment of both, substantially as specified.

2. The combination with the feed-belt and its lower compressing-roll, of a chute having an upper adjustable portion, a second compressing-

roll situated above the first roll, means for vertically adjusting said second roll, and mechanism connecting the upper portion of the chute to the shaft of said second roll, whereby both the roll and chute may be simultaneously adjusted.

3. The combination with the feed-belt and its lower compressing-roll, of a chute having an upper adjustable portion, a pair of bars extending transversely of the machine and carrying the upper portion of the chute, one of said bars being guided by the frame and the opposite bar having rearwardly-extending perforated portions, a second compressing-roll mounted above the first roll, a shaft carrying said roll and passing through the perforated rearwardly-extending portions of the chute-carrying bar, guided blocks forming journals for said shaft, and means for vertically adjusting said blocks.

4. In a mattress-stuffing machine, the combination of the feed-belt, a delivery-chute arranged at one end thereof, side boards for governing the width of the mattress to be made, guides carried at the front and rear ends of said boards, pivoted levers adapted to said guides, and means for simultaneously operating said levers, substantially as specified.

5. In a mattress-stuffing machine, the combination of the feed-belt, a delivery-chute arranged at one end thereof, side boards for governing the width of the mattress to be made, guides arranged on the exterior and at each end of said side boards, levers fulcrumed to the fixed frame of the machine and adapted to said guides, connecting-rods extending between said levers, a rock-shaft, an operating-lever thereon, and mechanism connecting said rock-lever to said connecting-rods.

6. In a mattress-stuffing machine, the combination of the feed-belt, a delivery-chute at one end thereof, side boards for governing the width of the mattress to be made, guides arranged on the exterior and at each end of said side boards, levers 38 and 40 fulcrumed to the fixed frame of the machine and connected to the front and rear guides respectively, connecting-rods 45 extending between said levers, a rock-shaft 42 extending transversely of the frame of the machine and adapted to suitable bearings thereon, an operating-lever on said rock-shaft, arms 47 secured to the rock-shaft near the opposite ends thereof, and rods 46 extending between said arms and the connecting-rod 45, substantially as specified.

7. In a mattress-stuffing machine, the combination of the feed-belt, adjustable side sections forming part of a delivery-chute, adjustable side boards carrying said side sections, an upper compression-roll, means for adjusting the same and for adjusting the side boards, and mechanism connecting the shaft of said roll to the upper portion of the delivery-chute.

8. In a mattress-stuffing machine, the combination of the feed-belt, and lower compression-roll, of a delivery-chute having or comprising a series of vertically and laterally adjustable sections, an upper compression-roll, a shaft carrying the same, means for connecting the shaft to the vertical adjustable sections of the chute, side boards connected to the laterally-adjustable sections of the chute, and means for adjusting said side boards.

9. In a mattress-stuffing machine, the combination of a feed-belt and lower compression-roll, of a delivery-chute having laterally-adjustable lower corner-sections, and upper corner-sections adjustable both laterally and vertically, an upper compression-roll, a shaft carrying the same, means for connecting said shaft to the upper corner-sections, means for vertically adjusting said shaft, adjustable side boards connected to both the upper and lower corner-sections of the chute, and means for adjusting said side boards.

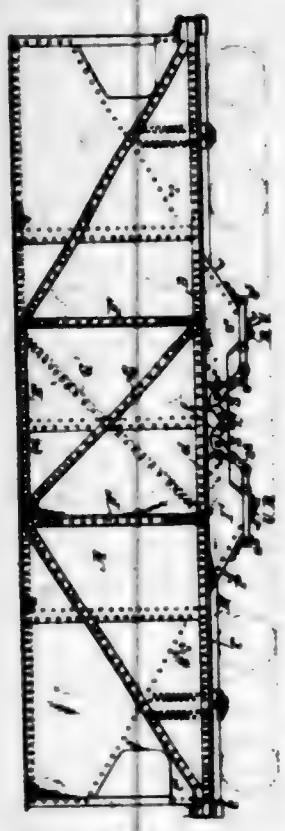
10. In a mattress-stuffing machine, the combination with a feed-belt and lower compression-roll, of a delivery-chute, having a fixed section 50 and a series of adjustable sections 55, 57 and 61, lower transverse bars carrying the fixed section and supporting the sections 55, upper transverse bars carrying the sections 57 and supporting the sections 61, an upper compression-roll, a shaft carrying said roll, said shaft being connected to the upper supporting-bar, means for vertically adjusting said shaft, side boards for governing the width of the mattress to be formed, said side boards being rigidly connected to the chute-sections 55 and slidably connected to the sections 61, with means for adjusting said side boards, substantially as specified.

11. In a mattress-stuffing machine, having a feed-belt and compression and delivery devices, an end plate formed in two sections for longitudinal adjustment, each of said sections having a rearwardly-extending supporting-wing and rearwardly-extending toothed bars, 77, adapted to engage in the material of which the belt is formed, substantially as specified.

708,659. FREIGHT-CAR. HERBERT R. KEITHLEY, Buffalo, N. Y. Filed Mar. 14, 1902. Serial No. 98,239. (No model.)

Claim.—1. In a car, a side-supporting structure composed of a plate-girder having a compression-flange, and a truss having a compression-chord independent of said compression-flange of the plate-girder, substantially as set forth.

2. In a car, a side-supporting structure composed of a plate-girder having a tension-flange, and a truss having a tension-chord independent of said tension-flange of the plate-girder, substantially as set forth.



3. In a car, a side-supporting structure composed of a plate-girder having tension and compression flanges, and a truss having chords independent of the flanges of said plate-girder, substantially as set forth.

4. In a car, a side composed of a plate-girder having tension and compression flanges, and a truss having chords independent of the flanges of said plate-girder, substantially as set forth.

5. In a car, a side-supporting structure composed of a plate-girder having tension and compression flanges, and a truss having a chord independent of the flanges of said plate-girder, said truss-cord having inclined portions, substantially as set forth.

6. In a car, a side-supporting structure composed of a plate-girder having tension and compression flanges, and a truss having chords independent of the flanges of said plate-girder, the upper chord of said truss having inclined portions, substantially as set forth.

7. In a car, a side-supporting structure composed of a plate-girder, the flanges of which project to one side of the web, and a truss which is complete in its formation independently of said plate-girder and is arranged between the flanges of said girder, substantially as set forth.

8. In a car, a side-supporting structure composed of a plate-girder having outwardly-projecting flanges, and a truss which is complete in its formation independently of said plate-girder and is arranged on the outer side of said plate-girder between the flanges thereof, substantially as set forth.

9. In a car, a side composed of a plate-girder having upper and lower flanges projecting to one side of its web, and a truss which is complete in its formation independently of said plate-girder and is arranged between the flanges thereof, substantially as set forth.

10. In a car, a side composed of a plate-girder having tension and compression flanges, and a truss having chords independent of the flanges of said plate-girder and which is arranged on one side of and riveted to said plate-girder, substantially as set forth.

11. In a car, a side in the form of a plate-girder composed of a web and flanged bars, and a truss which is complete in its formation independently of said plate-girder, the chords of said truss being arranged opposite to said flanged bars of the plate-girder and riveted thereto, substantially as set forth.

12. In a car, a side in the form of a plate-girder composed of a web and flanged bars, the horizontal flanges of which project outwardly, and a truss which is complete in its formation independently of said plate-girder and which is arranged on the outer side of said plate-girder web, the chords of said truss being arranged opposite and riveted to the flanged bars of said plate-girder, substantially as set forth.

13. In a car, a side composed of a plate-girder formed of a web and top and bottom flanged bars, and a truss which is complete in its formation independently of said plate-girder, one chord of said truss extending throughout its length parallel with one flanged bar of said plate-girder and secured thereto, and another chord of which is parallel with the other flanged bar of said plate-girder at its central portion and is secured thereto, substantially as set forth.

14. In a car, a side composed of a plate-girder formed of a web and upper and lower angle-bars, the vertical flanges of which are riveted to the inner side of said web and the horizontal flanges of which extend outwardly, and a truss which is complete in its formation independently of said plate-girder and is arranged on the opposite side of said web, the chords of said truss being riveted to said angle-bars of said plate-girder, substantially as set forth.

15. In a hopper-bottom car, the combination of continuous draft-beams extending through the bottom, a longitudinal draft-plate arranged above and secured to said draft-beams and provided with an end body portion having an extended bearing on and secured to the hopper-bottom, substantially as set forth.

16. In a hopper-bottom car, the combination of continuous draft-beams extending through the hopper-bottom, a longitudinal draft-plate arranged above and secured to the tops of said beams intermediate of its ends, and its end body portions having extended bearings on and secured to the opposite inclined portions of said hopper-bottom, substantially as set forth.

17. In a hopper-bottom car, the combination of continuous draft-beams extending through the bottom, a longitudinally-arranged plate secured to the tops of said draft-beams intermediate of its ends and having its end portions extending through openings in the opposite inclined portions of the hopper-bottom and secured to the under side of the latter, substantially as set forth.

18. In a hopper-bottom car, the combination of continuous draft-beams extending through the hopper-bottom, a longitudinal flat draft-plate arranged above and secured to the tops of said beams intermediate of its ends, and its end body portions having extended bearings on and secured to the opposite inclined portions of said hopper-bottom, substantially as set forth.

19. In a car, the combination with side members and draft-beams, of an end sill composed of a Z-bar having its web arranged horizontally and riveted at its ends to said side members, a vertical plate riveted to one flange of said Z-bar and an angle-bar secured to said vertical plate, and extending beneath the ends of said draft-beams and riveted to the flanges of the latter, substantially as set forth.

20. In a car, the combination with side members each composed of a complete truss and a complete plate-girder, an end sill, the ends of which are arranged in front of said side plate-girders and are riveted to said trusses, substantially as set forth.

21. In a car, the combination with side members each composed of a plate-girder, and a truss which projects beyond the end of the plate-girder, an end sill the ends of which are arranged in front of said girders and are carried by the portions of said trusses which project beyond said plate-girders, substantially as set forth.

22. In a car, the combination with side members each composed of a plate-girder, and a truss the end of which projects beyond the end of the plate-girder, and an end sill the ends of which inclose and are supported by the portions of said trusses which project beyond the ends of said plate-girders, substantially as set forth.

23. The combination of a draft-beam, and an abutment for a draft-rigging composed of two oppositely-arranged Z members having vertical flanges riveted to said draft-beam, and vertical flanges extending in opposite directions and overlapping each other, substantially as set forth.

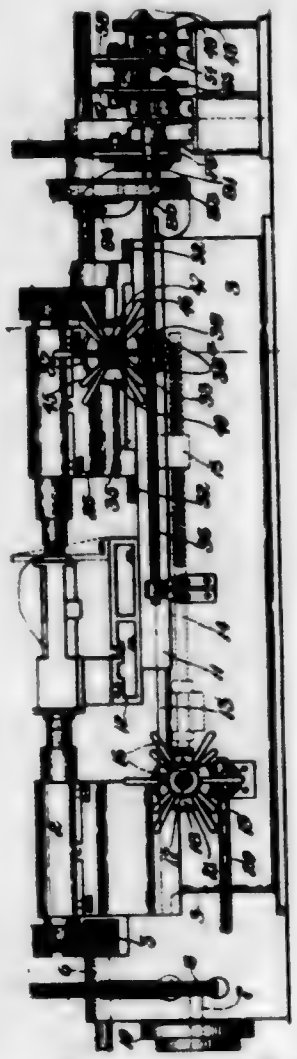
24. The combination with a hinged door, of an operating rock-shaft, a toggle-joint at each end of said door one link of which is fixed to said rock-shaft, a link connecting the other link of each toggle to said door, and a second link pivoted to a fixed part and to the second link of each toggle, substantially as set forth.

25. The combination with a hinged door, of an operating rock-shaft, a toggle-joint at each end of said door one link of which is fixed to said rock-shaft, a link connecting the other link of each toggle to said door, a second link pivoted to a fixed part and to the second link of each toggle, and stops for said last-mentioned links, substantially as set forth.

703,660. BORING-MACHINE. GEORGE DE LAVAL, Cambridge, and CHARLES W. CHENOWLH, Somerville, Mass., assignors to the George F. Blake Manufacturing Company, New York, N. Y., a Corporation of New York. Filed May 9, 1901. Serial No. 59,249. (No model.)

Claim.—1. In a boring-machine the combination with a front boring-spindle, of a work-carrying carriage, mechanism for automatically advancing said carriage to feed the work to the cutters carried by said front spindle, a rear boring-spindle, and mechanism for automatically advancing said rear spindle to feed the cutters carried by said spindle through the work as it is being fed, substantially as described.

2. In a boring-machine the combination with a front boring-spindle, of a work-carrying carriage, mechanism for automatically advancing said carriage to feed the work to the cutters carried by said front spindle, a sliding carriage mounted upon said work-carriage, a boring-spindle mounted in said sliding carriage, and mechanism for automatically advancing said sliding carriage on said work-carriage to feed the cutters carried by the rear spindle through the work as it is being fed, substantially as described.



3. In a boring-machine, the combination with a front boring-spindle, of a work-carrying carriage, feeding mechanism therefor, a carriage mounted to slide on the work-carriage, a boring-spindle mounted in said sliding carriage, mechanism for automatically moving said sliding carriage with relation to the work during the feed of the work-carriage, substantially as described.

4. In a boring-machine, the combination with a front boring-spindle, of a work-carrying carriage, feed mechanism therefor, a carriage mounted to slide on the work-carriage, a boring-spindle mounted in said sliding carriage, mechanism for automatically moving said sliding carriage with relation to the work during the feed of the work-carriage, and means for disconnecting said automatic feed mechanism, substantially as described.

5. In a boring-machine, the combination with a front boring-spindle, of a work-carrying carriage, feed mechanism therefor, a rear boring-spindle, automatic feed mechanism therefor and means for varying the speed of said latter feed mechanism, substantially as described.

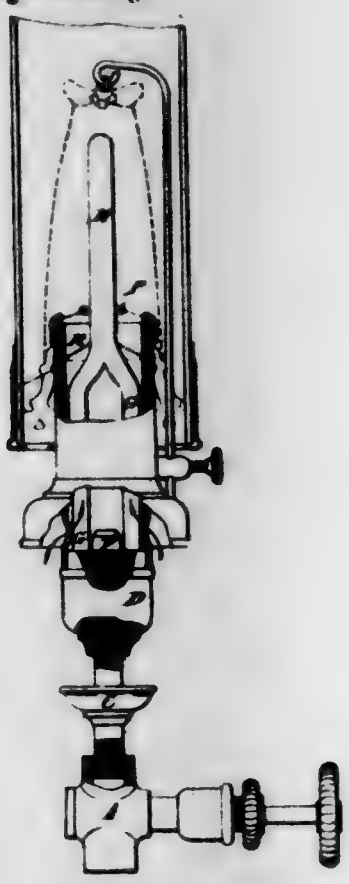
6. In a boring-machine, the combination with a front boring-spindle, of a work-carrying carriage, feed mechanism therefor, a rear boring-spindle, automatic feed mechanism therefor, and means for reversing said latter feed mechanism, substantially as described.

703,631. VAPOR-BURNER. ADOLPHE LACOUTRE, Paris, France. Filed Aug. 23, 1900. Serial No. 27,791. (No model.)

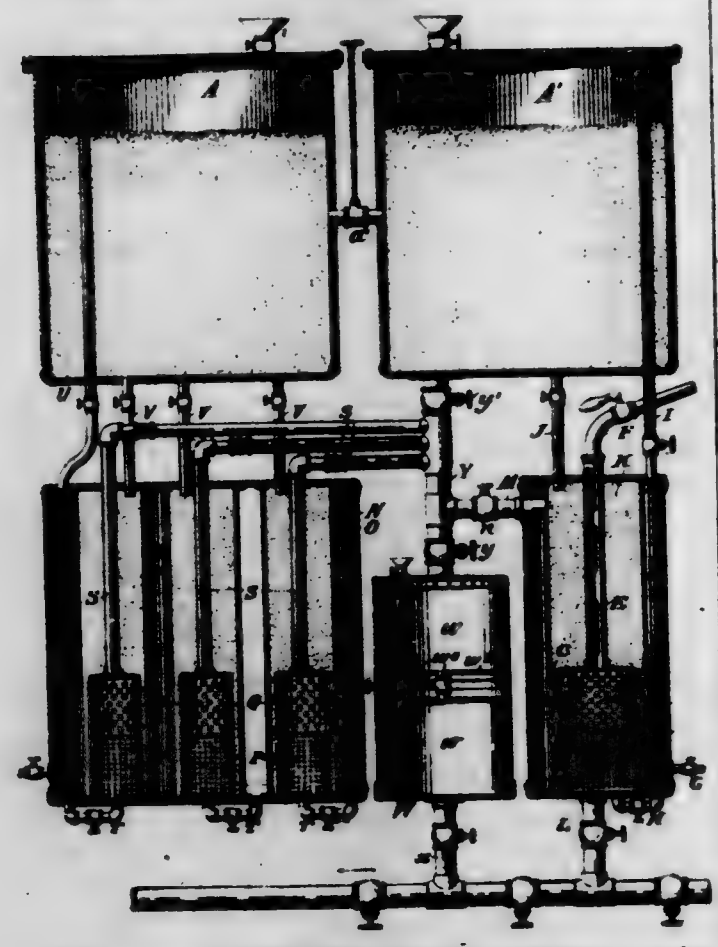
Claim.—1. A vaporizing-tube arranged for attachment to a supply-pipe at its lowest end and provided with a vapor-jet orifice at its upper end, a screw-threaded plug in such tube extending from its lower end to adjacent the jet-orifice, a metallic heat-retaining head surrounding the upper end of such tube, a Bunsen or mixing tube mounted on such head and provided with a cap at its upper end forming a burner, and a metallic heat-conductor secured to said head and extending axially of the mixing-tube and having its upper end projected through said cap to be heated by the burner-flame.

2. The combination of the cock for admitting liquid, the vaporizing-tube leading up therefrom to the mixing-point, a screw-threaded plug in said tube, extending practically from the cock to said vapor-jet orifice, a cup for the reception of fluid for the generating-flame, surrounding said tube adjacent to the cock, a metallic heat-retaining head surrounding the upper end of said tube, a Bunsen tube for mixing purposes, a burner above said mixing-tube, a mantle, and a metallic heat-conductor rising

centrally in said mantle and having forked depending arms through said burner which are directly attached to the metallic heat-retaining head to conduct heat thereto and continue the process of vaporization in the liquid-passage passing therethrough.



703,662. FIRE-EXTINGUISHING APPARATUS. JEREMIAH S. LEITH, Gladstone, N. D. Filed Aug. 12, 1901. Serial No. 71,794. (No model.)



Claim.—1. A fire-extinguishing apparatus comprising a powder-chamber; an air-supply chamber within the powder-chamber, a commingling-chamber communicating with the powder-chamber; means for forcing air through the air-supply chamber and into the powder-chamber, and a discharge-pipe communicating with the commingling-chamber and having a flexible valved end, substantially as described.

2. A fire-extinguishing apparatus comprising a powder-chamber; a perforated air-receiving chamber within the powder-chamber; a perforated commingling-chamber also within the powder-chamber, and a discharge-pipe connected with the commingling-chamber.

3. The combination of a powder-magazine; an air-supply chamber; a powder-receiving chamber surrounding the air-supply chamber; a perforated commingling-chamber within the powder-chamber, and a discharge-pipe connected with the commingling-chamber.

4. The combination of a powder-magazine, a powder-receiving chamber, a valved pipe connecting the powder-magazine with the powder-receiving chamber, an air-chamber surrounding the powder-receiving chamber, a pipe connecting the air-chamber with the powder-magazine, a perforated air-receiving chamber within the powder-chamber, a commingling-chamber, also within the powder-receiving chamber, and a discharge-pipe connected with the commingling-chamber.

5. The combination of a service-pipe; a powder-magazine; a powder-chamber; an air-chamber surrounding the powder-chamber; a perforated receiving-chamber connected with said first-mentioned air-chamber; a perforated commingling-chamber within the powder-chamber, and a discharge-pipe connected with the service-pipe.

6. The combination of a service-pipe; a powder-receiving chamber; a powder-magazine connected therewith; an air-receiving chamber surrounding the powder-receiving chamber; a pipe connecting said air-chamber with the powder-magazine; a perforated commingling-chamber within the powder-magazine, means for supplying air and powder thereto, and a discharge-pipe connecting the commingling-chamber with the service-pipe.

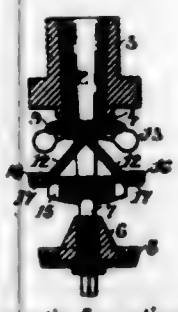
7. The combination of a powder-receiving chamber, an air-supply, a commingling-chamber, a discharge-pipe, the receiving-chamber, W, other powder-receiving chambers, air-supplies and commingling-chambers, and discharge-pipes connected with the receiving-chamber, W.

8. The combination of two powder-magazines, a powder-receiving chamber connected with one of said magazines, an air-chamber surrounding the powder-receiving chamber, an air-receiving chamber within the powder-receiving chamber and connected with the first-mentioned air-chamber, a commingling-chamber also within the powder-receiving chamber, a discharge-pipe connected with the commingling-chamber, a casing of large dimensions containing a series of powder-receiving chambers connected with one of the powder-magazines, and each containing an air-receiving chamber and a commingling-chamber, a storing-chamber, W, connected with one of the magazines, discharge-pipes connecting the commingling-chambers last mentioned with the storage-chamber, W, connections between this chamber and the powder-chamber of the first-mentioned apparatus, a service-pipe, and connections between the service-pipe and the storage-chamber, and between the service-pipe and the air-receiving chamber of the first-mentioned apparatus.

9. The combination of an inclosing casing, a series of powder-receiving chambers therein, each containing an air-receiving chamber and a commingling-chamber, which latter are each provided with a discharge-pipe, and a discharge-pipe of large dimensions to which said first-mentioned discharge-pipes are all connected.

10. The combination of a powder-receiving chamber, an air-receiving chamber within the powder-receiving chamber, a commingling-chamber also within the powder-receiving chamber, means for supplying air to the air-receiving chamber, a discharge-pipe, a cylinder connected therewith, a discharge-pipe or barrel, and a valve interposed between the cylinder and the discharge-pipe or barrel.

708,663. AUTOMATIC FIRE-EXTINGUISHER. ROBERT W. NEWTON, Providence, R. I. Filed Apr. 25, 1902. Serial No. 430,493. (No model.)



Claim.—1. In an automatic fire-extinguisher, in combination, the nozzle 2, the valve-seat 4, a valve for closing the outlet, a spring bearing on the valve, the thrust-arms 12 bearing on the spring and holding the same in the normal condition, metal to metal, to form a rigid thrust, the thrust-block 15, the thrust-plates 16 secured to the thrust-block by solder, means, substantially as described, for strengthening the solder-joint, the yoke 5, and the screw-threaded thrust-pin 7; the whole adapted to hold the valve to its seat rigidly and permit the solder-joint to yield while the valve is held to its seat, as described.

2. In an automatic fire-extinguisher, the combination with the nos-

zle 2, the valve-seat 4, the yoke 5, the valve, and the valve-support including the thrust-arms 12 and thrust-plates 16, of the perforated and screw-threaded cone 6, the screw-threaded thrust-pin 7, and the deflector 8 screw-threaded and adapted to lock the thrust-pin in the required position, as described.

3. In an automatic sprinkler, a valve-support for holding the valve closed comprising a thrust-block, a thrust-plate secured thereto by solder and adapted to move laterally when the solder is fused, an inclined arm bearing against said thrust-plate and tending to move the same laterally, and means whereby a lateral movement of the thrust-plate will cause said thrust-plate to be moved transversely away from the thrust-block to rupture the solder-joint, substantially as described.

4. In an automatic sprinkler, a valve-support for holding the valve closed comprising a thrust-block, a thrust-plate secured thereto by solder and adapted to move laterally when the solder is fused, an inclined arm bearing against said thrust-plate and tending to move the same laterally, and means for strengthening the solder-joint and causing the thrust-plate to be moved transversely away from the thrust-block when a lateral movement is given to the thrust-plate, substantially as described.

708,664. BOAT-LASHING DEVICE. SWEN NILSEN, Boston, Mass. Filed Nov. 6, 1901. Serial No. 81,203. (No model.)

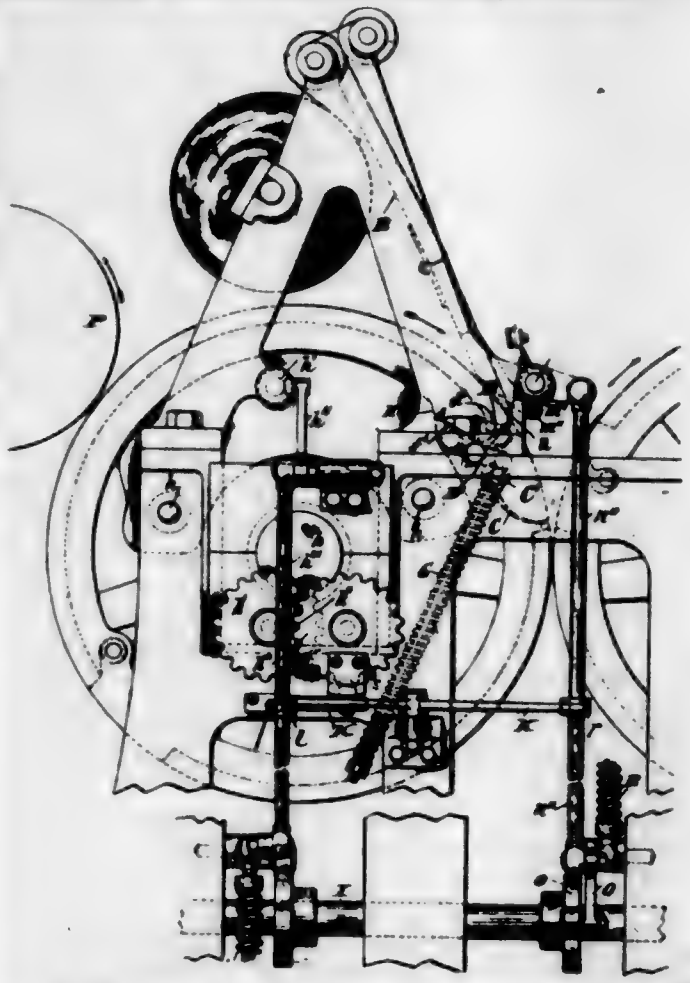
Claim.—1. The herein-described boat-lashing device, consisting in combination, of a hooked screw-threaded rod *d*, *d'*, D, an adjustable internally-screw-threaded sleeve E, a hooked rod F, rotatably connected to said sleeve, and provided with a pivoted latch F", a sleeve H, secured to the upper end of the rod F, and a longitudinally-adjustable spring-pressed latch-holding sleeve K, substantially as and for the purpose set forth.

2. The herein-described boat-lashing device, consisting in combination of a hooked screw-threaded rod, an adjustable internally-screw-threaded sleeve E, a rod F, rotatably connected to said sleeve, a hook F', made integral with said rod F, a latch F", pivotally connected to said hook and means substantially as described for locking said latch in closed position as and for the purpose set forth.

708,665. PRINTING-PRESS. THOMAS M. NORTH, Brooklyn, N. Y., assignor, by direct and mesne assignments, to Robt. Hoe and Charles W. Carpenter, New York, N. Y., under the firm-name of R. Hoe & Company. Filed Dec. 22, 1897. Serial No. 663,008. (No model.)

Claim.—1. The combination with a cylinder, of means for supplying an offset-web thereto, and means for separating a sheet from said web, substantially as described.

2. The combination with a cylinder, of means for intermittently supplying an offset-web thereto, and means for separating from said web a sufficient length to form an offset-sheet, substantially as described.



3. The combination with a cylinder, of means for intermittently supplying a perforated offset-web thereto, and means for separating from said web a sufficient length to form an offset-sheet, substantially as described.

4. The combination with a cylinder, of means for supplying an offset-web thereto, means for causing the cylinder to seize the end of the web, and means acting to clamp the web in opposition to the pull of the cylinder and thus cause an offset-sheet to be separated therefrom, substantially as described.

5. The combination with a cylinder, of means for intermittently supplying an offset-web thereto, means for causing the cylinder to seize the end of the web, and means acting to clamp the web in opposition to the pull of the cylinder and thus cause an offset-sheet to be separated therefrom, substantially as described.

6. The combination with a cylinder, of means for supplying an offset-web thereto, means for causing said cylinder to seize the web once in a predetermined number of revolutions, and a clamping device acting to hold the web against the pull of the cylinder whereby an offset-sheet is separated therefrom, substantially as described.

7. The combination with a cylinder having grippers, of means for intermittently supplying an offset-web thereto, and an intermittently-operated clamping device acting to hold the web against the pull of the cylinder whereby an offset-sheet is separated therefrom, substantially as described.

8. The combination with a cylinder having means for seizing the end of a web, of a table, means whereby an offset-web is fed over said table, and a clamping device acting to hold the web to the table after it has been seized by the cylinder and operating in connection with the web-seizing means on the cylinder to separate an offset-sheet from the web, substantially as described.

9. The combination with a cylinder having means for seizing the end of a web, of a movable table, means whereby an offset-web is fed over said table, and a clamping device acting to hold the web to the table after it has been seized by the cylinder and operating in connection with the web-seizing means on the cylinder to separate an offset-sheet from the web, substantially as described.

10. The combination with a cylinder, of means for supplying an offset-web thereto, means for releasing and removing from the cylinder an offset-sheet which has been used sufficiently, means for seizing the end of the offset-web, and means for separating an offset-sheet from the web, substantially as described.

11. The combination with a cylinder, of means for supplying an offset-web thereto, means for releasing and removing from the cylinder an offset-sheet which has been used sufficiently, means for seizing the end of

the offset-web, means for separating an offset-sheet from the web, and means for bringing said releasing, seizing and separating mechanism into operation once in a predetermined number of revolutions of the cylinder, substantially as described.

12. The combination with a movable table, of a movable paper-guide located over one end of the table, and means for causing said guide to depress the end of the paper which extends beyond the table beneath the level of the table, substantially as described.

13. The combination with a cylinder having grippers, of a movable paper-feeding table, means for depressing the end of the paper which extends beyond the table into the path of the grippers on the cylinder, substantially as described.

14. The combinaton with a cylinder having grippers, of a movable paper-feeding table, a shaft supported over one end of the table, means carried by the shaft for raising and lowering the table, and means also carried by the shaft for depressing the end of the paper which extends beyond the table into the path of the grippers on the cylinder, substantially as described.

15. The combination with a cylinder having grippers, of a movable paper-feeding table, a shaft located on one end of the table, means carried by the shaft for raising and lowering the table, a paper-guide also carried by the shaft and operating to depress the end of the paper which extends beyond the table into the path of the grippers on the cylinder, and a paper-clamping device, substantially as described.

16. The combination with a cylinder having grippers, of a movable paper-feeding table, a shaft located on one end of the table, means carried by the shaft for raising and lowering the table, a paper-guide also carried by the shaft and operating to depress the end of the paper which extends beyond the table into the path of the grippers on the cylinder, and a paper-clamping device carried by the shaft, substantially as described.

17. The combination of the regular printed-sheet grippers, offset-sheet grippers bearing on an incline of the edge of the cylinder-shell, and pins for lifting the edge of the offset-sheet, substantially as described.

18. The combination with a cylinder, of a set of sheet-holding grippers, a second set of grippers, and lifting devices connected to and operated by the second set of grippers, substantially as described.

19. The combination with a cylinder, of a set of grippers, a set of sheet-lifting pins, levers by which the pins are operated, and a loose connection between said pin-operating levers and the grippers, whereby movement of the grippers in each direction will operate the pins, substantially as described.

20. The combination with a cylinder, of a gripper-shaft, a set of grippers mounted thereon, lugs on the grippers, a set of sheet-lifting pins, levers by which the pins are operated, and a pin extending from said levers and lying between the lugs on the grippers, substantially as described.

21. The combination with a cylinder, of devices for intermittently supplying an offset-web thereto, means for separating from said web a sufficient length to form an offset-sheet, and intermittently-operated means for removing from the cylinder the used offset-sheet, substantially as described.

22. The combination with a cylinder, of devices for supplying an offset-web thereto, means for separating from said web a sufficient length to form an offset-sheet, and means for delivering said offset-sheet together with the printed sheet, substantially as described.

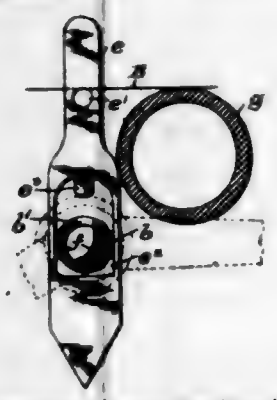
23. The combination with a cylinder, of devices for intermittently supplying an offset-web thereto, means for separating from said web a sufficient length to form an offset-sheet, and means operating once in a predetermined number of revolutions of the cylinder to deliver the offset-sheet together with the printed sheet, substantially as described.

24. The combination with a cylinder having grippers, of a movable cam for operating said grippers, mechanism for moving the cam, means for bringing said mechanism into operation once in a predetermined number of revolutions of the cylinder, means for feeding an offset-web to the grippers, and a clamping device operating in connection with the grippers to separate an offset-sheet from the web, substantially as described.

25. The combination with a cylinder having grippers, means for feeding an offset-web to the grippers, a clamping device operating on the web in opposition to the pull of the grippers, mechanism for operating the clamping device and a common locking device operating to simultaneously release the gripper-operating mechanism and the clamp-operating mechanism, substantially as described.

708,666. WARP STOP-MOTION FOR LOOMS. HENRY A. OWEN, Whitinsville, Mass. Filed Mar. 11, 1901. Serial No. 50,666. (No model.)

Claim.—1. In a warp stop-motion having detector-plates provided with stops and supported on the warp-threads, a tube having a slot, a rocking member in the tube, means for operating the rocking member, and means connected with the tube for stopping the loom upon the breaking of a warp-thread and the entering of the stop on a detector-plate into the slotted tube, as described.



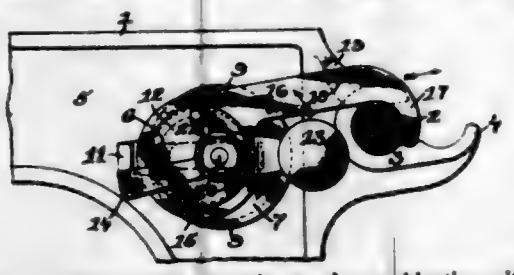
2. In a warp stop-motion, the combination with a series of detector-plates provided with stops and individually supported on warp-threads, of a longitudinally-slotted tube, journal-bearings supporting the ends of the tube, a rocking member in the tube, means for operating the rocking member across the slot in the tube, a stop-rod provided with a knock-off shoulder, and mechanism connected with the knock-off rod and the tube, whereby upon the breaking of a warp-thread and the dropping of the detector-plate the rocking member and the tube are caused to move together and the loom stopped, as described.

3. A detector-plate for a warp stop-motion for looms having an oblong opening with parallel sides, one end of which opening is curved inward to a central stop projecting into the opening, and an eye or opening for the passage of a warp-thread, as described.

4. In a warp stop-motion for looms, the combination with the tube *b* having the slot *b'*, the lever b^3, the connecting-rod b^3, the stop-rod b^4 provided with a knock-off shoulder and connected with the knock-off lever, and the shaft *f* having the crescent portion, of the detector-plate *e* having the projection e^3 extending into the opening of the detector-plate and adapted to enter the slot *b'*, whereby the crescent-shaped section may be locked to the tube upon the breaking of the warp-thread, as and for the purpose described.

5. In a warp stop-motion for looms, the combination of the following instrumentalities: a longitudinally-slotted tube, a vibrating member in the tube, mechanism for operating the vibrating member, a series of detector-plates supported on the warp-threads, an oblong opening in each detector-plate, a stop projecting into the opening at one end and adapted to enter the slot in the tube upon the breaking of the warp-thread, and mechanism connecting the tube with the stop-lever of the loom, as described.

708,667. BEAM-LOCK FOR LOOMS. OSCAR L. OWEN, Whitinsville, Mass. Filed Nov. 14, 1901. Serial No. 82,237. (No model.)



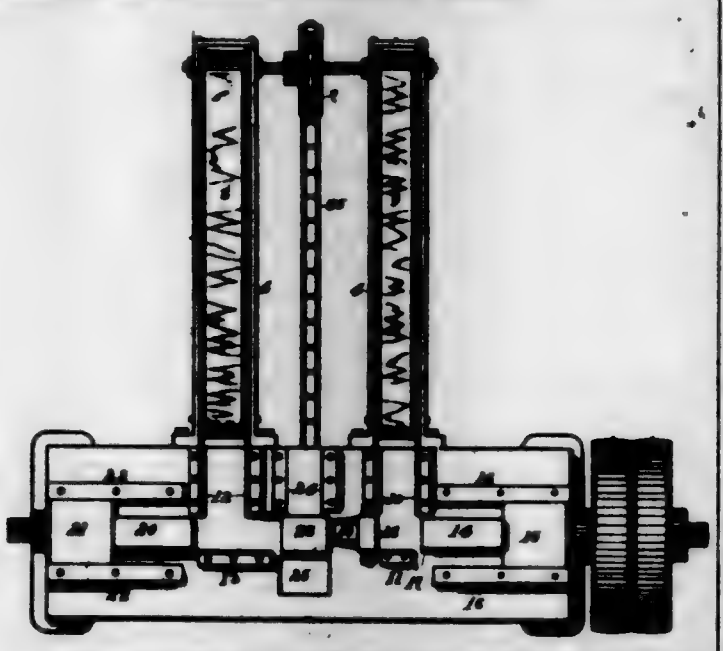
Claim.—1. In a beam-lock for looms, the combination with an arm provided with a hook at one end and a ring inclosing an eccentrically-mounted disk, of an actuating-handle and a bracket on the disk, said bracket engaging with the hooked arm, a cam-surface on the hooked arm and a shoulder on the end frame, whereby by the turning of the eccentrically-mounted disk the hooked arm may be drawn against the journal of the beam and under the shoulder on the end frame, as described.

2. In a beam-lock for looms, the combination with the end frame 1, the journal-bearing 3, the shoulder 19 on the end frame, and the slot 6, of the base 7, the journal-bearing 10 and stop 11 on the base, the eccentric 12, the actuating-handle 13 and bracket 14 on the eccentric, the arm 16, the ring 15 on one end of the arm, the hooked end 17 on the other end of the arm, and the cam-surface 18 on the end 17 of the arm 16, whereby the arm 16 may be operated to retain the journal of the warp-beam and locked as described.

708,668. MACHINE FOR BOXING MATCHES. HIRAM PARSONS, Barberton, Ohio. Filed Mar. 12, 1902. Serial No. 97,969. (No model.)

Claim.—1. In a machine for boxing matches, the combination of a table, two traveling belts moving toward the upper face of said table, the

one to bring forward filled cases of matches and the other empty shucks onto said table in alinement with one another, reciprocating plungers moving toward the center of said table to cause said cases to enter said shucks, and to cause such insertion to take place, substantially equidistant between said belts, substantially as shown and described.

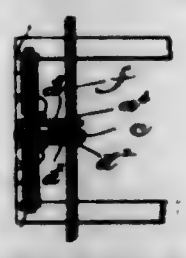


2. The combination in a machine for boxing matches, of a table, belts to bring forward into alinement on said table the filled drawers of matches and shucks, a spreader to open the ends of said shucks and to guide said filled drawers, situated on said table, reciprocating plungers to drive both drawers and shucks simultaneously together, substantially as shown and described.

3. The combination in a machine for boxing matches, of a table, means to feed filled drawers and shucks onto said table in alinement with one another, a shaft mounted in said table, cams mounted on said shaft, plungers mounted on the face of said table provided with depending rollers to engage said cams, and means to cause said cams to revolve and reciprocate said plungers to and from the center of the table, substantially as shown and described.

4. The combination in a machine for boxing matches, of a table, belts to convey drawers filled with matches and shucks in parallel lines onto said table, a spreader to direct the entrance of said drawers into said shucks, and reciprocating plungers on said table to cause the insertion of said drawers, and an ejector working transversely to the line of motion of the reciprocating plungers to force said cases from said table when the said drawers have been placed therein, substantially as shown and described.

703,669. WINDOW-OPERATING MECHANISM FOR GREENHOUSES. MATTHEW PRIOR, Watertown, Mass. Filed Mar. 14, 1902. Serial No. 98,338. (No model.)



Claim.—1. A device of the kind described, comprising fixed supporting means containing two pinions, a rack engaging said pinions at its opposite sides and secured at one end to the object to be moved thereby, an operating-shaft for operating one of said pinions, a short shaft secured to the other pinion, and a counterbalance-spring mounted on said shaft.

2. A device of the kind described, comprising a bracket, a rack-bar secured at one end to a movable object and its other end guided by said bracket, a pinion mounted in said rack to engage one edge of said rack-bar, a counterbalance-spring adapted to be wound and unwound by the rotation of said pinion, a second pinion mounted in said bracket for engaging the opposite edge of said rack-bar, an operating-shaft for driving said second pinion, said bracket having a hooked outer end, and said shaft being removably mounted in said hooked end.

3. In a device of the kind described, supporting means containing two fixed arms, having hooks at their outer ends, two pinions carried between said arms, one of said pinions being removably mounted in said hooks and the other pinion being at the opposite end of said arms, a rack-bar guided between said arms and in engagement with said two pinions, a counterbalance-spring adapted to be wound and unwound by the rotation of one of said pinions, and means for positively rotating the other pinion for raising the rack and object connected therewith.

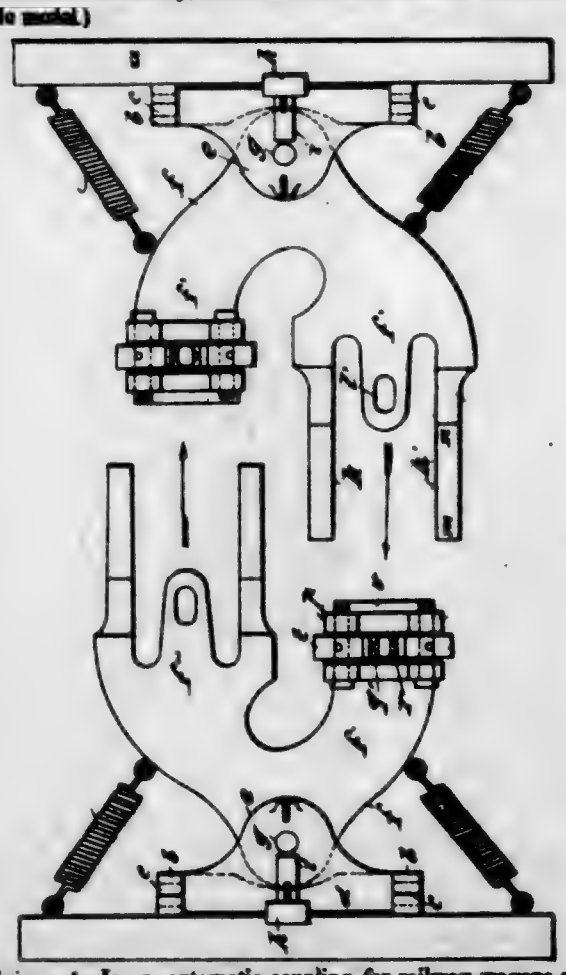
4. In a device of the kind described, supporting means containing two fixed arms, having hooks at their outer ends, two pinions carried between said arms, one of said pinions being removably mounted in said hooks and the other pinion being at the opposite end of said arms, a rack-bar guided between said arms and in engagement with said two pinions, a short shaft passed through said arms and one of said pinions, and a counterbalance-spring secured at one end to a fixed object and at its other end to said short shaft, and adapted to be placed under tension by the rotation of said shaft, and means for rotating the other pinion.

5. In a device of the kind described, a support, two pinions carried thereby, a rack-bar between said pinions and in driving engagement with one pinion and driven engagement with the other pinion, means for driving the latter pinion, a shaft for the former pinion extending at opposite sides thereof, and two counterbalance-springs, one at each end of said shaft.

6. A device of the kind described, including a rack-bar for lifting a window, and a driving-pinion and counterbalance-spring for coöperating therewith, combined with fixed supporting means supporting said rack beneath said driving-pinion, the thrust of the rack being in line with and borne by said supporting means.

7. A device of the kind described, comprising a series of window-lifting mechanisms, and a single operating-shaft for all of them, said several window-lifting mechanisms including hooked supports provided with fastening means for permanently and immovably fastening them to a fixed part of a building, and a bar for each window, said bars being retained and guided by the fixed hooked supports, said hooked supports receiving said shaft and supporting the same, said shaft having means for engaging and moving said bars longitudinally for lifting and lowering the windows, the said shaft being movable at will from engagement with said hooked supports and with said bars without interfering with or disturbing the hooked supports and bars.

703,670. COUPLING FOR RAILWAY-WAGONS, &c. ERNEST F. C. RAMBAUD, Parthenay, France. Filed Oct. 11, 1901. Serial No. 78,378. (No model.)



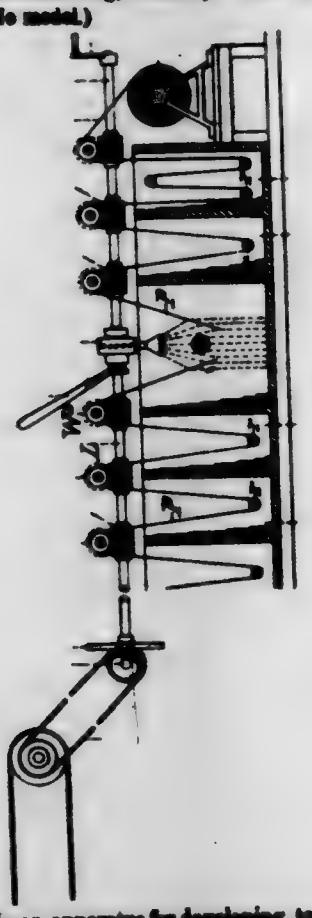
Claim.—1. In an automatic coupling for railway-wagons and the like, the combination with a plate fixed to the frame of each wagon and provided, by means of two bearings, with a shaft connecting two superposed flanges, of a vertical bar fixed to the before-mentioned plate, a spring fixed, on the one hand, to the said vertical bar and on the other to the upper flange, and a part placed between the two said flanges and connected thereto by a vertical pin around which the said part may oscillate horizontally, the said part being divided into two branches as described and as shown.

2. In an automatic coupling for railway-wagons and the like, the

combination with a plate fixed to the frame of each wagon and provided, by means of two bearings, with a shaft connecting two superposed flanges, of a vertical bar fixed to the before-mentioned plate, a spring fixed on the one hand to the said vertical bar and on the other to the upper flange, and a part placed between the two said flanges and connected thereto by a vertical pin, around which the said part may oscillate horizontally, the said part being divided into two branches, one of the said branches forming a trident the middle tooth thereof being provided with an oval hole and the two side teeth with raised edges and a groove engaged by a fastening-bolt, the said trident being provided with vertical parts between which move double racks integral with the fastening-bolt, two toothed sectors movably attached to the frame and meshing with the said double racks, a central chamber into which enters the central tooth of the said part, the outer teeth sliding upon the outside of the chamber and arranged so as to be lifted by the raised edge of the teeth of the trident of the device fixed to the neighboring wagon and falling into the slot of the central tooth of the coupling on the following wagon, substantially as described and as shown.

3. In an automatic coupling for railway-wagons and the like, the combination with a plate fixed to the frame of each wagon and provided, by means of two bearings with a shaft connecting two superposed flanges, of a vertical bar fixed to the before-mentioned plate, a spring fixed, on the one hand, to the said vertical bar and on the other to the upper flange, and a part placed between the two said flanges and connected thereto by a vertical pin, around which the said part may oscillate horizontally, the said part being divided into two branches, one of the said branches forming a trident, the middle tooth thereof being provided with an oval hole and the two side teeth with raised edges and a groove engaged by a fastening-bolt, the said trident being provided with vertical parts between which move double racks integral with the fastening-bolt, two toothed sectors movably attached to the frame and meshing with the said double racks, a central chamber into which enters the central tooth of the said part, the outer teeth sliding upon the outside of the chamber, means for raising said racks and feeding the central tooth and springs causing the coupling to return into its original position when a curve has been passed, substantially as described and as shown.

708,671. APPARATUS FOR TONING PHOTOGRAPHS. ARTHUR SCHWARZ, Berlin-Schöneberg, Germany. Filed May 10, 1897. Serial No. 635,864. (No model.)



Claim.—1. In an apparatus for developing, toning and fixing a long band of photographic paper, the combination of a bath containing the necessary solution, means for moving the long band of paper through the bath, means for regulating the time of treatment of the paper in the bath to obtain the desired shade of toning, and means for reversing the direction of travel of a part of the paper through the bath in the event of the band of paper becoming severed in its travel through the bath, substantially as described.

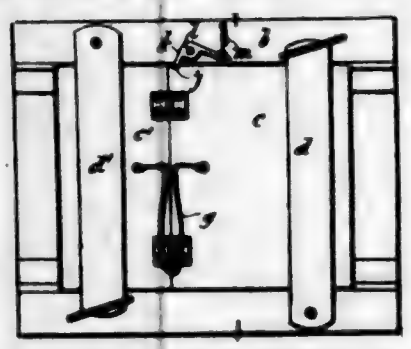
2. In an apparatus for developing, toning and fixing a long band of photographic paper, the combination of a series of baths containing the necessary solutions, means for moving the paper through the series of baths at a uniform speed, means for varying the period of time for movement of the paper through the baths, and means for reversing the direction of travel of a part of the paper through the bath in the event of the band of paper becoming severed in its travel through the bath, substantially as described.

3. In an apparatus for developing, toning and fixing a long band of photographic paper, the combination of a series of tanks, feed-rolls arranged to conduct the paper from one tank to another, a shaft common to all the rolls for driving the same and carrying a disk, a shiftable rotatable roll in frictional contact with said disk for varying the speed of the shaft by changing the point of contact between the disk and roll, and means for reversing the direction of travel of a part of the paper through the bath in the event of the band of paper becoming severed in its travel through the bath, substantially as and for the purposes described.

4. In an apparatus for developing, toning and fixing a long band of photographic paper, the combination of a series of tanks, feed-rolls arranged to conduct the paper from one tank to another, a divided shaft for driving said rolls having its members connected together by a clutching device adapted to disconnect the members to permit one member to rotate independent of the other member, and means for independently operating the disconnected members for withdrawing the band of paper in the event of the same breaking apart, substantially as and for the purposes described.

5. In an apparatus for developing, toning and fixing a long band of photographic paper, the combination of a series of tanks, feed-rolls arranged to conduct the paper from one tank to another, a divided shaft for driving said rolls common to all of said rolls and having its members connected together by a clutching device adapted to disconnect the members in the event of accident to permit one member to rotate independently of the other member, means for independently operating the disconnected members for withdrawing the band of paper in the event of the same breaking apart, a disk carried by one of said shaft members, and a shiftable rotatable roll in frictional contact with said disk for varying the speed of the feed-rolls through the shaft common to them all when the members of said shaft are connected, substantially as described.

708,672. PRINTING-FRAME. JAMES M. SMITH, Montreal, Canada, assignor of one-half to Alfred William Beltry, Montreal, Canada. Filed Mar. 3, 1902. Serial No. 97,375. (No model.)



Claim.—1. In a photographic-printing frame comprising a negative-holder and a removable back for retaining the sensitized paper upon the negative in said holder, the combination with said removable back of means for automatically lifting the sensitized paper from said negative upon the removal of the back, for the purpose set forth.

2. In a photographic-printing frame comprising a negative-holder and a removable back for retaining the sensitized paper upon the negative in said holder, the combination with said removable back of means for automatically lifting the sensitized paper from said negative upon the removal of the back; and means for retaining said paper in said position, for the purpose set forth.

3. In a photographic-printing frame comprising a negative-holder, a removable back consisting of a pair of leaves, and means for retaining said leaves in contact with said negative, of a retractile spring connected at its opposite ends to said leaves, substantially as described and for the purpose set forth.

4. In a photographic-printing frame comprising a negative-holder, a removable back consisting of a pair of leaves, and means for retaining said leaves in contact with said negative, of a retractile spring connected at its opposite ends to said leaves; an angular trip device pivotally connected to one side of said negative-holder, and a spring retaining one arm of said trip device across one of the leaves of said back and in the path thereof as it is lifted from the negative, substantially as described and for the purpose set forth.

5. In a photographic-printing frame comprising a negative-holder, a removable back consisting of a pair of leaves, and means for retaining

said leaves in contact with said negative, of a retractile spring connected at its opposite ends to said leaves, and a sucker mounted upon the inner face of one of said leaves, substantially as described and for the purpose set forth.

6. In a photographic-printing frame, comprising a negative-holder, a removable back consisting of a pair of leaves, and means for retaining said leaves in contact with said negative, of a retractile spring connected at its opposite ends to said leaves; a sucker in the form of a soft-rubber saucer on the inner side of one of said leaves; an angular trip device pivotally connected to one side of said negative-holder, and a spring retaining one arm of said angular device across the said leaf and in the path thereof as it is lifted from the negative, substantially as described and for the purpose set forth.

7. In a photographic-printing frame comprising a negative-holder, a removable back consisting of a pair of leaves, and means for retaining said leaves in contact with said negative, of a retractile spring connected at its opposite ends to said lever; an angular trip device pivotally connected to one side of said negative-holder and having the end of one arm offset; and a spring retaining said offset arm across one of the leaves of said back and in the path thereof as it is lifted from the negative, substantially as described and for the purpose set forth.

708,673. ELECTRIC BATTERY AND MOUNTING SAME. ELMER A. SPERRY, Cleveland, Ohio, assignor, by mesne assignments, to National Battery Company, a Corporation of New Jersey. Filed Sept. 13, 1899. Serial No. 730,290. (No model.)

Claim.—1. In a receptacle for a battery, free electrolyte within the receptacle, the walls of the case extending above the electrolyte and being provided with an inwardly and downwardly overhanging lip at or near the upper edge of the case with a free space between the lip and the wall.

2. A metallic case for a battery, forming part of an electric circuit, active material forming the negative electrode applied directly to the wall of the case, and an electrolyte within the case, in combination with an electrode, or electrodes, introduced into such case and made integral therewith at a plurality of points on the perimeter of the electrode or electrodes for affording better electrical distribution as between the electrode and the case.

3. A case for a battery, having sides consisting of a bent metallic conducting-plate, having a face supplied with active material placed in contact therewith, in combination with an additional plate attached to the active walls for better support of such material, the edges of the bent plate being joined to form a case for the electrolyte.

4. A case for a battery, having sides consisting of a bent metallic conducting-plate, having a face supplied with active material placed in contact therewith, in combination with a perforated plate attached to the active walls for better support of such material, the edges of the bent plate being joined to form a case for the electrolyte.

5. A case for a battery, having sides consisting of a bent metallic conducting-plate, having a face supplied with active material placed in contact therewith, in combination with an additional plate supplied with perforations and projections attached to the active walls for better support of such material, the edges of the bent plate being joined to form a case for the electrolyte.

6. A case for a battery, having sides consisting of a bent metallic conducting-plate, having a plurality of faces, supplied with active material placed in contact therewith, in combination with an additional plate or plates attached to the active walls for better support of such material, the edges of the bent plate being joined to form a case for the electrolyte.

7. In a receptacle for a battery, a case for containing the electrolyte, an electrode within the case, the walls of the case extending above the electrode, and an inwardly and downwardly overhanging lip at or near the upper edge of the case with a free space between the lip and the wall.

8. A case for a battery having sides consisting of a bent metallic conducting-plate with active material placed in contact therewith, in combination with an additional electrode or electrodes attached to the bent plate, a welded joint between the bent plate and the electrodes, the same being applied along the edge of the electrode at the junction with the plate, the bent plate being joined at its edges to form the sides of the case for the electrolyte.

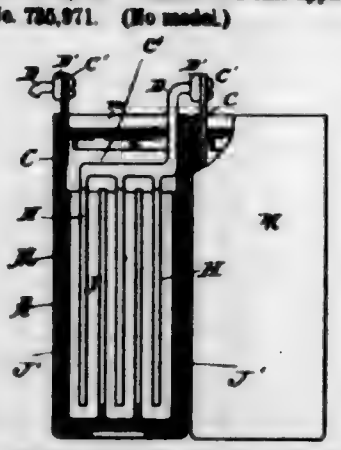
9. A thin metallic case for the battery, forming in part the negative electrode, containing electrolyte, in combination with an electrode or electrodes within such case and made integral therewith at a plurality of points for affording added support to the thin walls.

10. In a receptacle for a battery, a case for containing the electrolyte, electrodes within the case the walls of which extend above the electrodes, and an inwardly-projecting overhanging lip of flexible material at or near the upper edge of the case with a free space between the lip and the wall.

11. In a receptacle for a battery, a lead case for retaining the electrolyte, electrodes within the case, the walls of which extend above the top of the electrodes, and an inwardly-projecting overhanging lip of sheet-lead at or near the upper edge of the case with a free space between the lip and the wall.

12. A thin metallic case for a battery, containing an electrolyte, in combination with an electrode or electrodes, introduced into such case and fused into electric contact therewith at several points, but at less than the entire perimeter of three edges of the electrodes to leave communicating space from side to side of such electrodes, the electrode thus performing the function of a supporting-partition.

708,674. CONNECTION FOR BATTERIES. ELMER A. SPERRY, Cleveland, Ohio, assignor, by mesne assignments, to National Battery Company, a Corporation of New Jersey. Original application filed Sept. 13, 1899, Serial No. 730,290. Divided and this application filed Nov. 6, 1899. Serial No. 735,971. (No model.)



Claim.—1. In a battery, a case having its walls formed of thin conducting material, an electrolyte within the case, said case being provided with an extension projecting above the electrolyte, said extension being thicker than the walls of the case and being provided with a terminal having a broad contacting surface, and an insulating-support for the walls of said case.

2. In a battery, a case having its walls formed of thin conducting material, an electrolyte within the case, said case being extended upward above the level of the electrolyte, a terminal for an electric conductor carried by said extended portion of the case, said case being provided with an internal lip or flange arranged between the upper surface of the electrolyte and the top of the case, substantially as set forth.

3. In a battery, a case having its walls formed of thin conducting material, an electrolyte within the case, said case being provided with an extension thicker than the walls of the case and having a terminal substantially coextensive with one of the walls of the case formed integral therewith, and an insulating-support for the walls of said case, substantially as described.

4. In a battery, a case having its walls formed of thin conducting material, an electrolyte within the case, said case being provided with an extension thicker than the walls of the case and having a terminal with a broad contacting surface formed integral therewith, an insulating-support for said case comprising an envelop of flexible material, said envelop having its ends folded or bent under the bottom of the case, and a stiffening-plate interposed between the bottom of the case and said folded portion of insulating material, substantially as set forth.

5. In a battery, a case having its walls formed of thin conducting material, an electrolyte in said case, said walls being extended beyond the top of the electrolyte and provided with an inwardly-projecting flange or lip arranged between the surface of the electrolyte and the top of the case, and an insulating-support for said case comprising an envelop of flexible material having its ends folded or bent under the bottom of the case, substantially as set forth.

6. In a battery, a case having its walls formed of thin conducting material, an electrolyte within the case, the walls of said case being extended beyond the surface of the electrolyte, one of said walls being further extended to form a terminal for an electric conductor having a broad contacting surface, and an insulating-support for said case comprising a plurality of layers of insulating material, substantially as described.

7. In a battery, a case for containing an electrolyte having its walls formed of thin conducting material, the said walls being extended as a tubular section C^1 beyond the surface of the electrolyte and the said tubular section being relatively thick, and one of the sides of the said tubular extension being continued to form a terminal C for an electric conductor, and the said tubular extension being provided upon its inner surface with a flange or projection *a* situated between the upper edge of the tubular extension and the upper surface of the electrolyte, substantially as set forth.

708,675. THILL-COUPLING. LEWIS G. STRAGER, Henderson, N. Y., assignor of one-third to Leonard F. Bradford, Syracuse, N. Y., and John Carpenter, Henderson, N. Y. Filed May 21, 1902. Serial No. 108,426. (No model.)

Claim.—1. In a thill-coupling, in combination with an axle and a pivotal bar, a thill-iron having a fixed jaw and a movable jaw, a spring secured to the fixed jaw and movable independently of the movable jaw and a cam-lever pivotally connected to the fixed jaw and engaging the intermediate portion of the spring, the free end of said spring acting upon the movable jaw.

2. In a thill-coupling, an axle having a pivotal bar connected thereto, a shaft provided with a fixed jaw, a spring having one end secured to the fixed jaw and its other end tensioned to move away from the movable jaw independently of said movable jaw, a cam-lever pivotally connected to the fixed jaw and provided with a cam-shoulder engaging the intermediate portion of the spring to move the same against its own tension, the free end of the spring acting upon the movable jaw to force the same into engagement with the bar.

3. In combination with an axle having a pivotal bar, a shaft having a fixed jaw engaged with the bar, a second jaw pivotally mounted upon the fixed jaw and provided with a bearing-face for engaging said bar, said pivoted jaw moving by its own gravity away from the bar, a spring fixed at one end at one side of the pivot of the movable jaw and its other end extended beyond the opposite side of the pivot and tensioned to move away from the movable jaw independently thereof, and a cam-lever pivotally connected to the fixed jaw and engaged with the intermediate portion of the spring for operating said spring against its own tension, the free end of said spring operating upon the movable jaw to close the same upon the bar.

4. In combination with an axle having a pivotal bar connected thereto, a shaft having a fixed jaw engaged detachably with the bar, a spring having one end secured to the shaft and its other end movable toward and away from the bar, said spring being normally tensioned to move away from the bar, a second jaw pivotally connected to the shaft and extending between the free end of the spring and the bar and movable independently of the spring, adjusting means between the free ends of the pivoted jaw and spring for varying the tension of the spring upon the jaw, and means engaged with the spring for operating the same against its own tension for forcing the movable jaw into engagement with the bar.

5. In combination with an axle having a pivotal bar connected thereto, a shaft having a fixed jaw engaged with the bar, a second jaw pivoted to the shaft at one end and having its other end movable toward and away from the bar and provided with an adjusting-screw, a spring engaged with said screw, and a cam-lever engaged with said spring for compressing the same and forcing the movable jaw into engagement with the bar.

6. In combination with an axle having a pivotal bar, and a slotted spring connected to the axle, a shaft having a fixed jaw engaged with the bar and provided with a shoulder interlocking with said slotted spring when the shaft is elevated for holding said shaft in its elevated position, a spring having one end secured to the shaft and its other end extended rearwardly beneath the bar and movable toward and away from said bar, said spring being normally tensioned to move away from the bar, a second jaw having one end pivoted to the shaft and its other end movable between the free end of the spring and the bar and provided with an adjusting-screw engaged with the free end of the spring, and a cam-lever operating upon the spring to force the movable jaw into engagement with the bar.

708,676. PRINTING-PLATE HOLDER. EDWIN R. STOKE, New York, N. Y. Filed Jan. 2, 1902. Serial No. 88,126. (No model.)

Claim.—1. In a holder for printing-plates the combination of a block having grooves adapted to receive and hold one or more plate-clamps, and plate-clamps held in the grooves each of said clamps consisting of a face-piece having a wedge-shaped portion adapted to enter and partly fill the said groove, a nut adapted to be inserted at any point of the groove and set in conjunction with the said portion in the groove to hold the face-piece to the block and a screw connecting said nut and face-piece.

2. In a holder for printing-plates the combination of a block having grooves adapted to receive and hold one or more plate-clamps and plate-clamps held in the grooves each of said clamps consisting of a face-piece having a portion adapted to enter and partly fill the groove, a face on the said portion adapted to fit against the side of the groove, a nut adapted to be inserted at any point of the groove while connected to the face-piece and set in conjunction with the said portion in the groove to hold the face-piece to the block, and a screw connecting said nut and face-piece.

3. In a holder for printing-plates the combination of a block having grooves adapted to receive and hold one or more plate-clamps, and plate-clamps held in the grooves each of said clamps consisting of a face-piece having a portion adapted to enter and partly fill the groove, a nut narrower than the top of the said groove adapted to be inserted in the groove and set in conjunction with the said portion in the groove to hold the face-piece to the block and a screw connecting said nut and face-piece.

4. In a holder for printing-plates the combination of a block having grooves adapted to receive and hold one or more plate-clamps, and plate-clamps held in the grooves, each of said clamps consisting of a face-piece having a portion adapted to enter and partly fill the groove, a nut of a width to permit it to be inserted at any point of the groove and adapted to set in conjunction with the said portion in the groove to hold the face-piece to the block, and a screw having the bearing-surface of the head formed as a portion of the surface of a sphere, connecting said nut and face-piece.

5. In a holder for printing-plates the combination of a block having grooves of greater width at the bottom than at the top and plate-clamps adapted to be held in the grooves, each of said clamps consisting of a face-piece having a portion adapted to enter and fit against one side of the groove, a nut adapted to bear against the other side of the groove and the portion in the groove and act as a wedge in conjunction with the said portion to hold the face-piece to the block and a screw connecting said nut and face-piece.

6. In a holder for printing-plates the combination of a block having grooves of greater width at the bottom than at the top and plate-clamps consisting of a face-piece having a countersunk hole therein, a screw passing through the countersunk hole in the face-piece and working in a threaded hole in a nut, and a nut adapted to pass into the groove at its upper part without withdrawing the screw from the said threaded hole, and a projecting portion on the face-piece adapted to be inserted in the groove and prevent the withdrawal of the nut.

7. In a holder for printing-plates the combination of a block having grooves of greater width at the bottom than at the top and plate-clamps having a nut formed to partly fill the groove and adapted to pass into the said groove at its upper part, a face-piece having a portion adapted to enter the groove, force the nut to one side and act in conjunction with the nut to hold the face-piece to the block, and a screw connecting said nut and face-piece.

8. In a holder for printing-plates the combination of a block having grooves of greater width at the bottom than at the top and plate-clamps having a nut formed to partly fill, and fit against one side of, the groove

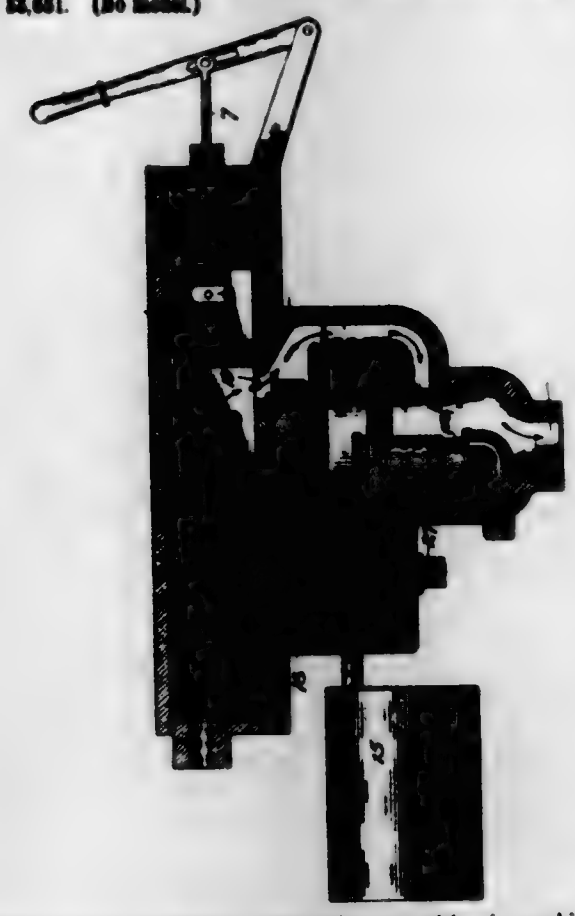
and adapted to pass into the groove at its upper part, an inclined plane forming one face of the said nut, a face-piece with a portion adapted to enter and fit against one side of the groove, a face on the said portion adapted to fit against the said inclined plane and means as a screw adapted to cause the inclined plane to slide on its corresponding face and force the portion against one side of the groove and the nut against the other side of the groove.

9. In a holder for printing-plates the combination of a block having grooves of greater width at the bottom than at the top and plate-clamps having a face-piece with a holding edge thereon, a portion extending from the face-piece formed to enter and fit against one side of the groove, a nut formed to pass into the groove at its upper part and partly fill the said groove, a face on the said extended portion formed to force the nut to one side in entering the groove, a face on the said nut formed to fit against and slide on the face formed on the said extended portion and a screw connecting the nut and face-piece adapted to bring the nut in co-operation with the extended portion and hold the face-piece to the block.

10. In a holder for printing-plates the combination of a block having grooves adapted to receive and hold one or more plate-clamps, and plate-clamps held in the grooves, each of said clamps consisting of a nut formed narrower than the top of the groove, a face-piece having a portion formed to enter the groove supplement the nut and prevent its withdrawal from the groove and means, as a screw, adapted to work in the nut to draw and hold the face-piece to the block.

11. In a holder for printing-plates the combination of a block having grooves adapted to receive and hold one or more plate-clamps, and plate-clamps held in the grooves each of said clamps consisting of a nut narrower than the top of the said grooves and adapted to be inserted at any point of the groove, a face-piece having a portion adapted to enter and hold the nut within the groove, and a screw connecting the nut and face-piece.

703,677. ENGINEER'S BRAKE-VALVE. PAUL SYNNESTVEDT, Glenview, Ill., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Nov. 25, 1901. Serial No. 83,681. (No model.)



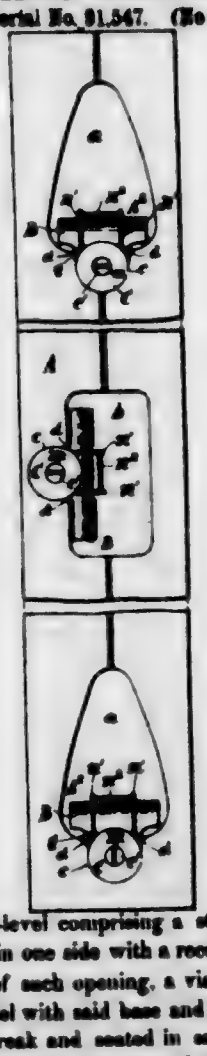
Claim.—1. An engineer's brake-valve comprising in combination a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage establishing communication of pressures on opposite sides of said piston, a check-valve in said passage, a direct supply-port, and a main controlling-valve controlling said direct supply-port, said direct supply-port being arranged to establish direct communication between the main-reservoir and train-pipe pressures, without causing said pressure flowing through said direct supply-port to pass said check-valve, substantially as described.

2. An engineer's brake-valve comprising in combination, a train-pipe connection, a main-reservoir connection, a train-pipe-service discharge-port, a train-pipe-service discharge-valve controlling said service discharge-port, a piston for producing slow or gradual closing of said valve, a pressure-chamber on the side of said piston opposite the train-pipe side thereof, a direct supply-passage for establishing communication between the main-reservoir and train-pipe pressures, said direct supply-passage leading around said chamber, a main controlling-valve controlling the said direct supply-passage, a passage for establishing communication between said chamber and the train-pipe, and a check-valve in said last-named passage, substantially as described.

3. An engineer's brake-valve comprising in combination, a train-pipe-service discharge-valve, a piston for producing slow closure of said valve, exposed on one side to train-pipe pressure, and on the other side to pressure of a chamber, a direct supply-port for establishing communication between a main reservoir and a train-pipe, and a secondary supply-port provided with means for maintaining a higher pressure in the reservoir than in the train-pipe, said last-mentioned port passing through the chamber and thence to the train-pipe past a check-valve, substantially as described.

4. An engineer's brake-valve comprising in combination, connections from a main reservoir and to a train-pipe, a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage for establishing communication between the fluid-pressures on opposite sides of said piston, means for automatically controlling the opening and closing of said passage, a passage for establishing direct communication between said main-reservoir and train-pipe connections, and means for controlling the opening and closure of said direct connecting-passage, substantially as described.

703,678. SPIRIT-LEVEL. JUSTUS A. TRAUT, New Britain, Conn. Filed Jan. 28, 1902. Serial No. 91,547. (No model.)



Claim.—1. A spirit-level comprising a stock having an opening therethrough and formed in one side with a recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion extending through said break and seated in said recess, and means for clamping said pendent portion to the base of the recess, said means including a guard extending over said vial-tube.

2. A spirit-level comprising a stock having an opening therethrough and formed in one side with a recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion extending through said break and adjustable in the recess on an invariable axis, and means for clamping said pendent portion to the base of said recess, said means including a guard extending over said vial-tube.

3. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion approximating the greater part of a circle in shape extending

through said break and adjustable in the recess on an invariable axis, and means for clamping said pendent portion in place, said means including a guard extending over said vial-tube.

4. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with the base thereof and having a pendent portion approximating the greater part of a circle in shape extending through said break and adjustable in the recess on an invariable axis, and a clamping device for said pendent portion having the same axis, said device including a guard extending over said vial-tube.

5. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with the base thereof and having a pendent portion approximating the greater part of a circle in shape extending through said break and adjustable in the recess on an invariable axis, a plate or washer also seated in the recess flush with the surface of the stock, and means for clamping said plate or washer against the pendent portion to hold the leveling device in place, said plate or washer being provided with a guard extending over said vial-tube.

6. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with the base thereof and having a pendent portion approximating the greater part of a circle in shape extending through said break and adjustable in the recess on an invariable axis, a removable axial member on which the pendent portion is adjustable, and means clamping said pendent portion in place, said means including a guard extending over said vial-tube.

7. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion approximating the greater part of a circle in shape extending through said break and seated in the recess, and a clamping device for said pendent portion including a washer, a screw, and a nut, said washer being provided with a guard extending over said vial-tube.

8. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion approximating the greater part of a circle in shape extending through said break and seated in the recess, said pendent portion having a central opening registering with a corresponding opening formed in the stock centrally of the recess, an axial member for the support of the pendent portion, and a plate and a nut on such member at opposite sides of the stock for securing said pendent portion in position, said plate being provided with a guard extending over said vial-tube.

9. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess less in diameter than the distance between adjacent parts of the sides of said opening, and having a break in the wall thereof at the base of the opening, a vial-tube located within the sides of said opening parallel with said base and having a pendent portion approximating the greater part of a circle in shape extending through said break and adjustably secured in the recess, the ends of said tube projecting beyond the edges of said pendent portion, and means for securing said pendent portion in place including a guard extending over the vial-tube.

10. A spirit-level comprising a stock, a leveling device, and a clamp for the leveling device including a washer and a guard integral therewith, said guard being formed of an upright frame and connecting-bars, and said frame being bent to bring the bars directly above said leveling device.

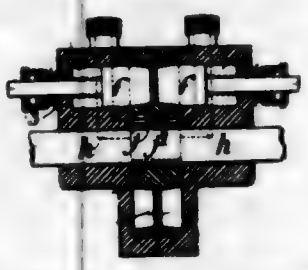
11. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with the base thereof and having a pendent portion approximating the greater part of a circle in shape passing through said break and seated in the recess, said pendent portion being adjustable on an invariable axis and formed with concentric arc-slots on opposite sides of said axis, screws entering the base of the recess through said slots, and a washer, a screw, and a nut for clamping said pendent portion in place.

12. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion approximating the greater part of a circle in shape extending through said break and seated in the recess, and a clamp for said pendent portion including a washer having a guard integral therewith formed of an upright frame and connecting-bars, said frame being bent to bring the bars directly above said vial-tube.

13. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with said base and having a pendent portion approximating the greater part of a circle in shape extending through said break and seated in the recess, and a clamp for said pendent portion including a washer, a screw, and a nut, said washer having a guard integral therewith formed of an upright frame and connecting-bars, and said frame being curved to bring the bars directly over said vial-tube.

14. A spirit-level comprising a stock having an opening therethrough and formed in one side with an approximately circular recess having a break in the wall thereof at the base of such opening, a vial-tube located within the sides of the opening parallel with the base thereof and having a pendent portion approximating the greater part of a circle in shape passing through said break and seated in the recess, said pendent portion being adjustable on an invariable axis and formed with concentric arc-slots on opposite sides of said axis, screws entering the base of the recess through said slots, and a washer, a screw, and a nut, for clamping said pendent portion in place, said washer being provided with a guard extending over the said vial-tube.

703,679. ROTARY ENGINE. CHARLES TUCKFIELD, East Molesey, England, assignor of two-thirds to Dyson Weston, London, England. Filed Nov. 15, 1901. Serial No. 82,399. (No model.)



Claim.—1. In a rotary engine, the combination with a casing provided with a circular recess, of a disk located in said recess, a shaft secured to said disk, said disk being provided on a lateral face, with an annular groove, decreasing gradually in radial diameter from the face of the disk, and a stop in said groove, having an inclined face extending from the face of the disk to the bottom of said groove, and a sliding abutment mounted in the casing and fitting said groove, substantially as described.

2. In a rotary engine, the combination with the casing provided with a circular recess and inlet and exhaust ports, of a rotary disk mounted therein and having a lateral face provided with an annular groove, a stop located in said groove, a cut-off recess communicating with said groove, and constructed to communicate with the inlet-port and a sliding abutment mounted in said casing and fitting said groove, substantially as described.

3. In a rotary engine, the combination with the casing provided with a circular recess and inlet and exhaust ports, of a rotary disk mounted therein and having a lateral face provided with an annular groove, a stop located in said groove, a cut-off recess located in the hub of said disk, communicating with the said groove, and constructed to communicate with the inlet-port, and a sliding abutment mounted in said casing and fitting said groove, substantially as described.

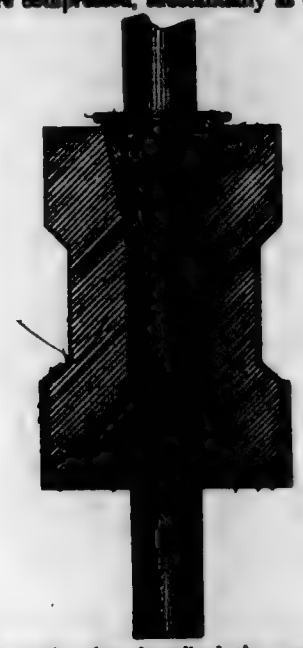
4. In a rotary engine, the combination with the casing provided with a circular recess and inlet and exhaust ports, of a rotary disk mounted therein and having its lateral faces provided each with an annular groove tapering gradually from the face of the disk to the bottom of the recess, a stop located in each groove and provided on each side with an inclined face extending from the lateral face of the disk to the bottom of the recess, and sliding abutments mounted in the casing and fitting said grooves, substantially as described.

703,680. TAPPET FOR STAMP-MILLS. JAMES C. H. VAUGHT, Phillipsburg, Mont. Filed Aug. 15, 1899. Renewed Nov. 16, 1901. Serial No. 82,591. (No model.)

Claim.—1. In a device of the class described, the combination with a stamp-stem, and a tappet having a flaring opening, of a compressible conical or wedge-shaped sleeve provided with oppositely-disposed longitudinally-inclined ribs arranged to embed themselves in the stamp-stem and adapted when the sleeve is compressed, to feed the same inward to tighten the parts, substantially as described.

2. In a device of the class described, the combination with a stamp-stem, and a tappet having a tapering opening, of a conical or wedge-shaped sleeve composed of two sections having oppositely-inclined corrugations forming longitudinally-inclined ribs arranged to embed themselves

in the stamp-stem, whereby the sections will be fed inward to tighten the parts when they are compressed, substantially as described.



3. In a device of the class described, the combination with a stamp-stem and a tappet having a tapering opening, of a sleeve composed of two sections and provided with a longitudinal opening, said sections being provided with ribs inclining downward or inward from opposite sides of the said opening and adapted to embed themselves in the stamp-stem to feed the sections downward or inward, and means for engaging the sections at the said opening, substantially as described.

4. A device of the class described comprising a tappet, a lower tapering or wedge-shaped sleeve fitting within the lower end of the tappet and provided with horizontal corrugations or ribs adapted to engage a stamp-stem, and an upper tapering or wedged-shaped sleeve provided with longitudinally-inclined ribs or corrugations adapted to engage the stamp-stem whereby the upper sleeve is fed downward, substantially as and for the purpose described.

5. A device of the class described comprising a tappet, and upper and lower resilient wedge-shaped sleeves split longitudinally, the lower sleeve being provided with horizontal threads or ribs, and the upper sleeve being provided with two sets of oppositely-inclined threads or ribs, substantially as described.

6. In a device of the class described, the combination with a stamp-stem, and a tappet having a tapering opening, of an upper tapering sleeve provided with a longitudinal opening and having oppositely-disposed longitudinally-inclined ribs arranged to embed themselves in the stamp-stem, and a longitudinal wedge arranged in the longitudinal opening, substantially as described.

7. A device of the class described comprising a tappet having a tapering opening, an upper tapering sleeve arranged in the tapering opening and having an outwardly-extending flange and provided with an opening, and a wedge having a flange and fitting in the opening of the sleeve, substantially as described.

8. A device of the class described comprising a tappet, having an exterior shoulder, and a cap fitting on the tappet and provided at its edges with a series of lugs bent inward and engaging the shoulder of the tappet, substantially as described.

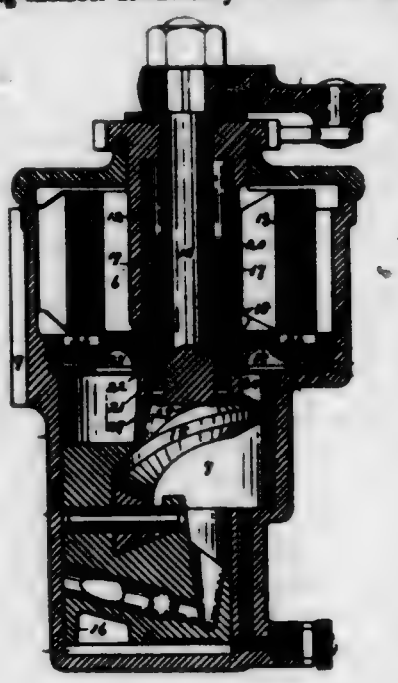
9. A device of the class described comprising a tappet, a cap, and a series of keys detachably interlocked with the cap and projecting therefrom and forming lugs bent inward and engaging the exterior of the tappet, substantially as described.

10. A device of the class described comprising a tappet, a cap provided at its upper edges with a series of dovetailed recesses, and a series of keys having enlarged lower portions detachably interlocked with the dovetailed recesses said keys forming lugs bent inward and engaging the exterior of the tappet, substantially as described.

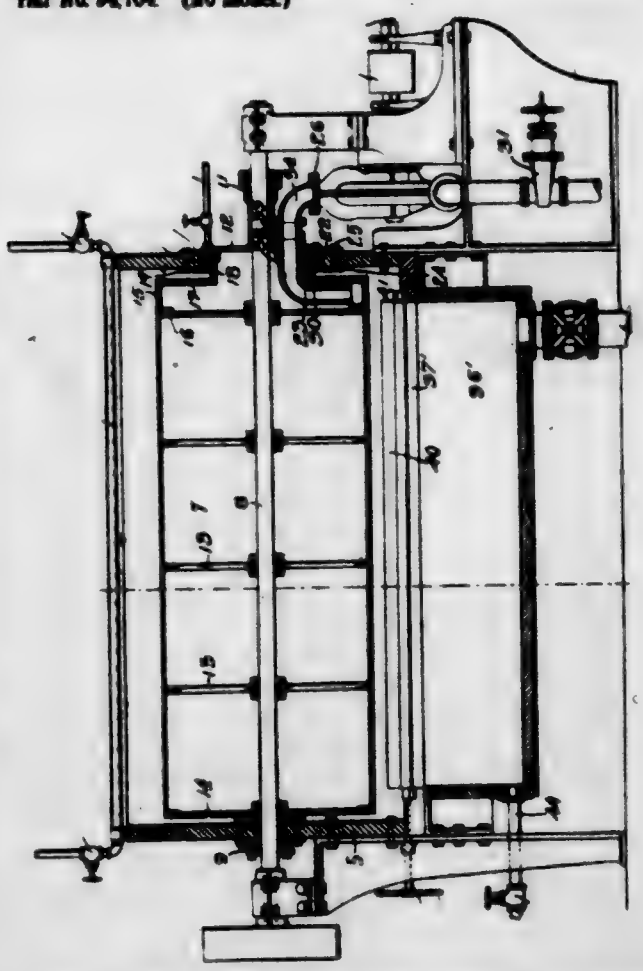
708,681. LIQUID DOOR-CHECK. HENRY O. VOSSEY, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company New Britain, Conn. Filed Feb. 28, 1902. Serial No. 96,663. (No model.)

Claim.—1. In a liquid door-check, the combination of the case having the liquid-chamber and the spring-chamber eccentrically arranged, with the diaphragm screwed into the lower end of the spring-chamber to divide it from the liquid-chamber, the said diaphragm having the two annular seats on its under face with a groove between, and the annular plate seated on the shoulder at the junction of the liquid and spring chambers between the said shoulder and the annular seats of the said diaphragm, substantially as described.

2. In a liquid door-check, the combination of the case having the liquid-chamber and spring-chamber, with a diaphragm dividing the said chambers, and the cam-shaft and cam, the confronting faces of the said cam and diaphragm being formed with the annular groove and cylindrical portion fitted thereto of less length than the depth of the said groove for forming a collecting-chamber, and with endwise-bearing abutments outside of the said cylindrical portion, the said cam being also perforated from the said collecting-chamber downwardly to its under side, substantially as described.



708,682. PAPER-PULP STRAINER. NATHANIEL L. VEDDER and ROBERT R. KIRKLAND, Watertown, N. Y. Filed Feb. 18, 1902. Serial No. 94,704. (No model.)



Claim.—1. The combination in a pulp-strainer, of a tank, a screening-cylinder disposed within the tank and having at one end a flanged suction-box at a point beyond the screening-surface, and a pump having a suction inlet-pipe in communication with the lower portion of said suction-box.

2. The combination in a pulp-strainer, of the tank, having an opening at one end, a screening-cylinder arranged within the tank and having at one end an annular flange, a grooved bearing-ring arranged within the opening in the tank and supporting said flange, a water-pipe communicating with the groove in said ring, a plate having an annular flange ex-

tending within the flange of the cylinder, an auxiliary plate forming a closure for the tank-opening, and a pump having a suction-pipe passing through an opening in said plate into the interior of the cylinder.

3. The combination in a pulp-strainer, of the tank, a screening-cylinder disposed within the tank and having a suction-box at one end, an annular flange carried by the suction-box, a grooved bearing-ring supporting said annular flange and forming a water-packing box, and a pump having a suction inlet-pipe extending through the tank and in communication with the lower portion of the cylinder suction-box.

4. The combination in a pulp-strainer, of the tank, a screening device therein, a flow-box disposed below the tank and in communication therewith, a valve for controlling communication between the flow-box and the tank, and a discharge-pipe leading from said flow-box.

5. The combination in a pulp-strainer, of the tank, a screening device therein, a flow-box disposed below the tank, a valve for controlling communication between the flow-box and the tank, a discharge leading from the flow-box, and a water-supply in communication with said flow-box.

6. The combination in a pulp-strainer, of the tank, a screening device therein, a flow-box arranged below the tank, a false bottom hinged at one of its edges to the bottom of the tank and controlling communication between the tank and flow-box, an operating device located outside the tank and connected to said false bottom, a valved discharge-pipe leading from the flow-box, and a valve water-supply pipe in communication with said flow-box.

7. The combination with a screening-cylinder, of a series of intermediate and end supporting-bars, the end supporting-bars being arranged in spaced pairs, spacing-blocks secured at intervals to the pairs of end bars, the intermediate bars being arranged in a plane above the plane of the end bars, removable screening-bars adapted to notches or grooves in the supporting-bars, and clamping-bars adapted to fit within the spaces between the end supporting-bars and having flanges for holding the screening-bars in position.

8. The combination with the polygonal end pieces, of longitudinally-disposed supporting-bars carried by said pieces, intermediate supports between the end pieces, and a screening-surface formed of a plurality of screening-bars supported and clamped in slightly-arched position by said longitudinal bars.

708,688. SCREEN-PLATE FOR PULP-STRAINERS. NATHANIEL I. VROOMAN and ROBERT B. KIRKLAND, Watertown, N. Y. Filed Feb. 21, 1902. Serial No. 95,026. (No model.)

Claim.—1. A screening device comprising a series of bars, and means for holding and supporting said bars in bowed position under a constant bending strain.

2. A screening device comprising a series of interchangeable screening-bars, devices for supporting the same, and means for clamping said bars in position and for slightly bending or bowing said bars

3. A screening device comprising a frame and a series of interchangeable screening-bars held in said frame under a constant bending strain.

4. A screening device comprising a frame having a series of parallel-supporting-bars having alining notches, the intermediate supporting-bars being arranged in a plane above that in which the outer supporting-bars are situated, and removable screen-bars carried by said supporting-bars.

5. The combination with a series of interchangeable screening-bars, of a frame comprising a series of notched supporting-bars adapted to receive the ends and intermediate portions of said screen-bars, the notches of the intermediate supporting-bars being arranged in the plane above the plane of the notches of the outer supporting-bars.

6. A screening device comprising a rectangular plate or frame having alining notches, a series of screen-bars disposed in said notches, the opposite ends of said screen-bars having reduced portions, and clamping-bars having flanges for engagement with said reduced portions.

7. A screening device comprising a frame having parallel side and intermediate bars each provided with notches or grooves, the bottoms of the notches or grooves of the intermediate bar being in a plane above the plane of the bottoms of the notches or grooves in the side bars, a series of screen-bars adapted to said notches, and means for confining the ends of said bars.

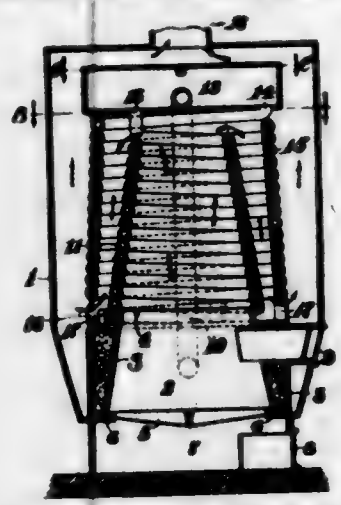
8. A screening device comprising a frame having parallel side and intermediate bars each provided with substantially V-shaped notches or grooves, those of the intermediate bars being arranged in a plane above the notches of the side bars, a series of screen-bars adapted to said notches, said screen-bars having reduced end portions, and a flanged clamping-bar adapted for engagement with the reduced end portions of the screening-bars.

708,684. WAISTCOAT. ELI G. D. WARE, Malta, Ohio, assignor of two-thirds to George S. Corner and John F. Davis, Malta, Ohio. Filed Feb. 28, 1902. Serial No. 95,723. (No model.)

Claim.—1. A garment provided at its front portion with pockets two upon each side, with one above another and extending toward each other and occupying the area of said sides and having entrance-openings thereto respectively at the central and side-seam portions of the garment said entrance-openings being arranged at relatively opposite sides of the pockets in each side or half of the front portion of said garment; substantially as specified.

2. A garment provided with a vertical closure at its front, hand-pockets at the opposite sides of said closure and extending from an opening at the sides of said garment to occupy the lower portion of the front of the garment, and breast-pockets in the upper portion of the garment having openings nearest said closure and extending from said openings toward the sides of the garment to occupy the space above said hand-pockets; substantially as specified.

708,685. HEATER OR BOILER. NATHANIEL R. WALES, Braintree, Mass. Filed Apr. 3, 1902. Serial No. 101,078. (No model.)



Claim.—1. In a water-heater, the combination of a fire-box the wall of which is frusto-conical; a water-chamber surrounding said fire-box; a second water-chamber located near the top of the inclosing casing; a frusto-conical tubular coil, the larger end of which rests upon, and communicates with the interior of the chamber surrounding said fire-box, and extends upward to within a short distance of the under side of said upper water-chamber, and communicates with the interior thereof; a second frusto-conical tubular coil surrounding said first-mentioned coil at a distance therefrom, with its upper and smaller end in contact with, and in communication with the interior of said upper chamber, and extending downward therefrom to within a short distance of, and communicating with the interior of the water-chamber surrounding the fire-box; means for admitting water to said fire-box water-chamber; and means for the discharge of water from said upper water-chamber.

2. The combination of a frusto-conical fire-box; a water-chamber inclosing said fire-box; the water-chamber 12; the frusto-conical tubular coils 11 and 15, the convolutions of each coil being wound in close contact with each other, said coils being arranged one within the other, and at a greater distance apart at their upper ends than at their lower ends, said coil 11 resting upon and communicating at its lower end with the interior of said fire-box water-chamber and extending upward to within a short distance of the under side of the chamber 12, and communicating

at its upper end with the interior of said chamber 12, and said coil 15 being in contact with the under side of, and communicating with the interior of said chamber 12, and at its lower end with the interior of the chamber surrounding the fire-box; and a series of standards interposed between the upper surface of the water-chamber 3 and the lower end of the coil 15, as and for the purposes described.

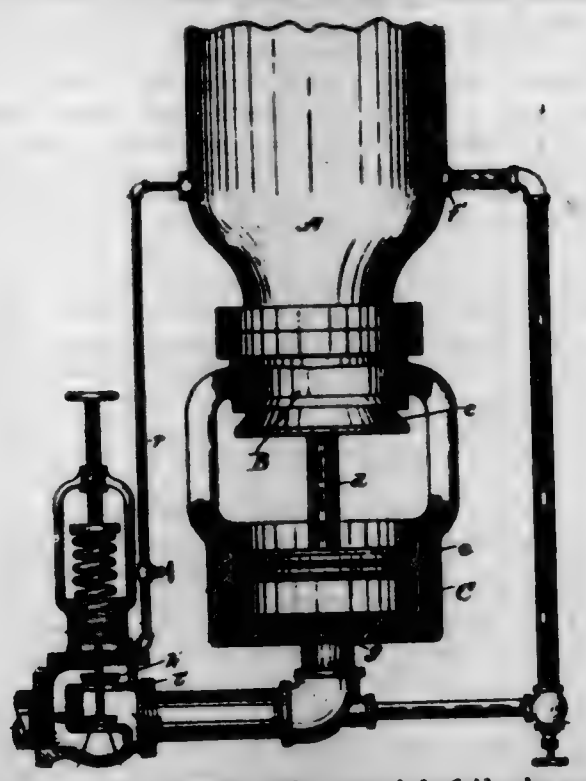
3. In a water-heater, the combination of a frusto-conical fire-box; the water-chamber 3, surrounding said fire-box, but having a height less than the wall of the fire-box; the closely-wound frusto-conical tubular coils 11 and 15, arranged one within the other, at a diverging distance apart, the lower convolution of the coil 11 fitting closely around the upwardly-projecting portion of the fire-box wall, and said coils being arranged relative to each other and to the water-chambers 3 and 12 as set forth; the feed-pipe 19; the discharge-pipe 20; the inclosing casing 1; and the chimney 18.

708,686. SHOE FORM OR LAST. HARRY B. WALKER, Brockton, Mass. Filed Sept. 20, 1901. Serial No. 75,693. (No model.)

Claim.—1. A shoe form or last having a continuous contour-line, consisting of a heel part and a fore part, made of a single integral piece of material, said fore part consisting of two independent, separated, laterally-resilient wings extending from the heel part and adapted to be brought toward each other to reduce the transverse dimension of the form or last, to facilitate insertion into and withdrawal from the shoe, and to draw away from each other within the shoe to fill out the fore part of the upper thereof, substantially as described.

2. A shoe form or last having a continuous contour-line, consisting of a heel part and a fore part made of a single integral piece of material, said fore part consisting of two independent, laterally-resilient wings extending from the heel part, separated by a space having an enlargement at its crotch, and adapted to be brought toward each other in the intervening space to reduce the transverse dimension of the form or last, to facilitate insertion into and withdrawal from the shoe, and to draw away from each other within the shoe to fill out the fore part of the upper thereof, substantially as described.

708,687. RELIEF-VALVE FOR RESERVOIRS CONTAINING FLUID UNDER PRESSURE. HENRY R. WARREN, Newton, Mass., assignor to the Leonard Governor Company, Boston, Mass., a Corporation of New Jersey. Filed Mar. 1, 1902. Serial No. 96,349. (No model.)



Claim.—1. In combination with a reservoir for fluid under pressure, a relief-valve which is connected with a piston operating within a cylinder, a fluid-conduit between this cylinder and said reservoir, and a waste-valve which communicates with the outlet of said piston-cylinder, and is operated by fluid-pressure directly from the reservoir and communicated thereto independently of the conduit to the piston-cylinder.

2. In combination with a reservoir for fluid under pressure, a relief-valve which is connected with a piston operating within a cylinder, a conduit between this cylinder and said reservoir which is adapted to regulate the flow of fluid to the cylinder, and a waste-valve which communicates with the outlet of said piston-cylinder, and is operated by direct fluid-pressure from the reservoir communicated independently of the conduit to said cylinder.

3. In combination with a reservoir containing fluid under pressure, a relief-valve controlled by a piston operating within a cylinder, a fluid-conduit between this cylinder and the said reservoir, means to regulate and maintain a resistance to the flow of fluid through said conduit which will reduce the fluid-pressure at its discharge, and a waste-valve which communicates with the outlet of said piston-cylinder and is operated by direct fluid-pressure from the reservoir communicated independently of the conduit to said cylinder.

4. In combination with a reservoir for fluid under pressure, a relief-valve adapted to be partially balanced by the fluid-pressure within itself, which valve is controlled by a piston operating within a cylinder, a fluid-conduit between this cylinder and said reservoir, means to regulate and maintain a resistance to the flow of fluid through said conduit which will reduce the fluid-pressure at its discharge, and a waste-valve in communication with the outlet of said piston-cylinder, which valve is independently operated by direct fluid-pressure from the reservoir independently communicated thereto.

5. In combination with a reservoir for fluid under pressure, a relief-valve constructed to be partially balanced by the fluid-pressure within itself, a cylinder containing a piston connected with said valve, the area of which piston is a minimum in excess of the area of the unbalanced portion of said valve, and a conduit from the cylinder to said reservoir to communicate the fluid-pressure therein to the piston in the cylinder, for the purpose described.

708,688. BALING-PRESS. THURMAN C. WEST, Hattiesburg, Miss. Filed July 28, 1901. Serial No. 69,434. (No model.)

Claim.—1. A baling-press comprising a box having plungers disposed for movement toward each other, a discharge-opening in the side of the box, a gate for said opening, a frame carried by the gate to lie against the bottom of the box when the gate is closed to receive the bale, said frame being movable with the gate when opened to discharge the bale, and means for operating the plungers.

2. A baling-press comprising a box having plungers disposed therein for operative movement toward the center of the box, a discharge-opening in the side of the box, a gate for said opening, a frame carried by the gate to receive the bale and movable with the gate to discharge the bale, a cover for the box, and means for operating the plungers.

3. A press comprising a box having plungers slidably mounted therein, a discharge-opening for the box, a slotted gate for the opening, a frame carried by the gate to lie against the bottom of the box when the gate

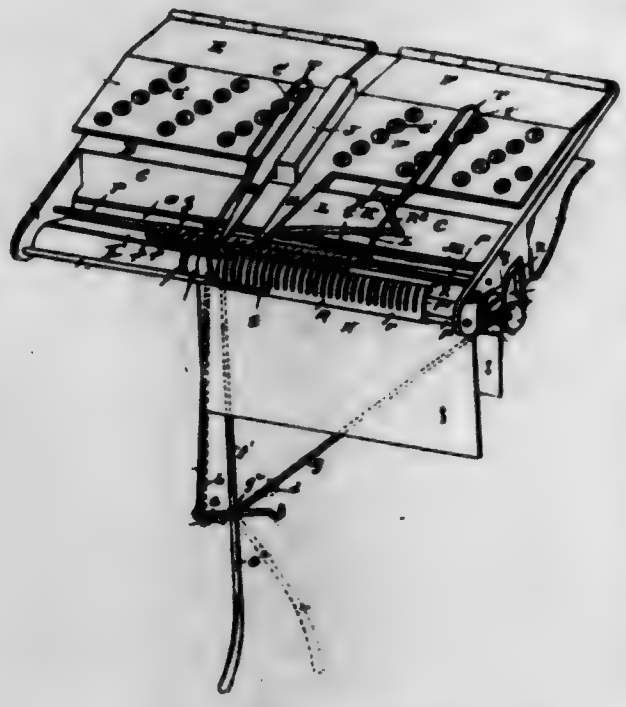
is in closed position, and to discharge the hole when the gate is opened, plungers mounted at the ends of the box for movement toward the gate, the box having slots aligning with the slots of the gate when the latter is in closed position, and means for moving the plungers simultaneously.

4. A boiling-press comprising a box, a plunger slidably mounted at each end of the box for operative movement toward each other, said plungers comprising rills, heads at the inner ends of the rills, and braces from the rills to the heads, and cables engaged with the braces through perforations in and having means for winding them to operate the plunger.

5. A boiling-press comprising a box having plungers mounted in its ends for operative movement toward each other, a discharge-opening midway of the ends of the box, a hinged gate for said opening provided with a frame disposed to receive and discharge the hole, a drum mounted upon the box, pulleys at the ends of the box, cables engaged with the drum and having their ends taken around the corresponding pulleys and then crossed and attached to the plungers for moving the latter in one direction, additional pulleys mounted in the box, and an additional cable engaged with the drum and having its ends taken around the last-named pulleys and attached to the plungers without crossing, to move the plungers in the opposite direction.

6. A boiling-press comprising a box having plungers mounted in its ends for operative movement toward each other, a cable-operating drum mounted upon the box midway of its length and provided with three double-cone-shaped oppositely-grooved winding-spools, pulleys at each end of the box, plunger-operating cables secured to the intermediate portions of the two end spools and having their ends taken around corresponding pulleys and then crossed and attached to the plungers for moving the latter in one direction, pulleys mounted in the end of the box intermediate of its width, and a divided plunger-returning cable having two of its ends secured to the extremities of the intermediate spool and its other two ends passed around the last-named pulleys and attached to the plungers without crossing, to move the plungers in the opposite direction, substantially as and for the purpose specified.

703,689. TYPE-WRITER. WILLIAM H. YOUNG, Athens, Ga. Filed Sept. 20, 1899. Serial No. 732,245. (No model.)



Claim.—1. In a type-writer, the combination of a paper-holding mechanism, a type-bar having a plurality of arms, a type on the free end of each arm, a type-impressing mechanism comprising a movable indicator-plate having thereon in different positions indicating characters corresponding with the type, and a finger-guide connected with the type-bar and situated over or along said plate, substantially as set forth.

2. In a type-actuating mechanism for type-writers, a type-bar having a plurality of arms, types on the free ends of the arms, a movable plate or keyboard having characters corresponding with the type of said bar, means carried by said plate for actuating the type individually, and means for shifting the type-bar, substantially as set forth.

3. In a type-actuating mechanism for type-writers, the combination of a sliding type-bar having a series of individually-movable type-arms, a type on the free end of each arm, means for shifting said bar, and devices for individually impressing the type, substantially as set forth.

4. The combination of a movable type-bar having a series of individually-movable type, arms extending therefrom, a type on the free end of each arm, devices for individually impressing the type, and a guide connected with said bar to shift the same and adapted to guide the finger in directions across the lines of movement of said guide, substantially as set forth.

5. The combination with paper holding and shifting devices, of a keyboard consisting of two independently-movable plates, each provided with indicating characters, two movable bars provided respectively with individually-movable projecting arms carrying on their free ends type corresponding with said characters, finger-guides attached to the type-bars and each extending over or along the plate corresponding with its type-bar, type-impressing devices actuated by said plates, and an inking device, substantially as set forth.

6. A type-bar for type-writers of thin sheet metal, having one edge bent toward the body of the bar to form a longitudinal sliding bearing-sleeve and partially divided to form partially-separated resilient arms, and a series of type fixed on said arms.

7. In a type-writer, the combination with a bed-plate or frame adapted to be held on any suitable support, type-actuating means and printing devices, of a paper-holding cylinder or roller situated at the front end of said frame between the operator and the type-actuating means, forward of the front edge of the bed-plate and adapted to hold the paper suspended in front of said support, substantially as set forth.

8. In a type-writer, the combination with a bed-plate or frame, and printing devices comprising a type-operating indicating-plate or keyboard at the upper rear part of said frame, of a paper-holding cylinder or roller mounted at the front of said frame forward of the front edge of the indicating-plate or keyboard, whereby the paper is situated below the wrists of the operator and the space above the keyboard left free for copy, substantially as set forth.

9. In a type-writer, the combination with paper holding and shifting devices and movable type-bars, of a keyboard comprising a movable plate having depressions therein for the finger of the operator, said depressions having indicating characters corresponding with the type, a finger-guide connecting with the type-bar and extending along or over said plate for the space occupied by said depressions and arms attached to the plate to contact the type, substantially as set forth.

10. In a type-writer, the combination of paper holding and shifting mechanism, printing devices, a bed-plate or frame therefor, means on the under side of said frame for supporting the machine in the hand, and a connection extending from said shifting mechanism to the under side of said frame for effecting the spacing operation by the supporting-hand, substantially as set forth.

11. In a type-writer, the combination of paper holding and shifting mechanism, printing devices comprising two movable indicator-plates, type-bars corresponding each with one of said plates, means for actuating said bars, means carried by the indicator-plates to impress the type and a spacing device or bar situated between said plates and connected with said shifting mechanism, substantially as set forth.

12. In a type-writer, the combination of paper holding and shifting mechanism, printing devices comprising two indicator-plates, type-bars corresponding with each of said plates, means for actuating said bars, means carried by the indicator-plates to impress the type, a spacing device or bar situated between said plates and extending in directions toward and from the operator, and adapted to be operated by the thumbs while the hands are respectively over said plates, and connections between the spacing-bar and said shifting mechanism, substantially as set forth.

13. In a type-writer, the combination with printing devices, of a paper-holding roller, carried by the same, and means for moving said roller, extending within reach of the knee of the operator, comprising rods secured to the carriage and united at their lower ends, a lever having a depending arm and an arm at right angles thereto fulcrumed at the union of said bars, a stop to limit the movement of the lever, and a rod having a pawl to engage the ratchet on the roller substantially as set forth.

14. In a type-writer the combination with paper-carrying means, of two supporting-bars, two type-bars slidingly disposed on said bars and arranged at opposite sides of the line of impression, arms on said bars provided with type for carrying the latter to said line of impression, means for actuating said arms individually, and actuating devices for sliding said type-bars bodily to bring the desired type into operative position.

15. The combination, with paper-carrying means, of two sliding type-bars arranged at opposite sides of the line of impression, spring-arms on said bars provided with type, supports on which said bars reciprocate, means for actuating the arms individually, and actuating devices for moving the bars bodily.

16. In a type-writer, the combination of a movable set of type supported to slide transversely of the machine, and pivoted, and oscillatory for the purpose of impression, means for turning said set of type on its

pivot and shifting said set of type, impression devices for actuating said type individually, an inking device extending across the machine parallel with the path of said set of type and having an opening at the printing-center, and means for supporting the inking device at its ends at the sides of the machine.

17. In a type-writer, the combination of a paper holding and shifting mechanism, a movable set of type, a guide for the same, a movable indicating-plate having characters corresponding with the type, adapted to be operated by the finger and having means for impressing the type individually, and a type-shifting device extending along said plate and adapted to be engaged laterally by the finger of the operator.

18. A type-bar-shifting device consisting of the combination, with a type-bar, of a movable indicator-plate, having characters corresponding with the type, and adapted to be operated by the finger, and a bar or arm for actuating the type-bar, extending along said plate and having a space or aperture for the passage of the finger of the operator.

19. In a type-writer, the combination of a paper-holding mechanism, a type-bar having a plurality of type, a type-impressing mechanism comprising a movable indicator-plate having thereon indicating characters corresponding with the type, and a shifting means for said bar situated along said plate and having an aperture for the finger of the operator.

20. The combination of a shifting type-bar, a movable indicator-plate adapted to be operated by the finger, and having indicating characters corresponding with the type of said bar, and a type-bar shifter adapted to be engaged laterally by said finger.

21. The combination of a rectilinearly-moving type-bar, a movable indicating-plate adapted to be operated by the finger and having characters corresponding with the type of said bar, and a type-bar shifter adapted to be engaged laterally by the finger and situated along said plate.

22. In a type-writer, an impression mechanism, consisting of the combination of a rectilinearly-sliding type-bar, an indicating-plate having means for impressing the type of said bar, and having a number of type-indicating marks at different distances from the path of said bar, and an actuating-arm connected with the bar, extending over said plate and having an elongated opening for the passage of the operator's finger.

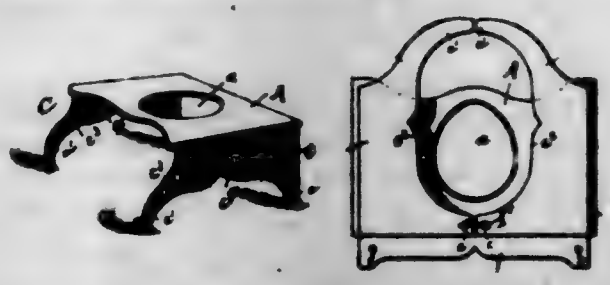
23. In a type-writer, the combination of a movable type-bar, a movable indicating-plate situated at the rear of the machine and having a type-impressing arm stiffly connected with the plate and extending forward to said bar, a paper-holding means at the front of the machine in line with the type of said bar, and means for shifting the bar, consisting of a finger-arm connected with the bar and extending rearwardly over said plate.

24. A type-writing machine, adapted to rest at its rear upon a table with its front part overhanging the same and having a downward-extending shoulder for engaging the front edge of the table, and holding means for securing the machine in such position, the said machine having a paper-holding device on said overhanging part adapted to suspend the paper in front of such table.

25. A type-writing machine adapted to rest at its rear upon a table with its front portion overhanging the same, and having a downward-extending shoulder for engaging the front edge of the table and holding means for securing the machine in such position, said machine having a paper-holding roller mounted at the front part of the machine and adapted to suspend the paper on front of such table, and having a type-operating keyboard at the rear part of the machine which is over the table.

26. A type-writing machine adapted to rest at its rear part upon a table with its front portion overhanging the same, and having a paper-holding device on said overhanging part, below the bottom of the rear part of the machine and adapted to suspend the paper in front of such table.

708,690. COMMODE-STOOL. WILLIAM H. YOUNG, Athens, Ga. Filed Jan. 3, 1902. Serial No. 88,511. (No model.)



Claim.—1. In a child's commode-stool, the combination, of the seat-board A provided with the aperture *a*, the legs C hinged to the seat-board and adapted to fold under the same, and the rear board G hinged to the seat-board and folding outwardly, said parts being adapted to inclose the commode except at the front, and to fold together and form but two thicknesses of material, substantially as set forth.

2. In a child's commode-stool, the combination, of the seat-board A formed with the aperture *a*, the end legs C hinged to and terminating at the seat-board, and arranged to provide a relatively wide base of support and the rear board or bar G pivoted to and terminating at the seat-board and adapted to drop between and brace the side legs when the parts of the stool are in open position, the side legs and back bar being arranged to lie in the same planes when folded, and all of said parts being relatively arranged as described, whereby when folded they present but two thicknesses of material, substantially as set forth.

3. In a child's commode-stool, the combination of the seat-board A, with the aperture *a*, the end legs C hinged to the seat-board and adapted to fold under the same, and having the leg portions c^3 serving as a handle when the stool is folded, substantially as set forth.

4. In a child's commode-stool, the combination of the seat-board A provided with the aperture *a*, the end legs C hinged to the seat-board, and adapted to fold against the face of the seat, and shaped to have leg portions which when the parts are folded come into proximity to each other at their ends and provide a handle as at E remote from the edge of the seat-board, substantially as set forth.

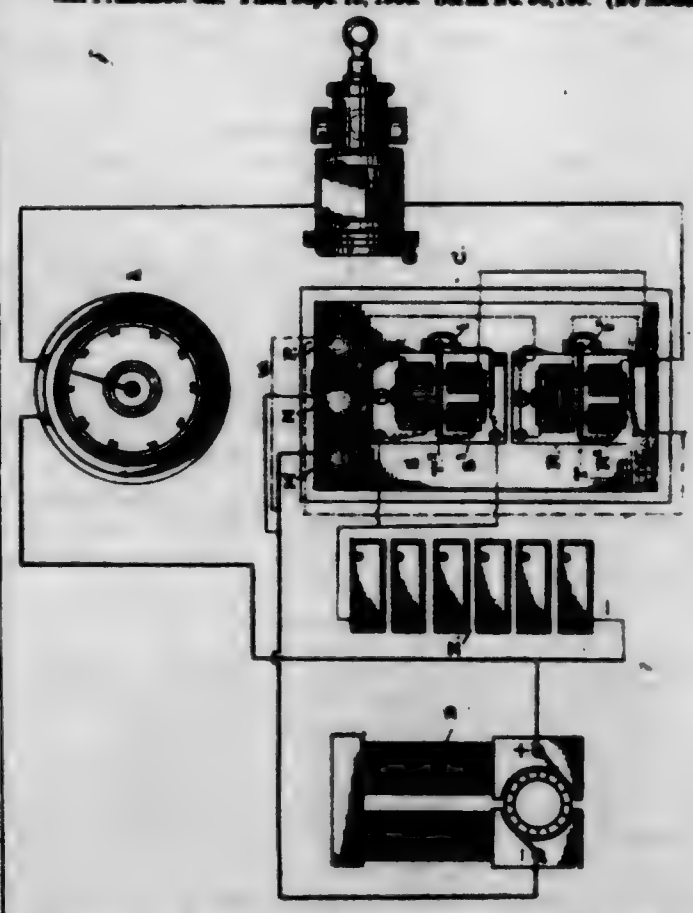
5. In a child's commode-stool, the combination of the seat-board A provided with the aperture *a*, the end legs C hinged to and terminating at the seat-board and to fold against the face thereof, said legs being shaped substantially as set forth, and arranged to have their ends approach each other when folded to provide a handle remote from the seat-board, and a back board G hinged to the seat-board, and arranged to drop between the legs C, when the latter are opened and to lie in the planes of the seat-board or the legs when the latter are folded, substantially as described.

6. In a commode-stool, the combination with the seat and the legs, of the folding back having the uprights hinged to the stool, and arranged to bear inwardly against stops, and the cross connecting device for the uprights as at J′ detachable from one or both thereof, substantially as set forth.

7. In a commode-stool, the combination, with the legs the seat having stops as at j^7, and the hinged back piece, of the uprights J, J pivoted to the hinged back piece and adapted to swing upward and abut against said stop, and means for connecting together the uprights when in their opened positions, substantially as set forth.

8. In a child's nursery-stool, the combination of the seat-board having a relatively small aperture *a*, the side bars c^2 hinged directly to the said seat-board and adapted to fold against the same to form a seat of two thicknesses of material, and front and rear legs carried by said side bars and arranged out of line with the aperture *a* when the parts are folded.

708,691. ELECTRIC-LOG REGISTER. WILLIAM R. ARMSTRONG, San Francisco, Cal. Filed Sept. 15, 1900. Serial No. 30,188. (No model.)



Claim.—1. In an electrical log, a source of electrical energy, two circuits, a register and a log therein, an indicator in each circuit, means

for passing a current through either of said circuits, and means for operating the indicator intermittently through said circuit.

2. In an electrical log, a source of electrical energy, two circuits, a register and a log therein, an indicator in each circuit, electrically-operated means for rendering either of said circuits operative by closing the same, the log being provided with means for intermittently opening and closing the operative circuit.

3. In an electrical log, a source of electrical energy, two circuits, a register, a log, and two sets of electromagnets therein, an armature between the sets of magnets, one of the circuits being provided with a contact in position to be engaged by said armature, whereby said circuit is closed when the other circuit is opened, and an indicator in each of said circuits.

4. In an electrical log, a primary source of electrical energy and a secondary source connected therewith, two circuits from said sources of electrical energy containing a log and a register, and means for automatically passing a current of electricity from either source through either of said circuits.

5. In an electrical log, a primary source of electrical energy and a secondary source connected therewith, electrical circuits connected with said sources, one of which is provided with an indicator and the other with a log and a register, and means for automatically passing a current from either source through the second-mentioned circuit.

6. In an electrical log, a primary source of electrical energy and a secondary source connected therewith, electrical circuits connected with said sources, one of which is provided with an indicator and the other with a log and a register, and electrically-controlled means for automatically passing a current from either source through said second-mentioned circuit.

7. In an electrical log, a primary source of electrical energy, and a secondary source connected therewith, electrical circuits connected with said sources of energy, one of which is provided with an electromagnet and the other is normally open and provided with a log, a register and a contact in position to be engaged by the armature of the magnet, whereby the second circuit may be closed when the first-mentioned circuit is opened.

8. In an electrical log, a primary source of electrical energy and a secondary source connected therewith, circuits connected with said sources of energy, the circuit connected with the primary source being provided with a log, a register, an indicator, a shunt-circuit and two electromagnets, the shunt being provided with an indicator and including an armature located between the magnets; one of the circuits from the secondary source of energy being provided with an indicator and an electromagnet, and the other circuit therefrom being normally open and including the armature of the last-mentioned electromagnet.

708,692. MANUFACTURE OF CARBONS FOR ARC-LAMPS.

CONRAD R. BOEHM, Charlottenburg, near Berlin, Germany. Filed Apr. 12, 1902. Serial No. 102,589. (No specimens.)

Claim.—1. Process for manufacturing carbons for arc-lamps which consists in incorporating into the carbon besides other metallic salts an addition of magnesium fluorid not less in proportion to said salts than is defined by equal or equivalent molecular weights.

2. Process for manufacturing carbons for arc-lamps which consists in incorporating into the carbon besides other metallic salts an addition of magnesium fluorid equal or equivalent to the proportion defined by the molecular weights.

3. As an article of manufacture a carbon for arc-lamps composed of carbon containing a mixture of magnesium fluorid with other metallic salts in which the proportion of the magnesium fluorid, to the other salts is not less than that defined by their respective molecular weights.

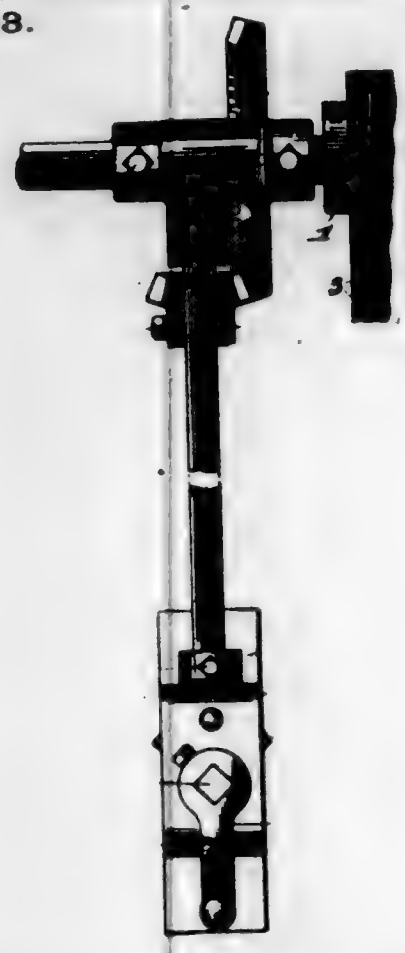
4. As an article of manufacture a carbon for arc-lamps composed of carbon containing a mixture of magnesium fluorid with other metallic salts in which the proportion of the magnesium fluorid to the other salts is defined by their respective molecular weights.

708,698. MEANS FOR OPERATING AWNINGS.

WESLEY S. BOWER, St. Louis, Mo. Filed Jan. 20, 1902. Serial No. 90,439. (No model.)

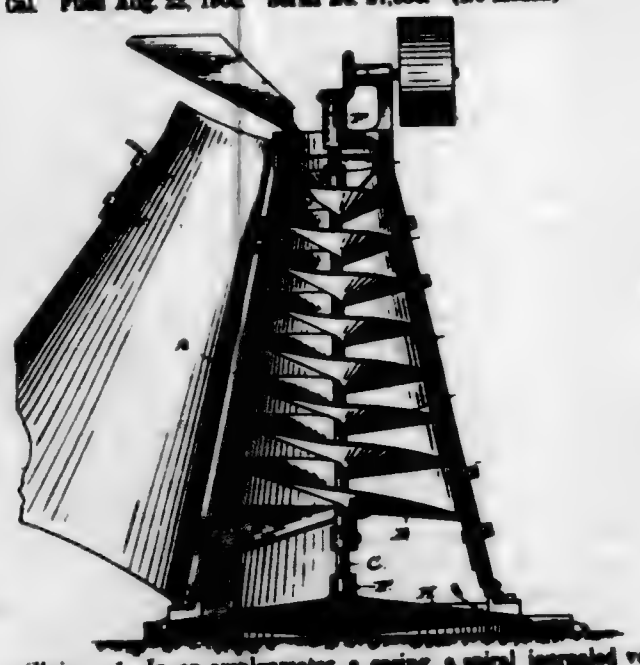
Claim.—In a device of the class described, the combination of a roller, a shaft on which said roller is mounted, a bevel-gear fixed to said shaft, a vertical shaft, means for rotating said vertical shaft, a bevel-pinion adjustably fixed to said vertical shaft and arranged for engagement with said bevel-gear, a swing-casket loosely mounted on said roller-shaft and in which the upper end of said vertical shaft is loosely seated to rotate freely therein, and a collar secured to said roller-shaft to hold said casket from endwise movement, substantially as described.

708,693.



708,694. AMALGAMATOR.

JAMES V. COLEMAN, San Francisco, Cal. Filed Aug. 22, 1901. Serial No. 72,654. (No model.)



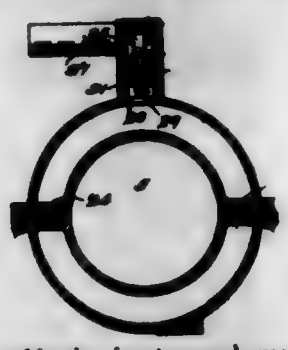
Claim.—1. In an amalgamator, a casing, a spiral journaled vertically therein, the upper surface of which is formed into an amalgamating-surface, each portion of the periphery of the spiral being located interiorly of a vertical plane through the corresponding portion of the spiral below it said spiral having an unobstructed outer edge, and means for rotating the spiral.

2. In an amalgamator, a conical casing, a conical spiral journaled vertically therein, the inner surface of the casing and the upper surface of the spiral being formed with amalgamating-surfaces, each portion of the periphery of the spiral being located interiorly of a vertical plane through the corresponding portion of the spiral below it and exteriorly of a vertical plane through the portion of the casing above it, said spiral having an unobstructed outer edge, and means for rotating the spiral upward toward the smaller end of the casing.

3. In an amalgamator, a conical casing, a conical spiral journaled vertically therein with its periphery in close proximity to the casing, the inner surface of the casing and the upper surface of the spiral being formed into amalgamating-surfaces, the upper surface of each portion of the spiral being inclined or substantially dish-shaped from its axis to its periphery, said spiral having an unobstructed outer edge and means for rotating the spiral upward, or, toward the smaller end of the casing.

4. In an amalgamator, a base provided with a standing rim, a conical casing therein, the lower edge of which is within the rim, a shaft journaled in the base and concentrically within the casing, a conical spiral around the shaft, having an unobstructed outer edge adjacent to the casing the upper surface of the spiral and the interior surface of the casing being formed into amalgamating-surfaces, and means for rotating the spiral toward the top of the casing.

708,695. GAS-ENGINE. EVERETT B. CUSHMAN and LESLIE S. CUSHMAN, Lincoln, Nebr. Filed Oct. 26, 1901. Serial No. 79,971. (No model.)



Claim.—1. The combination, in a two-cycle gas-engine, of a ported cylinder having outwardly-extending flanges at points above and below the cylinder-ports, a removable ring carried by said flanges, partitions dividing the space between the flanges and ring into a plurality of chambers, and gas inlet and escape ports for said chambers, substantially as specified.

2. The combination, in a two-cycle gas-engine, of a cylinder having ports and provided with upper and lower flanges, a ring adapted to said flanges, radial ribs formed on the cylinder between said flanges and serving to divide the annular space within the ring into a plurality of chambers, and gas inlet and escape ports for said chambers, substantially as described.

3. The combination, in a two-cycle gas-engine, of a cylinder having ports, upper and lower ribs formed on the cylinder and having peripheral rabbets, a two-part ring mounted in said rabbets, ribs for dividing the space within the ring and flanges into a plurality of chambers, and gas inlet and escape ports for said chambers, substantially as specified.

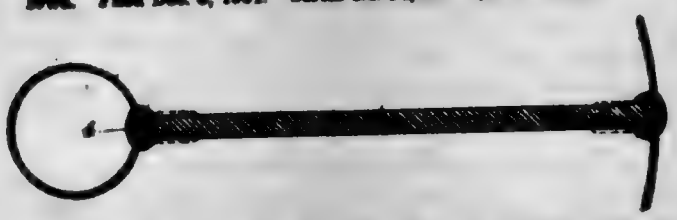
4. The combination, in a two-cycle gas-engine, of a ported cylinder, a crank-casing, annular flanges formed on the periphery of said cylinder at points above and below the cylinder-ports, one of said flanges being provided with an opening or port for communication with a gas-passage leading between the crank-casing and the cylinder-ports, a sectional ring mounted on said flanges, and gas entrance and escape ports formed in said ring, substantially as specified.

5. The combination in a gas-engine of a cylinder, a crank-casing forming a compression-chamber for the explosive mixture, annular flanges formed on the periphery of the cylinder, a ring mounted on said flanges, ribs for dividing the space within the flanges and ring into a plurality of chambers, piston-controlled ports extending between such chambers and the cylinder, an auxiliary port formed in the wall of the cylinder and leading between the crank-casing and one of said chambers, and a valved supply-port in communication with the chamber to which said auxiliary port is connected.

708,696. PROCESS OF UTILIZING CARBONIFEROUS COLLIERY WASTE. CLEMENS DÖRR, Cologne, Germany. Filed Aug. 26, 1900. Serial No. 28,018. (No specimens.)

Claim.—The method of utilizing carboniferous colliery waste consisting in finely granulating such material, and adding thereto coal-slime, coal-dust, small coke and the like, as herein set forth.

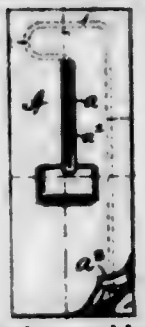
708,697. METAL WHEEL. BERT. REIFELDT, Davenport, Iowa, assignor to the Bettendorf Metal Wheel Company, a Corporation of Iowa. Filed Dec. 3, 1901. Serial No. 84,548. (No model.)



Claim.—1. In a metal wheel a spoke having at a point between the hub and rim, a shoulder in forcible engagement with the adjacent member of the wheel, which shoulder consists of a piled-up accumulation of the outer material only of the spoke.

2. In a metal wheel the combination with the rim and hub, of a spoke having its ends provided with heads at the outer side of the rim and inner side of the hub respectively, and having at the outer side of the hub a shoulder in forcible engagement with the hub, which shoulder consists of a piled-up accumulation of the outer material only of the spoke, and a shoulder on the spoke at the inner side of the rim.

708,698. TAG. CHARLES E. FAIRCHILD, New York, N. Y. Filed Sept. 16, 1901. Serial No. 75,468. (No model.)



Claim.—1. A tag or check comprising separate layers of suitable material secured together, a slot in said tag, a wire inserted between the layers of said tag, said wire comprising a section which extends longitudinally of said tag and a needle formed continuous with each other, said needle extending longitudinally of the slot formed in said tag, the point of said needle being normally disposed inside of the lateral surfaces of said tag or check, substantially as described.

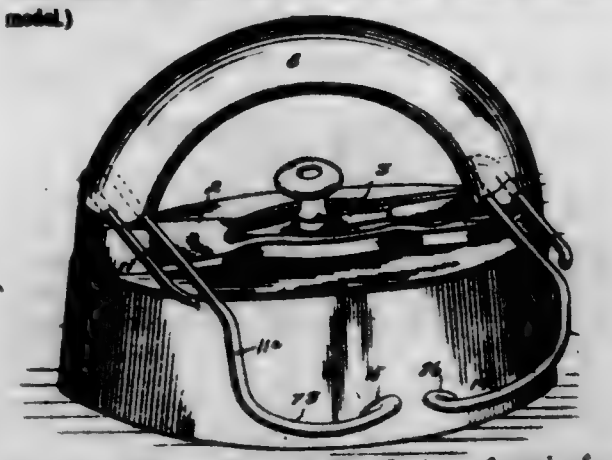
2. A tag or check comprising separate layers of suitable material secured together, a slot in said tag, a wire inserted between the layers of said tag, said wire comprising a section which extends longitudinally of said tag, a section which extends transversely of said tag and a needle all continuous with each other, said needle extending longitudinally of the slot formed in said tag, the point of said needle being disposed inside of the lateral surfaces of said tag or check, substantially as described.

3. A tag or check comprising separate layers of suitable material secured together, a slot in said tag, a wire inserted between the layers of said tag, said wire comprising a section which extends longitudinally practically the entire length of said tag or check, a section which extends transversely of said tag and a needle all continuous with each other, said needle extending longitudinally of the slot formed in said tag, the point of said needle being disposed normally inside of the lateral surfaces of said tag or check, substantially as described.

4. A tag or check comprising separate layers of suitable material secured together, a slot in said tag, a wire inserted between the layers of said tag, said wire comprising a section which extends longitudinally of said tag or check and a needle formed continuous with each other, said needle extending longitudinally of the slot in said tag and being disposed inside of the lateral surfaces of said tag or check, and said tag or check being relatively thick adjacent to the point of said needle, substantially as described.

5. A tag or check comprising separate layers secured together, a slot in said tag, a wire inserted between the layers forming said tag, said wire comprising a section which extends longitudinally of said tag and a needle formed continuous with each other, said needle extending longitudinally of the slot formed in said tag or check and pieces of relatively strong, tough fabric, as muslin or cheese-cloth, secured between the layers of the tag or check on opposite sides of the wire, substantially as described.

708,699. FLAT-IRON HANDLE ATTACHMENT. HARRY GREENWOOD, Barnesboro, Pa. Filed June 13, 1901. Serial No. 64,443. (No model.)



Claim.—1. The combination with a flat-iron, of a pair of supporters therefor independently adjustable in relation thereto, each supporter

having an upper elongated looped extremity, the members of said extremities being parallel and forming two opposite independent bearing portions adapted to be adjustably inserted between the handle ends and the body of said iron for preventing rotative movement of the supporters, one member of the looped extremity being continued into an outwardly-projecting straight extension merging into an angularly-bent portion which lies normally parallel with the side of the iron, said bent portion being continued into an inwardly-curved extension in the same plane as the bent portion for providing an extended rest for the iron.

2. The combination of a flat-iron having elevated portions at opposite extremities for attachment of a handle, a handle having a pair of transverse grooves in each end which are closed when the handle ends are secured to said elevated portions, and a pair of supports having elongated loops engaging said grooves, the members of said loops being parallel and forming opposite bearing portions for preventing rotation thereof, one member of each loop being projected in the form of a straight extension having an angularly-bent outer end extending normally parallel with the side of the iron, said extension having inwardly-curved extremities.

3. Means for supporting a flat-iron comprising two members, each member being independently adjustable in relation to the iron and provided with an upper elongated looped extremity forming two opposite independent bearing portions adapted to be inserted between the handle ends and body of an iron, each member having an outwardly-projecting straight extension merging into an angularly-bent portion which normally lies parallel with the side of the iron, said bent portion having an inwardly-curved extension in the same plane as the bent portion and forming an extended rest for the iron.

708,700. TROLLEY-WHEEL. WILLIAM F. HALL, Boston, Mass.
Filed Apr. 26, 1902. Serial No. 105,205. (No model.)

Claim.—1. In a separable trolley-wheel, the combination with the central portion and the disks arranged on opposite sides of the same, of a central sleeve or hub having at its end an annular groove, and a fastening device consisting of a divided ring or key inserted within said annular groove and bearing against the outer face of the adjacent side disk.

2. A separable trolley-wheel comprising a central portion, disks arranged on opposite sides of the same, a central longitudinally-split sleeve or hub inserted within the bore of the wheel and provided at its opposite ends outside said disks with annular grooves, a bushing inserted within said split hub and adapted to spread and force the same against the walls of the bore or central opening of the wheel within which it is placed, and divided rings or keys fitting within said annular grooves and overlapping and bearing against the outer faces of the adjacent side disks to clamp the same against the central portion and hold together the several parts of the wheel.

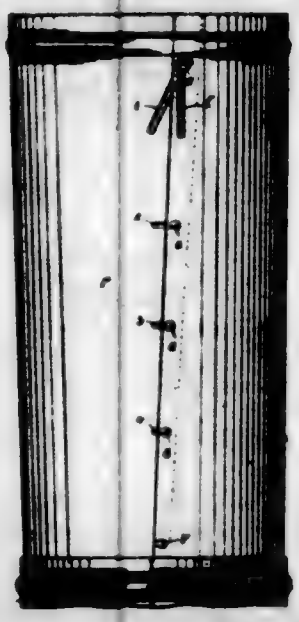
3. In a trolley-wheel, the combination with the central portion and removable disks or flanges arranged upon opposite sides of the same, said central portion and disks having their central openings each provided with an inwardly-projecting lug, of a central sleeve or hub split longitudinally and having a narrow opening between its opposite edges for the reception of said lugs and an annular groove at each end, a central bushing inserted within said split hub and adapted to spread and force the same against the walls of the bore or central opening of the wheel, and divided rings or keys fitting within the annular end grooves of the hub and bearing against the adjacent outer faces of the side disks or flanges to clamp the same against the central portion and hold together the several parts of the wheel.

708,701. TROLLEY-WHEEL. WILLIAM F. HALL, Boston, Mass.
Filed Apr. 26, 1902. Serial No. 105,205. (No model.)

Claim.—1. In a separable trolley-wheel, the combination with the central portion and side disks arranged upon opposite sides of the same, of a sectional hub composed of a series of concavo-convex keys provided at their opposite ends with outwardly-extending flanges adapted to overlap and bear against the side disks to hold the latter in place against the central portion, and a central sleeve or bushing driven into said sectional hub to hold its members in place within the central bore of the wheel.

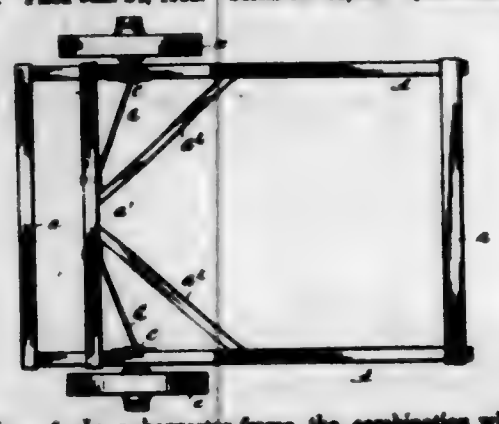
2. A separable trolley-wheel comprising a central portion, side disks or flanges arranged on opposite sides of the same, said central portion and disks having their central openings provided with inwardly-projecting lugs, a sectional hub composed of a series of concavo-convex keys lying in the grooves or spaces between said lugs, said keys being provided at their opposite ends with outwardly-projecting flanges adapted to overlap and bear against the side disks to hold the latter in place against the central portion, and a central sleeve or bushing driven into said sectional hub and acting to hold its members in place within the central bore of the wheel.

708,702. STOVEPIPE. CHARLES C. HALSTEAD, Blodgett, Mo.
Filed Feb. 17, 1902. Serial No. 94,809. (No model.)



Claim.—A stovepipe comprising a section having overlapping edges, the inner edge having at one end an inclined slot located adjacent thereto, and the outer edge having a slot parallel therewith, a sliding bolt operating in said slots, a series of rivets carried by the outer lap of the pipe, the inner lap having disposed a series of transverse closed slots of progressively-diminishing dimensions for the reception of the rivets, the inner ends of said transverse slots and the adjacent end of the inclined slot being disposed in a line substantially parallel to the edge of the inner lap, and a fixed rivet securing the overlapping edges at the opposite end, substantially as set forth.

708,703. HARVESTER-FRAME. CHARLES S. HEDGE, Chinook, Mont. Filed Jan. 24, 1902. Serial No. 91,052. (No model.)



Claim.—1. In a harvester-frame, the combination with the side pieces, of hangers pivoted thereto, lugs on said hangers, plates against which said lugs abut, brace-rods extending from the lower ends of the hangers to a cross-piece of the harvester-frame, and stub-axles projecting from said hangers, substantially as shown and described.

2. In a harvester-frame, the combination with the side pieces, of castings *b b* secured thereto, a plate *b'* located between said castings, hangers having bifurcated ends by which they are pivotally connected to the castings, lugs on said hangers adapted to abut against the plate, brace-rods extending from the lower ends of the hangers to the harvester-frame, and stub axles or spindles projecting outwardly from the lower part of the hangers, substantially as shown and described.

708,704. WALL-NAIL. ADAM HOFMANN, Munich, Germany, assignor to Ignaz Friedinger, Obertinal, near Linz, Austria-Hungary
Filed Mar. 14, 1902. Serial No. 98,088. (No model.)

Claim.—A wall nail, peg or pin consisting of a plurality of sections, each having a reduced screw-threaded spindle at one end, one of said

sections having its other end pointed, the other section having an internally-threaded sleeve at the end opposite its spindle and arranged to engage the screw-threaded spindle of the pointed section, in combination with a threaded button arranged to engage the spindle of either section.

708,705. SUMMER-HOUSE. Geneve R. Learwood, St. Louis, Mo. Filed Nov. 8, 1901. Serial No. 81,543. (No model.)

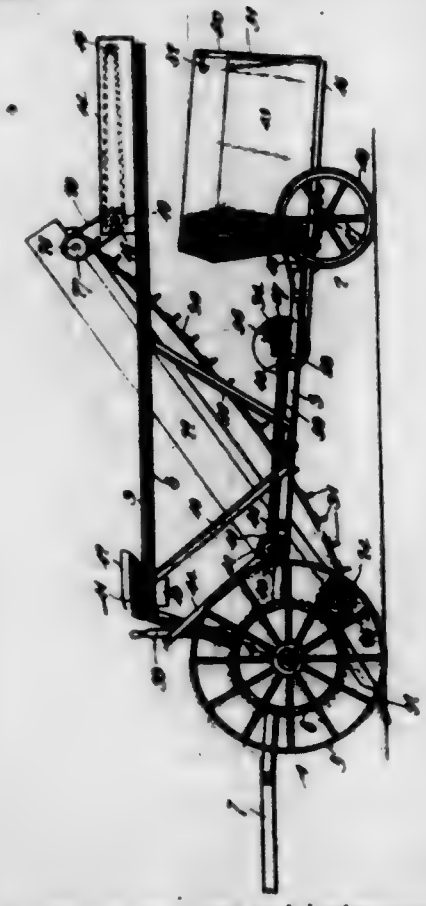
Claim.—The combination with an unwalled summer-house having a platform and roof, of inner and outer circular tracks, on said platform, and a pair of guards adapted to travel horizontally and separately on said tracks to partially close the structure, substantially as described.

708,706. CRUDE-OIL BURNER. JOHN A. HEYER, San Francisco, Cal. Filed Nov. 28, 1901. Serial No. 83,468. (No model.)

Claim.—An oil-burner comprising the following parts, to wit: a barrel terminating in a discharge-tip, a pipe having numerous perforations and of appreciably smaller size than said barrel and located therein, perforated collars located at intervals on the perforated pipe and extending between the pipe and the barrel, means for supplying oil to the interior of the barrel and around the perforated pipe, and means for supplying steam to the interior of said perforated pipe.

708,707. POTATO-DIGGER. JOHN MORAN, Bradley, Ill. Filed July 5, 1901. Serial No. 67,192. (No model.)

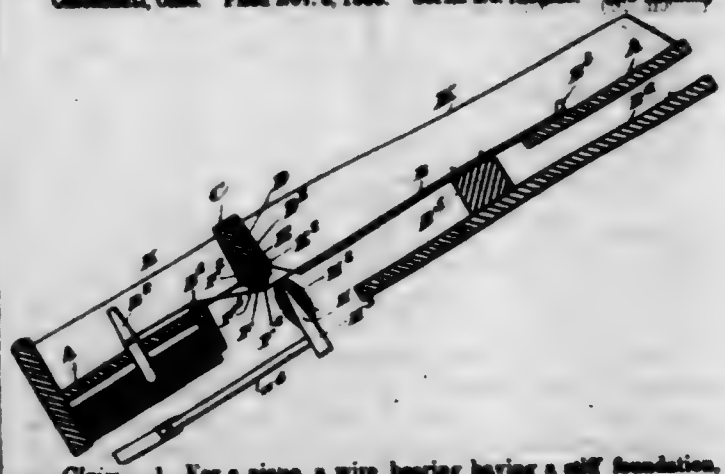
Claim.—1. In a potato-harvester, a front truck having an axle and supporting-wheels thereon, a frame 3 on the axle and extending rearwardly therefrom, an upper rearwardly-extending frame 8, having the front portions of its side bars downturned and secured to the frame 3, braces connecting said frames together, and an elevator carried by said frames, in combination with a rear truck coupled to the frame 3, substantially as described.



2. In a potato-harvester, a front truck having rearwardly-extending frames 3, 8, the latter above the former, said frame 8 carrying the upper portion of an elevator and also carrying a separater, the latter being disposed in rear of the elevator, in combination with a rear truck to which the frame 3 is coupled, said rear truck carrying a receptacle for the potatoes, substantially as described.

3. In a potato-harvester a front truck having rearwardly-extending frames 3, 8, the latter above and extending in rear of the former, said frames carrying an elevator, in combination with a rear truck having an axle, supporting-wheels thereon, a frame extending in front of the axle, under the rear end of the frame, 3, and being overlapped thereby, and coupled thereto and a counterbalancing potato-receptacle carried by said rear truck and extending rearwardly from the axle thereof, substantially as described.

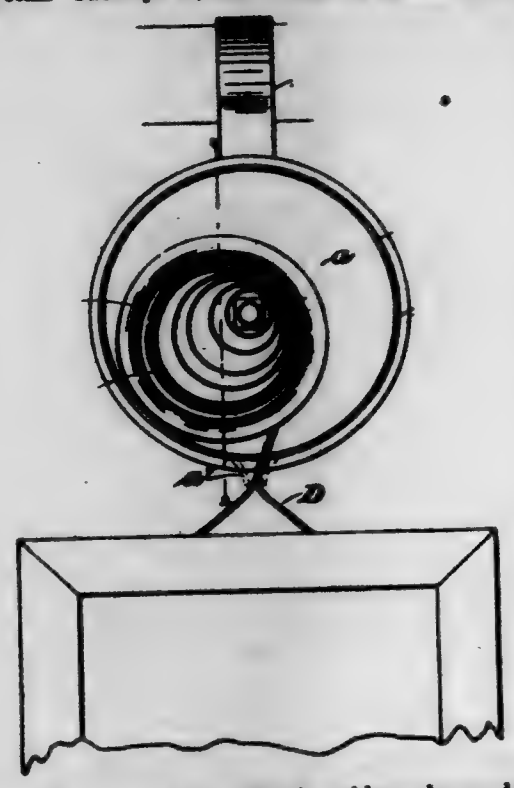
708,708. BEARING FOR PIANO-STRINGS. HERMAN MCCLELLAN, Cincinnati, Ohio. Filed Nov. 6, 1900. Serial No. 735,588. (No model.)



Claim.—1. For a piano, a wire bearing having a stiff foundation, provided with recess D^3, a bearing of material that does not yield or becomes grooved by the wires, and in so far as it vibrates, gives out a pure, soft tone, differentiated from the metallic ring of iron or steel, said wire bearing has a ridge F^1, and a rib or extension F^2, shoulders F^3, piece E adapted to resist the transmission of sound, and having recess E^2 into which the rib F^2 is received, and the said piece E being received into the recess D^3 of the foundation, substantially as and for the purposes specified.

2. For a piano, a wire bearing having an iron foundation provided with a recess D^3, a wooden bar E received therein and having a recess E^2, and an aluminium bearing, having a narrow bottom ridge F^1, and a rib F^2 received into the recess E^2, substantially as and for the purposes specified.

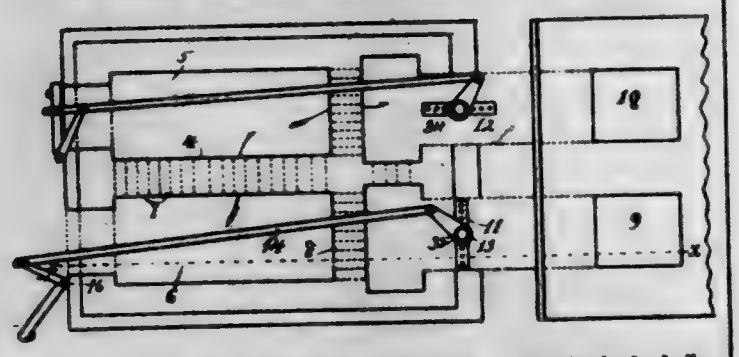
708,709. ADJUSTABLE HANGER. CLARENCE L. CLEMETSEN, New Haven, Conn. Filed Apr. 10, 1902. Serial No. 102,261. (Model.)



Claim.—1. In a casing the combination with a rod secured therein; of a flat coiled spring, one end of which is adapted to be rigidly attached to said rod; a loose drum, the periphery of which is adapted to bear on the inner side of said casing and be rigidly secured to the other end of said flat coiled spring; and a cord adapted to be wound on said drum, substantially as described.

2. In a casing having a removable cap, the combination with a rod, one end of which is rigidly secured to the back of said casing, and the other end passes through a perforation in the front of said casing; a nut screwed on said rod to hold the cap of said casing in position; a flat coiled spring, one end of which is rigidly attached to said rod; a loose channeled drum, the periphery of which is adapted to bear on the inner side of said casing and be rigidly secured to the other end of said flat coiled spring; a cord adapted to be wound on the channeled part of said drum; said casing having a perforation through which said cord passes, and a hanger secured to the outer side of said casing, substantially as described.

708,710. BOILER-FURNACE. HENRY R. SCOTT, Kansas City, Mo. Filed Apr. 16, 1901. Serial No. 56,142. (No model.)



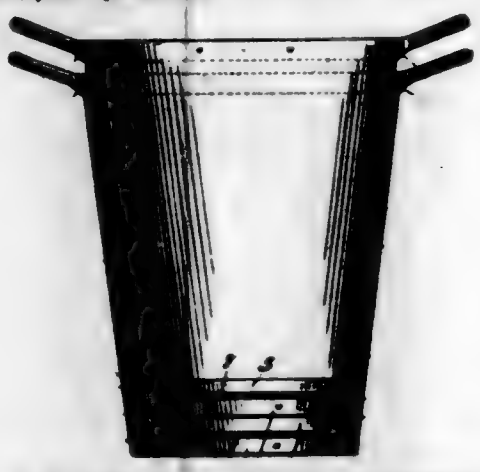
Claim.—1. The combination substantially as described of a boiler-furnace, an auxiliary furnace independent of said boiler-furnace and comprising a plurality of communicating compartments, independent combustion-passages between each of said compartments and the boiler-furnace, and draft-regulators arranged to control the draft through said passages.

2. The combination substantially as described of a boiler-furnace, an auxiliary furnace independent of said boiler-furnace and comprising a plurality of communicating compartments, independent combustion-passages between each of said compartments and the boiler-furnace, draft-regulators controlling the draft through said passages with the boiler-furnace, and means operated by the latch of the feed-doors for operating said draft-regulators.

3. In a furnace having draft-regulators, the combination with said regulators, of a fluid-pressure cylinder, a piston operating in said cylinder and having its piston-rod connected to the stem of said regulator, valves controlling the supply to and exhaust from said cylinder, cocks controlling the exhaust from said cylinder, a connecting-rod engaging and arranged to be operated by the latch of the feed-door and links directly connecting said rod with the valve-stems, whereby the valves are operated by lifting the latch of the feed-doors.

4. In a furnace having a draft-passage, a draft-regulator consisting of a casing forming a liquid-chamber, a tubular stem connected with said casing and communicating with said chamber, means for maintaining liquid circulation through said chamber, and means connected with said stem and arranged to be operated by the latch of the feed-doors for operating said draft-regulator.

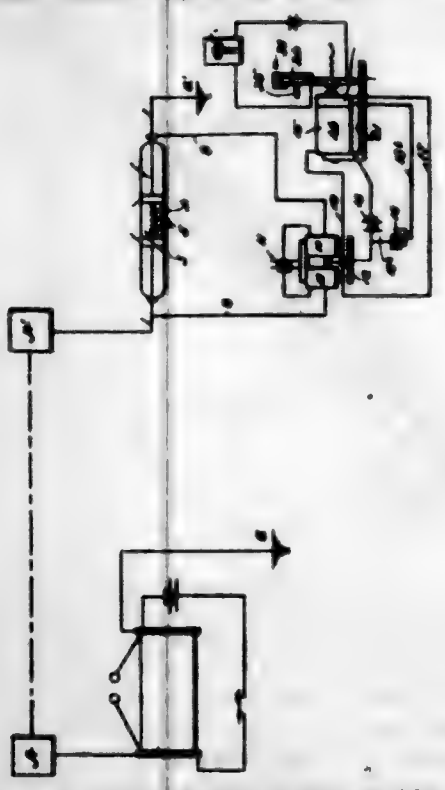
708,711. GARBAGE OR REFUSE CAN. ELIZABETH C. BRAHAM, New York, N. Y., assignor to the Iron Clad Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Jan. 22, 1901. Serial No. 44,233. (No model.)



Claim.—1. A nesting garbage or refuse can comprising a tapered body portion, a separate bottom portion reinforcing said body portion, and means secured within the body of the can at the bottom thereof, deriving part of its support from the bottom thereof and forming a supporting means in the inside of said can for permitting a series of cans of equal size to be loosely nested.

2. A nesting garbage or refuse can having a tapering body portion, a bottom reinforcing the body portion and a ring secured between the body portion and the bottom and serving as a step upon which another can of the same size and shape may rest whereby a series of such cans may be loosely nested.

708,712. WIRELESS TELEGRAPHY. HARRY SHOEMAKER, Philadelphia, Pa., assignor to Marie V. Gehring, Philadelphia, Pa. Filed Feb. 12, 1901. Serial No. 46,900. (No model.)

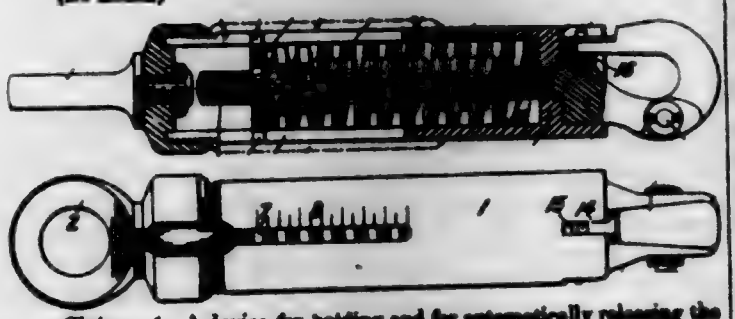


Claim.—1. A wireless-telegraph system comprising a transmitting apparatus and receiving apparatus; said receiving apparatus consisting of air and ground plates, a wave-responsive device connected therewith, a choking-relay in circuit with said wave-responsive device, another relay having two windings and circuit-controlled by said choking-relay, a condenser-circuit connected with one of the windings of said relay, a permanent magnet connected with the cores of said relay, an independent circuit operated by said relay and a sounder in said circuit.

2. A wireless-telegraph system comprising a transmitting-station and a receiving-station; said receiving-station consisting of a wave-responsive device and a choking-relay in circuit together; batteries, and a relay in circuit together adapted to be operated by the choking-relay, said last-mentioned relay consisting of two cores and their windings and a permanent magnet connected with said cores; a condenser-circuit connected with one of the windings of the relay; and a sounder-circuit operated by said last-mentioned relay.

3. In a receiver for electrical oscillations, the combination of a wave-responsive device, a choking-relay in circuit with said device, a relay having two cores and two separate windings controlled by said choking-relay, a holdover-circuit connected to one of the windings of the relay having a condenser therein to be charged so as to energize one of the relay's cores, and a recording instrument controlled by the energization of the relay's cores.

708,718. SAFETY RELEASING DEVICE FOR THE SHEETS OF BOATS, TOW-LINES, &c. CHARLES SMITH, South Croydon, and GEORGE J. HOUR, Romford, England. Filed Mar. 24, 1902. Serial No. 99,582. (No model.)



Claim.—1. A device for holding and for automatically releasing the sheets of boat-sails, tow-lines, and other connections, upon the application of a predetermined amount of force; consisting in the combination with a cylinder, having a diaphragm near one open end, and a loop near the other end by which it is fixed to any required part; of a plunger entering the cylinder, and passing through the diaphragm, a piston on the inner end of the plunger, springs acting between the diaphragm and the piston, a head to the plunger exterior of the diaphragm, a boat arm for receiving the connection to be automatically released, a pivot connecting one end of the arm to the plunger-head, the free end of the arm normally entering within the open end of the cylinder, and being there retained, until upon its withdrawal from the cylinder by the application of the predetermined force, it is permitted to open by turning about its pivot, substantially as described.

2. A device for holding, and for automatically releasing the sheets of boat-sails, tow-lines, and other connections, upon the application of a predetermined amount of force; consisting in the combination with a cylinder, means for connecting one end of the cylinder to a part by which it is to be held, and an interior diaphragm near the opposite end of the cylinder, the open end of the cylinder projecting beyond the said diaphragm; of a plunger passing through and guided by the diaphragm, a piston on the inner end of the plunger, helical springs located around the plunger between the piston and the diaphragm, means for adjusting the piston longitudinally upon the plunger for tensionally adjusting the springs, a boat attachment-arm pivoted to the outer end of the plunger for receiving the connection to be released, the free end of the said attachment-arm being normally located within the open end of the cylinder to prevent it releasing the connection by turning about its pivot upon the plunger end, until sufficient force is applied to pull out the plunger against the action of the aforesaid springs, and thereby withdraw the said free end of the attachment part from within the cylinder end, substantially as set forth.

3. In devices for holding, and for automatically releasing the sheets of boat-sails, tow-lines, and other connections, upon the application of a predetermined amount of force; the combination with a cylinder, means for connecting one end of the cylinder to a part by which it is to be held, an interior diaphragm near the opposite end of the cylinder, an open-ended portion of the cylinder projecting beyond the diaphragm, a longitudinal release-slot in the open end of the cylinder, and longitudinal guiding-slots near the opposite end of the cylinder, of a plunger entering the cylinder, and passing through the diaphragm and capable of longitudinal and rotary motion relatively to the cylinder, a screw-thread on the inner end of the plunger, a piston carried by the plunger, and engaging its screw-thread, means for preventing revolution of the piston, while permitting of its longitudinal motion within the cylinder, a helical spring located between the piston and the diaphragm of the cylinder, and tensionally adjustable by rotating the plunger, a head on the plunger exterior of the diaphragm, a pivot carried by the plunger-head, a boat attachment-arm hinging about the pivot, the free end of the said arm normally entering within the open end of the cylinder to prevent motion of the arm about its pivot, the free end of the said arm being capable of release, by revolving the plunger until the free end of the arm coincides with the release-slot of the cylinder, or automatically by the application of sufficient force to draw out the plunger and with it the end of the said boat arm clear of the end of the cylinder, substantially as set forth.

4. In devices for holding, and for automatically releasing the sheets of boat-sails, tow-lines, and other connections, upon the application of a predetermined amount of force; the combination of a cylinder, a loop on one end thereof for connection to a part by which the cylinder is to be held, a diaphragm within the opposite end of the cylinder, and an open-ended portion thereof projecting beyond the diaphragm, a plunger entering the cylinder, passing through the diaphragm, and adapted to be slid and revolved relatively to the cylinder, a piston adjustably connected to the plunger within the cylinder, a helical spring surrounding the plunger, and located between the piston and the diaphragm, a second helical spring of larger diameter than the first, surrounding the first spring, a head on the plunger exterior of the diaphragm, a pivot carried by the head, a boat attachment-arm movable about the pivot, the free end of the said arm normally entering within the projecting open end of the cylinder to prevent the motion of the arm about its pivot, until by the application of the predetermined force, the plunger is drawn out sufficiently to free the arm and release any connection held thereby, a stud on the free end of the arm, and a longitudinal slot in the end of the cylinder with which the stud engages to prevent accidental rotation of the plunger and arm relatively to the cylinder, and a spring on the plunger-head to hold the arm-stud in engagement with the slot, a release-slot in the wall of the cylinder at the open end thereof calculated to allow the exit thereby of the free end of the arm when the latter is released from its stud-carrying slot and is revolved to coincide with the release-slot, substantially as described.

5. In devices for holding, and for automatically releasing the sheets of boat-sails, tow-lines, and other connections, upon the application of a predetermined amount of force; the combination with a cylinder, a loop on the end thereof for attaching it to the part by which it is to be held, an interior diaphragm near the opposite end of the cylinder, the open end of the latter projecting beyond the diaphragm, a plunger passing into the cylinder through the diaphragm, a piston adjustably fixed to the plunger within the cylinder, helical springs located between the piston and the diaphragm, a head to the plunger, a pivot carried by the head, a hook-shaped arm carried by the pivot, the free end of the arm entering within the open end of the cylinder to normally prevent the arm turning about its pivot until sufficient force has been applied to the hook-shaped arm to draw its end, against the action of the springs, from out of the cylinder; of longitudinal slots in the cylinder, studs on the periphery of the piston entering the said slots, means for adjusting the piston longitudinally upon the plunger for tensioning the springs, and a graduated index upon the exterior of the cylinder, adjacent to one of the said slots for determining the degree of initial tension of the springs by the relative normal position of the piston-studs to the said index, substantially as described.

708,714. PAPER-MAKING MACHINE. CHARLES H. WARREN, Beloit, Wis. Filed June 22, 1901. Serial No. 66,570. (No model.)

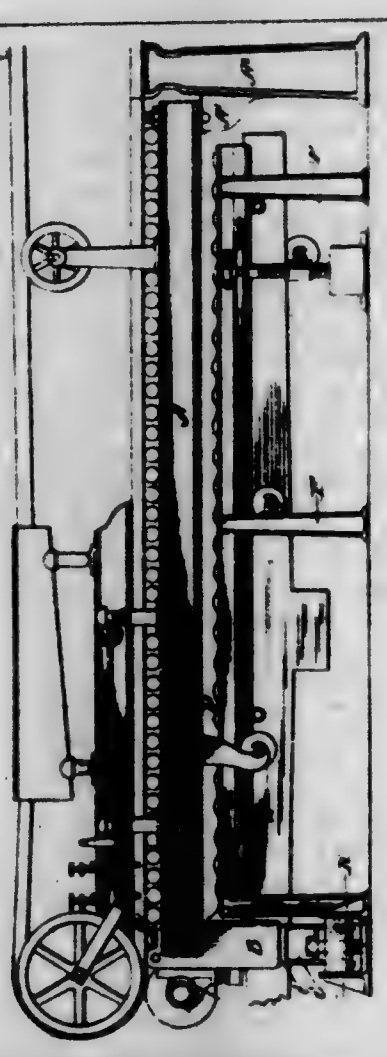
Claim.—1. In a machine of the class described, the combination with the table-rolls, of a pair of rails supporting them, means pivotally supporting said rails at one end, a breast-roll frame supporting said rails at the other end, said rails being without any intermediate support, save-alls arranged beneath the table-rolls, rails parallel with the rails aforesaid, supporting said save-alls, and posts supporting the rails last aforesaid, substantially as described.

2. In a machine of the class described, the combination of a shake-frame comprising a pair of rails and the vertically-adjustable breast-roll frame, said rails being supported at one end by said breast-roll frame, means pivotally supporting said rails at the other end, said rails being without any intermediate support, means for vertically adjusting the breast-roll frame, and table-rolls located above said rails and suitably supported thereby, substantially as described.

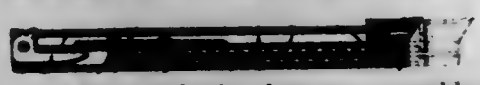
3. In a machine of the class described, the combination with the shake-frame, including the breast-roll frame, of a beam crossing the machine from side to side and arranged beneath the breast-roll frame, means interposed between said beam and breast-roll frame for supporting the latter and permitting the shake-frame to move from side to side, a pair of vertical screws, worm-wheels on said screws supporting the beam, worms meshing with said worm-wheels, and a shaft extending from side to side of the machine and carrying said worms, substantially as described.

4. In a machine of the class described, the combination with the shake-frame, of the beam J crossing the machine from side to side, means interposed between said beam and the shake-frame for supporting the latter and permitting it to move sidewise, a pair of vertical screws, worm-wheels on said screws, worms meshing with said worm-wheels, and a shaft carrying said worms, the beam having at its ends boxes in which the worm-wheels and worms are contained, substantially as described.

703,714.



708,715. SAFETY DEVICE FOR PIN-TONGUES. OTTO WESTPHAL, Jersey City, N. J., assignor of one-half to Emil Kohler, Newark, N. J. Filed Jan. 25, 1902. Serial No. 91,271. (No model.)



Claim.—1. A safety device for pin-tongues, comprising a tubular body having a perforated end, a bifurcated rest provided at said end, a rod housed in said tubular body and projecting from the perforated end thereof, a longitudinally-movable socket mounted on the projecting end of said rod, a spring engaging said rod, and a pin-tongue pivoted to said tubular body, substantially as set forth.

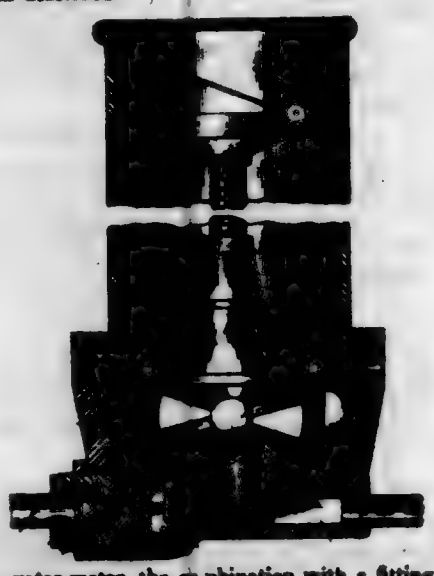
2. A safety device for pin-tongues, comprising a tubular body having a longitudinal slot at one end thereof, a pin-tongue pivoted to said end, a spring-actuated socket at the opposite end of said tubular body, a rod in said tubular body carrying said spring-actuated socket, a finger connected with said pin-tongue adjacent its pivotal point, and means at the inner end of said rod for engaging said finger, substantially as set forth.

3. A safety device for pin-tongues, comprising a tubular body having a longitudinal slot at one end thereof, a mounting pivoted to said slotted end, a pin-tongue secured in said mounting, a finger provided on said mounting and extending parallel to said pin-tongue, a rod housed in said tubular body, a spring-actuated socket mounted on the outer end of said rod, a stud secured to the inner end of said rod, and a plate mounted on said stud, substantially as set forth.

708,716. WATER-METER. HARRY F. BROWN, Chicago, Ill. Filed Nov. 11, 1901. Serial No. 81,572. (No model.)

Claim.—1. In a water-meter, the combination with a fitting having inlet and outlet ports said adapted to be permanently connected in the waterway, of a valve for controlling the inlet-port, a removable piston-casing, means for detachably connecting said piston-casing and fitting, and means interposed between the piston-casing and valve whereby when said piston-casing is being put in place its movement is transmitted to the valve and the valve thereby unseated, the piston-casing being provided with inlet and outlet ports, communicating with the inlet and outlet ports, respectively, of the fitting, substantially as described.

2. In a water-meter, the combination with a fitting adapted to be permanently connected in the waterway, said fitting having a seat for a piston-casing and having inlet and outlet ports one end of each of which terminates at said seat, of a removable piston-casing adapted to occupy said seat and having inlet and outlet ports communicating with the inlet and outlet ports, respectively, of the fitting, a valve for controlling the inlet-port of the fitting, and means interposed between said valve and the piston-casing whereby when the piston-casing is being put in place its movement is transmitted to the valve and the valve thereby unseated, substantially as described.

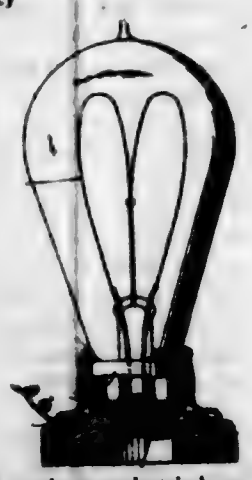


3. In a water-meter, the combination with a fitting adapted to be permanently connected in the waterway and having inlet and outlet ports, a removable piston-casing having inlet and outlet ports communicating with the inlet and outlet ports, respectively, of the fitting, a valve located in the waterway, on the street-main side of the meter, and adapted to control the inlet-port of the fitting, and means interposed between the valve and the piston-casing for transmitting movement from the piston-casing to the valve, substantially as described.

4. In a meter the combination with a base adapted to be permanently connected in the waterway and having a socket, of a piston-casing removably seated in said socket, a valve located in the waterway, on the street-main side of the meter, and adapted to seat with the water-pressure, a movable part contacting with the piston-casing, and means for transmitting the movement of said part to the valve, substantially as set forth.

5. In a water-meter, the combination of a base adapted to be permanently connected in the waterway, a piston-casing removably seated upon the base, a valve-casing located in the waterway, said base being provided with a socket in which said valve-casing fits, a valve, in said casing, adapted to seat with the water-pressure, a stem carrying the valve, and a lever, one arm of which engages the valve-stem and the other arm of which is engaged by the piston-casing, substantially as described.

708,717. INCANDESCENT ELECTRIC LAMP AND SOCKET. JESSE C. H. BROWN, Philadelphia, Pa. Filed Feb. 28, 1902. Serial No. 96,088. (No model.)

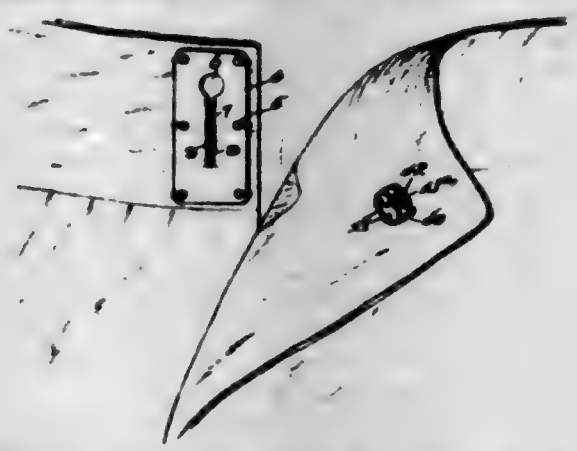


Claim.—1. An incandescent-electric-lamp socket, comprising a flat ring-shaped base of insulating material, a series of independent spring-fingers supported at their base upon and insulated from each other by the upper face of the insulating-base and projecting upward therefrom to form in series a tubular socket to receive the lamp-neck, a terminal for the current connected directly to one of said spring-fingers, a flat spring finger supported upon the face of the insulating-base and projecting inward parallel to said face and over the opening in said base, and a second terminal for the current connected directly with the flat spring-finger.

2. In an incandescent electric lamp and socket, a socket comprising a flat ring-shaped insulating-base, a series of independent spring-fingers supported upon and insulated from each other by said base and projecting upward therefrom to form in series a tubular socket, a terminal for the current connected directly to one of said fingers, a flat spring-finger sup-

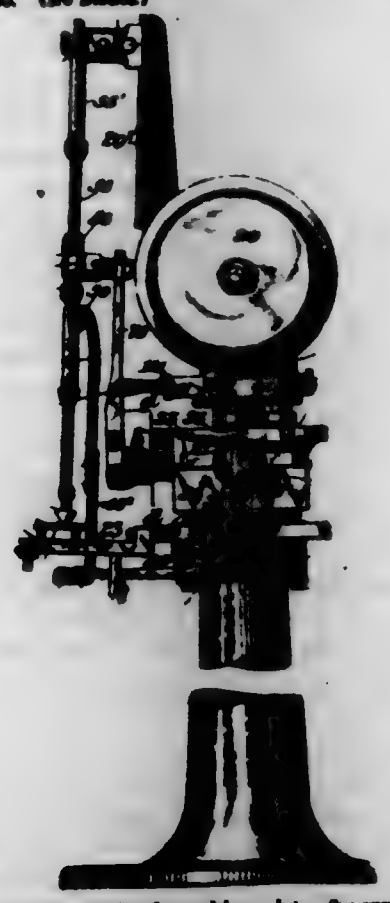
portal upon the insulating-base and projecting inward over the opening in said base, a second terminal connected with said flat spring-finger, a solid collar or sleeve supported upon the insulating-base and projecting upward therefrom, said collar or sleeve surrounding the vertical fingers and having an inner insulating-face adjacent to said fingers, in combination with a lamp having a neck and an inclosed incandescent body, a plain metallic sleeve surrounding the neck and connected directly with one end of the incandescent body, said neck and sleeve adapted to enter the vertical fingers of the socket, and a terminal plate formed on the base of the lamp-neck and adapted to enter the opening in the ring-shaped insulating-base of the socket to contact with the flat finger of said socket.

708,718. PLACKET-FASTENER. FREDERICK A. CANNADY, St. Louis, Mo. Filed Apr. 25, 1902. Serial No. 104,720. (No model.)



Claim.—A placket-fastener comprising an eye-plate having openings for stitching to the garment, and having an eye-opening to receive the hook, and having a narrow slit extending downwardly from the eye-opening, the metal being bent inwardly on each side of the slit to form spring-lips; in combination with a hook comprising an elongated sheet-metal plate having its ends bent to meet yieldingly at its center and form a spring-neck and then curved outwardly to form a head to pass through the eye-opening, so that the spring-neck may pass downwardly between the spring-lips and make a tight sliding connection; substantially as specified.

708,719. ENGRAVING-MACHINE. WALTER R. CRAFT, El Paso, Tex., assignor to the Pollard-Alling Manufacturing Company, New York, N. Y., a Corporation of New Jersey. Filed Oct. 27, 1900. Serial No. 34,580. (No model.)



Claim.—1. The combination, with a platen for supporting the work and a tool for forming a design on said work, of a two-part member adapted to follow a pattern, both of said parts swinging about a point in the axis of one of them, and separate connections between both parts of the following member and one of the elements coöperating with the work.

2. The combination, with a platen for supporting the work, and a tool for forming a design on said work, of a two-part member adapted to follow a pattern, one part of said member being held in position to swing about a point in its axis, and separate connections between both parts of the following member and one of the elements coöperating with the work.

3. The combination, with a platen for supporting the work, and a tool for forming a design on said work, of a two-part member adapted to follow a pattern, one of said parts being held in position to swing, and the other of said parts being freely slidable relatively thereto, separate connections between both parts of the following member and one of the elements coöperating with the work.

4. The combination, with a platen for supporting the work, and a tool for forming a design on said work, of a two-part member adapted to follow a pattern, one of said parts sliding within the other, and separate connections between both parts of the following member and one of the elements coöperating with the work.

5. The combination with a platen for supporting the work and a tool for forming a design on said work, of a two-part member adapted to follow a pattern: and independent connections between both parts of the following member and one of the elements coöperating with the work, one of which connections is adjustable and the adjustment of which is effective upon one of the parts only of the following member.

6. The combination, with a platen for supporting the work, and a tool for forming a design on said work, of a two-part member adapted to follow a pattern, and separate connections between both parts of the following member and one of the elements coöperating with the work, one of which connections is adjustable as to length.

7. The combination, with a platen for supporting the work, and a tool for forming a design on said work, of a two-part member swinging about a point in its axis and adapted to follow a pattern, and separate connections between both parts of the following member and the platen.

8. The combination, with a tool and a pattern-follower, of a platen, devices connecting therewith for imparting by the pattern-follower rectilinear universal movements through the platen to the work it carries, and means for yieldingly holding the platen on said devices.

9. The combination, with a tool and a pattern-follower, of a platen, a device for supporting the platen and imparting to it movements in a plane, and a device connecting with the platen for changing said plane.

10. The combination, with a tool and a pattern-follower, of a platen, a shaft for supporting the platen and imparting to it movements in a plane, and a rod connecting with the platen for changing said plane.

11. The combination, with a tool and a pattern-follower, of a platen, a longitudinally-movable shaft actuated by the pattern-follower and geared to the platen for imparting to it movements in a plane.

12. The combination, with a tool and a pattern-follower, of a platen, a longitudinally-movable shaft geared thereto for imparting to it movements in a plane, and a device for changing said plane.

13. The combination, with a platen, of a pattern; a sliding and swinging follower having a socket; a connecter having a ball at one end, fitted into said socket and at its opposite end provided with a corresponding socket; a lever having a ball fitted into the socket of said connecter; and means for universally connecting said lever with the platen.

14. The combination, with a platen, of a pattern; a follower; a lever connecting the follower and platen; and a normally stationary but yielding fulcrum for said lever.

15. The combination, with a platen, of a pattern; a follower mounted for universal movement and having a tip to trace the outline of the pattern; said tip being freely movable in all directions; a connecter attached to said follower by a universal joint or connection; a pivoted lever actuated by the connecter; and means actuated by said lever for controlling the movements of the platen.

16. The combination, with a platen, of a swinging follower mounted for rising and falling movements; a connecter coöperating with said follower; a pivoted lever actuated by said connecter and having a socket at one end; and a rod having a rounded end fitted into said socket, said rod connecting the platen to actuate the same.

17. The combination, with a platen having gear-surfaces, of a follower; gears meeting with said gear-surfaces; a shaft on which the gears are mounted; a lever pivoted to the shaft and connected with the follower and a pattern with which said follower coöperates.

18. The combination, with a platen having gear-surfaces, of gearing for engaging said surfaces and supporting the platen; a pattern; a follower; and means intermediate the follower and the gearing for actuating said gearing to move the platen.

19. The combination, with a platen, of a lever; a yielding fulcrum therefor normally held in one position; a pattern; a follower; and means connecting said follower and lever and adapted to actuate said platen.

20. The combination, with a platen having racks, of a shaft having

gluring in engagement with said racks and serving as a support for the platen; a pattern; a follower; and means intermediate the shaft and follower and connected with each for rocking the shaft.

21. The combination, with a platen, of a pattern; a two-part follower mounted for universal movements and having a tip movable independently of the other portion adapted to trace the outline of said pattern; a connector attached to the tip portion; devices intermediate the connector and platen for raising the platen; and means independent of the raising device and connected with the follower for reciprocating said platen.

22. The combination, with a platen chambered on its under side, of a rod having ball-shaped ends, one of said ends being received in the chamber of the platen; a lever having a socket to receive the other end of said rod; a follower; and intermediate connections between said follower and said lever.

23. The combination, with a platen chambered on its under side, of a rod one end of which enters the chamber of said platen; a pivoted reciprocatory lever having a socket in which the other end of said rod is received; an adjustable connector having a socket to receive the rounded end of said lever; a follower universally connected with said connector; and a pattern with which said follower coöperates.

24. The combination, with framework, of a platen having racks; a device carrying gears for engaging said racks; a pattern; a follower coöperating with said pattern; and means intermediate the follower and device for moving the gear-carrying device longitudinally and thereby causing a movement of the platen.

25. The combination, with a platen having racks on its under surface, of a horizontal shaft journaled in a bearing of the frame, said shaft carrying gear-teeth; a collar connected to one end of said shaft; a pattern; a follower; and a lever intermediate the follower and the collar for rocking the shaft.

26. The combination, with a platen, of a shaft geared thereto; a pattern; a follower; and universal connections between the follower and shaft for rocking the shaft and reciprocating it longitudinally.

27. The combination, with a platen having gear-surfaces, of a shaft geared with the platen; means connecting said shaft and said platen for reciprocatory movement and adapted to constrain said shaft and platen to reciprocate together; a pattern; a follower; and means intermediate the follower and the shaft for rocking the shaft and reciprocating it longitudinally.

28. The combination, with a platen having racks on its under surface, of a shaft mounted in a bearing of the framework and geared with said racks; means for connecting the platen and shaft for united reciprocatory movements; a follower; and universal connections between the follower and shaft for rocking and reciprocating said shaft.

29. The combination, with a platen having gear-surfaces, of a shaft geared with said platen; means connecting the shaft and platen; means for rocking and reciprocating the shaft; a follower coöperating with said last-mentioned means; and a pattern the outline of which is traced by the follower.

30. The combination, with a platen, of means for supporting the work thereon, a tool for operating on the same; a pattern; a follower for tracing the outline of said pattern; an adjustable connector operated by said follower; a lever to which said connector is universally connected; means controlled by said lever for raising the platen; and means controlled by the follower for reciprocating said platen.

31. The combination, with a platen, of a cutting-tool; means for actuating said tool; a follower-rod having a ball-shaped portion near its upper end; a socket on the framework, for receiving said ball-shaped portion; a follower; and universal connections from both rod and follower to said platen.

32. The combination, with a platen having gear-surfaces, of a device mounted for rocking movements in the frame and geared with and furnishing support for said platen; a follower-rod; a follower thereon; and connections between said follower-rod and the device for rocking said device and thereby actuating the platen.

33. The combination with framework, of platen-supporting means on the framework; a platen supported by said means to rock and move laterally; a pattern; a follower; and means intermediate the follower and the platen-supporting means for rocking and laterally moving said platen.

34. The combination, with framework, of a platen loosely fitted thereto; means contacting with said platen at three points for normally retaining it in one position, one of said supporting means being movable to raise the platen to another position; a follower; a pattern; and a device intermediate the follower and the last-named supporting means for actuating said platen.

35. The combination with a platen supported to rock and move laterally, of a cutter-head carrying a tool; a pattern; a follower; and means controlled by the movement of the follower for rocking and laterally moving the platen relatively to the tool, and thereby causing the tool to form a design, conforming to that of the pattern, upon the work carried by the platen.

36. The combination, with framework, of a platen having an opening and fitted thereon; a work-support adjustably connected to said platen; a rod mounted for universal movements on the framework; a follower slidingly connected to said rod; a pattern with which said follower coöperates; and separate intermediate devices connecting both the rod and follower with the platen, whereby said platen is made to conform to the movements of the follower.

37. The combination, with framework having a standard, of a platen having an opening in which said standard is loosely received; a shoe carrying a socket adjustably connected to an extension of said standard; a rod having a ball-shaped portion yieldingly secured in said socket; a follower slidingly mounted on said rod; a pattern with which said follower coöperates; and universal connections between the follower and the platen.

38. The combination, with framework having an upright portion, of a platen loosely fitted on said portion; a socket carried by the upper portion of the framework; a rod carrying a ball-shaped portion fitted into said socket; a spring coöperating with the socket and ball-shaped portion; a follower mounted for sliding movements on said rod; an adjustable connector universally connected with the follower and carrying a socket at one end; a lever having a universal connection with said socket; and means controlled by said lever for actuating the platen.

39. The combination, with framework, of a platen mounted for universal movements thereon; a pattern; a reciprocatory follower carrying a socket; a connector universally mounted in said socket; a lever having a ball-shaped end universally connected with said connector; and universal connections between said lever and said platen.

40. The combination, with framework, of a platen; means for elevating one side of said platen; means for longitudinally and laterally reciprocating the platen which also furnishes support therefor; a pattern; and adjustable connections intermediate the pattern and the reciprocating means for actuating the latter.

41. The combination, with framework having an extension, of an adjustable shoe carrying a socket on said extension; a two-part pattern-follower, a member of which carries a ball for coöperating with said socket; a spring for retaining said ball in the socket; a follower-tip carried by said member; a platen movably mounted upon the framework and connections between the follower and the platen.

42. The combination, with framework having an extension, and a platen mounted on said framework, of a two-part pattern-follower, a member of which is universally connected with said extension; a follower-tip mounted for reciprocation on said member; and separate means connecting both parts of the pattern-follower with the platen.

43. The combination, with framework, of a platen having racks on its under surface; a rod; a swivel in which said rod is mounted; a shaft having gear-segments for engaging with said racks; and means connecting said swivel and said shaft.

44. The combination, with a platen having racks, of a shaft geared with said racks and connected with the platen to reciprocate the same; a rod; a swivel in which said rod is mounted; a follower-tip in connection with said rod; and a connector between the swivel and the shaft.

45. The combination, with a platen having gear-surfaces, of a hollow shaft having gear-surfaces coöperating with said surfaces on the platen; a connection between said shaft and platen; a follower; a pattern; and means intermediate said follower and shaft for actuating said platen.

46. The combination, with a platen, of a lever carrying a swivel; a two-part pattern-follower, a member of which is carried by said swivel; a follower-tip movable upon said member; and separate connections between both parts of the follower and platen.

47. The combination, with a platen, of a lever carrying an adjustable swivel; a connection between the lever and platen; a follower-rod mounted in an eye of the swivel; and a follower-tip movable upon said rod; and an adjustable connection between the follower and platen.

48. The combination, with a platen, of a slotted lever; means intermediate the lever and platen; a swivel adjustably mounted in the slot of said lever; a follower-rod carried by said swivel; a follower-tip movable upon the rod; and a pattern coöperating with the follower.

49. The combination, with a platen, of a device geared thereto; a lever carried by said device; a swivel attached to the lever; and a rod carried by the swivel.

50. The combination, with a platen having a gear-surface, of a shaft having a gear-surface, said shaft being grooved near one end; a device carried by the platen and fitting into the groove of the shaft; and means for rocking and for reciprocating the shaft and thereby actuating the platen.

51. The combination, with a platen having gear-teeth, of a hollow shaft connected with the platen and also having gear-teeth; a collar connected to one end of the shaft; a lever pivoted to said collar; and means supported within the shaft to furnish a fulcrum for said lever.

52. The combination, with a platen, of a shaft for controlling the operation of said platen; a lever attached to one side of the shaft for rotating and longitudinally reciprocating it.

53. The combination, with a platen, of a hollow shaft for controlling the operation of said platen, and means for actuating said shaft connected to a yielding member extending within the shaft.

54. The combination, with a platen, of a hollow shaft geared with the platen and connected therewith, and means for actuating the shaft to impart reciprocatory movements to the platen connected by a universal joint to a member extending within the shaft.

55. The combination, with a platen, of a hollow shaft geared therewith and connected thereto; yielding devices located within the shaft; and means for actuating the platen connected to said devices.

56. The combination, with a platen, of a hollow shaft connected thereto; a stud carried by the frame and projecting into said shaft; a rod passing through said stud; a sleeve surrounding said rod; a spring bearing against one end of said rod; and means connected to the rod to reciprocate the shaft and its connected platen.

57. The combination, with a platen, of a hollow shaft connected therewith; a stud on the frame, projecting into said shaft; a rod passing through said stud; a coiled spring bearing at one end against a stop on said rod and at its other end against said stud; a sleeve surrounding the rod and received at one extremity in a socket of the stud; and means connected to said rod for actuating the platen.

58. The combination, with a platen, of a hollow shaft geared therein and connected therewith; a stud on the frame, projecting into said shaft; a rod located in said shaft; a coiled spring bearing against one end of the rod and said stud; a sleeve surrounding the rod and having a rounded end adapted to be received in a socket of the stud; a collar secured to the end of the shaft; a lever pivoted to said collar; and a device connecting said lever and said rod.

59. The combination, with a platen, of a hollow shaft mounted in a bearing of the framework and adapted for rocking and reciprocatory movements in said bearing; a gib projecting from the platen and entering a groove in the shaft; a stud projecting from the frame into said shaft, said stud having a socket; a rod passing through said stud and spring-actuated in one direction; a sleeve surrounding the rod and having a rounded end to fit the socket of said stud; a collar mounted at one end of the shaft; a lever pivoted to said collar; and a device carried by said lever and universally connected with said rod.

60. The combination, with framework, of a platen loosely mounted thereon; a shaft mounted in a bearing of the framework; a gib projecting from the platen and entering a groove in the shaft gearing between said shaft and platen; a stud projecting from the frame and entering the shaft; a rod passing through said stud; a coiled spring surrounding said rod and bearing at one end against the stud and at its opposite end against a nut on the rod; a sleeve also surrounding said rod and fitted at one end into a socket of said stud; a collar attached to the end of the shaft; a lever pivoted to said collar; and an adjustable device carried by said lever and having a socket to receive a ball on the end of said rod.

61. The combination, with a platen, of a head mounted for swinging movement on the framework; tools carried by said head; a device for latching said head when a tool is in position for operation upon the work; means for releasing the latching device; and means for swinging said head, when the latch is released to bring another tool toward a position for operation.

62. The combination, with a platen, of a head pivoted to the framework; a geared spindle carrying a roughing-cut tool, journaled in said head; a geared spindle carrying a finishing-tool, journaled in said head; means for latching the head in either of its extreme positions; means for releasing the latching devices; and a spring for swinging said head when a latch is released.

63. The combination, with framework, of a pivoted head; chuck-spindles mounted in said head; a friction-gear carried by each of said spindles; a friction-driver carried by a shaft, journaled in bearings of the framework; catches carried by the head; latches coöperating with said catches; and a spring for swinging the head when one of said latches is released.

64. The combination, with framework, of a tool-carrying head mounted for swinging movement thereon and carrying a pair of catches; a pair of latches for engaging said catches; a lever for releasing said latches; and means for swinging the head when one of the latches is released.

65. The combination, with framework, of a head movably mounted thereon; chuck-spindles journaled in said head and carrying friction-gears; a friction-driver journaled on a shaft, mounted in bearings of the head; means for latching the head to hold one of the gears on a spindle thereof into engagement with said friction-driver; means for releasing the head; and means for swinging said head to throw said friction-gear out of engagement with said driver.

66. The combination, with framework, of a tool-carrying head mounted for swinging movement thereon; a catch projecting from each side of said head; latches pivoted to the framework on each side thereof and adapted to coöperate with the catches of the head; a pivoted lever for actuating said latches; and means for swinging the head when one of the latches is released.

67. The combination, with framework, of a head mounted for swinging movement thereon and carrying at each side a catch; tool-spindles mounted for rotation in said head; latches for engaging the catches of the head and securing said head in either one or another position; means for releasing said latches as desired; and means for swinging the head after the latch engaging the same has been released.

68. The combination, with framework, of a tool-carrying head pivoted thereto; a catch secured to each side of said head; pivoted latches mounted on the framework and coöperating with said catches; and a lever for releasing said latches.

69. The combination, with framework, of a head mounted for swinging movement thereon and carrying catches; tool-carrying spindles journaled in said head and movable therewith; means for driving said spindles; means for latching and releasing the head; and means for swinging the head when a latch is released.

70. The combination, with framework, of a head pivoted thereto; chuck-spindles mounted in bearings of the head; a gear carried by each of said chuck-spindles; a driving-gear; a shaft mounted in bearings of the framework and carrying said driving-gear; means for actuating said shaft; latches for holding the head in either of its extreme positions; means for releasing said latches; and means for swinging the head when one of the latches is released.

71. A platen having an offset portion with a chambered extension, combined with a table for supporting the work; and means entering the chambered extension and adapted to raise the platen and having a universal connection therewith to permit lateral movement.

72. The combination, with a platen mounted for universal movements on the frame, of a device passing through the frame and geared with said platen; a lever for rocking and reciprocating said device; a swivel secured to said lever; a sleeve having ball-bearings carried by the swivel; a pattern; a follower; and intermediate devices connecting the swivel and follower.

73. The combination, with a work-support, of a pattern-follower including a rod for actuating the work-support, said pattern-follower rod being carried by a swivel having ball-bearings, and connections between the swivel and work-support.

74. The combination, with a work-support, of a pattern-follower including a rod for actuating the work-support, said pattern-follower rod being carried by an adjustably-mounted swivel, a sleeve having ball-bearings pivoted to said swivel; and connections between the sleeve and work-support.

75. The combination, with a platen, of a rotary tool-spindle; a rocking and longitudinally-movable device in engagement with the platen; and connections for actuating said device; a swivel carried by the lever; a sleeve having ball-bearings pivoted to the swivel; a bolt passing through said sleeve and secured to the lever; a follower comprising a rod and a follower-tip, said rod being fitted to the swivel; said follower-tip adapted to be freely movable on said rod; and a pattern coöperating with the follower.

76. The combination, with a platen having a central opening and equipped with gear-surfaces on its under side, of a hollow shaft having gear-surfaces intermeshing with those of the platen; means for locking said shaft and the platen together for longitudinal movement; a collar secured to the shaft; a lever pivoted to said collar and carrying at one end a bolt; a sleeve having ball-bearings fitted between flanges on said bolt; a swivel having conical surfaces in contact with other ball-bearings on said sleeve; a follower comprising a rod and a follower-tip, said rod being secured to the swivel; a chuck-sleeve mounted for sliding movement on said rod and carrying the follower-tip; a pattern with which said follower coöperates; a connector having a ball-and-socket connection with said chuck-sleeve; a lever having a ball-and-socket connection with said connector; and means actuated by the lever for raising the platen.

77. The combination, with a bed-plate having ways, of interchangeable patterns carried by slides adapted to be received in said ways; a platen mounted for universal movements on the frame and having a chambered extension; a work-support carried by the platen; a follower having a socket; a connector carrying a ball adapted to be received in said socket; a lever pivoted to the under side of the frame and having universal connection at one end with said connector; and a rod having ball-shaped ends one of which is received in a socket in said lever and the other in the chambered extension of the platen.

78. The combination, with a platen mounted for universal movements, of a pattern, and a follower comprising a rod and a follower-tip sleeved upon said rod; a sleeve at the upper part of said rod and having a ball-shaped end; a socket adjustably connected with the frame and with which the ball-shaped end of said sleeve engages; and a bowed leaf-spring for holding the ball on said sleeve in place in said socket.

79. The combination, with a frame having an upright extension provided with ways, of a shoe adjustably mounted on said ways and having a socket; a follower comprising a follower-tip and a rod carrying a sleeve having a ball-shaped end fitted into said socket; a spring operating against the ball-shaped end of said sleeve; said follower-tip slidingly mounted on the rod; a platen; means for connecting the follower with said platen; and a pattern with which the follower coöperates.

80. The combination, with a platen, of a follower comprising a rod having a universal connection at its upper end with a shoe on the frame and a follower-tip slidingly mounted on said rod; checks secured to the rod at an intermediate point in its length; a swivel having an eye through which the sleeve connecting said checks passes; means for connecting said swivel with the platen; and means for connecting the follower-tip with said platen.

81. The combination, with framework, of a platen having a series of racks on its under side; a gib secured to said platen; a hollow shaft mounted in a bearing of the framework and having a groove in which said gib is received; a collar secured to the end of said shaft; a lever pivoted to said collar; an adjustable plate having a ball-socket attached to said lever; a rod having a ball on its end adapted to fit the socket in said plate; a spring on said rod; a stud fitted on the frame and projecting within the shaft; a sleeve surrounding the rod and having one end rounded to fit a socket in the stud; a swivel having a bolt fitted in a longitudinal slot of the lever, attached to said sleeve; a sleeve mounted on said bolt and having ball-bearings; a follower-rod secured in an eye of the swivel; a check-sleeve carrying a follower-tip mounted for sliding movements on said rod; a socket at one end of said check-sleeve; a connector having a ball adapted to be received in said socket; a lever pivoted to the framework and having a long arm with a ball-shaped end received into a socket at one end of said connector; a universal connection between the short end of said lever and the platen; and a pattern coöperating with the follower.

82. The combination, with a platen mounted for rising-and-falling movements, of rods secured to said platen and projecting through openings in the frame; springs surrounding said rods and pressing at one end against the frame and at the other end against nuts on said rods; a pivoted lever mounted for reciprocatory movement on the frame and having a socket at one end; means for actuating said lever; and a rod having ball-shaped ends connecting said lever with the platen.

83. The combination, with a platen, of means for actuating said platen; a follower for operating said actuating means; a pattern; a swinging head mounted in the framework and carrying a pair of separated chuck-spindles; roughing-out and finishing tools respectively mounted in said chuck-spindles; gearing on the chuck-spindles; and a driving-wheel journaled on a shaft mounted in bearings of the frame; so located that the gearing on either chuck-spindle may be brought opposite and in contact with its side face by swinging the head.

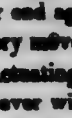
84. The combination, with a platen carrying a work-support, of a pivoted head; chuck-spindles carrying, respectively, roughing-out and finishing tools journaled in said head; means for latching the head in either of its extreme positions; friction gear-wheels carried by the chuck-spindles; a large friction-gear in engagement with the gear-wheels on said chuck-spindles; and a pair of springs coöperating with the head.

85. The combination, with a platen, of a pivoted lever; connections between said platen and said lever for raising said platen; stops for limiting the movement of said lever; a connector, formed of adjustable sections, in engagement with one end of said lever; a follower universally jointed to said connector; and a pattern coöperating with said follower.

86. The combination, with a vertical frame having an extension, of a platen fitted over said frame; racks mounted on the under surface of the platen; a geared shaft in engagement with said racks; a connection between the platen and shaft, whereby when the shaft is moved endwise the platen will be carried with it; a device for moving the shaft longitudinally and for rocking it; a pattern; a follower; and means connecting said follower with the shaft-operating devices.

87. The combination with a follower-tip adapted to be moved in an axial direction and transversely to its axis, of a platen adapted to be reciprocated and to be rocked; means actuated on the transverse movement of the follower-tip to reciprocate said platen; and means actuated on the axial movement of the follower-tip to rock said platen.

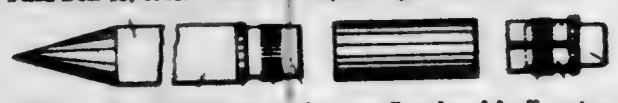
708,720. ARTIFICIAL DENTURE. JAMES E. DOHR, Chicago, Ill. Filed Mar. 18, 1902. Serial No. 98,536. (No model.)



Claim.—1. In a denture, in combination, an elastic plate conforming to the contour of the gum with which it is to be used, and having fixed thereto the teeth to be supplied, and an extension or projection on one of the natural teeth at each side of the jaw for engaging the plate when sprung into place.

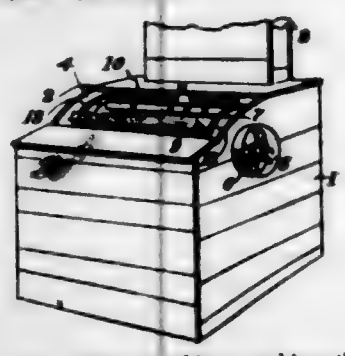
2. In a denture, in combination, an elastic plate conforming to the contour of the gum with which it is to be used, and having fixed thereto the teeth to be supplied, a crown secured to a natural tooth at each side of the jaw and having an inward extension, and a shoulder at each side of the plate and adapted to fit against each extension when the plate is sprung into place.

708,721. PENCIL-TIP. LOTHAR W. FABER, New York, N. Y. Filed Dec. 13, 1901. Serial No. 85,795. (No model.)



Claim.—The combination with a pencil, reduced in diameter at one end, of a tubular metal part fitting and secured upon the reduced end thereof and having a circumferential rib and a partially raised or roughened surface, a split thimble having a circumferential rib and a partially raised or roughened surface, a rubber eraser frictionally held by the said thimble, and a sleeve the ends of which are adapted to receive the said thimble and the said tubular metal part and pencil, substantially as specified.

708,722. PILLOW-BRUSHER. FREDERICK FRANKE, Louisville, Ky., assignor to S. D. Cruse, Louisville, Ky. Filed Nov. 28, 1901. Serial No. 83,536. (No model.)



Claim.—1. In a pillow-brushing machine, the combination of a case, provided with a table-top and a longitudinal opening in said table-top over which the pillow or other object to be brushed is moved and exposed to the action of a brush, a shaft journaled longitudinally in said case, a revoluble, combined brush and fan, having renewable and adjustable brush material, secured on said shaft, and a driving-pulley secured on said shaft outside of said case, substantially as specified.

2. In a machine for brushing pillows, the combination of a case, provided with a table-top and a longitudinal opening in said table-top over which the pillow or other object to be brushed is moved and exposed to the action of a brush, a shaft journaled longitudinally in said case, a revoluble, combined brush and fan, having renewable and adjustable brush material, secured on said shaft, a semicylindrical bottom in said case under said brush, the axis of which is to the rear relative to the aforesaid shaft, and a flue or conveyer communicating with said semicylindrical bottom, for carrying away the refuse, substantially as specified.

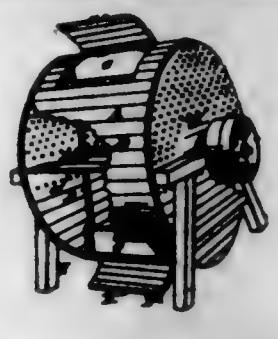
3. In a pillow-brushing machine, the combination of a case provided with an opening for exposing a brush, and a revoluble brush comprising a shaft, disks firmly secured to said shaft, bars joining said disks at their periphery and having their ends secured in the disks, bolts passing transversely through said bars, separable cleats pierced with apertures for, and secured to said bars with said bolts, and brush material adjustably and renewably secured between and by said bars and cleats, substantially as specified.

4. In a brushing-machine, the combination of a case 1, provided with an opening 4 for exposing the article to be brushed to the action of a brush, a brush 2, journaled in said case, and a semicylindrical bottom 11 in said case, the surface of which is near the brush in front and recedes from the brush in the direction of its motion, and a flue or conveyer 3, communicating with the part of said semicylindrical bottom 11 which is more distant from the brush, 2, all so connecting as to start removable matter from a pillow or other article, and, by the centrifugal action of the brush and the expanding bottom, create suction at the opening 4 and draw aforesaid removable matter into the case 1 and expel it through the flue 3, substantially as specified.

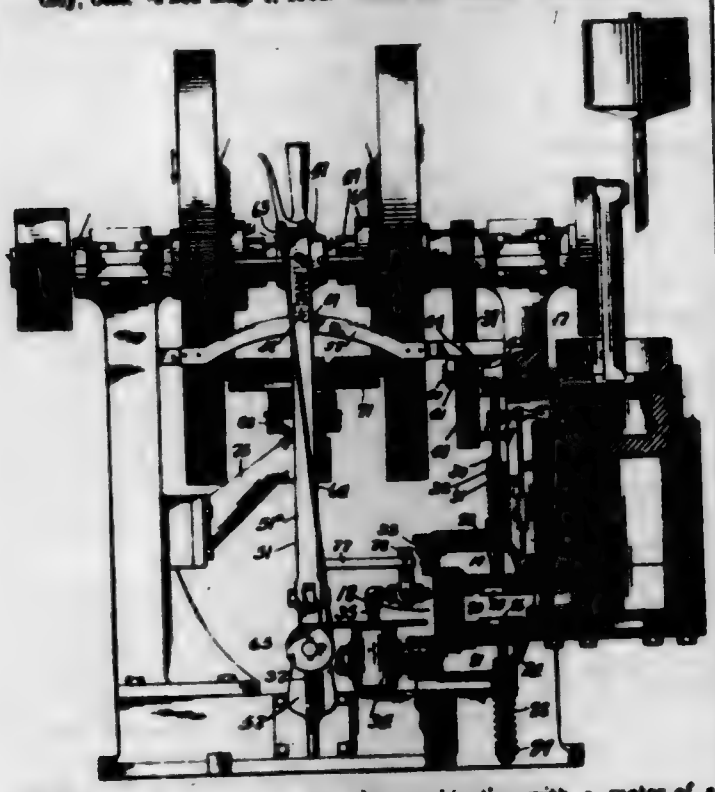
708,723. FEATHER-QUILLER. FERDINAND FRANKE, Louisville, Ky., assignor to S. D. Cruse, Louisville, Ky. Filed Jan. 20, 1902. Serial No. 90,282. (No model.)

Claim.—In a machine for quilling feathers, the combination of a drum-shaped casing, a shaft journaled axially in said casing, radial arms

secured on said shaft, fan-vanes secured on the outer ends of said radial arms, a door at the top of the periphery of said casing for charging, a discharging-door at the bottom of the periphery of said casing, and hoods in said casing, the upper half of which is perforated near the center with holes for admitting air, and near the circumference with holes for the emission of air and dust suspended therein, substantially as specified.



708,724. EXPLOSIVE-ENGINE. Spencer Scott, Canon City, Colo., assignor to Spencer H. St. John and J. Vernon St. John, Canon City, Colo. Filed Aug. 1, 1901. Serial No. 70,562. (No model.)



Claim.—1. In a gas-engine, the combination with a motor of a pair of operatively-connected reversely-rotating momentum-wheels, and means for connecting the two wheels in alternation with the motor.

2. In combination with an explosive-engine, a shaft driven by the engine, a pair of oppositely-rotating momentum-wheels loosely mounted upon the shaft, and means for connecting the momentum-wheels with the shaft in alternation.

3. In combination with an explosive-engine, a shaft driven by the engine, a pair of oppositely-rotating momentum-wheels loosely mounted upon the shaft, and coupling mechanism for connecting the momentum-wheels with the shaft in alternation.

4. In combination with an explosive-engine, a shaft driven by the engine, a pair of oppositely-rotating momentum-wheels loosely mounted upon the shaft, and clutch mechanism for connecting the momentum-wheels with the shaft in alternation.

5. In combination, an explosive-engine, a shaft, a connection from the engine for driving the shaft, a pair of reversely-rotating members, and means for coupling said members to the shaft in alternation

6. In an explosive-engine, in combination, a cylinder, a piston and a shaft connected with the piston, a momentum-wheel, indirect connection between the shaft and said wheel whereby the wheel is driven from the shaft but in the reverse direction, and means for breaking said indirect connection and for connecting the wheel directly with the shaft.

7. In an explosive-engine, in combination, a cylinder, a piston and a shaft connected with the piston, a momentum-wheel, operative connection between the shaft and wheel, and means for changing the relative direction of rotation of the shaft and wheel.

8. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft for driving the latter, fly-wheels loosely mounted on the shaft, and means for coupling the fly-wheels to the shaft in alternation to reverse the engine.

9. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft for driving the latter, fly-wheels loosely mounted on the shaft, a clutch splined on the shaft, and means for clutching the fly-wheels to the shaft in alternation.

10. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft for driving the latter, fly-wheels loosely mounted on the shaft, a clutch for coupling the fly-wheels to the shaft in alternation, and means for driving the fly-wheels in opposite directions.

11. In an explosive-engine, in combination, a cylinder, a piston therefor, a connection between the piston and the shaft for driving the latter, fly-wheels loosely mounted on the shaft, gears fixed to the fly-wheels, a gear meshing with the gears of the fly-wheels for driving the said fly-wheels in opposite directions, and a clutch carried by the shaft for coupling the fly-wheels to the shaft in alternation.

12. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, an exhaust-valve for the cylinder, means for reversing the movement of the shaft, a lever for controlling the reversing means, and connection between said lever and the exhaust-valve.

13. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, an exhaust-valve for the cylinder, means for reversing the movement of the shaft, means for controlling the reversing means, and connection between said last-named means and the exhaust-valve.

14. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, an exhaust-valve for the cylinder, means for reversing the movement of the shaft, a lever for controlling the reversing means, a bell-crank handpiece pivoted to the lever, and connection between the bell-crank handpiece and the exhaust-valve.

15. In a gas-engine, in combination, a motor having a shaft, a pair of operatively-connected reversely-rotating momentum-wheels, means for connecting such wheels in alternation with the shaft, an exhaust-valve for the motor, and a cam operatively connected with the shaft for opening the valve.

16. In a gas-engine, in combination, a motor having a shaft, a pair of operatively-connected reversely-rotating momentum-wheels, means for connecting such wheels in alternation with the shaft, an exhaust-valve for the motor, a cam operatively connected with the shaft for opening the valve, and means for manually controlling the exhaust-valve.

17. In a gas-engine, in combination, a cylinder, a piston therefor, a shaft, a connection between the piston and the shaft, means for reversing the movement of the shaft to reverse the engine, a gear driven from the shaft, a cam loosely mounted on the shaft of the gear, projections on the gear for engaging the cam to turn the same, and an exhaust-valve for the cylinder and which is opened by the cam.

18. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, means for reversing the shaft to reverse the engine; a lever for controlling the reversing means, an exhaust-valve, connection between the lever and the exhaust-valve for opening the latter, a gear driven from the shaft, a cam loosely mounted on the gear-shaft, projections on the gear for engaging the cam to turn the same in either direction, and the exhaust-valve having a stem which is moved by the cam to open the valve.

19. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, fly-wheels loosely mounted on the shaft, gears fixed to the fly-wheels, means for coupling the fly-wheels to the shaft in alternation, a gear meshing with the gears of the fly-wheels for driving the same in opposite directions, and means for imparting motion to the gear for starting the engine.

20. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, fly-wheels loosely mounted on the shaft, gears fixed to the fly-wheels, means for coupling the fly-wheels to the shaft in alternation, a gear meshing with the gears of the fly-wheels for driving the same in opposite directions, a drum, pawl-and-ratchet connection between the drum and the gear, a lever, a cord attached to the lever and to the drum, and a spring for winding the cord upon the drum.

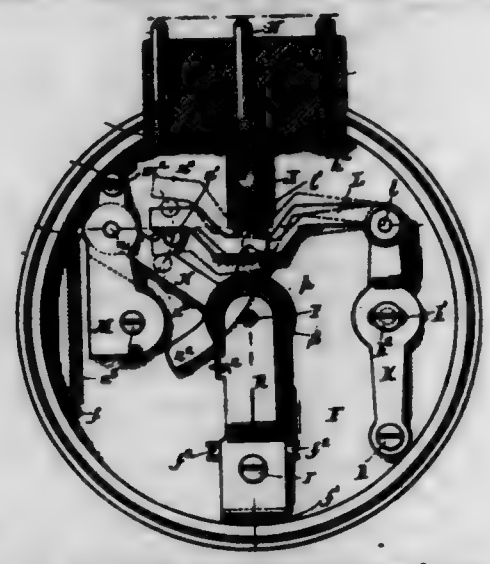
21. In an explosive-engine, in combination, a cylinder, a piston therefor, a shaft, connection between the piston and the shaft, fly-wheels loosely mounted on the shaft, a clutch for coupling the fly-wheels to the shaft in alternation, gears fixed to the fly-wheels, a gear meshing with the fly-wheel gears for driving the latter in opposite directions, an exhaust-valve for the cylinder, a lever for moving the clutch, a handpiece pivoted to the lever, a connection between the handpiece and the exhaust-valve, a drum, pawl-and-ratchet connection between the drum and the gear meshing with the fly-wheel gears, a second lever pivoted to the lever for controlling the clutch, a cord attached to the second lever and to the drum, and a spring for winding the cord upon the drum.

22. In an explosive-engine, in combination, a shaft, a momentum-wheel loose on the shaft, means for securing the wheel to the shaft, a drum rotatable independently of the shaft, a pull-cord wound upon the drum, and means for connecting the drum with the wheel.

23. In an explosive-engine, in combination, a shaft, a momentum-wheel loose on the shaft, means for securing the wheel to the shaft, a drum rotatable independently of the shaft and normally disconnected from the wheel, a pull-cord wound upon the drum, a spring acting in opposition to the cord, and automatic means for connecting the drum with the wheel when the former is turned by means of the cord.

24. In an explosive-engine, in combination, a shaft, a momentum-wheel loose on the shaft, means for securing the wheel to the shaft, a second wheel rotatable independently of the shaft, means for turning this second wheel, means for connecting the second wheel with the first wheel.

708,725. LENS-MEASURING INSTRUMENT. FRANKLIN HARDING, Chicago, Ill., assignor to Geneva Optical Company, Chicago, Ill., a Corporation. Filed July 12, 1900. Serial No. 23,288. (No model.)



Claim.—1. The combination in a lens-measure, of a pair of normally fixed contact-pieces, an intermediate movable contact-piece located in the plane of said fixed contact-pieces, each of said contact-pieces being independently and longitudinally adjustable in indicating mechanism operated by said movable contact-piece.

2. The combination in a lens-measure, of an inclosing casing, fixed contact-pieces projecting exteriorly of said casing and a movable contact-piece extending therethrough, indicating devices within the casing by which the relative positions of said contact-pieces are shown, comprising a pointer, an adjustable mechanism arranged to actuate said pointer and a part loosely contacting with said adjustable mechanism to which part said movable contact-piece is adjustably connected.

3. The combination in a lens-measure, of an inclosing casing, fixed contact-pieces projecting exteriorly of said casing, and a movable contact-piece extending therethrough, indicating devices within the casing by which the relative positions of said contact-pieces are shown, comprising a pointer, pivoted lever mechanism arranged to actuate said pointer and having its fulcrum adjustable and a part loosely contacting with said lever mechanism into which said movable contact-piece is adjustably threaded.

4. The combination in a lens-measure, of fixed and movable contact-pieces, indicating devices by which their relative positions are shown, said indicating devices comprising a pointer movable over a suitably-graduated scale and two independently-pivoted levers successively interposed between the contact-pieces and said pointer, one of said levers being operatively engaged by said movable contact-piece and having its fulcrum adjustable and its free end engaging the other of said levers.

5. The combination in a lens-measure, of fixed and movable contact-pieces, indicating devices by which their relative positions are shown, said indicating devices comprising two independently-pivoted levers movable in the same plane successively interposed between the contact-pieces, and a pointer movable over a suitably-graduated scale, one of which levers is operatively engaged by a movable contact-piece and whose free end engages the other of said levers, the engaging point between said contact-piece and said lever, the engaging point between said levers and the pivots of said levers normally lying in the same straight line.

6. In a lens-measure, the combination of fixed and movable contact-pieces, indicating mechanism by which their relative positions are shown, comprising a pair of coacting arms or levers successively interposed between said contact-pieces and a pointer movable over a suitably-graduated scale, and a movable part engaging one of said arms or levers to which part a movable contact-piece is adjustably secured.

7. The combination in a lens-measure, of contact-points, indicating devices by which their relative positions are shown, said indicating devices comprising a lever interposed between the contact-points and means for operating a pointer movable over a suitably-graduated scale, the fulcrum of said lever being adjustable, and the free end thereof engaging a second lever which in turn operatively engages said means.

8. The combination in a lens-measure, of contact-points, indicating devices by which their relative positions are shown, said indicating devices comprising a lever interposed between the contact-points and means for operating a pointer movable over a suitably-graduated scale, the fulcrum of said lever being mounted on a normally stationary adjustable part, and the free end thereof engaging a second lever which in turn operatively engages said means.

9. The combination in a lens-measure, of contact-points, indicating devices by which their relative positions are shown, said indicating devices comprising a lever interposed between one contact-point and means for operating a pointer movable over a suitably-graduated scale, the fulcrum of said lever being mounted on a normally stationary, adjustable, pivoted arm, and the free end thereof operatively engaging a second lever which in turn operatively engages said means.

10. The combination in a lens-measure, of contact-points, indicating mechanism by which their relative positions are shown, comprising a pointer movable over a suitably-graduated scale, a movable member arranged to actuate said pointer and a pivoted lever interposed between one contact-point and said movable member said lever having its fulcrum adjustable and its free end loosely engaging said movable member, so that the adjustment of said lever will not affect said member.

11. The combination in a lens-measure, of fixed and movable contact-pieces, indicating mechanism by which their relative positions are shown, comprising a pointer movable over a suitably-graduated scale, a movable member operatively geared to said pointer, and a pivoted lever interposed between said movable contact-piece and said movable member, said movable contact-piece loosely contacting with said lever and said lever having its fulcrum adjustable and its free end loosely engaging said movable member.

12. The combination in a lens-measure, of fixed and movable contact-pieces, indicating mechanism by which their relative positions are shown, comprising a pointer movable over a suitably-graduated scale, a movable member operatively geared to said pointer, a pivoted lever interposed between said movable contact-piece and said movable member, said lever having its fulcrum adjustable and its free end loosely engaging said movable member, and a part loosely engaging said pivoted lever to which said movable contact-piece is adjustably connected.

13. The combination in a lens-measure, of fixed and movable contact-pieces, indicating mechanism by which their relative positions are shown, comprising a pointer movable over a suitably-graduated scale, a pivoted lever operatively geared to said pointer, a second pivoted lever having its fulcrum adjustable and its free end loosely engaging said first-mentioned lever, and a part loosely contacting with said second lever into which said movable contact-piece is adjustably threaded.

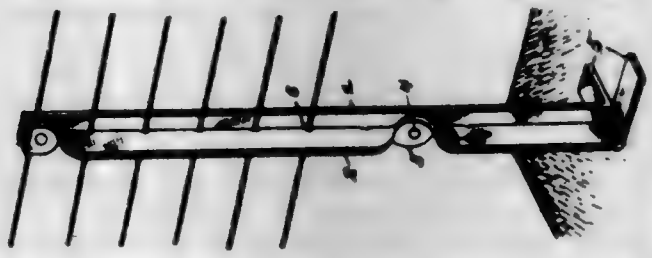
14. The combination in a lens-measure, of contact-pieces, indicating devices by which their relative positions are shown, said indicating devices comprising a pair of independently-pivoted levers successively interposed between the contact-pieces and gearing moving a pointer over a suitably-graduated scale, the free end of one of said levers operatively engaging the other of said levers and the fulcrum of the first of said levers being adjustably mounted to vary the operation of the instrument, and that of the second being adjustably mounted to vary the meshing of the gearing.

15. The combination in a lens-measure, of contact-points, indicating devices by which their relative positions are shown, said indicating devices comprising a pivoted lever interposed between said contact-points and mechanism for operating a pointer movable over a suitably-graduated scale, the free end of said lever operatively abutting against a contact-surface secured to said mechanism, the parts being so related that the distance between the point of contact of said lever and said surface and the pivot of the lever will vary as said lever oscillates.

16. The combination in a lens-measure, of contact-points, indicating devices by which their relative positions are shown, said indicating devices comprising a pair of independently-pivoted levers successively interposed between the contact-points and a pointer movable over a suitably-graduated scale, one of said levers operatively engaging a cylindrical pin mounted upon the other of said levers whereby the leverage of the first of said levers varies as said lever oscillates.

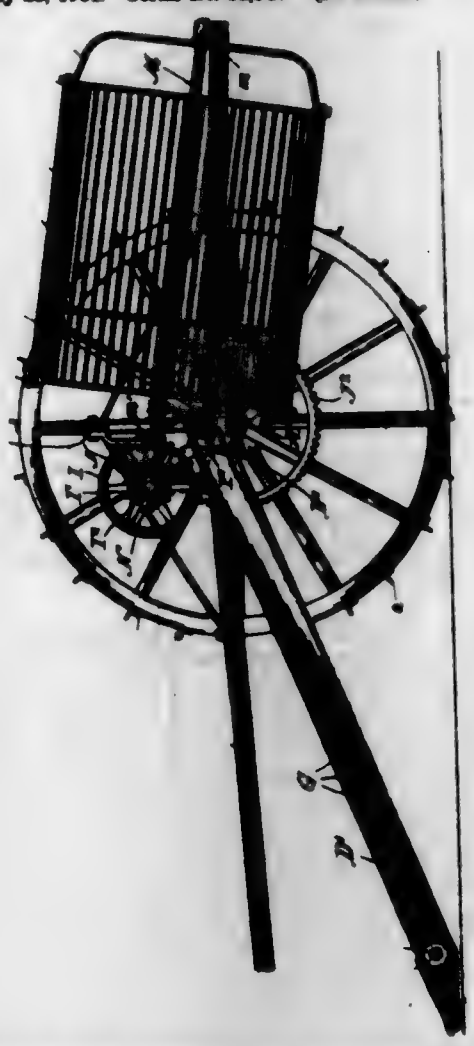
17. A lens-measure comprising a casing, a metal plate fitted within said casing upon which the operative parts are mounted, a pointer movable over a suitably-graduated scale, a shaft upon which said pointer is mounted, the inner end of said shaft journaled in said plate and the outer end journaled in a bent strip, the end of which strip is bent to engage a notch in said plate and projections stamped from the body of said plate and abutting against either side of said strip.

708,726. METALLIC FENCE-POST. OLIVER A. HARKER, Jr., Carbondale, Ill. Filed Nov. 8, 1901. Serial No. 81,561. (No model.)



Claim.—A metallic fence-post comprising a rectangular metallic bar having its lower end bent at right angles to the upper part; a second rectangular metallic bar placed against the face of the first bar along its center and at right angles thereto, said second bar having notches in its inner edge to receive the wires; the upper end of said second bar being twisted to lie parallel with and against the upper end of the first bar; and a portion of said second bar near its lower end being twisted to lie parallel with and against the lower part of the first bar; and the lower end of said second bar being bent at right angles to the upper part of the second bar, and at right angles to the lower end of the first bar; and bolts securing said bars together; said bolts being inserted through said twisted portions of the second bar and through the first bar; and said bars being of equal length, and the lower ends of said bars which are bent at right angles to the upper parts of the bars forming anchors; and said bars being removably connected by means of said bolts, substantially as specified.

708,727. POTATO-DIGGER. PETER HAMILTON, Chicago, Ill. Filed May 23, 1901. Serial No. 61,547. (No model.)

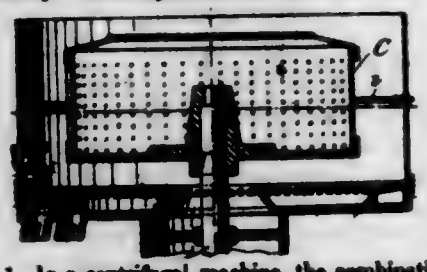


Claim.—1. In a potato-digger, the combination of the ground-wheels, the axle thereof, a frame supported by the axle, a rod parallel with the axle and supported by the frame, beams pivotally supported by said rod, a plow carried by the forward ends of the beams, a shaft carried by the forward ends of the beams, sprocket-wheels carried by the shaft, an endless conveyer embracing the sprocket-wheel, a second shaft supported by the frame of the machine independently of the beams, sprocket-wheels carried by said shaft and embraced by the conveyer, and gearing between said second shaft and the ground-wheels, substantially as described.

2. In a potato-digger, the combination of the ground-wheels, the axle thereof, a frame supported by the axle, a shaft journaled in bearings and supported by the frame, gearing connecting said shaft with the ground-wheels, sprocket-wheels carried by said shaft, an endless conveyer passing over said sprocket-wheels, beams pivotally supported independently of said shaft, a plow carried by the beams, and sprocket-wheels carried by said beams in the vicinity of the plow over which the endless conveyer passes, substantially as described.

3. In a potato-digger, the combination of the ground-wheels, the axle thereof, a frame supported by the axle, beams pivotally supported at their rear ends by the frame, a plow carried by the forward ends of the beams, sprocket-wheels supported by the forward ends of the beams, an endless conveyer passing over said sprocket-wheels, means for supporting and driving the rear end of said conveyer, said supporting means being independent of the beams, a rock-shaft supported by the frame, and means for raising and lowering the forward ends of the beams, substantially as described.

708,728. CENTRIFUGAL MACHINE. ADOLF HOLLAND, Magdeburg, Germany. Filed Sept. 24, 1901. Serial No. 76,353. (No model.)



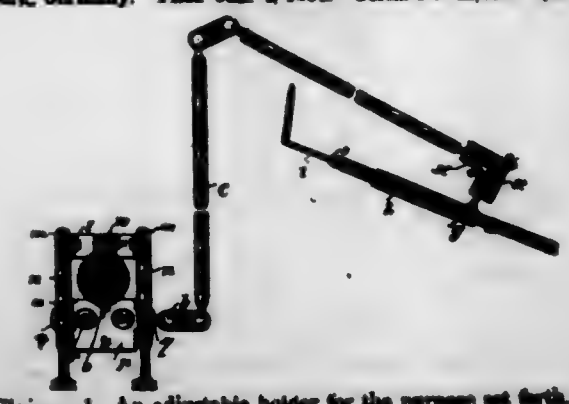
Claim.—1. In a centrifugal machine, the combination of a casing having a cylindrical body portion seated in a suitably-supported base-plate, said base-plate being provided with discharge-openings, a rotatable drum mounted in said casing, and an adjustable collecting-plate disposed below the bottom of said drum for directing the flow of liquid to either discharge-opening, substantially as set forth.

2. In a centrifugal machine, the combination of a casing having a suitably-supported base-plate, said base-plate being provided with discharge-openings, a rotatably-mounted drum in said casing, a partition-flange provided on said base-plate, and an adjustable collecting-plate arranged in contact with the interior surface of said casing and disposed below the bottom of said drum for directing the flow of liquid to either side of said partition-flange, substantially as set forth.

3. In a centrifugal machine, the combination, with a rotatably-mounted drum, of a casing provided with a cylindrical body portion, a base-plate having a circumferential flange and a concentric partition-flange, said cylindrical body portion being provided with an inwardly-flaring rim extending from said circumferential flange to said partition-flange, said inwardly-flaring rim having a plurality of openings, and an adjustable collecting-plate having openings to register with said openings in the rim, said base-plate having suitably-arranged discharge-openings, substantially as set forth.

4. In a centrifugal machine, the combination of a casing having a cylindrical body, a base-plate having a circumferential flange provided with a shoulder for receiving the cylindrical body portion, a concentric flange adjacent said circumferential flange forming two compartments of said base-plate, each compartment having a discharge-opening, an inwardly-flaring rim provided at the lower edge of said cylindrical body portion and disposed upon said flanges, said rim being provided with a plurality of elongated slots alternately arranged in concentric lines, an adjustable collecting-plate supported on said rim and having similarly-arranged slots, a handpiece connected with said collecting-plate and projecting through an opening in said cylindrical body portion, a cover-plate arranged over said opening for the handpiece, and a steam-pipe arranged in said casing with a plurality of perforations disposed toward the interior surface of said casing, substantially as set forth.

708,729. DENTAL MOUTH-MIRROR. JULIUS KUPPER, Bamberg, Germany. Filed Jan. 4, 1901. Serial No. 42,050. (No model.)

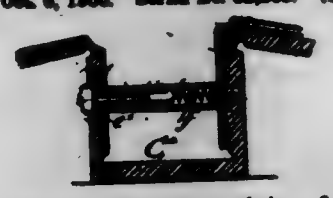


Claim.—1. An adjustable holder for the purpose set forth, consisting of the reversible clamping-plate 1, adapted to seat on one side against

a round support and on the other side against a rectangular support, the arms *n*, *n*, pivoted thereto, the reversible plate *p* and the clamping-screws *o*, *o*, carried by the arms and adapted to bear against the plate *p*, in combination with a jointed tool-carrying arm, substantially as described.

2. In an adjustable holder, the combination of arm-sections, and a ball-and-socket joint connecting them together, the latter consisting of two parallel angle-plates having sockets formed between them at their extremities and a screw adapted to clamp the plates against the ends of the arm-sections.

708,780. TEMPORARY BINDER. PAUL LADEWIG, Bremen, Germany. Filed Oct. 6, 1900. Serial No. 32,268. (No model.)

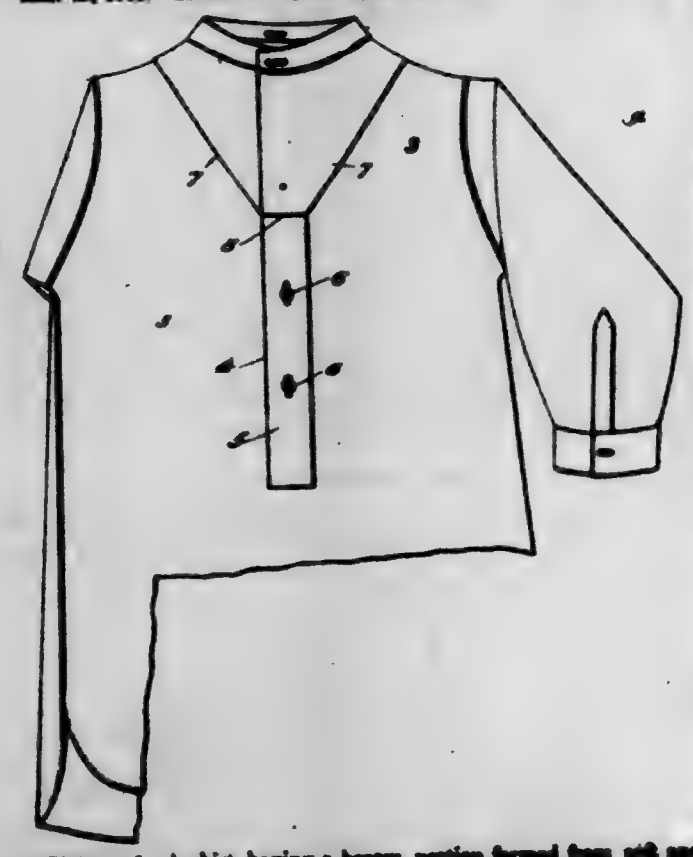


Claim.—1. A temporary binder, consisting of two covers, a back with hinged connection therewith, and having openings, posts attached to a portion of the back, one of said posts being hollow and provided with an L-shaped recess at its open end, a headed locking-post passing through one of said openings in another portion of the back, and provided with a lateral pin for interlocking with the L-shaped recess of the hollow post, and an eyelet provided in said opening and having a recess therein for the passage of said lateral pin, substantially as set forth.

2. A temporary binder, consisting of two covers, a back hinged to the covers, and composed of a middle and two side strips hinged together, a tubular post projecting from one of said side strips, and having an interiorly-threaded lower end, a headed screw for attaching said post to said strip, an L-shaped recess in the opposite end of the post, locking-post passing through the other side strip of the back and provided with a projecting pin interlocking with the L-shaped recess of the tubular post, and a tension-spring interposed between the fastening-screw of the tubular post and the inner end of the locking-post, substantially as set forth.

3. A temporary binder, composed of covers, a three-part back to which they are hinged, openings in one of said parts, posts, one of which connects the front and rear strips of said back, the other of said parts guided in one of said openings, and connecting-pieces adapted to be placed on said posts and provided with hinged wire staples for connection of newspapers, periodicals, &c., substantially as set forth.

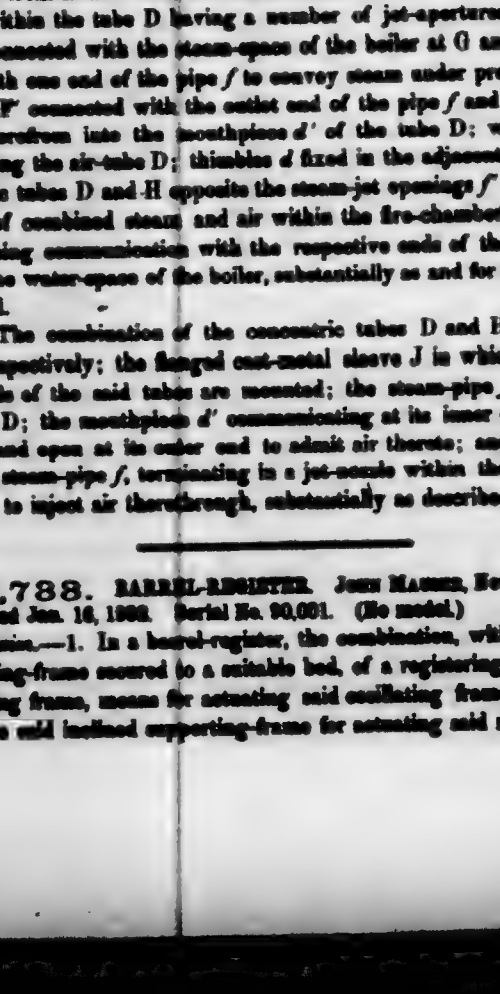
708,781. SHIRT. MILTON P. MARLY, Cincinnati, Ohio. Filed Mar. 13, 1902. Serial No. 98,010. (No model.)



Claim.—1. A shirt having a bosom portion formed from soft and thin material and provided with a front slit or opening extended down said bosom portion and provided with fastening devices, the upper part of said bosom portion being provided upon its outer side with stiffened or thickened parts extended around the neck of the shirt and upon the shoulder portions thereof and having their sides extended from said shoulder portions of the shirt downward to the edges of said front slit or opening with their lower ends above the fastening devices for said slit or opening, substantially as set forth.

2. A shirt having a bosom portion formed from soft and thin material and provided with a front slit or opening extended down said bosom portion and provided with fastening devices, one edge of said slit or opening being provided with a facing-strip or reinforce, and the upper part of said bosom portion being provided upon its outer side with stiffened or thickened parts extended around the neck of the shirt and upon the shoulder portions thereof and having their sides extended from said shoulder portions downward and diagonally toward each other and to the edges of said front slit or opening with their lower ends above the fastening devices for said slit or opening, substantially as set forth.

708,782. STEAM AND AIR FEEDING APPARATUS FOR BOILER-FURNACES. JAMES MARSHALL, Dunfermline, Scotland. Filed Dec. 21, 1901. Serial No. 86,512. (No model.)



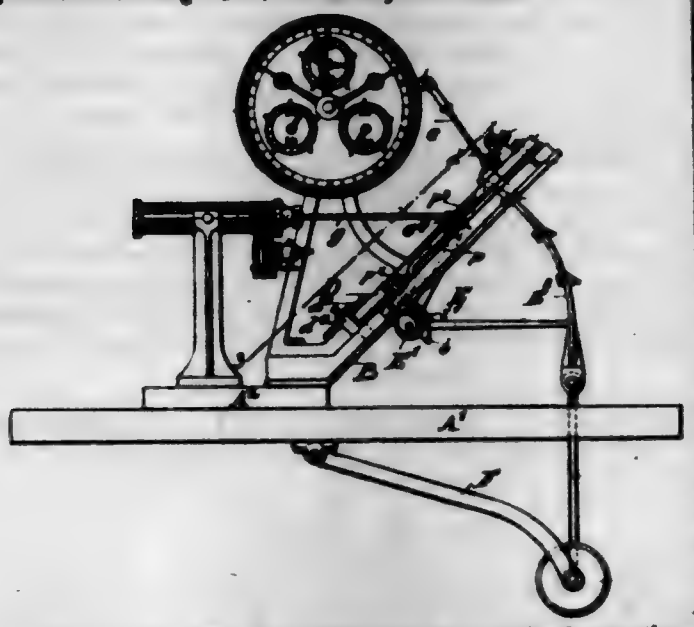
Claim.—1. The combination of the fire-chamber B; grate C C; bridge E; air-tube D having a projecting inlet-mouthpiece *d'* near one end and extending from front to rear on the interior of the fire-chamber; steam-pipe *f* within the tube D having a number of jet-apertures *f'*; steam-pipe F connected with the steam-space of the boiler at G and communicating with one end of the pipe *f* to convey steam under pressure thereto; pipe F' connected with the outlet end of the pipe *f* and discharging steam therefrom into the mouthpiece *d'* of the tube D; water-tube H surrounding the air-tube D; thimbles *d* fixed in the adjacent walls of the concentric tubes D and H opposite the steam-jet openings *f'* and delivering jets of combined steam and air within the fire-chamber; and pipes *h h'* forming communication with the respective ends of the water-tube H and the water-space of the boiler, substantially as and for the purposes described.

2. The combination of the concentric tubes D and H for air and water respectively; the flanged cast-metal sleeve J in which the united front ends of the said tubes are mounted; the steam-pipe *f*, within the air-tube D; the mouthpiece *d'* communicating at its inner end with the tube D and open at its outer end to admit air thereto; and outlet-pipe F' from steam-pipe *f*, terminating in a jet-nozzle within the mouthpiece *d'* so as to inject air therethrough, substantially as described.

708,788. BARREL-REGISTER. JOHN MAURER, New York, N. Y. Filed Jan. 16, 1902. Serial No. 90,091. (No model.)

Claim.—1. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, means for actuating said oscillating frame, means provided on said inclined supporting-frame for actuating said registering-in-

dicator, and means on said oscillating frame for operating said registering-indicator-actuating means, substantially as set forth.



2. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a swinging lever connected at its free end with said oscillating frame, means provided on said inclined supporting-frame for actuating said registering-indicator, and means on said oscillating frame for operating said actuating means, substantially as set forth.

3. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a swinging lever pivotally secured to said bed and having an antifriction-roller mounted at its free end, means connecting said free end thereof with said oscillating frame, means provided on said inclined supporting-frame for actuating said registering-indicator, and means on said oscillating frame for operating said actuating means, substantially as set forth.

4. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a swinging lever having its free end connected with said oscillating frame, spring-latches provided on said inclined supporting-frame, means connecting said latches with said registering-indicator, and means provided on said oscillating frame for operating said spring-latches, substantially as set forth.

5. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a swinging lever connected at its free end with said oscillating frame, latches pivotally mounted on said inclined supporting-frame, means connecting said latches with said registering-indicator, and projections provided on said oscillating frame to engage said latches, substantially as set forth.

6. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a swinging lever connected at its free end with said oscillating frame, latches pivotally mounted on said inclined supporting-frame and arranged suitably spaced apart, means connecting said latches with said registering-indicator, and projections provided on said oscillating frame, being arranged in separate planes corresponding with said latches, substantially as set forth.

7. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a lever pivoted to said bed and being connected with said oscillating frame, a slide-frame guided on said inclined supporting-frame, latches mounted on said slide-frame, means for sliding said slide-frame, and projections on said oscillating frame arranged in corresponding planes with said latches, substantially as set forth.

8. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of a registering-indicator, an oscillating frame, a lever for actuating said oscillating frame, a slide-frame guided on said inclined supporting-frame, latches pivotally mounted on said slide-frame and being arranged horizontally spaced apart, means for sliding said slide-frame on said inclined supporting-frame, and adjustable projections of different lengths arranged on said oscillating frame in corresponding vertical planes with said latches, substantially as set forth.

9. In a barrel-register, the combination, with an inclined supporting-frame secured to a suitable bed, of an oscillating frame having an arc-plate, a pivotal shaft provided on the under side of said inclined supporting-frame, said oscillating frame rigidly mounted thereon, a registering-indicator secured to said inclined supporting-frame, an air-cushion device supported on said bed and being connected with said oscillating frame, a swinging lever for actuating said oscillating frame, a slide-frame guided on said inclined supporting-frame, a pivotal shaft provided at the upper end of said slide-frame, latches mounted and spaced apart on said pivotal shaft of the slide-frame, means for operating said slide-frame, means connecting said latches with said registering-indicator, and adjustable projections of different lengths secured on said arc-plate of the oscillating frame, being arranged in vertical planes of said latches, substantially as set forth.

10. In a barrel-register, the combination, with an inclined supporting-frame, secured to a suitable bed, of an oscillating frame, a pivoted shaft for said oscillating frame, a slide-frame guided on said inclined supporting-frame, a depending finger on said slide-frame, and a cam provided on said pivoted shaft adapted to coöperate with said depending finger simultaneously with the motion of the oscillating frame, substantially as set forth.

11. In a barrel-register, the combination, with an inclined supporting-frame, of an oscillating frame, a pivotal shaft journaled at the under side of said inclined supporting-frame, said oscillating frame mounted thereon, a slide-frame guided on said inclined supporting-frame, a finger depending from one side thereof, a cam on said pivotal shaft adapted to engage the same, a spring-actuated pawl mounted adjacent one side of the slide-frame, a notched plate on said slide-frame, and means for actuating said pawl, substantially as set forth.

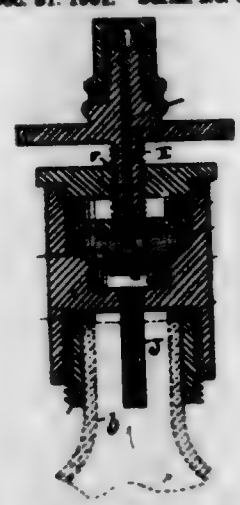
12. In a barrel-register, the combination, with an inclined supporting-frame, of an oscillating frame, a pivotal shaft journaled at the under side of said inclined supporting-frame, said oscillating frame mounted thereon, a slide-frame guided on said inclined supporting-frame, a finger depending from one side thereof, a cam on said pivotal shaft adapted to engage the same, a spring-actuated pawl having a curved end and being mounted on said inclined supporting-frame adjacent said slide-frame, a notched plate provided on said slide-frame for said pawl, and a pin on said pivotal shaft adapted to engage said curved end of the spring-actuated pawl, substantially as set forth.

708,784. FEED-GAGE FOR PRINTING-PRESSES. EDWARD L. MEEHAN, Brooklyn, N. Y. Filed Apr. 12, 1902. Serial No. 102,504. (No model.)

Claim.—1. A feed-gage for platen printing-presses formed of thin sheet metal, having a gage-head with rearwardly-bent wings, and laterally-projecting guards in their rear, whereby the said wings are shielded and braced, substantially as set forth.

2. In a feed-gage for platen printing-presses formed from thin sheet metal, a gage-head having rearwardly-bent wings, and a rearwardly-extended supporting-shank, said shank being provided with lateral guards, whereby the said wings are braced and shielded, substantially as set forth.

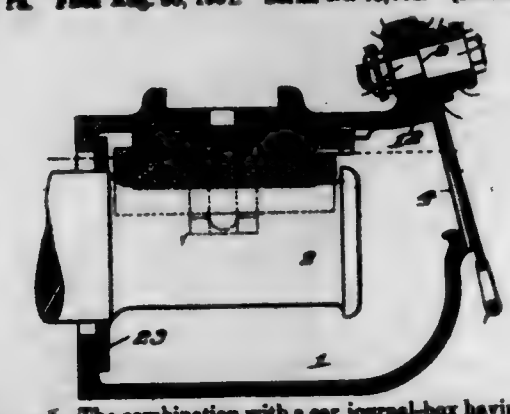
708,785. STOPPER FOR BOTTLES. ANTON MOLINARI, Woodridge, N. J. Filed Dec. 31, 1901. Serial No. 87,884. (No model.)



Claim.—The combination with a bottle, of a threaded sleeve applied on the outside of the neck of the bottle, a packing-ring on the upper end of the bottle-neck, a block provided in its bottom with an internally-threaded recess into which the sleeve on the bottle-neck can be screwed, said block also having in its upper part a recess provided with a bottom opening, a cap on said block, a screw-stem mounted to turn in said cap, a head on the lower end of said screw, and provided on its under side with a recess, a yielding packing secured in said recess in the under side of the head, which yielding packing is adapted to close the

bottom opening in the top recess formed in the block, the screw-stem having a duct extending from the side of the valve-head to the upper end of the screw-stem, substantially as set forth.

708,786. JOURNAL-BOX LID. HARRY C. MCCARTY, Williamsport, Pa. Filed Aug. 30, 1901. Serial No. 73,771. (No model.)

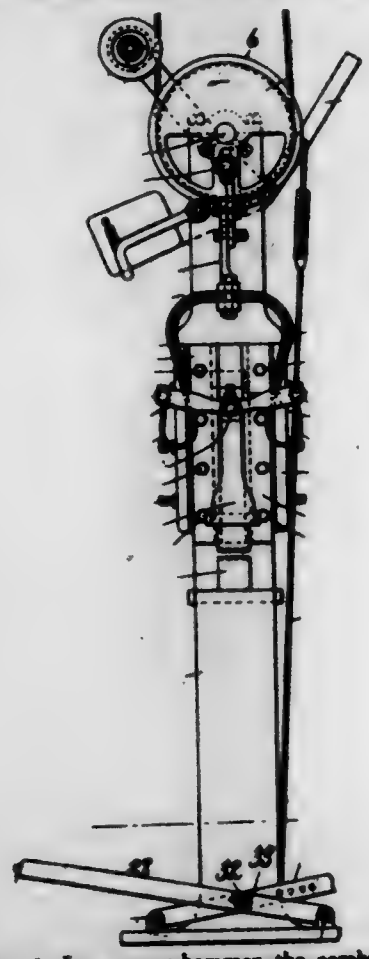


Claim.—1. The combination with a car journal-box having an opening in its forward end, ribs at the sides of said opening, and a projecting bolt above said opening, there being an annular recess or socket surrounding said bolt, of a lid pivotally mounted upon the bolt and adapted to fit between said ribs, said lid having a projection fitting into said recess, and a spring surrounding the bolt and bearing against the lid.

2. The combination with a car journal-box having an opening in its forward end, ribs at the sides of said opening, and a projecting bolt above said opening, there being an annular recess or socket surrounding said bolt, of a lid pivotally mounted upon the bolt and adapted to fit between said ribs, said lid having an annular projection fitting into said recess, and a spring surrounding the bolt and bearing against the lid.

3. The combination with a car journal-box having an opening in its forward end, ribs at the sides of said opening, and a projecting bolt above said opening, there being an annular recess or socket surrounding the bolt, of a lid pivotally mounted upon said bolt and adapted to fit between the ribs, and having an annular projection fitting into said recess, a flanged sleeve upon the bolt, and a spring interposed between the lid and the flange upon the sleeve.

708,787. POWER-HAMMER. JARED B. MCLANE, North Reading, Mass. Filed Oct. 18, 1901. Serial No. 79,079. (No model.)

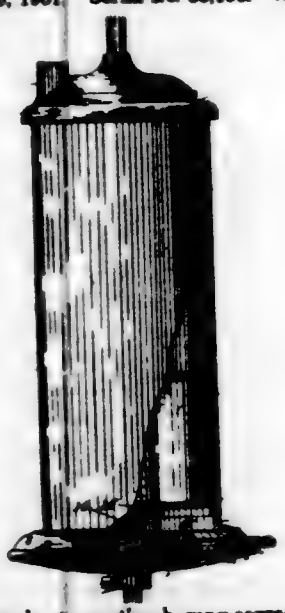


Claim.—1. In a power-hammer, the combination of a hammer, a hammer-operating member, and a connection between the two including a pair of links suspending the hammer at their outer ends, and a lyre-shaped spring device connected with the hammer-operating member and having two depending spring-arms formed with outwardly and upwardly recurved terminal portions connected to the outer ends of the links.

2. In a power-hammer, the combination of a frame having a seat for a guide, hammer-operating means mounted on said frame, a hammer, a guide therefor, having an unplaned back, bolts detachably securing the guide to said seat on the frame, and a soft packing interposed between the guide and said seat.

3. In a power-hammer, the combination of a frame having a seat for a guide, hammer-operating means mounted on said frame, a hammer having a dovetailed guide-engaging portion, a guide for said hammer comprising a gib-holder engaging the back of said dovetailed portion of the hammer, gibs mounted in said holder and engaging the edges of said dovetailed portion, and bolts passing through said gibs and gib-holder and detachably securing the same together and to said seat on the frame.

708,788. WATER-HEATER. HENRY W. O'DOWD, New York, N. Y. Filed Oct. 26, 1901. Serial No. 80,138. (No model.)



Claim.—1. A water-heater section having corrugated sides as shown, tubes uniting the top and bottom corresponding in number with the corrugations and located concentrically therewith, a deflecting-plate midway between the bottom and top surfaces and united with the tubes in the manner shown, and a central waterway in the top and bottom with means for connecting one section with another, substantially as herein shown and described.

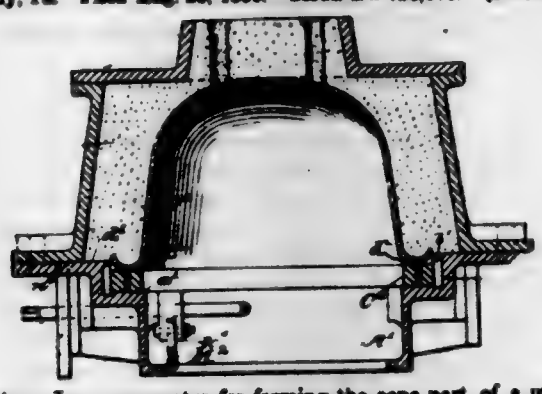
2. The combination in a water-heater of cast sections, central threaded parts for connecting the sections said parts being provided with water-passages, the sections having corrugated sides and tubes corresponding in number to the corrugations and placed concentrically therewith, a deflecting-plate centrally of the sections and uniting with the tubes, and the sections mounted to alternate the tubes and corrugations so that the tubes and corrugations of one section will have a staggered relation to those of the adjacent sections, substantially as herein set forth.

708,789. ANCHOR. JACOB H. REED, Philadelphia, Pa. Filed Mar. 6, 1902. Serial No. 96,982. (No model.)

Claim.—An anchor having a shank, a fluke rigidly connected thereto, said shank being of non-circular section and embodying a spiral conformation, a stock, having an eye extending vertically clear through it and adapted to said shank, said stock being free for longitudinal movement with respect to said shank to a position in close proximity to the fluke, and arranged to be rotated, in sliding downward over said spiral conformation, to a position in the plane of the fluke, and in sliding upward, to a position approximately perpendicular to the plane of the fluke, and being maintained in all adjustments in perpendicular relation to said shank, and a clevis adapted to be engaged by a cable, the respective side members of which clevis are engaged with the stock on opposite sides of the shank, the arrangement being such that said clevis has lateral swing

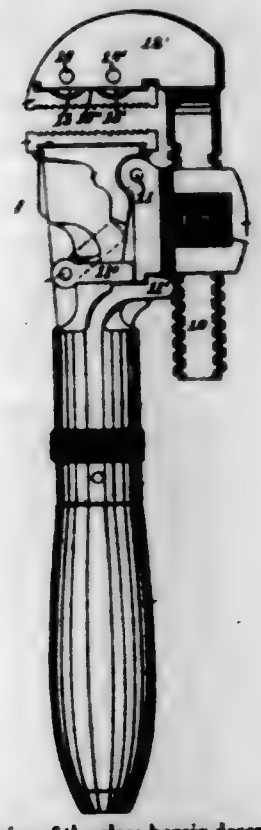
or movement with respect to the stock with the result that said clevis when the stock is at the upper end of the shank may extend in line above the shank, and may, when the stock is to be moved down the shank, be thrown to one side to clear the shank.

708,740. APPARATUS FOR MOLDING. JOHN C. REED, Allegheny, Pa. Filed Aug. 23, 1899. Serial No. 728,571. (No model.)



Claim.—In an apparatus for forming the cope part of a mold, the combination of a pattern, a frame to which said pattern is secured, vibrating arms or bars attached to said frame, a base upon which said frame rests, formed with a depression to receive said frame, and with openings for the passage of said vibrating arms, a cope part, and mechanism for separating the cope from the base, comprising transverse shafts coupled together for conjoint action, cams upon said shafts, yokes in which said cams work, and pins projecting from said yokes and bearing on the cope, substantially as described.

708,741. COMBINATION-WRENCH. GEORGE H. R. LUTHERBOCHER, Brooklyn, N. Y. Filed Dec. 17, 1900. Serial No. 40,145. (No model.)



Claim.—1. A device of the class herein described comprising a body provided with a reduced portion having an engaging lip, and with a spindle-socket, a spindle within said socket and having a boss, and a keeper on said spindle at the outer side of said boss, the said keeper having a flange at one face thereof adapted to engage said lip and lock said spindle against displacement from said socket.

2. A device of the class herein described comprising a hollow body; a cutter-carrier within said body, and therein movable longitudinally; means for holding said carrier against a rotary movement; a spindle having a threaded engagement with said carrier; and a rotatable keeper capable, when in its locked position, of normally holding said spindle against movement independent of said body, and of permitting a rotary movement of said spindle though loosely holding said spindle against displacement from said body, when the said keeper is eased out of its locked position.

3. A device of the class herein described comprising a body, a cradle having a swinging movement with respect to said body, means for limiting the movement of said cradle away from said body, and a suitably-fulcrumed lever for locking said cradle at the limit of its movement away from said body.

4. A device of the class herein described comprising a hollow body, a carrier within and longitudinally movable with respect to said body, a rotary disk-cutter on said carrier, means for imparting a longitudinal movement to said carrier, means for locking said carrier when moved to any desired position, a cradle having a swinging movement with respect to said body, means for limiting the movement of said cradle away from said body, a suitably-fulcrumed lever for locking said cradle at the limit of its movement away from said body, an adjustable shank in said cradle, the said shank having a recessed head lying opposite to said cutter, and a pair of rollers in the recess of said head, the said rollers being located one on each side of the center line of said cutter, substantially as herein described.

708,742. CLOTHES-HOOK. COLIN SALMOND, San Francisco, Cal. Filed Sept. 12, 1900. Serial No. 29,848. (No model.)

Claim.—1. In a device of the nature indicated, a base, a casing thereon and having a slot therein, and a hook having swinging connection with said casing and lying in said slot when in closed position but adapted to be swung outwardly therefrom, the point of swinging connection between the said hook and casing being suitably removed from the said base, said casing inclining backwardly to said base from said point of swinging connection, and said hook also so inclining when in closed position; substantially as described.

2. In a device of the nature indicated, a casing having a slot therein, a hook member having a part thereon movable in said slot, and a weighted portion within said casing upon said part and forming a shoulder therewith, said hook and weighted member having free play in said casing; substantially as described.

3. In a device of the nature indicated, a casing having a slot therein, a hook member, an inwardly-extending arm thereon resting upon the lower wall of said slot, said arm having its lower face so formed that when the hook is in open position said face inclines upwardly and outwardly with relation to said wall, and a weighted member within said casing and upon said arm, a shoulder being formed extending laterally from said arm to prevent passage of said weighted member through said casing-slot, said parts having free play in said casing whereby the said hook can be thrown into open or closed position; substantially as described.

4. In a device of the nature indicated, a base, a hook, means for supporting said hook upon said base and permitting said hook to swing with relation to said base, and a weighted member upon said hook and lying against said base, the face of said weighted member adjacent said base being inclined away from said base and the hook, whereby as said weighted member is pressed toward said base the hook is rocked outwardly; substantially as described.

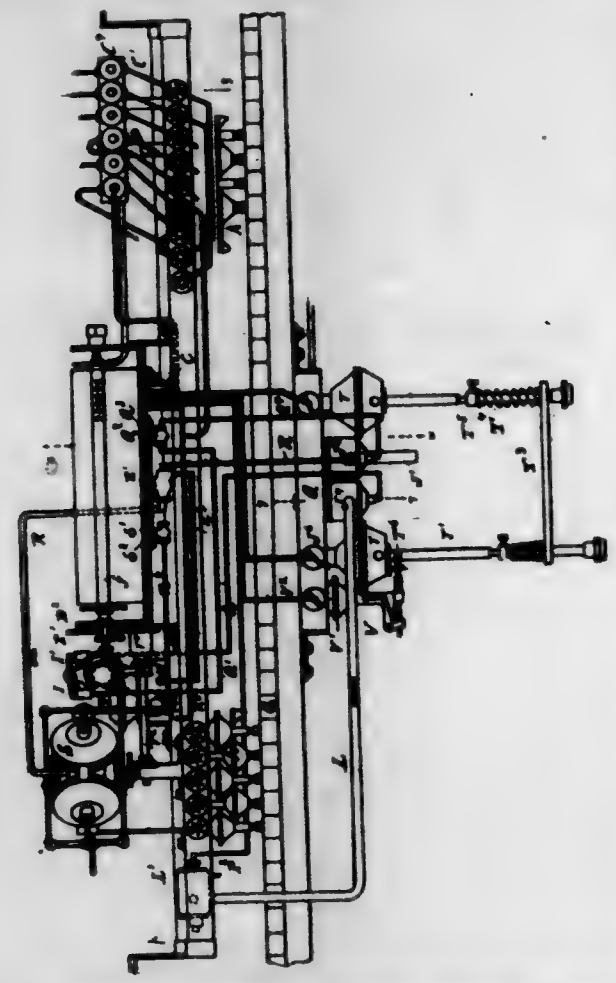
5. In a device of the nature indicated, a base, a hook, means for supporting said hook upon said base and permitting said hook to swing with relation to said base, and a weighted member upon said hook and lying against said base, the face of said weighted member adjacent said base being curved away from said base and the hook, whereby as said weighted member is pressed toward said base the hook is rocked outwardly; substantially as described.

708,748. PLAYING ATTACHMENT FOR KEY MUSICAL INSTRUMENTS. HARRY M. SALYER, New York, N. Y., assignor to Ludwig & Company, New York, N. Y., a Firm. Filed Jan. 10, 1901. Renewed May 5, 1902. Serial No. 105,975. (No model.)

Claim.—1. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the same, of a pneumatic mechanism for reversing the music-sheet-moving gear and at the same time controlling the admission of air to the pneumatic playing mechanisms, substantially as herein shown and described.

2. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the same, of a pneumatic mechanism for re-

vering the music-sheet-moving gear and at the same time controlling the admission of air to the pneumatic playing mechanisms, and a motor for operating the music-sheet-moving gear, substantially as herein shown and described.



3. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the bridge, of two valve-casings, a valve in each for controlling the admission of compressed air to the pneumatic mechanisms, a tube connected with each casing, a controlling-valve connected with each tube, means for operating said valves so as to keep one open while the other is closed and a pneumatic mechanism for operating said means, substantially as herein shown and described.

4. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the bridge, of two valve-casings, a valve in each for controlling the admission of compressed air to the pneumatic mechanisms, a tube connected with each casing, a controlling-valve connected with each tube, means for operating said valves so as to keep one open while the other is closed and a pneumatic mechanism for operating said means and a hand-cock in the tube connected with one of said casings, substantially as herein shown and described.

5. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the same, of a valve-casing connected with a compressed-air-supply tube, a valve in said casing, pneumatic means for controlling said valve and a pneumatic mechanism for actuating said pneumatic valve-controlling means and the music-sheet-moving means, substantially as herein set forth.

6. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the same, of a valve-casing connected with a compressed-air-supply tube, a valve in said casing, a second valve-casing, connected with the first-mentioned valve-casing, a valve in said second casing, a pneumatic means in each casing for controlling the valve therein, a pneumatic mechanism for controlling the sheet-moving means and the pneumatic valve-controlling means at the same time, substantially as herein shown and described.

7. In a self-playing attachment for musical instruments, the combination with pneumatic playing mechanisms, a duct-bridge and means for moving a music-sheet over the same, of a valve-casing connected with a compressed-air-supply tube, a valve in said casing, a compressed-air motor, a tube connecting the motor with said valve-casing, a second valve-casing connected with the first-mentioned valve-casing, compressed-air chambers connected with said second valve-casing, a valve in said second casing, a pneumatic means for each casing for controlling the valve therein, and a pneumatic mechanism for controlling the sheet-moving means and the pneumatic valve-controlling means aforesaid, at the same time, substantially as herein shown and described.

8. In a self-playing attachment for musical instruments, the combination with a duct-bridge, and means for moving a music-sheet over the same, of compressed-air chambers, a valve for controlling the admission of compressed air into said chambers, a tube connected with the casing of said valve, a valve at the end of said tube, a cock in said tube and a pneumatic mechanism for controlling the sheet-moving mechanism and the valve at the end of the above-mentioned tube, substantially as herein shown and described.

9. In a self-playing attachment for musical instruments, the combination with a duct-bridge and a means for moving a music-sheet over said bridge, of a pneumatic mechanism for controlling said sheet-moving means, compressed-air chambers, a valve controlling the admission of compressed air into said chambers, means for controlling the said admission-valve by hand, and additional means for controlling the said admission-valve automatically, which automatic means are operated by the pneumatic mechanism controlling the sheet-moving means, substantially as herein shown and described.

10. In a self-playing attachment for musical instruments, the combination with two music-sheet-roller shafts, of gearing for rotating them, a means for throwing either shaft in gear, a pneumatic mechanism for operating the gear-shifting means and means for controlling the supply of motive power to the key-actuating mechanism, by the same pneumatic mechanism that operates the gear-shifting means, substantially as herein shown and described.

11. In a self-playing attachment for musical instruments, the combination with two music-sheet-roller shafts, of gearing for rotating them, a sleeve for throwing either shaft in gear with the driving mechanism, a lever for operating the sleeve, a pneumatic mechanism for operating the lever step by step and a valve for controlling the music-producing mechanism, which valve is also controlled by said lever, substantially as herein shown and described.

12. In a self-playing attachment for musical instruments, the combination with a duct-bridge, of a means for moving a music-sheet over the bridge, a sleeve for throwing said means in gear, a lever for shifting the sleeve, two arms on said lever, a pneumatic mechanism for operating the lever, two valves for controlling the admission of compressed air to various pneumatic mechanisms, a valve for controlling each admission-valve, said controlling-valve having stems in the paths of the arms of the aforesaid lever, substantially as herein shown and described.

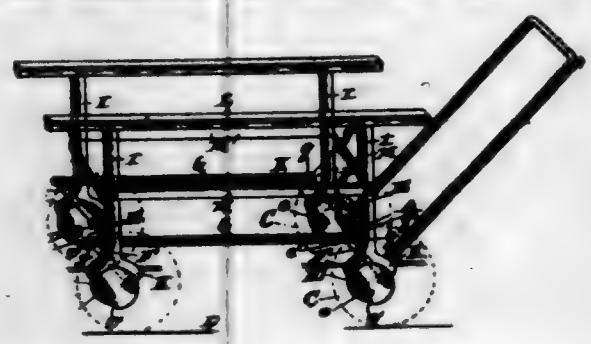
13. In a self-playing attachment for musical instruments, the combination with a duct-bridge said means for moving a music-sheet over the same, of compressed-air mechanisms for operating the sound-producing devices and rarefied-air mechanisms for controlling said compressed-air mechanisms from the music-sheet, substantially as herein shown and described.

14. In a self-playing attachment for musical instruments, the combination with a duct-bridge said means for moving a music-sheet over the same, of compressed-air mechanisms for operating the music-producing and other devices, a rarefied-air mechanism, connected with each compressed-air mechanism and ducts extending from said rarefied-air mechanisms to the duct-bridge, substantially as herein shown and described.

15. In a self-playing attachment for musical instruments the combination with a duct-bridge having ducts and a chamber connected with all the ducts, of means for adjusting the connection between each duct and said chamber and means for rarefying the air in said chamber substantially as herein shown and described.

16. In a self-playing attachment for musical instruments the combination with a duct-bridge having ducts, a chamber formed in said bridge and an aperture extending from each duct to said chamber, of a screw at each duct for adjusting the size of the aperture extending from the duct to said chamber and means for rarefying the air in said chamber, substantially as herein shown and described.

703,744. ELEVATING-TRUCK. ALEXANDER A. SCOTT, Knoxville, Tenn. Filed Nov. 14, 1901. Serial No. 82,370. (No model.)



Claim.—1. In an elevating-truck, wheels journaled on the axles, cams keyed to the axles between said wheels, means to cause the operation of said cams simultaneously, and a platform having legs constructed to ride on said cams, substantially as shown and described.

2. In an elevating-truck, cams keyed to the front and rear axles having a flange and shoulder, means to cause a simultaneous oscillation of said cams, and a separable platform having legs constructed to ride on said cams, substantially as shown and described.

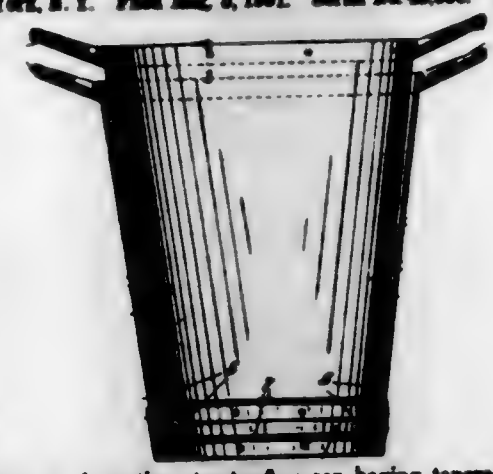
3. In an elevating-truck, the platform consisting of parallel horizontal beams, legs attached to said beams, segmental bases fixed to said legs, and means attached to the axles of the truck for raising and lowering said platform, substantially as shown and described.

4. In an elevating-truck, flanged cams keyed to the front and rear axles, arms keyed to said front and rear axles and pivotally connected to horizontal rods, and a platform having legs adapted to ride said cam, substantially as shown and described.

5. In an elevating-truck, cams keyed to the axles, a lever-handle fixed to the front axle, rocking arms fixed to the axles and connected by rods pivoted thereto, a platform having vertical legs, and segmental bases on said legs to ride on said cams, substantially as shown and described.

6. In an elevating-truck, a platform having parallel horizontal beams, legs fixed to said platform having segmental bases, cams keyed to the axles to receive said segmental bases, a shoulder on each cam to strike against the segmental base and limit the movement of the cam in raising the platform, a rocking frame secured to said axle, a lever-handle secured to one axle, and wheels journaled on said axles, substantially as described.

708,745. GARBAGE OR REFUSE CAN. ELIZABETH C. SHAHAN, New York, N. Y. Filed Mar. 5, 1901. Serial No. 49,936. (No model.)



Claim.—1. A nesting street-refuse can having tapered side walls and provided with a plurality of interiorly-located, separated, integral stops each formed from and by the inward projection of the metal forming such side walls, such stops being disposed at intervals around the can and in position to have their upper surfaces form bearing-surfaces to engage the lower part of another can and thereby permit the cans to be assembled without the jamming or wedging thereof.

2. A nesting street-refuse can having tapered side walls and provided with a plurality of interiorly-located, separated, integral stops each having a curved bearing-surface and formed from and by the inward projection of the metal of such side walls, such stops being disposed at intervals around the can and in position to have their curved surfaces engage the lower part of another can and thereby permit cans to be assembled without the jamming or wedging thereof.

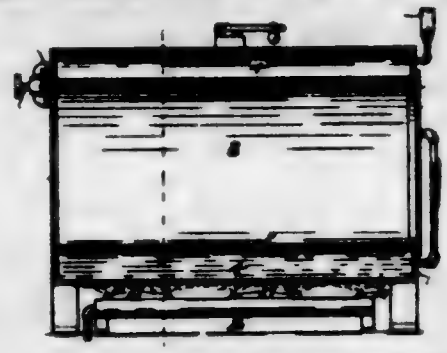
3. A nesting street-refuse can having tapered side walls and provided with a plurality of interiorly-located, separated, integral stops each formed from and by the inward projection of the metal of such side walls, such stops being disposed at intervals around the can and in position to have their upper surfaces form bearing-surfaces to engage the lower part of another can and thereby permit the cans to be assembled without the jamming or wedging thereof, and a bottom disposed interiorly of said can with a part thereof located at the point of flexure of the metal of the stops with the can-wall, whereby such bottom supports and reinforces such stops.

4. A nesting can having tapered side walls and provided with interiorly-located stops or supporting-faces disposed at intervals around the can and in position to engage a part of another can and thereby permit the cans to be assembled without the jamming or wedging thereof, and a hoop located on the exterior of said can and in position to reinforce that part thereof carrying the stops, and to externally enlarge that part of the walls below such stops and in position to be engaged by the stops on another can.

5. A nesting can having tapered side walls and provided with an interiorly-located integral stop in position to engage a part of another can and thereby permit the cans to be assembled without the wedging or jamming thereof, and a reinforcing-hoop exteriorly located and in position to reinforce that part of the can carrying said stop, and to externally enlarge that part of the walls below such stop and in position to be engaged by the stop on another can.

6. A nesting can having tapered side walls, a bottom having a flange lapping said walls, a plurality of integral stops located adjacent to such bottom and at intervals around such walls to engage a part of another can and thereby permit the cans to be assembled without the wedging or jamming thereof, and a reinforcing and enlarging hoop located on the exterior of said can at that part thereof provided with said stops, and extending to the lower end of the side walls.

708,746. APPARATUS FOR DRYING. CYRUS J. SALTZER, Philadelphia, Pa. Filed Sept. 26, 1901. Serial No. 76,447. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a boiler, of a hollow cylinder arranged therein and of smaller diameter than the boiler, whereby an annular chamber is formed between the boiler and the cylinder, one of the heads of the boiler being provided with an opening through which access may be had to the interior of the cylinder, a door for closing said opening, and a pipe arranged at the exterior of said boiler and leading from the annular chamber to and discharging within the interior of the cylinder, said pipe being provided with a valve for controlling communication between said annular chamber and the interior of said cylinder.

2. In an apparatus of the class described, the combination with a boiler, of a hollow cylinder arranged therein and of smaller diameter than the boiler, whereby an annular chamber is formed between the boiler and the cylinder, said cylinder being secured to and supported by the heads of the boiler, one of the heads of the latter being provided with an opening through which access may be had to the interior of the cylinder, a door for closing said opening, and a pipe arranged at the exterior of said boiler and leading from the annular chamber to and discharging within the interior of the cylinder, said pipe being provided with a valve for controlling communication between said annular chamber and the interior of said cylinder.

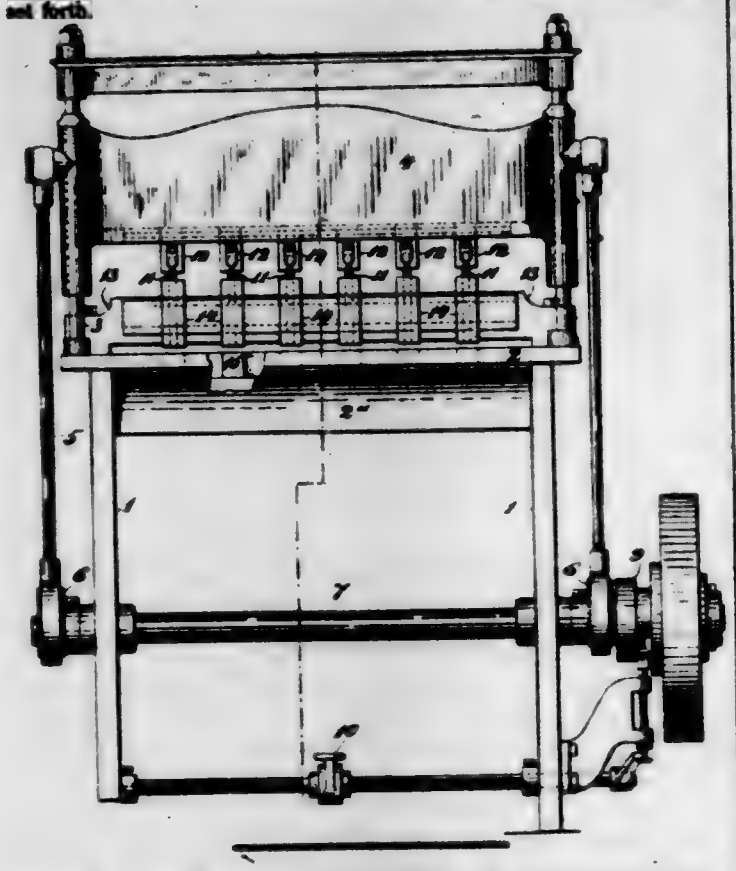
708,747. LOCKING DEVICE FOR USE IN PUNCHING-MACHINES OR THE LIKE. EDWIN R. SIMPSON, Brooklyn, N. Y. Filed Jan. 14, 1902. Serial No. 89,734. (No model.)

Claim.—1. In a machine of the character described having a support for the same, a movable part or element to be secured in place on said support, said element having mounted in it a locking device to secure it in place on the machine, said locking device comprising a jaw having a stem provided with a bearing in the element, and a screw driven into said element in a direction transversely to the axis of said stem, the said stem having on it a shoulder in position to be impinged upon by the conical tip of said screw for moving the stem longitudinally, the clamping-face of the jaw being on the side of the same opposite to the stem thereof, substantially as set forth.

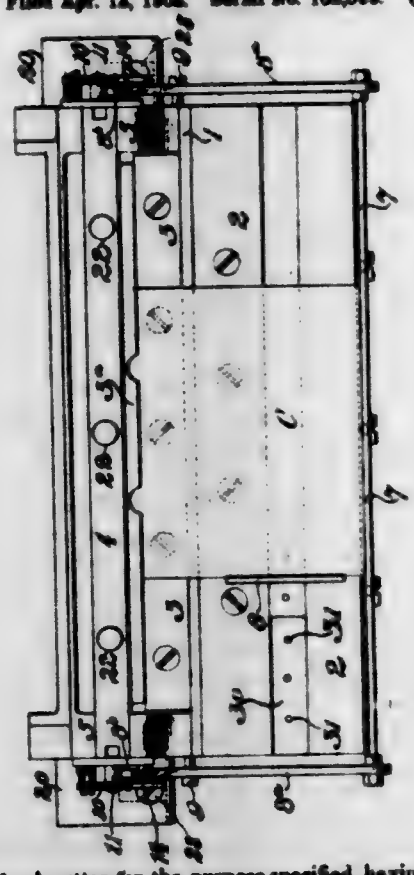
2. In a machine of the character described having a support for the same, a movable part or element to be secured in place on said support, said element having mounted in it a locking device to secure it in place on the machine, such locking device comprising a jaw in the nature of a plate which normally occupies a recess in the surface of the element, a stem on said jaw which extends into the body of the element, and which is provided with an inclined shoulder, and a cone-pointed screw which screws into said element in position to apply the conical surface of its point to the inclined shoulder on the stem to drive the jaw out from its recess, substantially as and for the purpose set forth.

3. The combination with a machine-bed having in it a slot and suitable supporting-shoulders, and a die-block supported on said shoulders and movable along said slot between the walls of the same, of a locking device carried by said block for locking it in position in the slot when adjusted, said locking device comprising a clamping-jaw 17, occupying a recess in the end of the die-block adjacent to the side wall of the slot in the bed, the shank 18, of said jaw, which shank extends into the block and has on it a shoulder, and the cone-pointed screw 20, driven in the

block transversely to the axis of said stem and in position to bear on the shoulder on the latter and thus drive the jaw forcibly outward and against the side wall of the containing-slot in the machine-bed, substantially as set forth.



708,748. TAB-CUTTING MACHINE. EDWIN B. STIMPSON, Brooklyn, N. Y. Filed Apr. 12, 1902. Serial No. 102,509. (No model.)



Claim.—1. A cutter for the purpose specified, having a bed to support the sheet to be cut, a movable cutting-blade, a movable back stop or gage for the sheet, means for operating the said cutting-blade, and means between the cutting-blade and back-stop which wholly displaces the latter when said blade makes its cutting movement, whereby the operator may remove the sheet by sliding it back off from the bed.

2. A cutter for the purpose specified, having a bed to support the sheet to be cut, a movable cutting-blade, a movable back stop or gage for the sheet, means for operating the said cutting-blade and back-stop substantially simultaneously, whereby the back-stop is wholly displaced when the blade makes its operative movement so that the sheet may be slipped back off the bed, means for detaining the displaced stop during a part of the retreating movement of the blade, and means for returning the stop to its normal position when released.

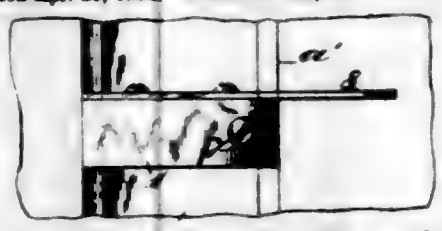
3. A cutter for the purpose specified, having a bed to support the sheet to be cut, a slide and its guides, a cutting-blade carried by said slide, a fixed blade on the bed, a movable back-stop for the sheet, mechanism between the said stop and slide whereby the former is actuated by the latter, said mechanism comprising the elbow-levers carrying the back-stop and studs on the slide adapted to actuate or rock said levers when the slide makes an operative movement, the retracting-springs of the levers, the locking-latches adapted to be upheld normally by said studs, and the studs in the levers for said latches to engage.

4. The combination with a slotted bed to receive the cutter, of the said cutter having a block 20 on and extending below its base to engage said slot, the locking-plate 24, provided with a stem 25 guided in a bore in the block, and a cone-pointed screw 28 driven in the block at an angle to the said stem and adapted to bear on a shoulder on the latter for moving out the clamping-plate into forcible contact with the wall of said slot, whereby the cutter may be moved along the slot in the bed and clamped at any desired point by means carried with the cutter.

5. The combination with the machine having a sliding head 18, a slotted bed 16, and holders 23 adjustably mounted on said head 18, of a cutter having a blade-carrying slide 4, provided with headed stems 22 to engage the holders 23, and means for locking the base of the cutter in the slotted bed 16, substantially as set forth.

6. A tab-cutter having a displaceable back-stop, a movable cutting-blade, and means between said blade and stop whereby the former wholly displaces the latter in its cutting movement, whereby space is provided for sliding the cut sheet back off from the bed.

708,749. ADJUSTABLE GUIDE. EDWIN B. STIMPSON, Brooklyn, N. Y. Filed Apr. 22, 1902. Serial No. 104,342. (No model.)

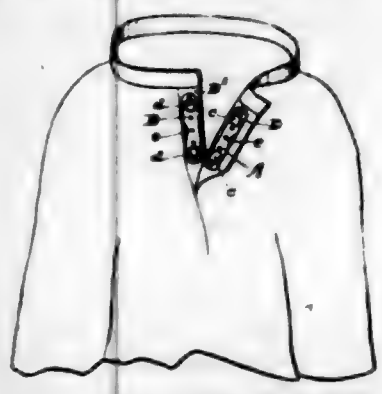


Claim.—1. A guide comprising a block with squared ends, a clamping-plate occupying a recess in one end of the block and provided with a shouldered stem slidable in the block, a screw with a conical tip set in the block and adapted to engage the shoulder on said stem, and a guide-plate secured to said block and extending out therefrom parallel with the side of the block, substantially as set forth.

2. A guide comprising a block having squared ends parallel with each other, a screw clamping device mounted in said block for securing it in position, and a guide-plate secured to one side or lateral face of said block, the said plate extending out beyond the end of said block and having the lower edge of said extended portion parallel with the upper and lower faces of the block, substantially as set forth.

3. The combination with a bed having a guideway with parallel sides formed therein, of a guide comprising a block with squared, parallel end faces mounted in said guideway, a clamping device carried by said block for securing it fast in the guideway when adjusted, and a guide-plate carried by said block and extending transversely of the guideway, said plate extending out beyond the block and having its lower edge coincident with the surface of said bed, substantially as set forth.

708,750. PLACKET-FASTENER. NELSON B. TAYLOR and WILLIAM C. ATWATER, Chicago, Ill. Filed Nov. 8, 1899. Serial No. 736,342. (No model.)



Claim.—1. As an article of manufacture, a fastener for plackets and similar openings in articles of wear comprising two separate thin flat strips of flexible material adapted to be secured to the opposite sides of the opening, one of said strips being provided with a pair of inwardly-extending tongues, one on each end, and the other strip having a corresponding pair of outwardly-extending tongues, said tongues extending above and at an

acute angle to the meeting faces of the strips, whereby said strips may be interlocked by bending the latter strip over the former until its tongues pass below the corresponding tongues of the former strip, and then allowing it to straighten itself by its own endwise expansive tendency, substantially as described.

2. As an article of manufacture, a fastener for plackets and similar openings in articles of wear comprising two separate thin flat strips of flexible material adapted to be secured to the opposite sides of the opening, one of said strips having a pair of inwardly-extending tongues, one on each end, cut and raised from the material of the strip, and the other strip having a corresponding pair of outwardly-extending tongues similarly cut and raised from the material of the strip, said tongues extending at an acute angle to the meeting faces of the strips, whereby said strips may be interlocked by bending the latter strip over the former until its tongues pass below the corresponding tongues of the former strip, and then allowing it to straighten itself by its own endwise expansive tendency, substantially as described.

3. As an article of manufacture, a fastener for plackets and other openings comprising two separate thin flat strips of flexible material adapted to be secured to the opposite sides of the opening, one of said strips being provided with a plurality of inwardly-extending tongues, and the other strip having a corresponding plurality of outwardly-extending tongues, said tongues extending above and at an acute angle to the meeting faces of the strips, whereby said strips may be interlocked by bending the latter strip over the former until its tongues pass below the corresponding tongues of the former strip, and then allowing it to straighten itself by its own endwise expansive tendency, substantially as described.

708,751. GARMENT. WILLIAM P. C. ADAMS, Olympia, Wash., assignor of one-half to Robert J. Priekman, Olympia, Wash. Filed Nov. 13, 1901. Serial No. 82,108. (No model.)

Claim.—1. A body-garment, having a waistband or belt permanently attached to the exterior thereof along its upper edge only and adapted to receive thereunder the waistband of the trousers, said garment having a series of slits or apertures therein located beneath said attached waistband or belt to permit the passage therethrough of the ends of an underlying suspender and their attachment to the suspender-buttons on the trousers-waistband.

2. A body-garment, having a waistband or belt permanently attached thereto along its upper edge only and adapted to receive thereunder the waistband of the trousers, said belt separated at its back and provided with an elastic coupler uniting its ends.

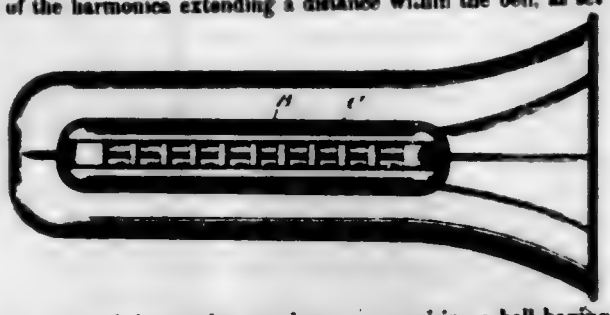
3. A body-garment, having a waistband or belt permanently attached thereto along its upper edge only and adapted to receive thereunder the waistband of the trousers, said belt separated at its back and provided with a detachable elastic coupler uniting its ends.

4. A body-garment, having a waistband or belt permanently attached thereto along its upper edge only and adapted to receive thereunder the waistband of the trousers, said belt separated at its back and provided with a detachable and adjustable elastic coupler uniting its ends.

708,752. ATTACHMENT FOR MOUTH-HARMONICAS. ARTHUR S. ALEXANDER and ALFRED VIEHER, New York, N. Y. Filed Jan. 18, 1902. Serial No. 90,295. (No model.)

Claim.—1. A mouth-harmonica attachment, comprising a bell having in its side an opening extending lengthwise of the side, and terminating a distance from each end of the bell, the opening being arranged to receive the mouth-harmonica from within the bell, and fastening devices within the bell for holding the mouth-harmonica in position, as set forth.

2. The combination with a mouth-harmonica, of an attachment comprising a bell having in its side an opening into which the said mouth-harmonica is inserted from within the bell, and fastening devices in the bell for holding the mouth-harmonica in position thereon, the discharge edge of the harmonica extending a distance within the bell, as set forth.

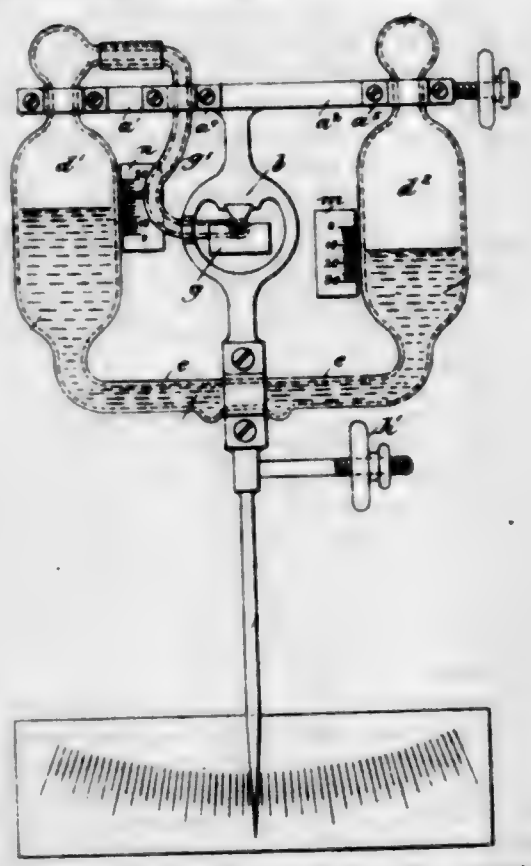


3. A mouth-harmonica attachment, comprising a bell having in its side an opening for the reception of the mouth-harmonica, and fastening devices in the bell for holding the mouth-harmonica in position, one of the said fastening devices being fixed at the closed end of the bell and the other fastening device being movable at the mouth of the bell, as set forth.

4. The combination with a mouth-harmonica having longitudinal ribs on its cover, of a bell having in its side an opening for the insertion of the mouth-harmonica, the said ribs abutting against the wall of the bell at the inside thereof, and fastening devices for holding the mouth-harmonica in position on the bell, as set forth.

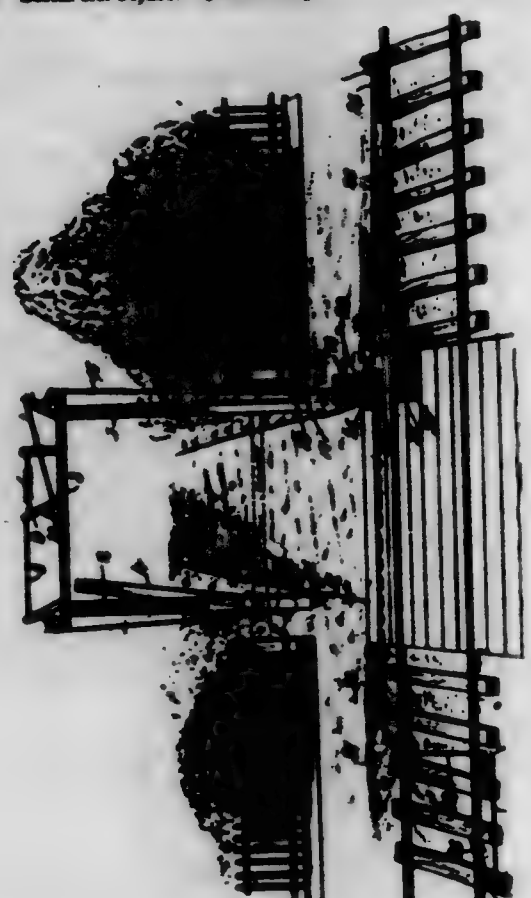
5. The combination with a mouth-harmonica having tapering sides, of a bell provided in its side with an opening having a width somewhat less than the width of the mouth-harmonica at the discharge edge thereof for the side walls of the opening to limit the outward movement of the mouth-harmonica on inserting the latter into the said opening from the inside of the bell, the said discharge edge extending a distance within the bell, and fastening devices for holding the mouth-harmonica in position on the bell, as set forth.

708,753. INSTRUMENT FOR INDICATING THE PRESSURE OF GAS. MAX ARNDT, Aix-la-Chapelle, Germany. Filed Jan. 17, 1898. Serial No. 666,085. (No model.)



Claim.—Apparatus such as described, comprising a scale-beam, knife-edge and support, a vessel open to the atmosphere held in one end of the scale-beam, a closed vessel held in the other end thereof, a rigid tube e connecting the bottoms of the vessels, a flexible inlet-tube for gas leading from the support near the knife-edge to the upper end of the closed vessel, fixed scales proximate the liquid-levels in the vessels, whereby the reading on said scales will equal the difference between the elevation or depression of the liquid-level due to the swing of the apparatus and that due to the displacement of the liquid from one vessel to the other, and adjustable weights above and below the knife-edge to set the connected parts to a predetermined scale-point, and a pointer secured to the beam and arranged to travel over a suitable scale to indicate the amount of swing of the entire instrument, substantially as and for the purpose set forth.

708,754. CROSSING-GATE. MARK C. BARRY, Atlanta, Ga., assignor of one-half to Andrew L. Barry, Atlanta, Ga. Filed Mar. 10, 1902. Serial No. 97,469. (No model.)



Claim.—1. A crossing-gate comprising a frame, a gate-bar mounted to swing in said frame, a spring for moving said gate-bar to closing position, a sliding bar arranged at one side of the track and operating to release the spring tension, a locking device for said bar, and devices actuated by a train for moving the locking device out of engagement with the sliding bar, substantially as specified.

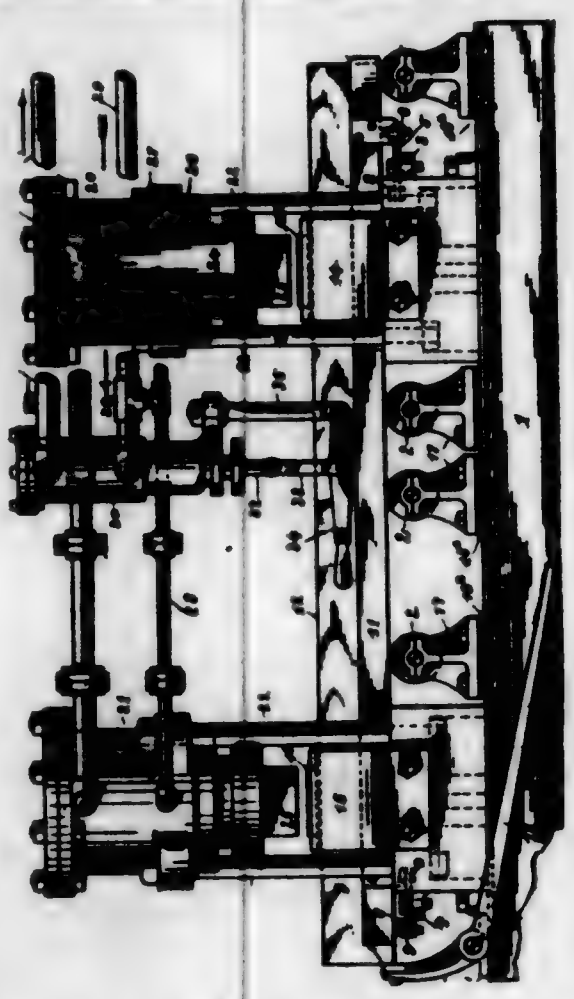
2. A crossing-gate comprising a frame, a gate-bar mounted to swing in the frame, a spring for moving said gate-bar to closing position, a sliding bar arranged at one side of the track and having connections for releasing the tension of the spring, a locking-block for the bar, means operated by a train for moving the locking-block out of engagement with the bar, and means operated by a train for resetting the sliding bar, substantially as specified.

3. A crossing-gate comprising a frame, a gate-bar mounted to swing in the frame and weighted rearward of its pivot, a spring for moving the gate-bar to closing position, a frame arranged at one side of the track, a sliding bar movable transversely through said frame and having connections for releasing the tension of the spring, a locking-block guided vertically in said frame, angle-levers mounted on opposite sides of the frame and having pivotal connection with the block, rock-shafts arranged at opposite sides of the track and at opposite sides of the crossing, connections between said rock-shafts and the angle-levers, and levers mounted on said rock-shafts and adapted to be engaged by a part carried by a train, substantially as specified.

4. A crossing-gate comprising a frame, a gate-bar mounted to swing in the frame, a spring for moving said gate to closing position, a frame arranged at one side of the track, a sliding bar movable transversely through said frame and operating to release the spring, releasing-levers arranged at opposite sides of the track and at opposite sides of the crossing, connections between said levers and the sliding bar for releasing the same, a resetting-lever mounted to swing horizontally between the rails, and a connection between said resetting-lever and the sliding bar, substantially as specified.

5. A crossing-gate comprising a frame having uprights and a cross-timber at the top, a gate-bar mounted to swing on one of the uprights, an angle-lever having connection with the gate-bar rearward of its pivotal point, a lever-mounted on the cross-bar, a connection between the upper end of said lever and the upwardly-disposed member of the angle-lever, a fixed standard on the cross-bar, a spring connection between said standard and the upper portion of the lever, an angle-lever at the opposite end of the cross-bar, a connection between the upwardly-disposed member of said angle-lever and the lower end of the spring-holding lever, an angle-lever arranged at the base of the frame and having connection with a member of the last-named angle-lever, a frame arranged between the track and the angle-lever at the base of the frame, a sliding bar movable transversely through said frame, a yielding connection between said lever and the sliding bar, a locking-block guided vertically in the frame, angle-levers mounted on the frame at opposite sides and connecting with the block, rock-shafts arranged at opposite sides of the track and at opposite sides of the crossing, connections between said rock-shafts and the angle-levers on the frame, levers on said rock-shafts, a horizontally-swinging curved lever between the track-rails, and a connection between said horizontally-swinging lever and the sliding bar, substantially as specified.

708,755. TIE-PLATING MACHINE. GEORGE L. BENDER, San Francisco, Cal., assignor of one-half to W. A. Bender, San Francisco, Cal. Filed Oct. 26, 1901. Serial No. 79,856. (No model.)



Claim.—1. A tie-plating apparatus comprising means for receiving and centering a tie, devices for holding tie-plates gaged to the tie, and means for exerting pressure upon the tie-plates and driving same into the tie.

2. A tie-plating apparatus comprising means whereby the tie is received and centered, spaced devices for receiving the tie-plates and holding same gaged to the tie, devices for limiting the inward movement of the tie and means for forcing the tie-plates into the tie.

3. A tie-plating machine comprising means for receiving the tie to be plated, adjustable gage-plates for the tie-plates, mechanism whereby the tie is centered and held during the operation of plating, and adjustable means for exerting pressure upon the tie-plates and forcing same into the tie.

4. In a tie-plating machine, the combination with the supporting-rails for the tie, of means for centering and locking the tie to be plated.

5. In a tie-plating machine, the combination with the bed, of means for centering the tie placed thereon and holding same locked during the operation of applying tie-plates to the tie, gage-plates for the tie-plates, vertically-movable pistons for forcing the tie-plates into the tie, and of means for imparting vertical movement to the said pistons.

6. In a machine of the described character, the combination with the bed, of tie-rails arranged above the bed, cushions interposed between the bed and rails, and means whereby the tie is centered and held centered.

7. In a tie-plating machine, the combination with the bed, of gage-plates for the tie-plates adjustably secured thereto, of means whereby the tie is centered and held centered during the operation of applying tie-plates to the tie, and mechanism whereby the tie-plates are forced into the tie.

8. In a machine of the described character, the combination with the bed, of the gage-plates attached thereto, means for centering and hold-

ing the tie centered to the work, of vertically-movable pistons, and mechanism for imparting movement to said pistons.

9. The combination with the bed, of the gage-plates attached thereto, a lever for limiting the inward movement of the tie, said lever being adjustably attached to the bed, and means for centering the tie and holding same centered to the work.

10. In a machine of the described character, the combination with the bed, of means for centering and holding the tie centered to the work, of the vertically-movable pistons, a die-plate attached to the stems thereof, and means for imparting movement to said pistons to force the dies carried thereby into the tie whereby an impression of the tie-plate is formed in the tie at proper points.

11. In a machine for applying tie-plates to a railroad-tie, the combination with movable pressure devices located at a predetermined distance apart, of tie-supporter toward which said movable pressure devices approach, and means for actuating said movable devices whereby the interposed tie-plates and tie are subjected to compression at the points of engagement between the tie-plates and tie.

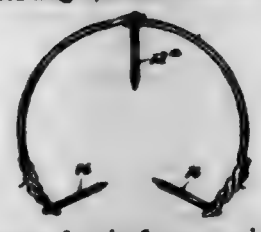
12. In a machine for applying tie-plates to ties, the combination with movable pressure devices located at a predetermined distance apart, of tie-supporter toward which said movable pressure devices approach, and means for actuating said movable pressure devices whereby the interposed tie-plates and tie are subjected to compression, and means adapted to engage one end of the tie to properly position the same with respect to the tie-plates.

13. In a machine for applying tie-plates to a railroad-tie, the combination with movable pressure devices located at a predetermined distance apart, of tie-supporter toward which said movable pressure devices approach whereby the interposed tie-plates and tie are subjected to compression, and means for retaining the tie in proper position with respect to the tie-plates while the latter are being inserted.

14. In a machine for applying tie-plates to a railroad-tie, the combination with movable pressure devices adjustably located at a predetermined distance apart, of tie-supporter toward which said movable pressure devices approach, means for actuating said movable pressure devices whereby the interposed tie-plates and tie are subjected to compression, means adapted to engage an end of the tie to properly position the same with respect to the tie-plates, and means for retaining the tie in the desired position relative to the plates while the latter are being applied.

15. In a machine for applying tie-plates to a railroad-tie, the combination with cylinders located at a predetermined distance apart, of pistons therein, of tie-supporter toward which such pistons are adapted to move and means for controlling the admission of fluid-pressure to said cylinders whereby the interposed tie-plates and tie are subjected to compression at the points of engagement between said plates and tie.

708,756. FENCE-WIRE FASTENER. REMUS M. RENFRO, Gettysburg, S. D. Filed Aug. 5, 1901. Serial No. 70,908. (No model.)



Claim.—1. A fastener for wire fences, consisting of a strand or band designed to be bent around a fence-post to secure a line-wire thereto, and having a nail at each end thereof, and a nail carried by the strand or band and located between the end nails.

2. A fastener for wire fences, consisting of a strand of wire designed to be bent around a fence-post to secure a line-wire thereto and having a nail loosely connected to each end thereof, and a nail loosely connected to the strand and located between the end nails.

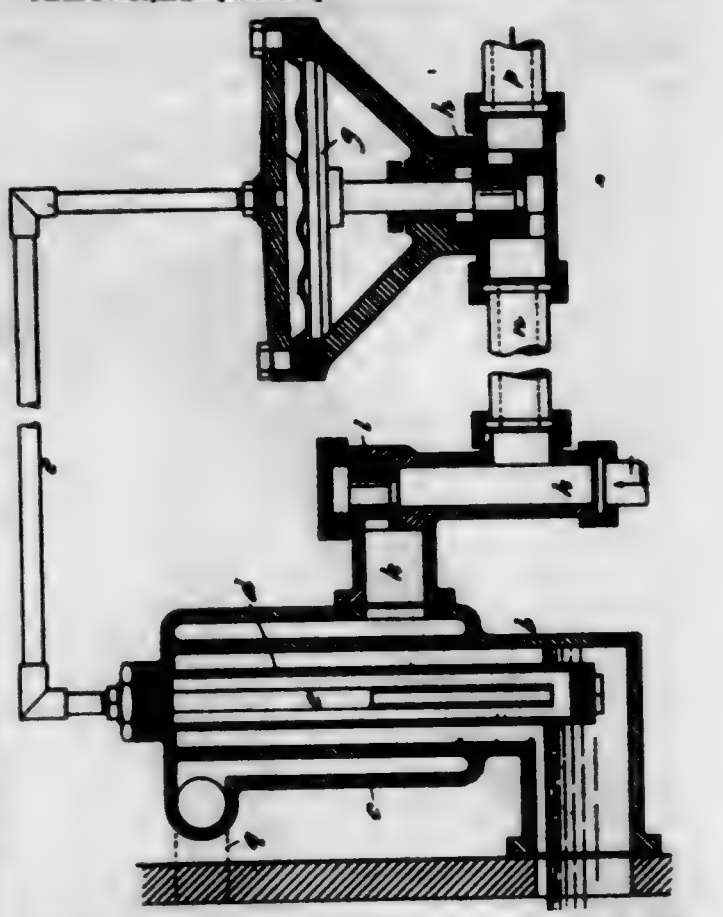
3. In a wire-fastener, in combination, a fence-post, a line-wire, and a fastener comprising a strand of wire bent around the post and having an intermediate pin and a pin flexibly connected to each end of the strand, the line-wire passing between the post and the strand and resting upon the intermediate pin of the latter.

4. In a wire-fastener, in combination, a fence-post, a line-wire, and a fastener comprising a strand of wire or band having a pin flexibly connected to each end, a pin intermediate of the ends of the strand, the strand being designed to be passed over the line-wire and the ends bent around the post and secured by the pins, and the strand being of sufficient length to partially or entirely encircle the post.

5. A fastener for wire fences, consisting of a strand designed to be bent around a fence-post to secure a line-wire thereto and having an eye at each end thereof and an intermediate eye, and a nail engaging each of said eyes.

6. In a wire-fastener, in combination, a fence-post, a line-wire, and a strand passing over the line-wire and about the post and having its ends secured to the side of the post opposite to the line-wire, and a nail loosely connected to each of the said ends for securing the same.

708,757. AUTOMATIC FEED-REGULATOR FOR STEAM-BOILERS. JOHN R. V. BENFORD, Camberne, England. Filed Mar. 7, 1902. Serial No. 97,694. (No model.)



Claim.—An automatic feed-regulator for a steam-boiler comprising a vessel communicating at its bottom with the boiler at the normal water-level, and having a jacket communicating with the boiler and through a check-valve with the feed-pipe, within the said vessel an inner vessel communicating with a space covered by a flexible diaphragm bearing upon the stem of a valve situated in a by-pass to the suction of the feed, arranged and operating substantially as described.

708,758. PNEUMATIC RIVETING-TOOL. JOHN W. BERNSTROM and RICHARD W. FUNK, New York, N. Y., assignors to the Empire Pneumatic Tool Company, New York, N. Y., a Corporation of New York. Filed Dec. 14, 1901. Serial No. 86,011. (No model.)

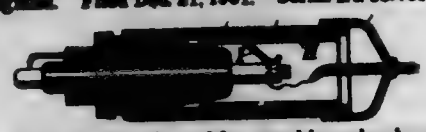
Claim.—1. The combination, with a casing provided with supply channels and ports, of a handle at one end of the same, a tool guided in the opposite end of the casing, a piston-valve located at the interior of the casing, said piston-valve being hollow and provided with circumferential grooves and an opening in one of said grooves, a return-channel connecting the rear end of the casing with the front end of the same, a sliding hammer in the casing, a cushioning-spring located between the piston-valve and handle, a channel connecting the interior of the casing with the space behind the valve, and shoulders at the rear end of the casing for arresting the spring and the piston-valve in their forward motion, substantially as set forth.

2. The combination, with a casing, of a bow-shaped handle attached to the rear end of the same, an inlet-valve in the handle, a supply-channel in the handle communicating with the supply-tube, a supply-channel in the rear portion of the casing, provided with ports, a hollow piston-valve in the rear portion of the casing provided with two circumferential grooves and an opening in one of said grooves, a sliding hammer in the casing, a sliding block closing the front end of the casing, a channel in the casing for supplying compressed air for the return of the hammer, a channel connecting the interior of the casing with the space between the piston-valve and the handle, and exhaust-ports for permitting escape of air from the interior of the casing between the slide-block and hammer, and between the hammer and piston-valve, respectively on the forward and return strokes of the hammer, substantially as set forth.

3. The combination, with a casing, of a handle attached to the rear end of the same, an inlet-valve in the handle, a supply-channel in the handle, a supply-channel in the rear portion of the casing provided with ports opening into the interior of the same, a return-channel in the cas-

ing provided with ports at the rear portion of the casing, a hollow piston-valve in the rear portion of the casing between the ports of the supply and return channels and provided with two annular grooves and an opening in one of said grooves to the interior of the valve, shoulders at the rear portion of the casing, a spring between the rear shoulder and the handle, a rim on the piston-valve adapted to abut against the other shoulder, the area of the rear end of said valve being slightly larger than that of its front end, a sliding hammer in the casing, a channel connecting the interior of the casing with the space behind the piston-valve, and exhaust-ports communicating with the interior of the casing, substantially as set forth.

708,759. ELECTRICAL SPARKING DEVICE. ALFRED C. BROWN, London, England. Filed Dec. 21, 1901. Serial No. 86,762. (No model.)



Claim.—1. The combination with a sparking-plug having a metallic body through which one of the electrodes passes, of a tubular condenser comprising two metallic tubes one of which is in immediate metallic union with the body of the plug while the other is contained within the first and is in direct connection with the wire or conductor terminating in the other electrodes of the device.

2. The combination with a sparking device for an internal-combustion engine comprising a metallic plug, an electrode connected therewith, and a second electrode passing through the plug but insulated therefrom, of a condenser, the capacity plates of which consist of two tubes insulated from one another one of which is connected with the plug and has its axis substantially coincident with the axis thereof, while the other is metallically connected with the conductor which terminates in the opposite electrode of the plug.

3. The combination with a sparking-plug, of a condenser whose two opposite plates are both in immediate direct and uninterrupted electrical connection with the two opposite sides or poles of said plug respectively, as and for the purpose set forth.

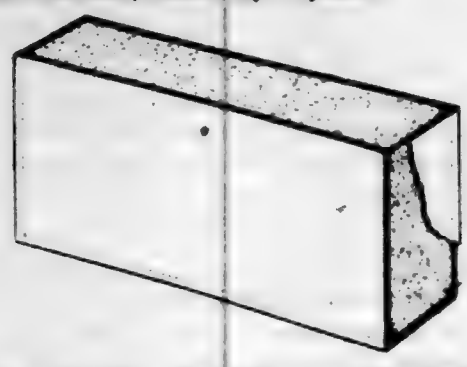
708,760. BRICK OR BLOCK. LEWIS A. BROWN, St. Louis, Mo. Filed Aug. 21, 1901. Serial No. 72,603. (No model.)

Claim.—1. The combination with a brick or block, of a metallic plate having projections rigid with its edges which extend into the body of the brick in different directions, substantially as specified.

2. The combination with a brick or block, of a metallic plate having its edges turned inwardly and inclosed within the brick or block, the exposed surface of the plate being of equal width with the body of the brick or block and forming the outer surface thereof, substantially as specified.

3. A brick, having one or more of its surfaces protected by metallic plates, the inner edges of which are turned into and molded within the brick, substantially as specified.

4. The combination with a brick, of a metallic plate having its edges turned inwardly and inclosed within the brick, the said plate forming the outer surface of the brick, substantially as specified

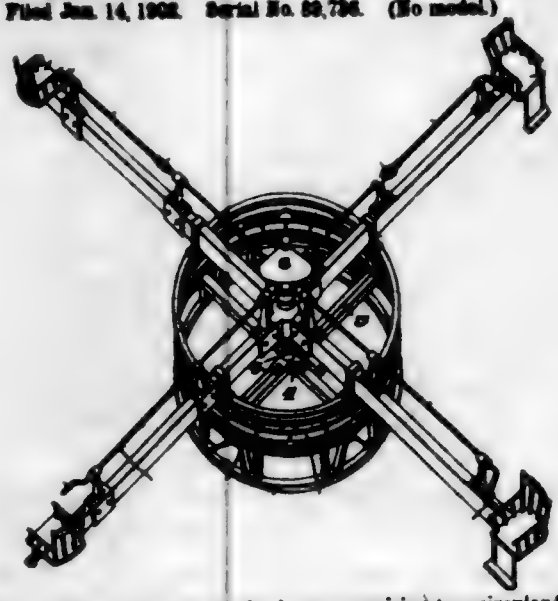


5. The combination with a brick, of a plate 1 having its edges 2 turned inwardly at an incline and inclosed within the brick, the said plate being connected thereto while the brick is being molded, substantially as specified.

6. The combination with a brick or block composed of sand, cement and sulfur, of a metallic plate having its edges turned inwardly and inclosed within the brick, the said plate forming the outer surface of the brick or block, substantially as specified.

7. The combination with a brick or block, of a metallic plate having projections extending into the body of the brick in different directions to prevent detachment of the said plate, substantially as specified.

708,761. MERRY-GO-ROUND. GEORGE D. BULLER, Duquesne, Pa. Filed Jan. 14, 1902. Serial No. 89,736. (No model.)

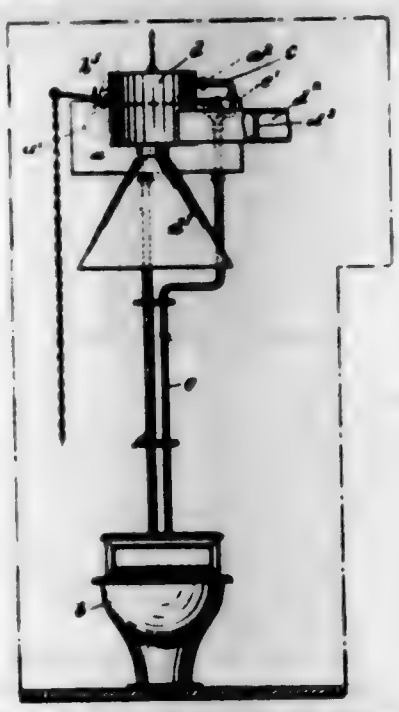


Claim.—In a merry-go-round, a base comprising two circular frames, suitably spaced apart with braces secured to the upper frame extending inwardly to the center thereof and carrying integrally-formed arms with a central boss carried by the arms, a track secured upon the upper of said frames, a frame carrying grooved wheels mounted on said track, a turn-table comprising a circular frame carrying a track on its under side engaging in said grooves of the wheels, a stationary shaft secured in said central boss, a series of cross-beams carrying a cross-head at their one end mounted on said shaft, yokes straddling the cross-beams and secured to the frame of the turn-table, means for operating the turn-table, chairs carrying U-shaped brackets seated on the upper face of the cross-beams with screw-threaded rods carried by the chair and passing through the cross-beams, U-shaped brackets secured to the under face of the cross-beams and means on the lower ends of the rods for engagement with the lower bracket whereby the seat may be retained in its predetermined position, substantially as described.

708,762. VENTILATOR. THEODORE M. CARPENTER and FRED L. BAKER, Los Angeles, Cal. Filed Oct. 18, 1901. Serial No. 79,168. (No model.)

Claim.—1. In a ventilator of the character described, a casing having an upper and lower compartment, the lower compartment having an inlet in its bottom and an outlet in its side, and the upper compartment having a conical bottom and provided with a water-supply pipe leading into the same above the bottom and a discharge-pipe leading from the bottom thereof, a vertical shaft mounted in the casing and having its ends extending into the compartments, a water-wheel mounted upon the upper end of the shaft in the upper compartment and into which the apex of the conical bottom of the upper compartment extends, said wheel being

provided with peripheral buckets, and a fan mounted upon the lower end of the shaft in the lower compartment, as set forth.



2. The combination of a casing, a partition therein, a cone on the top of the partition, an outlet-pipe leading from the casing at the base of the cone, a tube passing from the apex of the cone down to the partition, a shaft mounted in the tube, an annular flange arranged on top of the cone adjacent to its apex, a fan attached to the lower end of the shaft, a disk attached to the upper end of the shaft above the said annular flange, and buckets carried by the disk at the periphery thereof, the casing having inlet and outlet openings at each side of the partition, for the purpose specified.

3. The combination with a flushing-tank, of a casing arranged adjacent to the flushing-tank and formed with an upper and lower chamber, the upper chamber having a conical bottom and the lower chamber having an inlet in its bottom and an outlet in its side, a horizontal water-wheel mounted in the upper chamber and into which the apex of the conical bottom of the upper chamber extends, said wheel being provided with peripheral buckets, a fan in the lower chamber, the fan and wheel being mounted on a common shaft, a supply-pipe leading into the upper chamber and discharging onto the buckets of the wheel, a valve in said pipe, a float in the flushing-tank and controlling the valve, and a pipe leading from the upper chamber into the flushing-tank to convey the overflow of the wheel to said tank, as set forth.

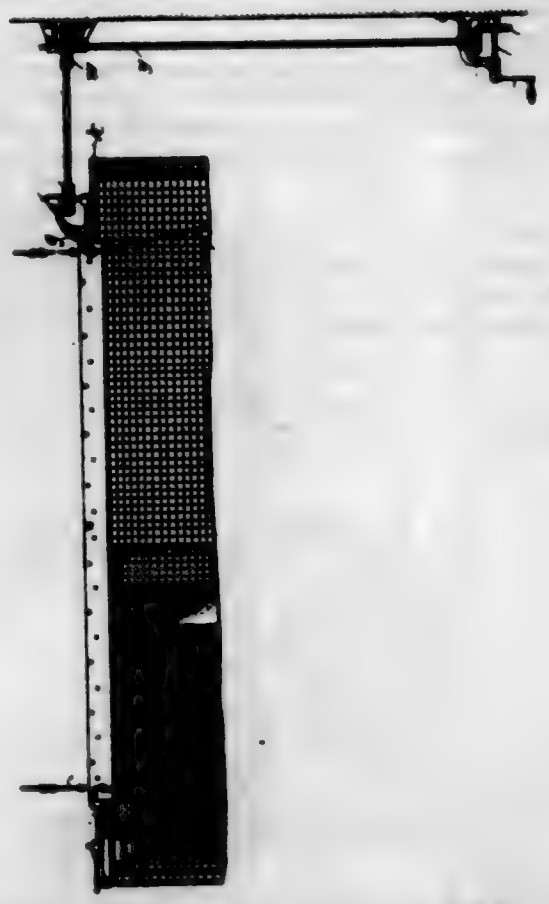
4. The combination with a flushing-tank, of a casing arranged adjacent to the flushing-tank and having two chambers one above the other, the upper chamber having a conical bottom, and the lower chamber having an inlet in its bottom and a valved outlet in its side, a head projecting from the bottom of the lower chamber, a horizontal water-wheel mounted in the upper chamber and into which the apex of the conical bottom of the chamber extends, said wheel having peripheral buckets, a fan mounted in the lower chamber, a vertical shaft mounted in the casing and carrying the fan and wheel, a water-supply pipe leading into the upper chamber of the casing, and discharging onto the water-wheel, a valve in the said pipe, a float in the flushing-tank and controlling the valve and a pipe leading from the bottom of the upper chamber into the flushing-tank to convey the overflow from the wheel to the said tank, as set forth.

5. The combination with a chamber having a conical bottom, of a water-wheel mounted in the chamber and comprising a disk having a downwardly-projecting peripheral flange carrying buckets, and an annular flange arranged on the conical bottom of the chamber and extending upward to within a short distance of the body of the wheel, as and for the purpose set forth.

6. The combination with a flushing-tank, of a casing arranged adjacent to the flushing-tank and having two chambers one above the other, the upper chamber having a conical bottom and an outlet leading from the bottom into the flushing-tank, and the lower chamber having an inlet on its bottom and a lateral outlet, a fan in the lower chamber, a water-wheel in the upper chamber and comprising a disk having a downwardly-projecting peripheral flange carrying buckets, the wheel and fan being mounted on a common vertical shaft, an annular flange arranged on the conical bottom and projecting to within a short distance of the body of the wheel, a water-supply pipe leading into the upper chamber of the casing and discharging onto the water-wheel, a valve in said pipe, and a float in the flushing-tank and controlling the valve, as set forth.

7. In a ventilator of the character described, the combination with a chamber provided with a conical bottom having a central opening, a tube fitting in the opening of the conical bottom and having a conical head at its upper end fitting upon the conical bottom of said chamber, a packing between the tube and the wall of the opening of the bottom, a shaft projecting through the tube and a water-wheel mounted on the upper end of the shaft, said wheel comprising a disk having a downwardly-projecting peripheral flange carrying buckets, as set forth.

708,768. THEATRICAL SCENERY. LINCOLN J. CARTER, Chicago, Ill. Filed Dec. 21, 1901. Serial No. 86,917. (No model.)



Claim.—1. In an apparatus of the class described, the combination of a removable suspensible frame, two sets of pulley-wheels each consisting of a plurality of integral belt-wheels of different diameters rotatably mounted upon and suspended with such frame, a plurality of endless belts extending from one set of wheels to the other and mounted thereon, and an endless curtain having web and open-work portions suspended from each belt and means for suspending the frame, substantially as described.

2. In an apparatus of the class described, the combination of a removable suspensible frame, two sets of pulley-wheels each consisting of a plurality of integral belt-wheels of different diameters rotatably mounted upon and suspended with such frame, a plurality of endless belts extending from one set of wheels to the other and mounted thereon, an endless curtain having open-work portions suspended from each belt, and means for rotating the pulley-wheels, substantially as described.

3. In an apparatus of the class described, the combination of two sets of pulley-wheels each consisting of a plurality of integral belt-wheels of different diameters, an annular flange at the bottom of each belt-wheel, a plurality of endless belts extending from one set of wheels to the other and mounted thereon, an endless curtain suspended from the inner belt, and an endless curtain suspended from each belt outside of the inner belt and its curtain and provided with open-work netting portions for permitting the inner portions to be seen therethrough, substantially as described.

4. In an apparatus of the class described, the combination of a removable suspensible frame, two sets of pulley-wheels each consisting of a plurality of integral belt-wheels of different diameters rotatably mounted upon and suspended with such frame, an annular flange at the bottom of each belt-wheel, a plurality of endless belts extending from one set of wheels to the other and mounted thereon, an endless curtain for the inner belt, and an endless curtain suspended from each belt outside of the inner belt and its curtain and provided with open-work netting portions for permitting the inner curtains to be seen therethrough, substantially as described.

5. In an apparatus of the class described, the combination of a movable main frame, brackets upon each end of such frame, two sets of pulley-wheels mounted in such brackets and a plurality of endless curtains extending from one set of wheels to the other suspended therefrom and provided with open-work netting portions for permitting the inner curtains to be seen therethrough, substantially as described.

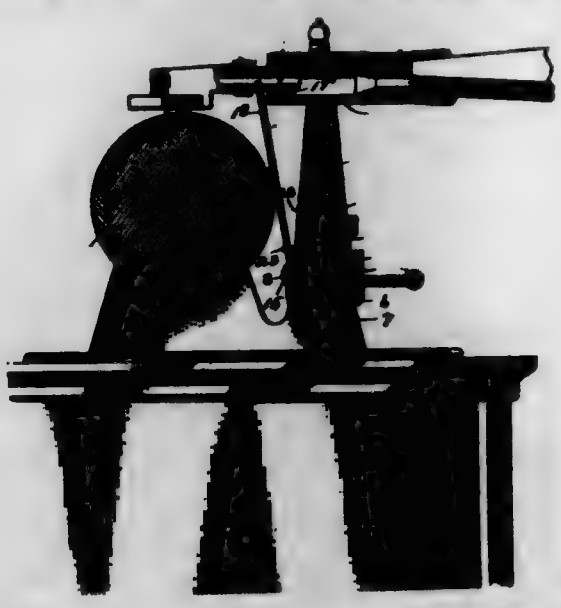
6. In an apparatus of the class described, the combination of a removable suspensible main frame, brackets upon each end of such frame, two sets of pulley-wheels mounted in such brackets and a plurality of endless curtains extending from one set of wheels to the other and provided with open-work netting portions for permitting the inner curtains to be seen therethrough, means for suspending the frame, and means for rotating the pulley-wheels, substantially as described.

7. In an apparatus of the class described, the combination of two sets of pulley-wheels, each consisting of a plurality of wheels of different diameters, and a plurality of endless flexible curtains, having transparent portions, extending from one set of wheels to the other, and mounted thereon, substantially as described.

8. In an apparatus of the class described, the combination of two sets of pulley-wheels, each consisting of a plurality of wheels of different diameters and a plurality of endless flexible curtains, having web and open-work portions, extending from one set of wheels to the other, and mounted thereon, and means for rotating the pulley-wheels, substantially as described.

9. In mechanisms of the class described, the combination of a suspensible frame, a plurality of endless concentric flexible curtains having web and open-work portions movably mounted on such frame, means for moving the curtains at different rates of speed, and means for suspending the frame, substantially as described.

708,764. GRAPHOPHONE ATTACHMENT. LOUIS H. CHAPMAN, Littlehills, N. Y. Filed Feb. 20, 1901. Serial No. 48,128. (No model.)



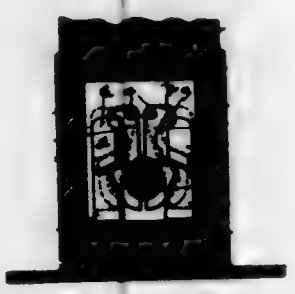
Claim.—1. A sound-box bracket comprising a base adapted for connection to the feed-nut of a graphophone and having a slot to receive the collar thereof, a tubular head having a stem connected to the base adapted for attachment of a sound-funnel at one end, a tube-section pivotally connected with the opposite end of the head, an eye carried by the base and a rod exterior to the stem and base, and passed through the eye, said rod having a yoke at its upper end in which the pivoted tube-section rests and having its lower end disposed in the slot of the base for engagement by the lug or lifting-finger of the collar.

2. A sound-box bracket comprising a base adapted for connection to the feed-nut of a graphophone and having a slot to receive the collar thereof, a tubular head having a stem connected to the base and adapted for attachment of a sound-funnel at one end, a tube-section pivotally connected with the opposite end of the head, an eye carried by the base and a rod exterior to the stem and base, and passed through the eye, said rod having a yoke at its upper end in which the pivoted tube-section rests and having its lower end disposed in the slot of the base for engagement by the lug or lifting-finger of the collar, the head and base being adjustable toward and away from each other.

708,765. RAPID-ACTING VISE. HORACE D. CHIPMAN, Cincinnati, Ohio. Filed Mar. 3, 1902. Serial No. 97,216. (No model.)

Claim.—1. In a vise employing a movable jaw journaled in the frame supporting the stationary jaw, a screw-rod, half-nuts in normal engagement with the screw-rod, a nut-frame normally engaging the said half-nuts, lifting mechanism composed of a cam, the combination of a sector and a key operated by the screw-rod adapted to lift the nut-frame and free the nut engagement by the backward turn of the screw-rod, substantially as specified.

2. In a vise employing a stationary jaw, a sliding jaw supported in the vise-frame, a power-nut composed of segmental half-nuts pivoted to the frame of the vise, in combination with a nut-frame having limbs normally engaging the half-nuts and locking them in position, and swinging said half-nuts by the lifting of the nut-frame, substantially as specified.



3. In combination with the screw-rod of a vise secured to a movable jaw and half-nuts pivotally attached to the vise-frame, a nut-frame adapted to engage the half-nuts and hold them in the closed or open position, a lifting mechanism composed of a sector pivoted to the nut-frame, a cam having a key feathered engagement with the screw-rod, the sector and cam being so disposed that the sector will be swung laterally by the cam engagement during the forward revolution of the screw-rod and will engage and lift the sector during a part of the backward revolution of said screw-rod, substantially as specified.

4. In a vise, a nut-releasing mechanism composed of a cam having a slotted sleeve encompassing a screw-rod, a sector pivoted to a nut-releasing frame, a feather-key adapted to connect the screw-rod with the cam-sleeve, the parts being so disposed that the sector will swing idly during the forward turn of the screw-rod and come into slipping engagement with the cam by the backward turn of the screw-rod, substantially as specified.

5. In a vise employing a lifting-sector, a cam for operating the same provided with means for periodical engagement with a screw-rod, the said sector being pivoted in the path of the traveling cam, the peripheries of said sector and cam being arcs of a circle adapted to engage each other, substantially as herein specified.

6. In a vise, the combination of a fixed and a sliding jaw, an operating-screw, a housing within the sliding jaw containing two half-nuts pivoted from above so as to normally fall together by gravity upon the contained operating-screw, a vertically-movable frame engaging the opposite sides of the half-nuts exteriorly, said frame being normally seated by gravity, to clamp said half-nuts on the screw, and when lifted to separate said half-nuts therefrom, a cam-sleeve on said screw adapted to turn therewith, and connections between said sleeve and frame adapted to be actuated by the reverse rotation of the screw to lift said frame, whereby the sliding jaw may be adjusted without the screw, substantially as specified.

7. In a vise the combination of a fixed and sliding jaw, an operating-screw, a housing in the sliding jaw containing movable half-nuts for engaging the screw, a sliding frame straddling the half-nuts adapted to clamp the nuts to the screw and release the nuts therefrom, a cam-sleeve on the screw, tripping devices between said frame and cam-sleeve whereby the said frame is raised at a point in one direction of rotation of the screw, a peripheral keyway in the cam-sleeve and a key on the screw engaging said way, whereby the operating-screw may be given a part rotation within said cam-sleeve before the cam-sleeve is caused to rotate therewith, substantially as specified.

8. In a vise, a screw-rod, a cam-sleeve on the screw-rod, a key on the said screw-rod, a peripheral slotted keyway in the said sleeve allowing the said screw-rod when its direction of rotation is reversed to travel a part of one revolution independent of said sleeve, and half-nuts adapted to engage said screw-rod and to be actuated by the said cam, substantially as described.

708,766. WIND-MOTOR. JAMES M. COCHRAN, Gober, Tex. Filed Oct. 16, 1901. Serial No. 78,815. (No model.)

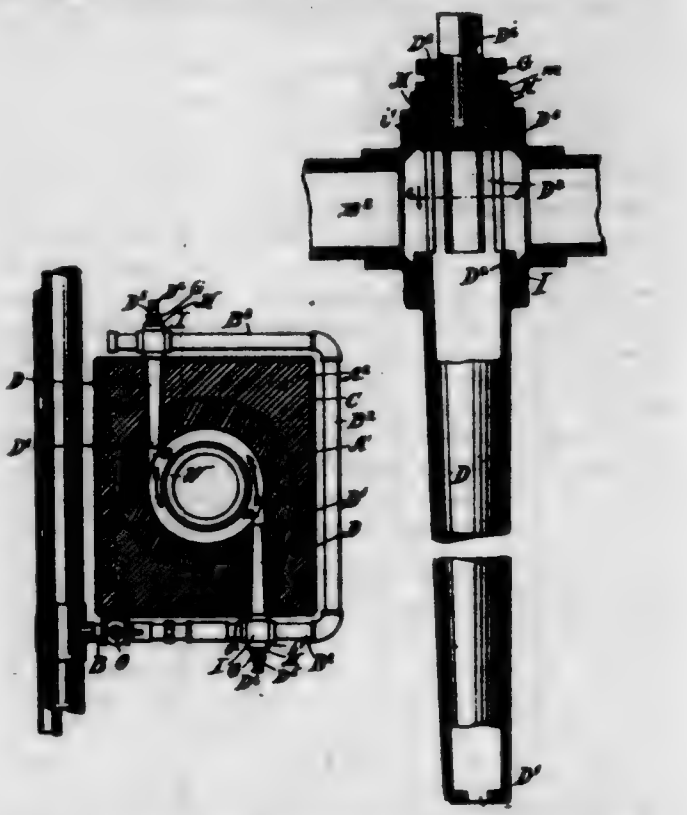
Claim.—1. The combination of a vane provided with a shaft-bearing, a spindle carried by the vane and disposed in a concentric relation to said bearing and extending forwardly beyond the latter, a hollow wheel-shaft sleeved on said spindle and journaled in said bearing, a wheel, and a driven shaft geared to said wheel-shaft.

2. The combination of a vane provided with a vertical hollow bearing and with a bar which extends across the hollow bearing and terminates in a spindle, a hollow wheel-shaft sleeved on said spindle, and driven shafts geared to the wheel-shaft, one of the driven shafts being journaled in said bar.

3. A wind-motor having a vane provided with a vertical hub mounted to turn, a brace for the vane-body, and an extension on the brace for forming a bearing for the wind-wheel shaft, as set forth.

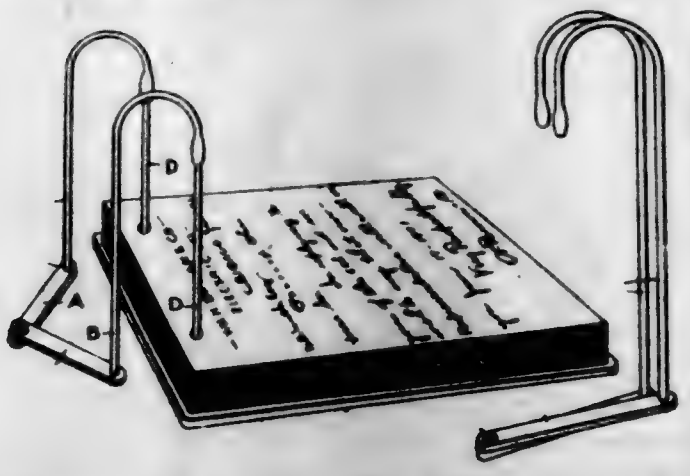
708,766.

and a chamber I in such supply-pipe having the screw-threaded portion i^3 matching the threads D^2, the portion D^3 of the burner being open-work so as to constitute a strong extension of the burner across the chamber I, but so liberally apertured as to freely admit the gas and air, such apparatus being adapted to allow the burner to be adjusted outward and inward and to be removed and replaced when required without disturbing the other parts, all substantially as herein specified



2. In a metallurgical apparatus having a furnace-lining A' with a passage *a* leading from the outside to the inside of the furnace-wall, and a supply-pipe B^3 arranged to bring gases under pressure, a chamber I in said supply-pipe having the internally-screw-threaded part i' and also having the internally-screw-threaded part i^3 for holding the burner and a burner *D* extending longitudinally of such passage and having the screw-threaded part D^3 thereon, in combination with each other and with the screw-threaded ring M as matched in the screw-threaded orifice i' on the outer side of said chamber, adapted to serve the double function of a stuffing-box and a jam-nut, all substantially as herein specified.

708,767. TRANSFER-FRAME FOR LETTER-FILES AND BINDERS. JOHN F. CORDER, Chicago, Ill. Filed Feb. 2, 1901. Serial No. 45,750. (No model.)



Claim.—1. The combination with a jointed base, of posts adjustably secured thereon and socketed ends on said posts.

2. In a device of the class described, the combination with hinged base-bars of a post adjustably secured on each, curved ends on said posts and means for engaging the same on the posts of a loose-leaf binder.

3. The combination with a plurality of curved posts, of means on each for engaging the posts of a loose-leaf binder and jointed base-sections adjustably engaging said posts and adapted to permit the same to be adjusted to varying distances apart.

4. A transfer-frame comprising a plurality of articulated base-bars, posts adjustably and rotatably supported on each, the free end of each post being curved downwardly and provided at its extremity with a socket adapted to engage over a post of a loose-leaf binder.

708,768. FURNACE. PHILIP GERSHMAN, Wakefield, N. Y. Filed Mar. 30, 1901. Serial No. 53,722. (No model.)

Claim.—1. In a metallurgical apparatus, a furnace A having a tangential passage *a* leading from the outside of the furnace-wall to the interior space of the furnace and a supply-pipe B^3 arranged to bring gases under pressure, a burner D adapted for being inserted and removed longitudinally of such passage, a screw-threaded portion D^2 on such burner, a stuffing-box on the exterior of the chamber, a further extension of the burner outward beyond the stuffing-box equipped to receive a wrench,

2. In a metallurgical apparatus having a furnace-lining A' with a passage *a* leading from the outside to the inside of the furnace-wall, and a supply-pipe B^3 arranged to bring gases under pressure, a chamber I in said supply-pipe having the internally-screw-threaded part i' and also having the internally-screw-threaded part i^3 for holding the burner and a burner *D* extending longitudinally of such passage and having the screw-threaded part D^3 thereon, in combination with each other and with the screw-threaded ring M as matched in the screw-threaded orifice i' on the outer side of said chamber, adapted to serve the double function of a stuffing-box and a jam-nut, all substantially as herein specified.

708,769. MOTOR-VEHICLE. GEORGE E. DE LONG, New York, N. Y., assignor to the Industrial Machine Company, Phoenix, N. Y., a Corporation. Filed Feb. 20, 1901. Serial No. 48,650. (No model.)

Claim.—1. In a motor-cycle the combination with a suitable motor, of a frame having two or more hollow sections, a receptacle for the fuel-supply of the motor formed in one of said hollow sections, and a carbureter and igniting devices for the motor located in another of said hollow sections of the frame, substantially as described.

2. In a motor-cycle the combination with a suitable motor and a fuel-supply for the same, of a frame having two or more hollow sections, igniting devices for the motor located in one of said hollow sections, and a carbureter for the motor located in another of said hollow sections of the frame, substantially as described.

3. In a motor-cycle the combination with a suitable motor and a fuel-supply for the same, of a frame having a hollow section, and igniting devices for the motor comprising one or more battery-cells and a sparking coil located in said hollow section of the frame, substantially as described.

4. In a motor-cycle the combination with a suitable motor and a fuel-supply for the same, of a frame having two or more hollow sections, igniting devices for the motor comprising one or more battery-cells and a sparking coil located in one of said hollow sections, and a carbureter for the motor formed in another of said hollow sections of the frame, substantially as described.

5. In a motor-cycle the combination with a suitable motor, of a hollow frame, a receptacle for the fuel-supply and a carbureter for the motor formed in and constituting a part of said hollow frame, and igniting devices for the motor comprising one or more battery-cells and a sparking coil located in said hollow frame, substantially as described.

6. In a motor-cycle the combination with a suitable motor, of a tubular frame of the diamond pattern, a receptacle for the fuel-supply formed in the upper forward brace of said frame, igniting devices for the motor located in the lower forward brace of said frame, and a carbureter for the motor located in the upright brace of said frame, substantially as described.

7. In a motor-cycle the combination with a suitable motor and a fuel-supply for the same, of a tubular frame of the diamond pattern, igniting devices for the motor comprising one or more battery-cells and a sparking coil located in the lower forward brace of the frame, and a carbureter for the motor formed in the upright brace of the frame, substantially as described.

8. In a motor-cycle the combination with a suitable motor and a fuel-supply for the same, of a tubular frame of the diamond pattern, and igniting devices for the motor comprising one or more battery-cells and a sparking coil located in the lower forward brace of the frame, substantially as described.

9. In a motor-bicycle the combination with a tubular frame of the diamond pattern, a receptacle for the fuel-supply formed in the upper forward brace of the same, a suitable motor located near the lower part of the frame, and a carbureter for the motor formed in and constituting a part of the upright brace of the frame, substantially as described.

10. In a motor-cycle the combination with a suitable motor and a fuel-supply for the same, of a tubular frame of the diamond pattern, igniting devices for the motor comprising one or more battery-cells and a sparking coil removably mounted in the lower forward brace of the frame, substantially as described.

11. In a motor-cycle the combination with a suitable motor, of a tubular frame of the diamond pattern, a receptacle for the fuel-supply formed in the upper forward brace of the frame, igniting devices for the motor comprising one or more battery-cells and a sparking coil removably mounted in the lower forward brace of the frame, and a carbureter for the motor formed in the upright brace of the frame, substantially as described.

12. In a motor-cycle the combination with a tubular frame of the diamond pattern having an upright brace divided at its lower portion, of a suitable motor located within the divided portion of the upright brace of the frame, a receptacle for the fuel-supply of the motor formed in the upper forward brace of the frame, igniting devices for the motor comprising one or more battery-cells and a sparking coil removably mounted in the lower forward brace of the frame, and a carbureter for the motor formed in the undivided portion of the upright brace of the frame, substantially as described.

13. A frame for a motor-cycle comprising two or more hollow sections, one of said sections being constructed to form a receptacle for the fuel-supply for the motor and another of said sections being constructed to form a receptacle for the igniting devices of the motor, substantially as described.

14. A frame for a motor-cycle comprising two or more hollow sections, one of said sections being constructed to form a receptacle for the fuel-supply for the motor, and other of said sections being constructed to form receptacles for the carbureter and the igniting devices of the motor, substantially as described.

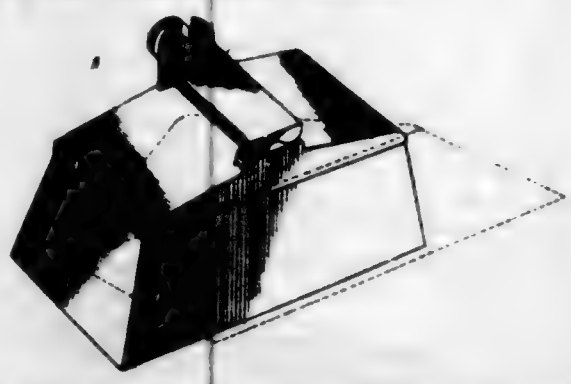
15. A frame for a motor-cycle having a divided lower rear brace and an upright brace divided at its lower portion, two of the members of the divided portion of the upright brace being connected at their lower ends to the members of the lower rear brace, substantially as described.

16. A frame for a motor-cycle having a lower forward brace, a divided lower rear brace, and an upright brace divided at its lower portion, two of the members of the divided portion of the upright brace being connected at their lower ends to the members of the lower rear brace and another member of the divided portion of the upright brace being connected to the lower forward brace, substantially as described.

708,770. FRUIT-PICKING DEVICE. ISAAC DUNKER, McKees Rocks, Pa. Filed Feb. 24, 1902. Serial No. 95,177. (No model.)

Claim.—In a fruit-picker, the combination of a receptacle formed of strengthening-ribs, a band carried by said ribs extending in a transverse direction thereto, a movable section comprising ribs pivoted to the ends of said band with springs secured to said ribs and the band, a cutter carried by the movable ribs, one of said strengthening-ribs having a guideway formed therein adapted to receive said cutter, said movable section adapted to operate downwardly into the receptacle and carrying a loop at its front portion, and a cord engaging in said loop and over said movable section whereby the said section is actuated downwardly when the cord is operated, substantially as described.

708,771. MOISTENER. LEWIS S. DUNCAN, New York, N. Y. Filed Nov. 12, 1901. Serial No. 81,994. (No model.)



Claim.—1. A moistener, comprising a tank for water, a cover therefor having transverse openings, a wick looped through said openings, and a presser or guide plate vertically adjustable over the wick, substantially as specified.

2. A moistener, comprising a tank, a cover therefor having its upper surface inclined downward from about its center in both directions, the said cover at its central portion being provided with openings, a wick material looped through said openings, and a vertically-adjustable presser-plate concaved on its under side and arranged above the wick, substantially as specified.

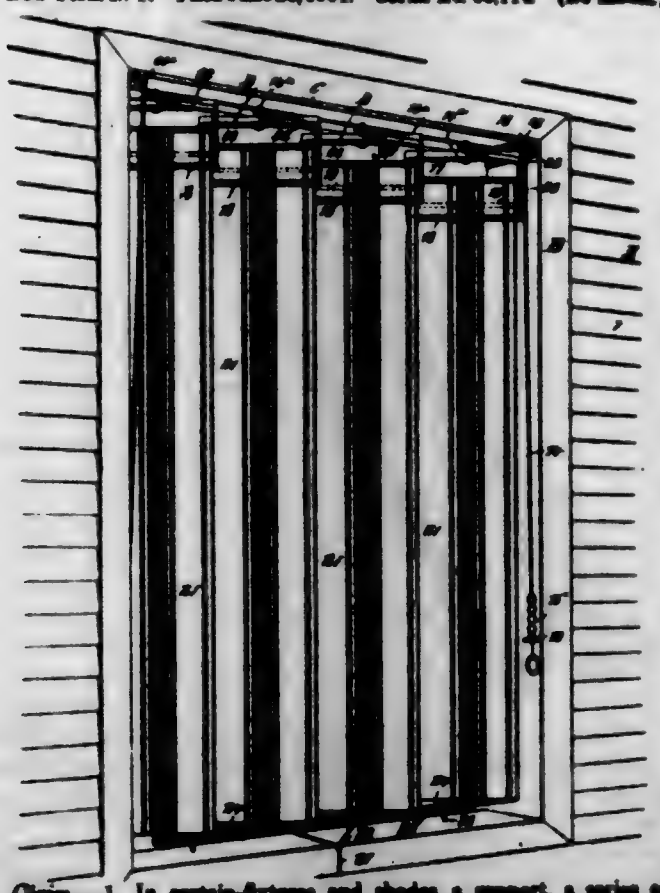
3. A moistener, comprising a tank, a cover therefor provided with openings, a wick looped through said openings, and a vertically-adjustable presser or guide plate above the exposed portion of the wick, the said presser or guide plate being longitudinally channeled on its under side, substantially as specified.

4. A moistener, comprising a tank, a cover therefor having its upper surface inclined downward from about its center in both directions, the said cover being provided at its center with transverse openings, a wick looped through said openings, a slotted plate attached to one side of the cover, a presser-plate arranged above the exposed portion of the wick, a threaded shank on said plate extended through the slot in the plate attached to the cover, and a clamping-nut on said shank, substantially as specified.

708,772. RAILWAY-SWITCH. STEPHEN A. DUVALL, Penrith, W. Va. Filed Apr. 17, 1901. Serial No. 56,223. (No model.)

Claim.—In a railway-switch, the combination with the pivoted switch-tongue and the movable rail member, of a switch-bar connected to said tongue and rail member, a bell-crank 4 to which said switch-bar is pivotally connected, a lever 7 extending underneath the rails of the track, a bell-crank 17 located at the opposite side of the track to the bell-crank 4 and to which the lever 7 is pivotally connected, a lever 6 connecting the bell-crank 4 with the lever 7, a link connecting said lever 7 with a rotatable sleeve mounted at the side of the track, an arm carried by said sleeve, and means carried by the locomotive for engagement with said arm to actuate the switch-tongue and movable rail member, substantially as described.

708,778. WINDOW SHADE AND FIXTURE. JOSEPH BOKERT, New York, N. Y. Filed June 26, 1901. Serial No. 66,114. (No model.)

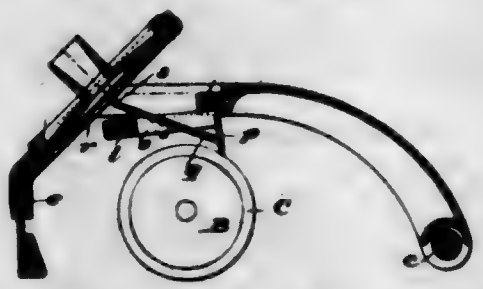


Claim.—1. In curtain-fixtures and shades, a support, a series of hangers pivotally connected with the said support, sundry of the hangers being spring-controlled, a bar pivotally connecting the hangers, shade-rollers carried by the hangers, a shade constructed in sections, the sections being attached to the shade-rollers, a latch-bar pivotally attached to the bottom portions of the sections of the shade, a connecting-bar pivotally connecting the lower portions of the shade-sections, means for turning the hangers upon their pivots, and guide-rollers carried by the hangers below the shade-rollers, between which guide-rollers the sections of the shade are passed, as set forth.

2. In a window-shade, the combination, with a top support and a bottom latch-bar, of hangers sundry of which are spring-controlled intermediately pivoted on the top support, sticks pivotally connected intermediate of their ends to the bottom latch-bar, curtain-sections extending vertically and connected to the hangers and sticks, a connection between the hangers whereby to throw them on their pivots, keepers for the latch-bar, and a device for operating the latch-bar, as described.

3. In a window-shade, the combination with a top support and a sill provided with keepers, of hangers intermediately pivoted on the top support, a latch-bar arranged for engagement with the keepers, sticks pivotally connected intermediate of their ends to the latch-bar, spring shade-rollers mounted on the hangers, curtain-sections mounted on the rollers and fastened to the sticks, trip devices substantially as described for releasing the curtain-rollers, a pivoted bar movable to actuate the trip devices, and a connection between the hangers to throw them upon their pivots, for the purpose specified.

708,774. REPRODUCER FOR PHONOGRAPHS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Mar. 24, 1898. Serial No. 675,000. (No model.)



Claim.—1. In a phonograph, the combination with a phonograph-record, of a reproducing-lever carrying a reproducing device coöperating with said record, a weighted retarding device connected with said lever at its end, a diaphragm, and a link connecting said diaphragm with said lever between the reproducing device and said weight, whereby the friction between the reproducing device and the rotating record will impose stress on the diaphragm, substantially as and for the purposes set forth.

2. In a phonograph, the combination with a phonograph-record, of a reproducing-lever carrying a reproducing device which coöperates with the record, said lever being arranged at an angle to the diameter of the record, a weighted retarding device connected to said lever at its end, a diaphragm, and a link connecting said diaphragm with there producing-lever between the reproducing device and said weight, whereby the effort of the weight tends to increase the inclination of said lever to impose tension on the diaphragm, substantially as and for the purposes set forth.

3. In a phonograph, the combination with a phonograph-record, of a reproducing-lever carrying a reproducing device coöperating with said record, a pivoted retarding-weight to which the lever is pivoted at its end, a diaphragm, and a link connecting the diaphragm with said lever between the reproducing device and said weight, substantially as and for the purposes set forth.

4. In a phonograph, the combination with a phonograph-record, of a reproducing-lever carrying a reproducing device coöperating with said record, a pivoted retarding-weight to which the lever is pivoted at its end, a diaphragm, and a link connecting the diaphragm with said lever between the reproducing device and said weight, said link passing through a slot in the weight, substantially as and for the purposes set forth.

5. In a phonograph, the combination with the record, of a reproducing-point, a diaphragm connected to the reproducing-point, a stationary casing with respect to which said diaphragm vibrates, the diaphragm being located sufficiently close to the casing as to allow for a thin film of air between the two, whereby the vibrations of the diaphragm will be retarded, and radial ribs secured to said diaphragm for stiffening said diaphragm so as to produce bodily movements thereof, substantially as set forth.

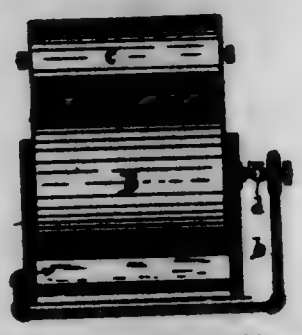
6. In a phonograph, the combination with the record, of a reproducing-point, a diaphragm connected to the reproducing-point, a stationary casing with respect to which said diaphragm vibrates, the diaphragm being located sufficiently close to the casing as to allow for a thin film of air between the two, whereby the vibrations of the diaphragm will be retarded, and radial ribs of gradually-decreasing thickness secured to said

diaphragm for stiffening said diaphragm so as to produce bodily movements thereof, substantially as set forth.

7. An improved diaphragm for phonographs comprising a plate, and radial ribs secured to the same on one side thereof, substantially as set forth.

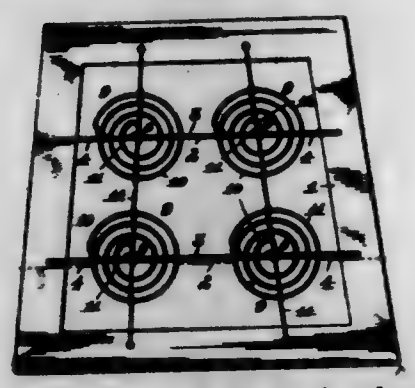
8. An improved diaphragm comprising a plate, and radial ribs of gradually-decreasing thickness secured to the same on one side thereof, substantially as set forth.

708,775. PAPER-MAKING MACHINE. GEORGE HERBART, Fulton, N. Y. Filed Dec. 19, 1901. Serial No. 86,504. (No model.)



Claim.—In a cylinder paper-making machine organized to form single-ply paper, the combination with the vat and making-cylinder, of means for drawing pulp from the vat at one corner thereof and introducing said pulp into the vat at the diagonally opposite corner substantially as and for the purpose set forth.

708,776. SPRING-SUPPORT FOR FURNITURE. FRANK E. EWER, Medina, N. Y. Filed Jan. 23, 1902. Serial No. 90,262. (No model.)



Claim.—1. In a spring-seat, the combination of a support having an eye extending above and an eye extending below the same on a vertical plane, and a spring having its lower end bent upon itself and arranged to enter the upper eye from one side of the support and the lower eye from the other side of the same, substantially as set forth.

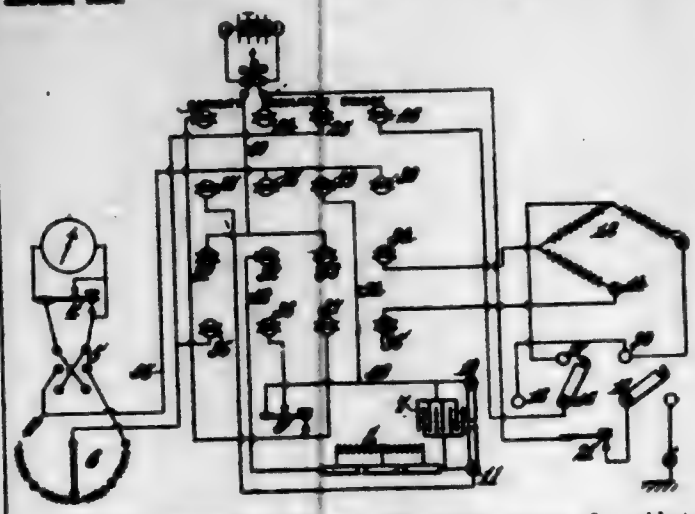
2. In a spring-seat, the combination of a wire support having two eyes formed on opposite sides thereof, and a spring having its connecting end bent upon itself and arranged to enter one eye from one side of said support and the other eye from the opposite side of the same, substantially as set forth.

3. In a spring-seat, the combination of a wire support having an eye above and an eye below its longitudinal axis, and a spring having its lower end terminating in a hook which enters the upper eye from one side and the lower eye from the opposite side of said support, substantially as set forth.

4. In a spring-seat, the combination of a support composed of wire bent upon itself to form an eye above and an eye below its longitudinal axis and a spring having a hook at its lower end disposed diametrically to cross the axis of the same, said hook passing through the upper eye from one side of the support and through the lower eye from the opposite side thereof, substantially as set forth.

708,777. CABLE-TESTING APPARATUS. HENRY W. FISHER, Pittsburg, Pa. Filed July 15, 1901. Serial No. 68,340. (No model.)

Claim.—1. The combination with a plurality of instruments of a cable-testing set, a series of different circuits leading to and from said instruments and adapted to be connected up in different ways with said instruments for making various tests, contacts arranged in pairs in said circuits, of a switch comprising a rotary shaft carrying a plurality of contact-arms arranged to bridge the circuits between the different pairs of contacts in such manner that when said switch is in one position all the proper connections will be made with said instruments through some of said contacts for one test and when in another position all the proper connections will be made with said instruments through other contacts for another test.



2. The combination with a plurality of instruments of a cable-testing set and a series of different circuits leading to and from said instruments and adapted to be connected up in different ways for making different tests, of contacts in said circuits arranged in horizontal and vertical rows, the contacts being so arranged that when the circuit is closed between all the horizontal contacts in two adjacent vertical rows the apparatus will be set for one test and when closed between all the horizontal contacts in two of the other adjacent vertical rows the apparatus will be set for another test, and a rotary switch having a series of contact-arms thereon equal in number to the contacts in each of the vertical rows, the said arms being located one above the other in the same planes, respectively, as the horizontal rows of contacts and having segmental projections thereon adapted to bridge the circuit between the horizontal contacts in two adjacent rows, whereby when said switch is in one position all the proper connections with said instruments will be made for one test, and when in another position all the proper connections will be made with said instruments for another test.

708,778. WIRE-ROPE MACHINE. EDWARD P. FERGUSON, St. Louis, Mo. Filed Feb. 27, 1900. Serial No. 6,770. (No model.)

Claim.—1. The combination, in a wire-rope machine, of a continuous shaft, standards by which the shaft is supported, bushings interposed between the shaft and the standards, and spool-carriers mounted on said shaft, one in front of the other, and separated by said standards; each of said bushings being secured to the shaft so as to revolve therewith and having journal-bearing in its standard to prevent vertical and lateral vibrations of the shaft when the machine is in motion, and said bushings

having apertures through which the wires from the rear carriers pass, substantially as shown and described.

2. The combination, in a wire-rope machine, of a continuous shaft, standards by which the shaft is supported, bushings interposed between the shaft and the standards, and three spool-carriers mounted on said shaft one in front of another, two of said standards being located between said carriers and one at each end of the shaft, and said bushings being secured to the shaft and having journal-bearing in the standards to prevent vertical and lateral vibration of the shaft when the machine is in motion, the bushings that are located between the spool-carriers having apertures for the passage of the wires from the rear carriers, substantially as set forth.

3. In a wire-rope machine, the combination of a continuous shaft, a series of spool-carriers, fixed to the shaft, bushings keyed to the shaft between each spool-carrier and provided with a series of apertures, and standards on which the bushings are journaled.

4. In a wire-rope machine, the combination of a continuous shaft, a series of spool-carriers fixed to the shaft, and comprising a series of rings, each ring having a series of apertures, and a plurality of spool-frames journaled in the rings, bushings keyed to the shaft between each spool-carrier, and provided with a series of apertures, and standards on which the bushings are journaled.

708,779. ELECTRIC-RAILWAY RAIL-BOND. EDWARD P. FRIEDRICH, St. Louis, Mo., assignor of one-half to James D. Houseman, St. Louis, Mo. Filed Mar. 20, 1902. Serial No. 99,105. (No model.)

Claim.—1. In a railway-rail bond, the combination of a conductor, and chambered terminal couplings having pockets in the wall thereof adapted to receive a filling introduced to fill the chambers of the couplings, substantially in the manner and for the purpose set forth.

2. In a railway-rail bond, the combination of a conductor, terminal couplings provided with pockets and having chambers therein in communication with said pockets, and a soft metal filling in said terminal couplings in which said conductors are embedded, substantially as and for the purpose set forth.

3. In a railway-rail bond, the combination of a conductor, terminal couplings in which said conductor is seated and held, bushings adapted for introduction into the webs of the railway-rails at the rear of said terminal couplings, and bosses located between said terminal couplings and the webs of the rails, substantially as described.

4. In a railway-rail bond, the combination of a conductor, terminal couplings in which said conductor is seated and held, arms carried by said terminal couplings, bushings positioned in said arms and adapted to enter the webs of the railway-rails, and means for attaching said terminal couplings and bushings to said rail-webs, substantially as described.

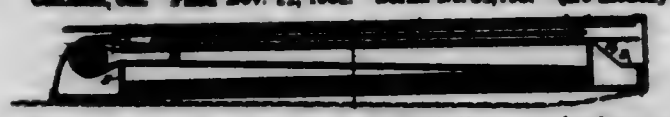
5. In a railway-rail bond, the combination of a conductor, terminal couplings in which said conductor is seated and held, arms carried by said terminal couplings, bushings having tapered ends adapted to seat in said arms and in said rail-webs, and bosses carried by said bushings positioned between said coupling-arms and said rail-webs, substantially as described.

708,780. TIE-PLUG OR DOWEL. WILLIAM H. FRIEDERSEN, Copenhagen, Denmark. Filed Nov. 12, 1901. Serial No. 82,072. (No model.)

Claim.—1. A wooden tie-plug or dowel comprising a straight body circularly shaped or rounding in cross-section, a similarly-shaped enlarged head concentric with the body and a taper or incline around the plug at the juncture of its head and body; substantially as described.

2. A wooden tie-plug or dowel comprising a straight circular or rounded body, a similarly-shaped enlarged head concentric with the body and a taper or incline around the plug at the juncture of its head and body, the said plug having a bore to receive the spike; substantially as described.

708,781. MANIFOLDING SALES DEVICE. CHARLES R. FISHER, Oakland, Cal. Filed Nov. 11, 1901. Serial No. 81,796. (No model.)



Claim.—1. A sales-registering device including a case having a top portion integral with the sides said case closed except for an opening near one end, a hinged bottom through which paper is inserted, means upon the top of the case for retaining the carbon and sheets in place and normally out of contact with each other, means for cutting the sheets, and a flexible cover for the case.

2. In a sales-registering device, a case closed except for a transverse opening near one end through which the sheets are withdrawn, means upon the top of the case for retaining the carbon and sheets in place and normally out of contact with each other.

3. In a sales-registering device, a case adapted to receive and retain one or more continuous sheets of paper, a transverse slot in the case through which the sheets may be withdrawn, a carbon-sheet interposed between the sheets of paper and clamps whereby the carbon and sheets are held in place and out of contact with each other.

4. In a sales-registering device, a case adapted to contain one or more continuous sheets of paper, a slot in the case through which the paper passes, a carbon-sheet interposed between the sheets of paper, means holding the carbon-sheet normally out of contact with the other sheets, and a cover having a flexible hinge portion secured to the bottom of the case at one end thereof, said cover adapted to fold over the top of the case to protect the paper and carbon when the case device is not in use.

5. In a sales-registering device, a case having a top and sides and having a slot near one end through which the paper may pass, and a bottom for the case, in combination with arms hinged at the side of the case and normally extending transversely across the top of the case, and holding the lowermost sheet of paper upon said top, and other arms engaging the carbon-sheet and coacting with the first-named arms for holding it normally out of contact with the first-named sheet.

6. In a sales-registering device, a case adapted to contain one or more continuous sheets of paper, arms pivoted upon the side of the case and adapted to hold one of said sheets in place upon the top of the case, and other arms between which and the first-mentioned arms the carbon-sheet is held, said second arms serving to support a second sheet of paper above and out of contact with said carbon-sheet.

7. In a sales-register device, a case having a transverse slot near one end, arms pivoted upon one side of the case and movable over the top of the case, other arms pivoted on the first-mentioned arms and movable independently thereof, said sets of arms forming clamps between which the carbon-sheets are retained, and means for detachably securing the outer ends of the arms to the case.

8. In a sales-registering device, a casing having a closed top, a hinged bottom, a transverse partition within the box and near one end, a space between the top of said partition and the top of the box, a roller between said partition and the adjacent end of the box or casing, a resiliently-supported plate adapted to bear against said roller, a projection upon the other end and exterior of the casing, a cutter on said projection and means upon the casing whereby sheets of paper and carbon may be held in place but normally out of contact with each other.

9. A sales-check book consisting of a case adapted to contain one or more continuous sheets of paper, said case closed at the top except for a transverse opening through which the paper passes, independently-movable clamp members upon the top between which a carbon-sheet may be held, one of said sheets of paper adapted to pass beneath the clamps and rest upon the top of the case, the other of said sheets adapted to pass above said clamps and guides by which the second sheet of paper is held

in position, a cutter and a cover hinged to the rear of the case and adapted to be folded over the top of the case to protect the sheets when the book is not in use.

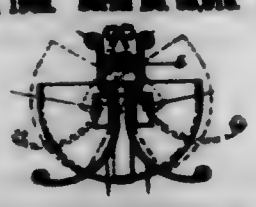
708,782. TROLLEY-FORK. HENRY L. GRIFFIN, Newport News, Va. Filed Feb. 21, 1902. Serial No. 95,022. (No model.)

Claim.—1. In a trolley-fork, circular ends being provided upon the members or prongs of the fork, said ends being provided with circular openings, plates fitted within the openings so as to have a certain amount of rotary movement in the same, each of said plates being curved outward on a radius struck at a point midway between the prongs of the fork, said plates being provided with slots or guideways, bearing-blocks fitted within said slots or guideways, a trolley-wheel, an axle secured to said trolley-wheel, the ends of said axle being journaled within the bearing-blocks, springs so arranged as to normally center the wheel and also act as a conductor for the electric current, and caps secured to the outside of the ends of the two members of the fork, substantially as described and for the purpose specified.

2. In a device of the character described, a trolley-fork composed of two prongs or members, each prong or member being provided with a circular opening in their ends, a guide-plate D held within said circular opening but adapted to revolve to a certain extent within the same, said plates being each curved outward upon the radius of a circle struck from a point midway between the forked members, said plates being provided with slots or guideways, bearing-blocks held within said slots or guideways, a trolley-wheel, an axle secured to said trolley-wheel, the ends of said axle being journaled within the bearing-blocks, two flat springs one arranged upon each side of the trolley-wheel, said springs being secured to the fork and their free ends bearing against the sides of the trolley-wheel to hold the same in alinement, substantially as and for the purpose specified.

3. In a device of the character described, a fork composed of two members, said members being provided with a circular opening through their ends, a channel formed in the ends of the members surrounding the circular opening, guide-plates D having their ends so curved and shouldered as to fit within the channel, said plates being each curved outward upon a radius of a circle struck from a point midway between the forked members, said plates provided with a slot or guideway, bearing-blocks lying within the slots or guideways, said bearing-blocks being shouldered upon the inside, said shoulders coming in contact with the concaved surface of the guide-plates, a trolley-wheel, an axle secured rigidly to said trolley-wheel, shouldered ends formed upon the axle, said ends protruding through openings formed through the bearing-blocks, caps F secured upon the outside of the forked members so as to overlap the ends of the guide-plates and hold them in position against lateral motion, springs so arranged as to normally hold the trolley-wheel in alinement, and also to act as a conductor for conveying the electric current, substantially as described and for the purpose specified.

708,783. CULINARY DEVICE. LAURA E. GREEN, New York, N. Y. Filed Feb. 21, 1902. Serial No. 95,016. (No model.)



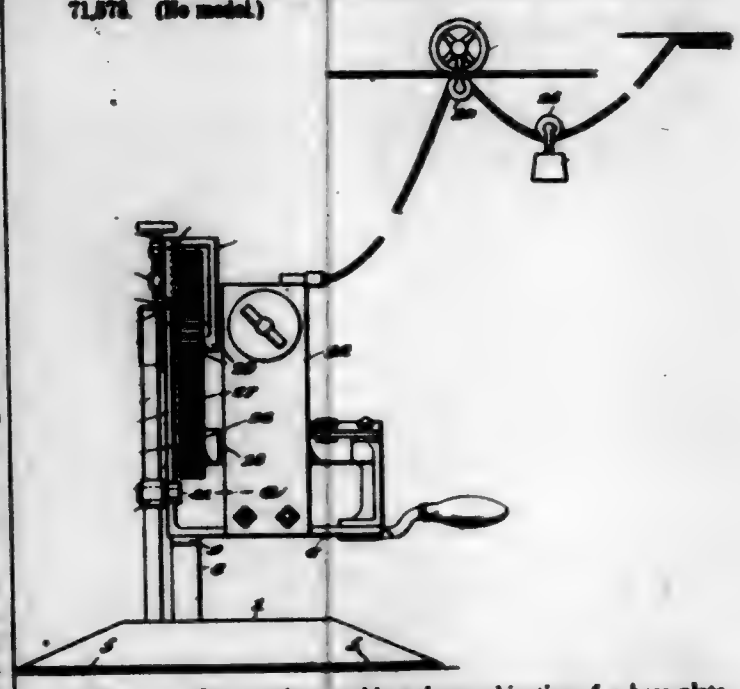
Claim.—1. A culinary device comprising two similar cup-shaped receptacles divided centrally and vertically into two similar parts, the edges of one of which are adapted to fit within the corresponding edges of the other, the parts of said receptacles being also pivoted together at the top portion thereof, and at the opposite sides, transverse and horizontally arranged members which connect the said receptacles at the top portion thereof, and legs connected with said members, and provided with upwardly-directed handles, and a spring placed between said handles, substantially as shown and described.

2. A device of the class described comprising two similar cup-shaped receptacles composed of two similar parts, the edges of one of which fit within the edges of the other, said parts being pivotally connected at the opposite sides at the top thereof, transversely-arranged members which connect the opposite parts of said receptacles near the top thereof, and legs connected with said members and projecting above the same to form handles, substantially as shown and described.

3. A culinary device comprising a cup-shaped receptacle divided centrally and vertically into two similar parts, the edges of one of which are adapted to fit within the corresponding edges of the other, the parts of the receptacle being also pivoted together at the top portion thereof, means for holding the separate parts of the receptacle together and handles whereby the receptacle may be manipulated and the separate parts separated at the bottom, substantially as shown and described.

4. A device of the class described comprising a plurality of cup-shaped receptacles divided vertically into corresponding parts which are pivotally connected and the edges of which are adapted to fit one within the other, means for holding the separate parts of said receptacles together and means whereby the said receptacles may be manipulated and the separate parts thereof separated at the bottom, substantially as shown and described.

708,784. CLOTH-CUTTING MACHINE. JOHN G. GROSSER and HARRY H. GROSSER, Cincinnati, Ohio. Filed Aug. 10, 1901. Serial No. 71,573. (No model.)



Claim.—1. In a cutting-machine, the combination of a base-plate, a frame above the base-plate, an endless cutting-band having its runs extended between the frame and base-plate, a device at the base-plate and around which the lower bight of said endless cutting-band is passed, a motor, a shaft held to turn on the frame and driven from the motor and having one end extended in front of the frame, a driving-wheel held on the extended end of said shaft and adapted to receive and removably hold the upper bight of said endless cutting-band, and means for tightening said endless cutting-band, substantially as set forth.

2. In a cutting-machine, the combination of a base-plate over which materials to be cut are adapted to be passed, an endless cutting-band passed through the base-plate and extended above and below the same, a plurality of rollers or wheels beneath the base-plate for carrying the lower bight of the cutting-band, means to move one of said wheels or rollers for tightening the endless cutting-band, a wheel above the base-plate for carrying the upper bight of the base-plate, and driving means for imparting endwise movement to the cutting-band, substantially as set forth.

3. In a cutting-machine, the combination of a base-plate having an opening, a frame above the base-plate, a cutting device extended from the frame and having a lower bight passed through the opening in the base-plate and having actuating mechanism carried by the frame, a pedestal for supporting the frame above the base-plate and a part movable on the base-plate for closing the opening therein after the lower bight of the cutting device has been passed therethrough, substantially as set forth.

4. In a cutting-machine, the combination of a base-plate, a frame above the base-plate, an endless cutting-band extended between the base-plate and frame, and means, located beneath the base-plate, for tightening said cutting-band, substantially as set forth.

5. In a cutting-machine, the combination of a base-plate, an endless cutting-band having a bight below the base-plate, two sheaves below the base-plate and around which the bight of the cutting-band is passed and two idler-sheaves arranged between the first-named sheaves and arranged to bear on the two runs of the cutting-band for pressing said runs toward each other, substantially as set forth.

6. In a cutting-machine, the combination of a base-plate, an endless cutting-band having a bight formed in it, two sheaves held to turn and around which said bight of the cutting-band is passed and means for mov-

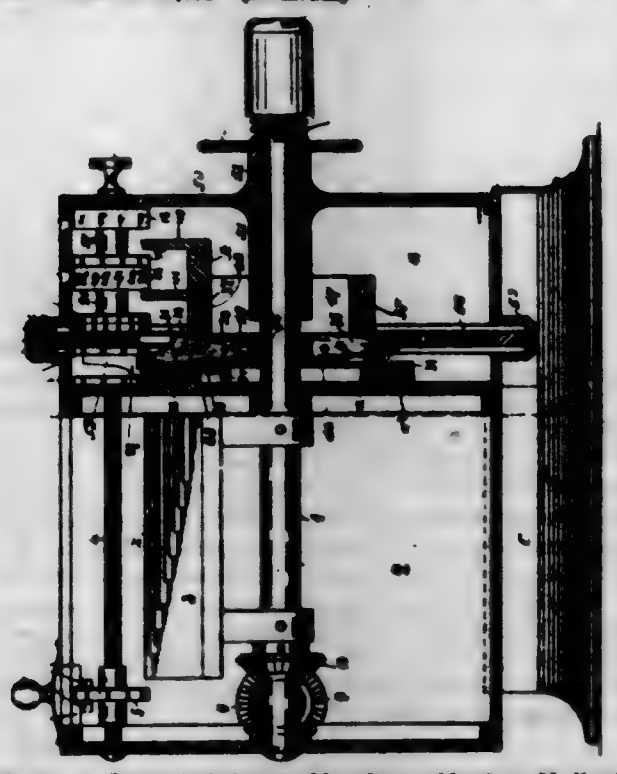
ing one of said sheaves relatively to the other for tightening and loosening said cutting-band, substantially as set forth.

7. In a cutting-machine, the combination of a base-plate, an endless cutting-band having a bight below the base-plate, sheaves around which said bight is passed, a part mounted for sliding movement and on which one of the said sheaves is carried, and a screw collared on the base-plate and having threaded engagement with said sliding part for moving the sheave carried thereon to tighten or loosen the cutting-band, substantially as set forth.

8. In a cutting-machine, the combination of a base-plate, a frame above the base-plate, an endless cutting-band extended between the frame and base-plate, a motor, a shaft held to turn on the frame and having one end extended in front of said frame, gearing for driving said shaft from the motor, a driving-wheel on the extended end of said shaft and adapted to receive and removably hold the upper bight of said endless cutting-band, a plurality of shafts at the base-plate, each shaft being held to turn in bearings and having one end extended beyond its bearings and wheels or rollers on the extended ends of said shafts and adapted to receive and removably hold the lower bight of said endless cutting-band, substantially as set forth.

9. In a cutting-machine, the combination of a base-plate, a frame above the base-plate, an endless cutting-band extended between the frame and base-plate, a motor, a shaft held to turn on the frame and driven from said motor and having one end extended in front of the frame and provided with a driving-wheel on which the upper bight of said endless cutting-band is removably held, a plurality of shafts at the base-plate, each shaft being held to turn in bearings and having one end extended beyond its bearings, wheels or rollers on the extended ends of said shafts and adapted to receive and removably hold the lower bight of said endless cutting-band, and means for moving one of said lower shafts toward and away from the other, substantially as set forth.

708,785. CALCULATING-MACHINE. CHRISTIAN HAMANN, Berlin, Germany, assignor to Paul Hamann, Berlin, Germany. Filed July 2, 1900. Serial No. 22,251. (No model.)



Claim.—1. In a calculating-machine the combination of indicating mechanism for showing the results of the calculations, actuators therefor, and a stopped driver, the teeth of which are fixed relatively to each other and which is adapted to engage with and operate one or more of the actuators or all of them.

2. In a calculating-machine the combination of indicating mechanism for showing the results of the calculations, actuators therefor, a stopped driver the teeth of which are fixed relatively to each other and which is adapted to engage with and operate one or more of the actuators or all of them, and means for adjusting the actuators relatively to the driver.

3. In a calculating-machine the combination of indicating mechanism for showing the results of the calculations, actuators therefor, a stopped driver, the teeth of which are fixed relatively to each other and which is adapted to engage with and operate one or more of the actuators, or all of them, and means for adjusting the indicating mechanism relatively to the actuators.

4. In a calculating-machine the combination of a driving-shaft, indicating mechanism, actuators therefor arranged in different radial positions in an arc around the driving-shaft, and a stopped driver revolving about the axis of the driving-shaft, and which is adapted to engage with and operate one or more of the actuators, or all of them during one revolution.

5. In a calculating-machine the combination of a driving-shaft, indicating mechanism, the members of which are arranged in different radial positions in an arc around the axis of the driving-shaft, actuators detachably connected with the indicating mechanism, and a stopped driver revolving about the axis of the driving-shaft, and which is adapted to operate one or more of the actuators or all of them during one revolution.

6. In a calculating-machine the combination of a driving-shaft, indicating mechanism, the members of which are arranged in an arc around the driving-shaft, actuators, the shafts of which are arranged in an arc around the driving-shaft and which are placed end to end with the shafts of the indicating mechanism, connections between the actuators and the indicating mechanism, and a stopped driver for operating the actuators.

7. In a calculating-machine the combination of indicating mechanism for showing the results of the calculations, actuators therefor, and a single stopped driver, all the teeth of which traverse a fixed path, and which are adapted to engage with and operate one or more of the actuators or all of them.

8. In a calculating-machine the combination of indicating mechanism for showing the results of the calculations, actuators therefor, a stopped driver, the teeth of which are fixed relatively to each other and which is adapted to operate one or more of the actuators or all of them, and means for bringing any one or all of the actuators into the path of the driver or to move them out of the path thereof.

9. In a calculating-machine the combination of indicating mechanism, a single stopped driver, a series of actuator-shafts arranged transversely to the line of movement of the driver, and connected with the indicating mechanism, pinions on the actuator-shafts and means for moving the pinions on the shafts into and out of the path of the driver.

10. In a calculating-machine the combination of indicating mechanism, a driving-shaft, a single stopped driver attached to the driving-shaft, and the teeth of which are arranged in an arc around said shaft, a series of actuator-shafts detachably connected with the indicating mechanism and arranged in an arc around the driving-shaft, pinions on the actuator-shafts, and means for bringing one or more or all of said pinions into operative connection with the driver.

11. In a calculating-machine the combination of indicating mechanism, actuators therefor, a single stopped driver, the teeth of which are fixed, and which is adapted to engage with and operate one or more or all of the actuators at one revolution, and means for connecting any one of said actuators with different parts of the indicating mechanism.

12. In a calculating-machine the combination of a driving-shaft, a single stopped driver secured to the driving-shaft and revolving around the axis thereof, a series of actuator-shafts arranged in an arc around the driving-shaft, adjustable pinions on said actuator-shafts adapted to gear with the driver, a cylindrical casing inclosing the driver, actuator-shafts and pinions, a series of indicator-shafts arranged in an arc around the driving-shaft, and detachably connected with the actuator-shafts, a cylindrical casing inclosing the indicator-shafts and supporting them, means for turning the casing of the indicating mechanism relatively to the casing of the driving mechanism, and devices for locking the two casings together when adjusted.

13. In a calculating-machine the combination with the driving, indicating, and actuating mechanism, of transfer mechanism comprising a pawl adapted to engage with and operate any one of the members of the indicating mechanism, and a series of dogs actuated by the indicating mechanism, and adapted to engage with and set said pawl.

14. In a calculating-machine the combination with the driving, indicating and actuating mechanism, of a series of pawls each of which is adapted to engage with and operate any one of the members of the indicating mechanism, and a series of dogs actuated by the indicating mechanism, and adapted to engage with and set said pawls.

15. In a calculating-machine the combination of a driving-shaft, indicating mechanism, the members of which are arranged in an arc around the driving-shaft, actuating mechanism, connected with the indicating mechanism, and the members of which are arranged in an arc around the driving-shaft, a pawl revolving about the axis of the driving-shaft and adapted to engage with and operate any one of the members of the indicating mechanism, and a series of dogs actuated by the indicating mechanism and adapted to engage with and set said pawl.

16. In a calculating-machine the combination of a driving-shaft, indicating mechanism, the members of which are arranged in an arc around the driving-shaft, actuating mechanism, the members of which are connected with the indicating mechanism, and which are arranged in an arc around the driving-shaft, a driver engaging the actuating mechanism, a series of pawls revolving about the axis of the driving-shaft, and dogs op-

erated by the indicating mechanism and adapted to engage with and set said pawls.

17. In a calculating-machine the combination with the driving, indicating and actuating mechanism, of a recessed, pivoted pawl adapted to engage with and operate the indicating mechanism, and a series of sliding dogs actuated by the indicating mechanism, and provided with laterally-projecting overlapping arms carrying cams adapted to engage with and set said pawl.

18. In a calculating-machine the combination with the driving, indicating and actuating mechanism, of a series of pawls any one of which is adapted to engage with and operate each member of the indicating mechanism, a series of dogs actuated by the indicating mechanism in one direction to engage with and set said pawls, and projections operated by the driver which move the dogs in an opposite direction to disengage them from the pawls.

19. In a calculating-machine the combination of the driving-shaft, the indicating and actuating mechanism, the members of which are arranged in an arc around the driving-shaft, a driver revolving with the driving-shaft, a pawl adapted to engage with each member of the indicating mechanism and revolving about the axis of the driving-shaft, and devices for moving said pawl into and out of engagement with the indicating mechanism.

20. In a calculating-machine the combination with the driving, indicating and actuating mechanism, of coupling devices for connecting the indicating mechanism with the actuating mechanism, sliding dogs moved in one direction by said coupling devices, and a pawl adapted to engage with the indicating mechanism and which engages with and is set by said dogs.

21. In a calculating-machine the combination with the driving and actuating mechanism, of indicating mechanism, each member of which comprises two numbered wheels adapted to turn independently of each other, and each of which is connected with a separate mutilated gear-wheel, an actuator having two racks for operating said mutilated wheels, and devices for moving the actuator to cause it to engage either one of said mutilated gears, or both of them.

22. In a calculating-machine the combination of a driving-shaft, a driver secured thereto and revolving about the axis thereof, actuators arranged in an arc around the driving-shaft, indicating mechanism comprising a series of members arranged around the driving-shaft, and each comprising two numbered wheels movable independently of each other, a mutilated gear-wheel connected with each of said numbered wheels, an actuator attached to the driving-shaft and provided with two racks arranged in an arc about the driving-shaft and adapted to gear with the mutilated wheels of the indicating mechanism, and means for moving said actuator to cause it to engage either one of said mutilated wheels, or both of them.

23. In a calculating-machine the combination of a stepped driver, actuators adapted to gear with the driver, indicating mechanism connected with the actuators, an actuator for returning the indicating mechanism to zero, said driver, actuators, indicating mechanism and actuator for bringing the indicating mechanism to zero being arranged concentrically about the same axis.

24. In a calculating-machine the combination of a single stepped rotary driver, indicating and actuating mechanism arranged to move about the axis of the driving-shaft, mutilated gear-wheels connected with the indicating mechanism, a toothed segment adapted to engage with said mutilated gear-wheels, but normally out of engagement therewith, and means for engaging said actuator with said mutilated wheels.

703,786. APPARATUS FOR PREVENTING TROLLEY-WHEELS FROM LEAVING THE FEED-WIRE. GEORGE W. HANSCOM, Philadelphia, Pa., assignor of one-half to Samuel S. Wiener, Philadelphia, Pa. Filed Mar. 3, 1902. Serial No. 96,395. (No model.)

Claim.—1. In a device of the character named, a trolley-pole, forwardly-projecting members attached thereto, rearwardly-projecting members on said pole, collars journaled upon said pole, arms pivotally mounted upon said collars adapted to contact with said rearwardly-projecting members, inwardly-projecting members upon said arms, and means for holding the latter in position with respect to each other.

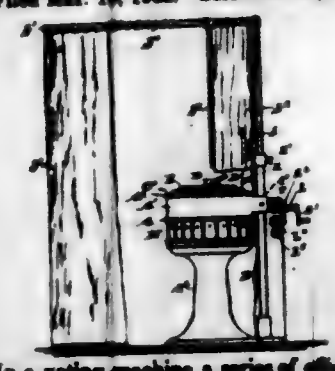
2. In a device of the character named, a trolley-pole, forwardly-projecting members attached thereto, rearwardly-projecting members on said pole, collars journaled upon said pole, arms pivotally mounted upon said collars adapted to contact with said rearwardly-projecting members, inwardly-projecting members upon said arms, means for holding said inwardly-projecting members in juxtaposition, and means for permitting said arms and members to have a yielding rotary movement.

3. In a device of the character named, a trolley-pole, forwardly-projecting members attached thereto, rearwardly-projecting members on said pole and having inclined forward portions and upwardly-flaring rear portions, collars journaled upon said pole, arms pivotally mounted upon said collars adapted to contact with said rearwardly-projecting members, inwardly-projecting members upon said arms, springs for holding said members in juxtaposition, and means for permitting said arms and members to rotate with respect to said trolley-pole.

4. In a device of the character named, a trolley-pole, forwardly-projecting members attached thereto, rearwardly-projecting members on said pole, collars rotatably mounted upon said pole, arms pivotally mounted upon said collars adapted to contact with said rearwardly-projecting members, inwardly-projecting members on said arms, and means for holding said members in position relative to each other and to the pole.

5. In a device of the character named, a trolley-pole, forwardly-projecting members attached thereto, rearwardly-projecting members on said pole, and having inclined forward portions and outwardly-flaring rear portions, collars journaled upon said pole, arms pivotally mounted upon said collars adapted to contact with said rearwardly-projecting members, inwardly-projecting members on said arms, and springs for holding the latter in position.

703,787. VOTING-MACHINE. CHARLES F. HARRISON, Lyndhurst, N. J. Filed Mar. 10, 1902. Serial No. 97,262. (No model.)



Claim.—1. In a voting-machine, a series of office-dials each mounted on an independent shaft, means for turning them in unison, and registering mechanisms and actuating means therefor adapted to be brought into operable relation by such movement.

2. In a voting-machine, a series of office-dials each mounted on an independent shaft, each bearing names or other identifying symbols of several candidates for that office, and registering mechanisms and their actuating means adapted to be brought into operable relation by the movement of said dials to properly present the names desired to be voted.

3. In a voting-machine, a series of office-dials each mounted on an independent shaft, means for turning them in unison, a single lever for inducing such movement, and registering mechanisms for each dial and actuating means therefor adapted to be brought into operable relation by the movement of said lever.

4. In a voting-machine, a series of office-dials each bearing names or other identifying symbols of the several candidates for that office, a single lever and mechanism operated thereby for turning said dials in unison, locking devices operated by said lever, the latter serving to unlock said dials, turn them to the desired position and lock them in such position.

5. In a voting-machine, a series of office-dials each mounted on an independent shaft, each bearing the names or other identifying symbols of the several candidates for that office, means for turning said dials in unison, locking mechanism for said dials by which they may be held in the desired positions, and registering mechanisms and actuating means therefor adapted to register votes for candidates selected by such movement of said dials.

6. In a voting-machine, a series of office-dials each mounted on an independent shaft, each bearing the names or other identifying symbols of the several candidates for the office represented by such dial, means for moving such dials in unison, and means whereby each dial may be moved independently of the others, and registering mechanisms and actuating means therefor adapted to be brought into operable relation by such movements.

7. In a voting-machine, a series of office-dials each mounted on an independent shaft, each bearing the names or other identifying symbols of the several candidates for the office represented by such dial, registering mechanism and actuating means therefor for each of said names or symbols, and means carried by said dial for receiving ballots for independent candidates.

8. In a voting-machine, a series of office-dials each bearing the names or other identifying symbols of the several candidates for the office represented by such dial, a party-dial bearing the names or symbols of the several parties presenting candidates, a registering mechanism for each candidate and actuating means therefor, a pointer for said party-dial, and mechanism connected with said pointer for moving the office-dials of said series in unison, whereby the registering mechanisms of all the candidates of any party will be brought into operable relation with their actuating means when said pointer indicates such party.

9. In a voting-machine, a series of office-dials each bearing the names or other identifying symbols of the several candidates for the office represented by such dial, a party-dial bearing the names or symbols of the several parties presenting candidates, a registering mechanism for each candidate and actuating means therefor, a pointer for said party-dial, and mechanism connected with said pointer for moving the office-dials of said series in unison, whereby the registering mechanisms of all the candidates of any party will be brought into operable relation with their actuating means, and means for moving said office-dials independently of each other whereby votes may be registered for candidates of other parties or moved into such relation with the actuating means of said registering mechanisms as to omit registering.

10. In a voting-machine, a series of office-dials each bearing the names or other symbols of the several candidates for the office represented by such dial, means for moving said dials in unison or independently, registering devices moving with said dials, one for each candidate thereon, a striking-plate arranged to actuate said registering devices when the latter are properly presented thereto, and means for operating said striking-plate.

11. In a voting-machine, a series of office-dials each bearing the names or other identifying symbols of the several candidates for the office represented by such dial, means carried by the latter for receiving a ballot for an independent candidate for each office, means for moving said office-dials in unison or independently, registering devices moving with said dials, one for each candidate thereon, means for depositing said ballot in a receptacle, a striking-plate arranged to actuate said registering devices and depositing means when properly presented thereto, and means for operating said striking-plate.

12. In a voting-machine, a series of office-dials each bearing the names or other identifying symbols of the several candidates for the office represented by such dial, means for moving said dials in unison or independently, locking means for holding said dials against such movement, means for unlocking all the dials of said series simultaneously, means for unlocking any of said dials independently, registering devices for the several candidates and actuating means for said registering devices.

13. In a voting-machine, a series of office-dials, and means for moving them, registering devices moving with said dials, a striking-plate actuating said registering devices when the latter are properly presented thereto, locking means for holding said dials and registering devices in position to be acted upon by said striking-plate, and means for automatically releasing said dials by the operation of returning said dials to their original positions.

14. In a voting-machine, a series of office-dials, means for moving said dials in unison, registering devices moving with said dials, actuating means for said devices, locking means for holding said dials and registering devices in the desired positions, and a single lever operating said locking means and moving said dials, whereby the operations of unlocking said dials, moving them to the desired positions and locking them therein are performed by said single lever.

15. In a voting-machine, a series of office-dials, means for moving said dials in unison, registering devices moving with said dials, actuating means for said devices, locking means for holding said dials and registering devices in the desired positions, and a single lever operating said locking means and moving said dials, whereby the operations of unlocking said dials, moving them to the desired positions and locking them therein are performed by said single lever, and mechanism for operating said actuating means for said registering devices, adapted to automatically unlock said dials and return them to their original positions.

16. In a voting-machine, the combination with a gear-wheel and a series of pinions meshing therewith, of one or more registering devices arranged to move with each pinion, means for actuating said registering devices, and means for turning said wheel and thereby presenting the desired registering devices to said actuating means.

17. In a voting-machine, the combination of a party-dial bearing the names or symbols of the parties presenting candidates, a series of office-dials each bearing the names or symbols of the candidates for each office, a shaft carrying a gear-wheel, a pointer moving with said shaft and adjacent to said party-dial, a series of pinions meshing with said gear-wheel each carrying one of said office-dials, registering devices carried by the latter, one for each candidate thereon, and actuating means for operating such registering devices as are properly presented thereto, whereby a movement of said shaft in bringing said pointer to one of said party names or symbols correspondingly turns said dials and their registering devices into operable relation with said actuating means.

18. In a voting-machine, the combination of a party-dial bearing the names or symbols of the parties presenting candidates, a series of office-dials each bearing the names or symbols of the candidates for each office, a shaft carrying a gear-wheel, a pointer moving with said shaft and adjacent to said party-dial, a lever for imparting motion to said shaft, a series of locking-bars engaging said office-dials and adapted to lock and unlock the latter through connections from said lever, a series of pinions meshing with said gear-wheel and each carrying one of said office-dials, registering devices carried by the latter, one for each candidate thereon, and an actuating means for operating such registering devices as are properly presented thereto, whereby the movements of said lever unlock said office-dials, turn said pointer to the desired party and correspondingly turn said office-dials and their registering devices into operable relation with said actuating means, and lock the whole in such position.

19. In a voting-machine, a party-dial bearing the names or symbols of the parties presenting candidates, a series of office-dials each bearing the names or symbols of the candidates for each office, a shaft carrying a gear-wheel, a pointer moving with said shaft and adjacent to said party-dial, a lever for imparting motion to said shaft, a series of locking-bars engaging said office-dials and adapted to lock and unlock the latter through connections from said lever, a series of pinions meshing with said gear-wheel and each carrying one of said office-dials, registering devices carried by the latter, one for each candidate thereon, and an actuating means for operating such registering devices as are properly presented thereto, whereby the movements of said lever unlock said office-dials, turn said pointer to the desired party and correspondingly turn said office-dials and their registering devices into operable relation with said actuating means, and lock the whole in such position, in combination with each other and with independent mechanism for operating said actuating means and automatically unlocking said office-dials and returning the whole to the original position.

20. In a voting-machine, the combination of the shaft B, gear-wheel B' and pinions C' meshing therewith, office-dial C⁵ and platform C⁶ carried by each of said pinions, registering devices J J on said platforms, the striking-plate F⁵ and its arms F⁶ F⁶ adapted to operate each of said registering devices as are presented thereto by the turning of said gear-wheel and pinions.

21. A pinion C' having a pin C⁷, a sleeve C⁸ carried by said pinion and having the finger C⁹ adapted to be struck by said pin to cause said sleeve to turn with said pinion, the spring C¹⁰ serving to hold said finger in contact with said pin, the dial C⁴ and button C⁵ on said sleeve, whereby the said dial will turn with said pinion and also be free to turn independently of the latter in one direction, all combined and arranged to serve with a voting-machine.

22. A pinion C⁴ and platform C⁶ and dial C⁴ carried thereon, registering devices J J on said platform and having arms J' J', the trap K on said dial, and the arm K' and connections therefrom to said trap whereby the latter is tripped and means as the striking-plate F⁵ and its arms F⁶ for engaging the arms of said registering devices and trap when properly presented thereto, all combined and arranged to serve in a voting-machine.

23. In a voting-machine the combination of the shaft B, gear-wheel B' thereon, and sleeve F and locking-bars G, with a series of pinions C' each carrying a dial C⁴ having the flange C⁵ and notches therein receiving said bars.

24. In a voting-machine, the combination of the shaft B, gear-wheel B' thereon, and sleeve F and locking-bars G, with a series of pinions C' each carrying a dial C⁴ having the flange C⁵ and notches therein receiving said bars, the cap D connected to said sleeve, and the lever D' mounted in said cap and adapted to lift said bars from said notches when required.

25. In a voting-machine, the combination of the shaft B, gear-wheel B' thereon, and sleeve F and locking-bars G, with a series of pinions C' each carrying a dial C⁴ having the flange C⁵ and notches therein receiving said bars, the cap D connected to said sleeve, and the lever D' mounted in said cap and engaged with said shaft, adapted to lift said bars from said notches and also to turn said shaft when thus liberated.

26. In a voting-machine, the combination of the shaft B, gear-wheel B' thereon, the sleeve F and slip-joint F⁷ therein, the striking-plate F⁵ and its arms F⁶ on one portion of said sleeve, and the locking-plate F' and its locking-bars G on the other portion, means for raising said lev-

ering said locking-plate, and independent means for raising and lowering said striking-plate.

27. In a voting-machine, the combination of a shaft B and gear-wheel B' thereon, a series of pinions C' meshing with said wheel and carrying each a dial, a pin B^2 on said wheel, a swinging lever P having the leg P', and a shaft L having the offset L^1 adapted to receive said leg and permit said lever to swing idly in one direction by the turning of said gear-wheel and to contact with said leg to return said gear-wheel and pinions to an inoperative or normal position.

28. In a voting-machine, the combination of a shaft B and gear-wheel B' thereon, the sleeve F and striking-plate F^1 thereon having the arms F^2, a series of pinions C' meshing with said gear-wheel and carrying each a series of registering devices, and a shaft L having the crank L' connected to said striking-plate and adapted when turned to draw down said plate and actuate such of the registering devices as are presented to said arms.

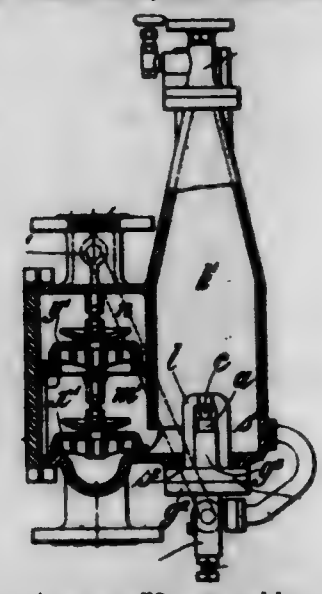
29. In a voting-machine, the combination of a shaft B and gear-wheel B' thereon, the sleeve F and striking-plate F^1 thereon having the arms F^2, a series of pinions C' meshing with said gear-wheel and carrying each a series of registering devices, a pin B^2 set in said gear-wheel, a swinging lever P having the leg P', and a transverse shaft L having the crank L' connected to said striking-plate and having the offset L^1 adapted to coöperate with said leg, whereby the turning of said transverse shaft draws down the said striking-plate and actuates such of said registering devices as are presented to said arms, and also serves through said swinging lever to return said gear-wheel and its connections to an inoperative or normal position.

30. In a voting-machine, the combination of a shaft B and gear-wheel B' thereon, a series of pinions C' each carrying a dial C^4 having a flange C^5 and notches c^9 c^{10}, the bed-plate A, casing A' and ring A^3 having openings receiving said dials, the lip A^5 on said ring having notches a^3, and the locking-plate F' and bars G thereon adapted to be received in said notches a^3 and to engage in said notches c^9 c^{10} in said dials.

31. In a voting-machine, the shaft B, sleeve F and locking-plate F' having the locking-bars G, in combination with the bed-plate A, casing A', ring A^3 and lip A^5 on the latter having the notches a^3 serving to receive said bars, the flange A^6 on said ring and glass plate H supported thereon, the dial E separably secured to said lip, and a series of registering devices within said casing, all arranged to allow the removal of said dial and connected parts to permit said registering devices to be inspected through said glass plate.

32. A voting-machine having a casing A' containing registering mechanism adapted to be set by a voter to indicate a choice of candidates, in combination with a booth inclosing such machine and comprising the upright R, rod S supported therein, hoop S' on said rod, hanging rod S^2 arranged to slide on said loop, the curtain S^3 attached to said loop and having a portion secured to said hanging rod, and a spring S^4 serving to draw the margins of said curtain together.

708,788. PULSOMETER. PAUL HASSENAER, Burg, near Magdeburg, Germany. Filed Jan. 13, 1902. Serial No. 89,491. (No model.)

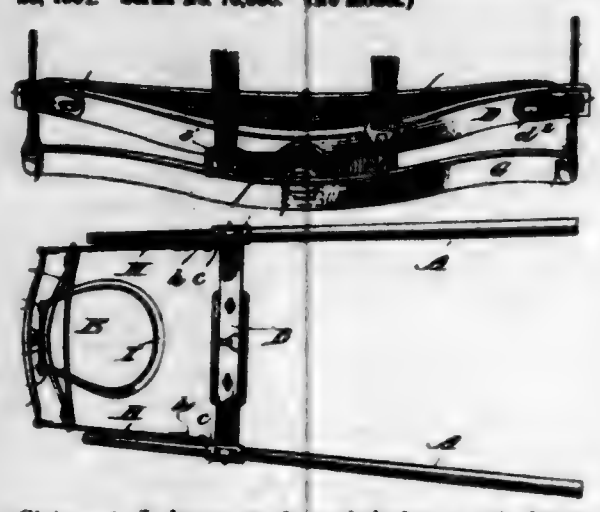


Claim.—1. A steam water-lifter, comprising a working chamber, a spraying device therein and an injector adjustable with relation to the spraying device.

2. In a steam water-lifter, a pressure-chamber, a working chamber, an injector-pipe extended into the working chamber, a spraying-cone above the pipe, and means for adjusting the pipe toward and from the cone.

3. In a steam water-lifter, two pressure-chambers, two working chambers, injector-pipes leading into the working chambers, spraying-cones supported rigidly at the inner ends of the pipes and outside thereof, means for adjusting the pipes with relation to the cones, and flexible tubes for connecting the injectors with chambers.

708,789. HARNESS. ARCHIBALD L. HAWKINS, Georgetown, Tex., assignor of one-half to Joseph M. Page, Georgetown, Tex. Filed July 28, 1901. Serial No. 70,080. (No model.)



Claim.—1. In harness, a forward draft-bar, a singletree mounted upon the forward side of the draft-bar, and a rocking shoulder-strap bar carried by the draft-bar, as set forth.

2. In harness, a forward draft-bar, a singletree mounted on the forward side of the draft-bar, and a rocking shoulder-strap bar mounted between the said draft-bar and singletree, as set forth.

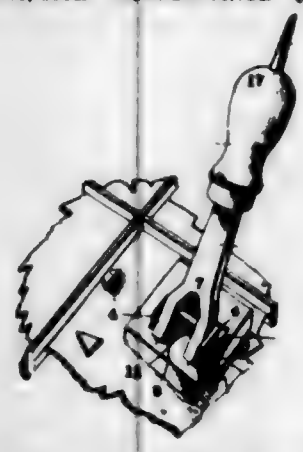
3. In harness, a singletree, a forward draft-bar upon the front sides of which the singletree is mounted, said bar being provided with an opening at each end through which the traces attached to the singletree are adapted to pass, and a shoulder-strap bar carried by the draft-bar, as set forth.

4. In harness, a singletree, a forward draft-bar upon the front side of which the singletree is pivotally mounted, said bar being provided with an opening at each end through which the traces attached to the singletree are adapted to pass, and a pivotally-mounted shoulder-strap bar between the singletree and draft-bar, as set forth.

5. In harness, a draft-bar having an opening at each end, and provided with a central forwardly-projecting stud, a singletree pivotally mounted on the end of the stud, and a shoulder-strap bar pivotally mounted on the stud between the singletree and draft-bar, as set forth.

6. In harness, a curved draft-bar having an opening at each end and provided with a central forwardly-projecting stud, a draft-strap having its ends passed through the openings of the draft-bar and secured to said bar, a singletree mounted on the outer end of the stud, and a shoulder-strap bar mounted on the stud between the said bar and singletree, as set forth.

708,790. GLAZIER'S HAMMER. DAWSON M. HUMERTON, Tonica, Ill. Filed Sept. 26, 1901. Serial No. 76,714. (No model.)



Claim.—1. A glazier's hammer having a head with straight sides, and a handle pivoted to said head, the pivotal movement of the head relatively to the handle being limited in both directions by engagement of the parts.

2. A glazier's hammer having a handle and a head with a straight side, the side having a groove parallel with and near to the face.

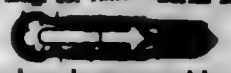
3. A glazier's hammer having a handle and a head with a rim in a plane around its face, and a recess or air-cushion inside said rim, substantially as described.

4. A glazier's hammer having a head polygonal in outline, a handle

pivotally connected to the back of said head, means for limiting the pivotal movement of the head relatively to the handle, and grooves in the sides of said head

---

708,791. INCANDESCENT LAMP. HERMAN J. JAEGER, New York, N. Y. Filed Aug. 13, 1901. Serial No. 71,894. (No model.)



Claim.—1. A telephone-lamp comprising a tubular glass vacuum-chamber, a thick half-globular translucent top joined thereto by the fusion of the glass and integral therewith.

2. A telephone-lamp comprising a tubular glass vacuum-chamber, a thick half-globular translucent top integral therewith and decreasing gradually in thickness from its top center toward the walls of the tubular chamber.

3. A telephone-lamp comprising a tubular glass vacuum-chamber, a thick half-globular translucent top joined thereto by the fusion of the glass and decreasing gradually in thickness from the top toward the walls of the tubular chamber, and a bottom vacuum-seal.

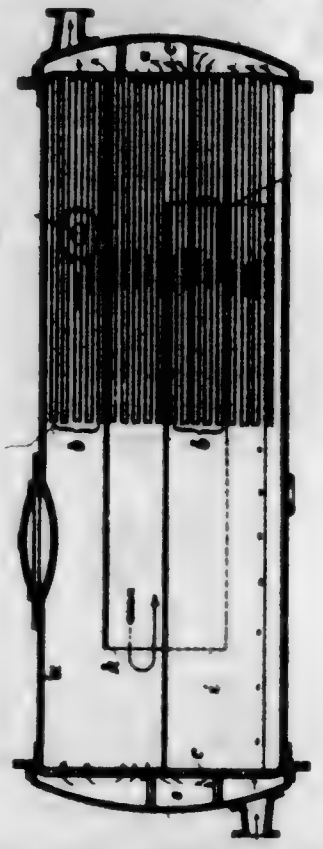
708,792. ADJUSTABLE SEAT AND DESK. JAMES W. JOHNSTON, Chicago, Ill. Filed June 27, 1901. Serial No. 66,304. (No model.)

Claim.—1. The combination in an adjustable desk and seat of a desk-supporting bracket, a bearing-surface on said bracket arranged at a vertical angle of about sixty degrees, a central vertical tongue, two vertical grooves, one on each side, and parallel with said tongue, said tongue and grooves forming the said bearing-surface of said bracket; an aperture transversely through the said tongue and bearing-surface, a threaded bolt adapted to pass through and fit said aperture, and a nut adapted to fit said bolt, with a base comprising two vertical parts, each of said parts having corrugated projections arranged to fit into each other and to form the head of said base, an aperture passing transversely through the head of said base, a threaded bolt adapted to pass through said aperture, and a nut adapted to fit said bolt and to fasten the two vertical parts of said base together, the feet of said base being similarly joined; a vertical bearing-surface arranged at an angle of about sixty degrees, a central vertical slot formed by the joining together of the said parts extending from the foot to the head of said base adapted to receive and to engage the vertical tongue of said bracket, and the said bearing-surface of said base being adapted to enter and to be engaged by the vertical grooves in said bracket, the bracket being adjustable vertically on said base and arranged to be affixed thereon in the position desired by the bolt and nut, substantially as described.

2. The combination in an adjustable desk and seat of a seat-supporting bracket, a bearing-surface on said bracket arranged at a vertical angle of about sixty degrees, a central vertical tongue and two vertical grooves, one on each side and parallel with said tongue, the said tongue and grooves forming the said bearing-surface of said bracket, an aperture transversely through said tongue and bearing-surface, a threaded bolt adapted to pass through and fit said aperture, and a nut adapted to fit said bolt, with a base comprising two vertical parts, each of said parts having corrugated projections arranged to fit each other and to form the head of said base; an aperture passing transversely through the head of said base, a threaded bolt adapted to pass through and fit the said aperture, and a nut adapted to fit said bolt and to fasten the two vertical parts of said base together, the feet of said base being similarly joined, a bearing-surface arranged at a vertical angle of about sixty degrees, a central vertical slot formed by the joining together of said parts extending from the foot to the head of said base, adapted to receive and to engage the vertical tongue of said bracket, and the said bearing-surface of the said base being adapted to enter and to be engaged by the vertical grooves in said bracket, the bracket being adjustable vertically on said base and arranged to be affixed thereon in the position desired by the bolt and nut H, substantially as described.

3. The combination with a seat and a desk, of supporting-brackets having bearing-surfaces constructed with a vertical angle of about sixty degrees, the bearing-surfaces of each of said brackets having a tongue and grooves, and having an aperture passing transversely through each of said tongues and bearing-surfaces, and a base constructed to stand upon and to be affixed to the floor, and having bearing-surfaces forming a vertical angle of about sixty degrees, said bearing-surfaces in the said base having each a vertical slot extending from the foot to the head of said base, the said bearing-surfaces and slots being adapted to receive and fit the tongues and grooves of the said brackets, so as to allow of the vertical and horizontal adjustment of the said brackets, desk and seat, and a bolt and nut adapted to pass through the said slots in the base and through the transverse aperture in the bearing-surfaces of said brackets for the purpose of holding each of said brackets in the position desired on each of said bases, substantially as and for the purposes specified.

708,798. CONDENSER. EMIL JOSSE, Wilmersdorf, Germany. Filed May 17, 1901. Serial No. 60,644. (No model.)



Claim.—1. A condenser comprising a drum or casing with interior heads forming chambers at the ends, pipes connecting said chambers, and inclined partitions arranged in the casing between said heads.

2. A condenser comprising a drum or casing with interior heads forming chambers at the ends, pipes connecting said chambers, and inclined partitions arranged in the casing between said heads, said partitions extending from opposite heads to within a distance from the other heads.

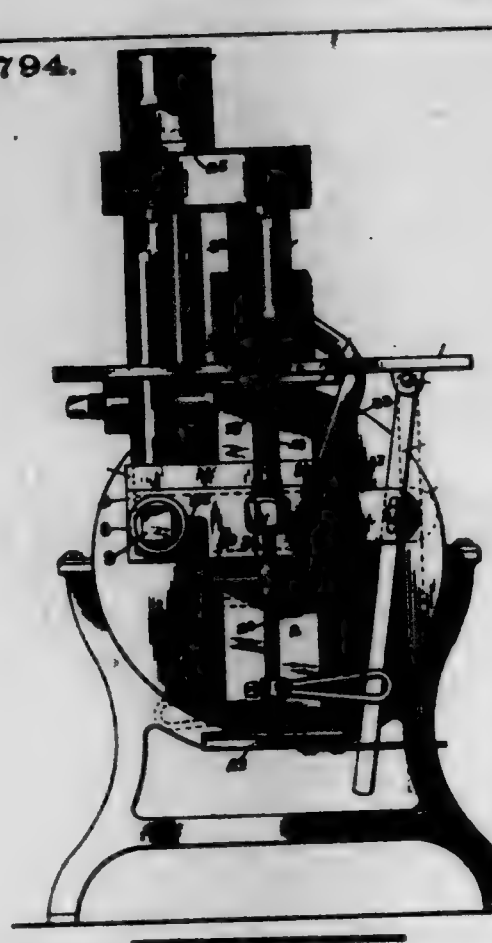
3. A condenser comprising a drum or casing with interior heads forming chambers at the ends, pipes connecting said chambers, and inclined partitions arranged in the casing between said heads, said partitions being provided with discharge-apertures at their lowest points.

708,794. CARBURETER. JOSEPH W. KITTEL, Chicago, Ill., assignor to Safety Gaslight Co., Chicago, Ill., a Corporation of Illinois. Filed Sept. 9, 1901. Serial No. 74,782. (No model.)

Claim.—1. In a carbureter, a reservoir, a generator-burner, a distributing-pipe, a gas-eduction tube leading to said distributing-pipe, a screw-controlled needle-valve in said gas-eduction tube, a back-flow conduit connecting the generator-burner with the distributing-pipe, in combination with the valve 32 interposed in said conduit, said valve being mounted upon a rock-shaft, and a lever-arm upon said rock-shaft in operative connection with said needle-valve.

2. The combination in a carbureter, of a reservoir, a generator extension connected therewith, a generator-burner adjacent to said extension, a distributing-pipe, a gas-eduction tube leading to said distributing-pipe, a screw needle-valve in said gas-eduction tube, a back-flow conduit connecting the generator-burner with the distributing-pipe, a poppet-valve interposed in said conduit, said valve being mounted upon a rock-shaft, a lever-arm upon said rock-shaft in operative connection with said needle-valve, a sliding gate in the gas-chamber of said burner, and a lever for actuating said gate.

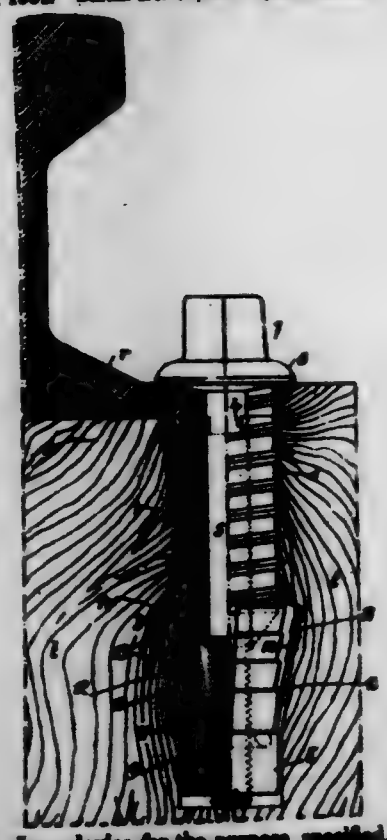
708,794.



708,795. HAT-PIN RETAINER. EDWARD KRAMMER, Brooklyn, N. Y. Filed Oct. 16, 1901. Serial No. 78,831. (No model.)

Claim.—As an article of manufacture, a hat-protecting device comprising a composite button made of open-ended members provided with screw-threads and detachably secured together, and a resilient filling mounted in one of said members, and detachably secured independently of the other member, for the purpose of receiving the shaft of a hat-pin.

708,796. BOLT-RETAINER. GEORGES LAKHOVSKY, Paris, France. Filed July 24, 1901. Serial No. 69,515. (No model.)



Claim.—1. In a device for the purpose specified, the combination with the tubular bushing and guide for the bolt, said guide being smooth on the inside, screw-threaded exteriorly, and closed at its inner end, and the bolt, the body of which fits said guide and which has an enlarged and channeled step at its inner end to receive and form bearings for the expanding segments, of the said segments, forming a cylinder when closed, having teeth on their outer faces and flared or beveled at their upper ends to receive the conical end of the fixed bushing and guide.

2. In a device for the purpose specified, the combination with the tubular bushing and guide for the bolt, said guide being smooth on the inside, screw-threaded exteriorly, and closed at its inner end, and the bolt, the body of which fits said guide and which has an enlarged and channeled step at its inner end, the said channel being divided into sections by studs 10, and the segments 12, having tenons 11, which fit into the channel between the studs, and teeth 13 on their outer faces.

708,797. RAILWAY-TIE. JOHN P. LANCASTER, Chicago, Ill., assignor to Joseph Nicholas Vasey, Chicago, Ill. Filed Dec. 4, 1901. Serial No. 84,668. (No model.)

Claim.—1. In a railway-tie, the combination of a main tie-body apertured at each side of the rail-seat thereon, lever-clamps arranged to extend through said apertures and fulcrumed upon the under side of the tie-body between their ends, and a tension member united with the tie-body and cooperating with said clamp-levers, for the purpose set forth.

2. In a railway-tie, the combination of a main tie-body, provided at each side of its rail-seat portions with apertures, clamp-levers mounted in said apertures to extend through the tie-body, a tension member consisting of a bar-like body of resilient metal having parts arranged to rest in direct bearing with the under surface of the tie-body, and other parts supported free from the tie-body, said clamp-levers being fulcrumed between their ends and having their lower ends in engagement with the tension member, and their upper ends engaging the rail-body, and tension-bolts holding said tension member adjustably to the tie-body, for the purpose set forth.

3. In a railway-tie, the combination with a main tie-body provided with longitudinally-extending slots located adjacent to, and at each side of the rail-supporting portions thereof, a tension member arranged beneath said tie-body having their portions arranged to rest directly in bearing with the under surface of the rail-seat portions of the tie, an intermediate portion immovably secured to the tie-body, and resilient portions between said intermediate and their portions, and between the latter and ends of the tie respectively, arranged at a distance from the under surface of the tie, clamp-levers arranged to extend through said slots, and fulcrumed between their ends upon the under surface of the tie-body and engaging at their opposite ends the rail-body and resilient portions of the tension member respectively, and adjusting-bolts extending through said tension member and the tie-body, substantially as described.

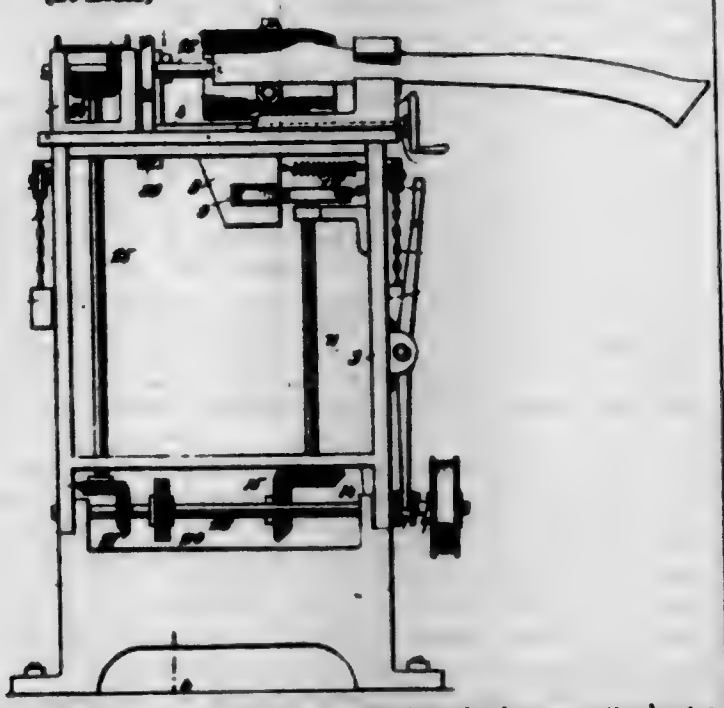
4. In a railway-tie, the combination with a main tie-body provided with longitudinally-extending slots located adjacent to, and at each side of the rail-supporting portions thereof, a tension member arranged beneath said tie-body having their portions arranged to rest directly in bearing with the under surface of the rail-seat portions of the tie, an intermediate

portion immovably secured to the tie-body, and resilient portions between said intermediate and chair portions, and between the latter and ends of the tie respectively, arranged at a distance from the under surface of the tie, clamp-levers arranged to extend through said slots, and fulcrumed between their ends upon the under surface of the tie-body and engaging at their opposite ends the rail-body and resilient portions of the tension member respectively, and adjusting-bolts extending through said tension member and the tie-body, said clamp-levers being arranged to extend obliquely downwardly and divergingly from the rail-body and their lower ends being arranged to engage inclined portions of the tension member, whereby endwise movement of the clamp-levers is prevented, substantially as described.

8. In a railway-tie, the combination with a main tie-body provided with longitudinally-extending slots located adjacent to, and at each side of the rail-supporting portions thereof, a tension member arranged beneath said tie-body having chair portions arranged to rest directly in bearing with the under surface of the rail-seat portions of the tie, an intermediate portion immovably secured to the tie-body, and resilient portions between said intermediate and chair portions, and between the latter and ends of the tie respectively, arranged at a distance from the under surface of the tie, clamp-levers arranged to extend through said slots, and fulcrumed between their ends upon the under surface of the tie-body and engaging at their opposite ends the rail-body and resilient portions of the tension member respectively, and adjusting-bolts extending through said tension member and the tie-body, the slots in the tie-body being made of greater length than those portions of the clamp members which rest therein when the latter are in operative positions, whereby said clamp-levers may be shifted longitudinally of the tie-body in assembling the structure.

6. The combination with a tie having a slot therein, of a fastener mounted in said slot and comprising a head portion, a body portion and a neck connecting said head to said body portion intermediate their extremes, and a block seated in said slot and located intermediate said head and said body portion and abutting said neck, substantially as described.

708,798. LATHE FOR TURNING IRREGULAR FORMS. FRANK J. LELAND, Knoxville, Tenn. Filed June 18, 1901. Serial No. 65,002. (No model.)



Claim.—1. In a lathe for turning irregular forms, a cutter-head, a work-holder comprising a spindle and a gripper consisting of a block having an opening to receive the work and a slot extended outward from the opening through which the work may pass, means for rotating the work, and means for causing a relative longitudinal movement between the work-holder and the cutter-head, substantially as specified.

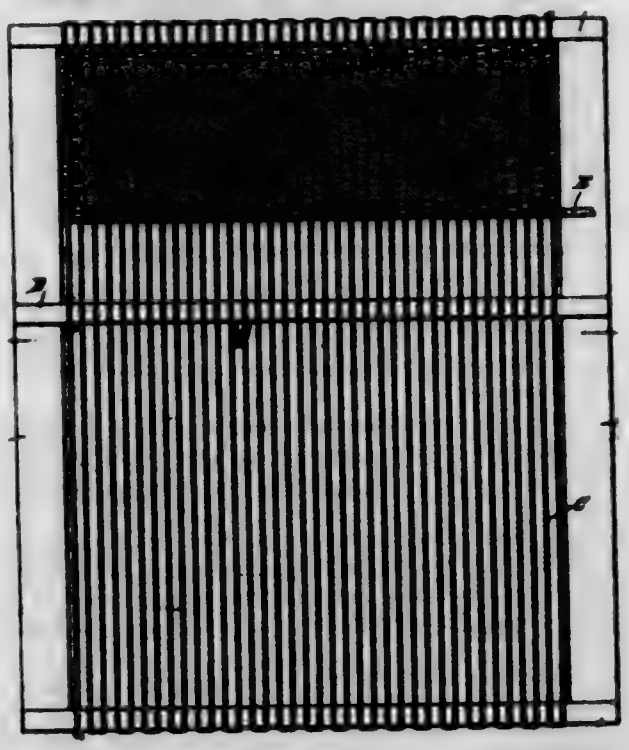
2. In a lathe for turning irregular forms, a cutter-head, a work-holder comprising a spindle and a gripper consisting of a block having an opening to receive the work, opposite walls of said opening being angular, and a slot extended outward from the opening through which the work may pass, means for rotating the work, and means for causing a relative longitudinal movement between the work-holder and the head, substantially as specified.

3. A lathe for turning irregular forms, comprising a fixed frame, a frame mounted to swing on the fixed frame, a carriage movable on the fixed frame, a cutter-head mounted to rotate in said carriage, a vertical shaft, a cam on said shaft, a part depending from the carriage with which said cam engages, means for rotating the shaft, a centering-spindle mounted on the swinging frame, means for rotating said centering-spindle, a gripping device adjustable on the swinging frame, means for moving the swinging frame outward relatively to the cutter-head, and means for moving the swinging frame toward the cutter-head, substantially as specified.

4. A lathe for turning irregular shapes, comprising a fixed frame, a frame mounted to swing on the fixed frame, a cutter-head mounted to rotate on the fixed frame, a centering-spindle on the swinging frame, means for rotating said spindle, a cam removably placed on the spindle, an adjustable abutment for engaging with said cam, means for moving the swinging frame toward the cutter-head, and a rotating gripping-block for the work and carried on the swinging frame, substantially as specified.

5. A lathe for turning irregular shapes, comprising a fixed frame, a frame mounted to swing on the fixed frame, a shaft on which the swinging frame is fulcrumed, a driving-shaft having gear connections with the first-named shaft, a cutter-head-supporting carriage movable on the fixed frame, means operated from the driving-shaft to move said carriage in one direction, a centering-spindle mounted on the swinging frame, means operated from the first-named shaft for rotating said spindle, and a work-gripping device mounted to rotate and adjustable on the swinging frame, the said gripping device being adapted for engaging around the work operated on and having a lateral opening through which the work may pass, substantially as specified.

708,799. KINDERGARTEN-LOOM. BRAYTON E. LITCHFIELD, Faribault, Minn. Filed Apr. 4, 1902. Serial No. 101,336. (No model.)



Claim.—1. A school-loom having a frame provided with means for supporting the warp, and a lay manually slidable on the sides of the loom-frame and having spaced slots for the passage of the warp-strands, to hold the latter properly spaced apart, the said lay having shoulders for engaging the top and inner sides of the side bars of the loom-frame, the lay extending further above the top faces of the side bars of the loom-frame than the ends thereof, as set forth.

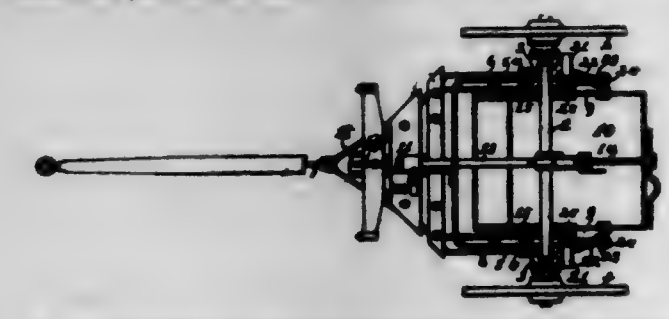
2. A loom, comprising a frame having parallel side bars, and end bars projecting above the top faces of the side bars, the end bars being formed in the top with notches for the passage of the warp, and a lay comprising a bar manually slidable on the sides of the frame and extending further above the top faces of the side bars than the ends of the frame, the lay having spaced slots in the top for the passage of the warp-threads to hold the latter properly spaced apart, the lay also serving to beat in the weft, as set forth.

708,800. WHEELED SCRAPER. WHITFIELD S. LIVINGSTON, Kansas City, Mo., assignor to the Smith & Sons Manufacturing Company, Kansas City, Mo., a Corporation of Missouri. Filed Nov. 20, 1901. Serial No. 84,131. (No model.)

Claim.—1. In a wheeled scraper of the character described, a bail pivotally mounted in advance of the axle, a scraper-pan pivotally hung on said bail to the rear of its point of suspension, a brace-bar connected with the axle and supporting the rear of said pan, and the draft appliances connected directly to said pan whereby as the draft is applied the leverage of the bail tends to thrust said pan into the soil; substantially as set forth.

2. In a wheeled scraper having its scraper-pan carried by a fur-

wardly-extending bail suspended from the axle, and provided with a brace-bar supporting the rear of said pan, draft-bars connected with said pan, and arranged in such manner that as the draft is applied the bail will act to thrust said pan into the soil, substantially as set forth.



3. In a wheeled scraper having its scraper-pan carried by a bail suspended from the axle and provided with a brace-bar supporting the rear of said pan, draft-bars connected with said pan, and links connected with said draft-bars for the application of the draft directly to the pan; substantially as set forth.

4. A wheeled scraper comprising the wheels and axle, side bars connected with the axle and carrying the tongue, a platform mounted on said side bars, a brace-bar supporting the axle, a bail provided with a hand-lever suspended from the axle, a scraper-pan hung on said bail, a brace-bar connected with the axle for supporting the rear of said pan, a latch arranged to engage said hand-lever when the scraper is raised up, and the draft appliances connected with said pan whereby as the draft is applied said bail will act to thrust said pan into the soil, substantially as set forth.

5. In a wheeled scraper having its pan carried by a bail suspended from the axle and provided with a brace-bar connected with the axle for supporting the rear of said pan, draft-bars connected with said pan, links connected with said draft-bars, and a draft-rod connected with said links for the application of a "snatch-team;" substantially as set forth.

6. In a wheeled scraper having its pan carried by a bail suspended from the axle, and a platform carried by side bars connected with the axle, draft-bars connected with said pan, links connected with said draft-bars for the application of the draft, and drop bars pivotally mounted in brackets secured upon said platform for supporting said draft-bars; substantially as set forth.

7. In a wheeled scraper having its pan carried by a bail suspended from the axle, a rigid support stationarily mounted on said axle, and a resilient connection between said support and the scraper-pan, substantially as set forth.

8. In a wheeled scraper having its pan carried by a bail suspended from the axle, a rigid support stationarily mounted on said axle and extending rearwardly therefrom, and a resilient connection extending from said support to said scraper-pan at the rear of the axle; substantially as set forth.

9. In a wheeled scraper having its pan carried by a bail suspended from the axle, and provided with a brace-bar supporting the rear of said pan, a resilient connection between the axle and said pan; substantially as set forth.

10. In a wheeled scraper having its pan carried by a bail suspended from the axle, standards mounted upon the axle and springs connected with said standards and with said pan; substantially as and for the purpose set forth.

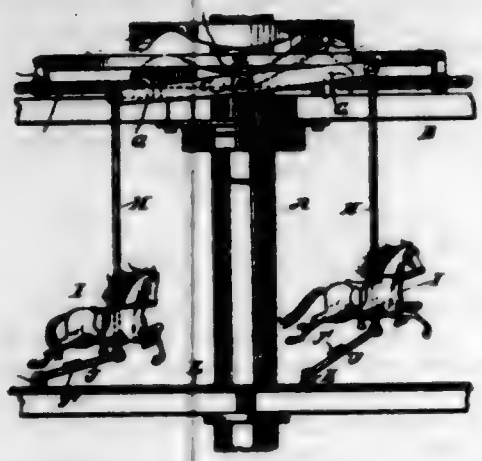
11. In a wheeled scraper having its pan carried by a bail suspended from the axle, standards mounted upon the axle and springs connected with said standards and with said pan, to the rear of the axle, substantially as and for the purpose set forth.

12. In a wheeled scraper having its pan carried by a bail suspended from the axle, standards mounted upon the axle, springs connected with said standards and with said pan, and means for regulating and adjusting the tension of said springs; substantially as and for the purpose set forth.

708,801. MERRY-GO-ROUND. CHARLES LOWY, Jr., Brooklyn, N. Y. Filed Oct. 28, 1901. Serial No. 79,642. (No model.)

Claim.—1. A merry-go-round having a revolvable frame, a rock-shaft journaled on the said frame and provided at one end with a cam-arm and at the other end with an arm for supporting a seat, a fixed cam engaged by the said cam-arm to cause a rocking motion of the rock-shaft on revolving the said frame, short auxiliary rock-shafts also journaled on the frame and provided with arms connected by a link with an arm on the first-named shaft, and arms for supporting seats carried by the auxiliary rock-shafts, as set forth.

2. A merry-go-round having a revolvable frame, rock-shafts journaled on the said frame and extending in a radial direction, supporting-arms on the outer end of the rock-shafts, seat-rods carried by the said supporting-arms, guide-links pivoted to the said seat-rods and extending rearwardly under the seat, the said guide-link being fulcrumed on the platform of the revolvable frame, a cam-arm on the inner end of each rock-shaft, and a fixed cam engaged by the said cam-arm, as set forth



3. A merry-go-round comprising a center post, a frame mounted to turn on the said post, radially-arranged rock-shafts journaled on the said frame, transversely-extending double supporting-arms secured on the outer portions of the said rock-shafts, seat-supporting rods held on the said supporting-arms, guide-links pivotally connected with the seat-supporting rods and fulcrumed on the frame, cam-arms secured on the inner ends of the said rock-shafts and each carrying a friction-roller at its free end, and a cam secured on the said center post and provided with a groove engaged by the said friction-rollers, as set forth.

4. A merry-go-round having a revolvable frame, rock-shafts journaled on the said frame and extending in a radial direction, supporting-arms on the outer ends of the rock-shafts, seat-rods carried by the said supporting-arms at the free ends thereof, guide-links pivoted to the said seat-rods and pivotally connected with the revolvable frame, the said guide-links being each provided with a step, a cam-arm on the inner end of each rock-shaft, a fixed cam engaged by the said cam-arm, short auxiliary rock-shafts connected with and rocked from the said first-named rock-shafts, supporting-arms on the said auxiliary rock-shafts, and seat-rods held on the last-mentioned supporting-arms, as set forth.

5. A merry-go-round having a revolvable frame provided with a platform, rock-shafts journaled on the said frame and extending in a radial direction, supporting-arms on the outer ends of the rock-shafts, seat-rods carried by the said supporting-arms, seats supported by said rods, guide-links pivoted to the lower ends of said seat-rods and pivotally connected with bearings on the platform of the revolvable frame, the said guide-links being each provided with a step, a cam-arm on the inner end of each rock-shaft, a fixed cam engaged by the said cam-arm, short auxiliary rock-shafts connected with and rocked from the said first-named rock-shafts, supporting-arms on the said auxiliary rock-shafts, and seat-rods held on the last-mentioned supporting-arms, the last-mentioned seat-rods and their seats being in alinement with the seat-rods and seats first mentioned, as set forth.

6. A merry-go-round, comprising a revolvable frame, rock-shafts journaled on the frame and extending in a radial direction, supporting-arms on the outer ends of the rock-shafts, seat-rods carried by the said supporting-arms, seats supported thereby, means for imparting a rocking motion to the rock-shafts on revolving the said frame, short auxiliary rock-shafts alternating with the main rock-shafts, supporting-arms on the said auxiliary rock-shafts, seat-rods held on the last-mentioned supporting-arms, seats carried thereby, and links connecting arms on the main rock-shafts with arms on the auxiliary rock-shafts, each seat connected with the auxiliary rock-shafts extending between a pair of seats connected with the main rock-shafts and moving in an opposite direction to the seats between which it is located, as set forth.

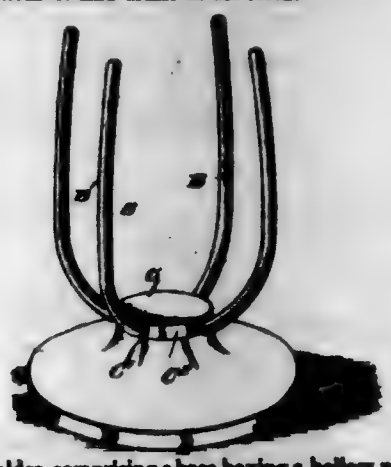
708,802. BOTTLE-HOLDER. EUGENE C. LEECH, New York, N. Y. Filed Feb. 26, 1901. Serial No. 48,878. (No model.)

Claim.—1. A bottle-holder, comprising a base, arms resting on the base and crossing each other at their middle portions, and a cap covering the crossed middle portions of the arms, the side portions of said arms rising from the base and cap.

2. A bottle-holder, comprising a base having a hollow neck, arms crossing each other at their middle portions in said hollow neck, a cap for closing the neck and middle portions of the arms, and metal filling said neck and cap and surrounding the crossed portions of the arms, as set forth.

3. A bottle-holder, comprising a base having a hollow neck, U-shaped arms crossing each other at their middle portions in said hollow neck, a

cap for closing the neck, and metal filling said neck and cap and surrounding the crossed portions of said arms, as set forth.



4. A bottle-holder, comprising a base having a hollow neck, U-shaped arms crossing and interlocking each other at their middle portions in said hollow neck, a cap for closing the neck, and metal filling said neck and cap and surrounding the crossed and interlocked portions, as set forth.

5. A bottle-holder, comprising a base having a hollow neck, arms crossing each other at their middle portions in said hollow neck, a cap for closing the neck and middle portions of the arms, and metal filling said neck and cap and surrounding the crossed portions of the arms, the arms extending through registering openings in the neck and the depending flange of the cap, as set forth.

708,808. PLOW. JOSEPH KUBALKA, Comerve, Tex. Filed Apr. 7, 1902. Serial No. 101,708. (No model.)

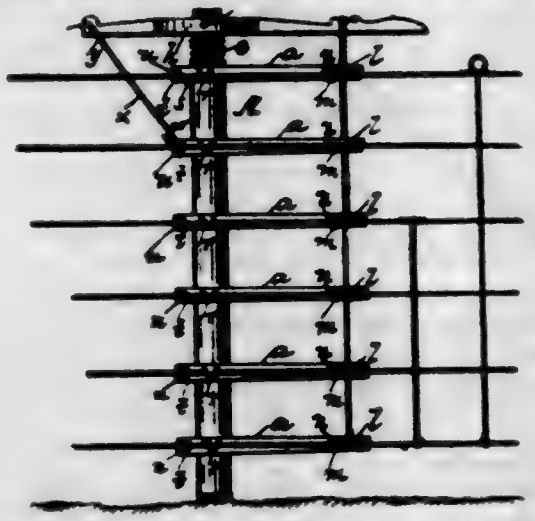
Claim.—1. In a plow, a beam, a shoe-bar secured to the beam, a standard adjustably connected with the beam, an adjusting-brace carried by the shoe-bar and in adjustable engagement with the standard, and means for locking the brace to the standard, for the purpose described.

2. In a plow, a shoe-bar rigidly secured to the beam, handles carried by the shoe-bar and adjustably connected with the beam, a standard located in front of the shoe-bar, a brace carried by the shoe-bar, extending through the standard and having a toothed connection therewith, means for locking the brace to the standard, and auxiliary braces adjustably connecting the standard with the beam, for the purpose described.

3. In a plow, the combination with a beam and a shoe-bar secured to the beam, of a standard consisting of spaced members connected at their bottom portions by a spacing-block, the members of the standard having teeth formed at their rear edges, a main brace for the standard, pivotally attached to the shoe-bar and extending diagonally upward between the members of the standard, terminating at its upper end in a ribbed cap-disk arranged for engagement with the forward edges of the standard members, the rib of the cap-disk fitting in the space between the standard members, teeth formed upon the standard-brace at the sides thereof, adapted to mesh with the teeth on the standard members, whereby said standard may be adjusted vertically, and strap-braces adjustably connected with the beam and having connection with the standard, whereby the said standard may be given any desired inclination, as described.

4. In a plow, the combination with the beam and the shoe-bar secured to the beam, of a standard consisting of opposing members separated by a spacing-block located at their lower ends, a brace for the standard, comprising an upwardly and forwardly curved body having a reduced section which passes diagonally upward between the members of the standard, and a head-section consisting of a cap-plate arranged for engagement with the forward edge of the standard, and a rib at the back of the cap-plate, which fits in the space between the standard members, teeth at the side portions of the standard-brace, adapted for interlocking engagement with the teeth on the standard members, a bolt passed through the cap-plate of the standard-brace and its rib and rearwardly through the space between the standard members, a washer fitted to the rear end of the said bolt, having a rib adapted to fit in the space between the standard members, and a lock-nut for the bolt engaging with the said washer, for the purpose specified.

708,804. WIRE-FENCE MACHINE. PHARES M. MEMLER, Hagerstown, Md. Filed Mar. 8, 1902. Serial No. 96,891. (No model.)

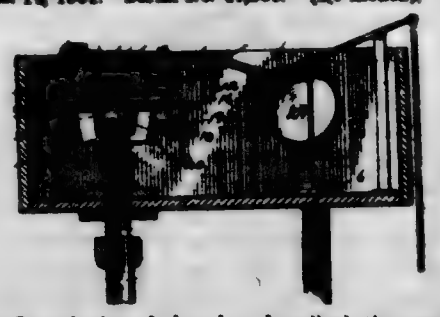


Claim.—1. The combination with the support A, of the tension-lever having the central opening and side perforations or bearings, the collar provided with the lateral lugs or bearings, and an eye at one end and a hook and perforation at the opposite end, the coiled spring and arms, having the hooks and pins, said coiled spring interposed between the collar and one of the arms, all substantially as shown and described.

2. In a device of the character described, the tension-lever, having a central opening, the sides provided with the perforations, one end having the perforation, and the opposite end the hook and opening, the collar arranged within the central opening of the lever and provided with the bearing-lugs, the coiled spring, and the arms, said arms having the clamping end and hook adjacent thereto, and a hook and pins at the opposite end and the bar having at one end a hook and pin and means at the opposite end for attachment to the tension-lever, the whole adapted to operate substantially as described.

3. The combination with the support, of the rocking lever, the spring therefor, the arms provided with the hooks and pins, the brace-hook, one end attached to the end of the lever and the other end to the support and the adjustable bars, having the hooks and pins, substantially as described.

708,805. BALL-COCK. ALEXANDER W. MURRAY, Chicago, Ill. Filed Feb. 14, 1901. Serial No. 47,360. (No model.)



Claim.—In a device of the class described, the combination of an inlet-pipe having a threaded upper end, the cylindrical cap having a central threaded perforation into which the pipe is screwed, said pipe having an annular series of perforations surrounding the central perforation and having its outer face threaded, the hollow cylindrical body screwed

upon the cap, said body being reduced in interior diameter to form shoulders, the disk-shaped valve disposed between the shoulders and the cap and covering the annular series of perforations, said valve having a central perforation communicating with and of lesser diameter than the pipe, the ring disposed between the top of the cylindrical body and the washer and resting loosely upon the latter, the reduced tubular extension over the top of the body portion and communicating with the interior thereof, and the float-lever pivoted upon the upper end of the body and having a valve disposed to rest upon the upper end of the tubular extension to close it.

708,806. CUTTER-BAR FOR MOWING-MACHINES. JOHN T. MYERS, Gainesville, Fla. Filed Mar. 3, 1902. Serial No. 96,450. (No model.)

Claim.—1. The combination of a knife-bar having one of its ends provided on its upper face with an extension having a beveled under face, a series of vertically-arranged lugs carried by the said knife-bar, a series of removable cutter-blades arranged on said cutter-bar, a locking-bar provided with a series of slots to receive the upper ends of the said lugs, and having one of its ends beveled and arranged under the said extension, and means whereby said knife-bar and locking-bar are locked together.

2. The combination with a knife-bar and a series of lugs arranged thereon, said lugs having elongated upper ends provided with beveled under surfaces of a series of cutter-blades arranged between the said lugs, a locking-bar provided with a series of openings to receive the upper ends of the said lugs, a locking-bolt arranged between the said knife-bar and locking-bar, said locking-bolt provided with an angular head seated in an opening in the knife-bar, and a nut on the outer end of the said bolt.

3. The combination with a knife-bar having one of its ends provided on its upper face with an inwardly-projecting extension, said extension having a beveled under face, and a series of lugs arranged on said knife-bar, and provided with elongated upper ends having beveled under faces, of a series of cutter-blades arranged between the said lugs, a locking-bar provided with a series of slots to receive the upper ends of the said lugs, and having one of its ends beveled and arranged under the said extension, a locking-bolt arranged between the said knife-bar and locking-bar and provided with an angular head seated in an opening in the knife-bar, a nut on the outer end of the said bolt, and means for preventing the rotation of the said nut, substantially as described.

708,807. PLOW-POINT. SAMUEL C. MYERS, Mifflintown, Pa. Filed Apr. 24, 1902. Serial No. 104,525. (No model.)

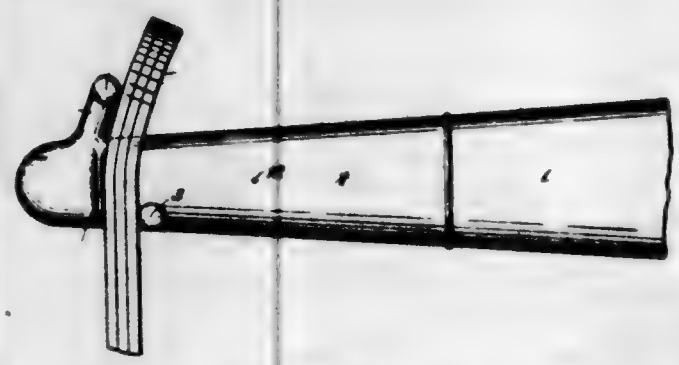
Claim.—1. A plowshare having cast integral therewith a plate which throughout a portion of its surface is separated from the body of the plowshare and which may be removed when the nose or point has become dull, in order to leave a new sharp nose or point, substantially as set forth.

2. A cast-metal plow-point having an integral plate cast lengthwise of the point, forming one surface of the same and capable of being removed to leave a new sharp point, substantially as set forth.

3. As a new article of manufacture, a plowshare having a cast-metal point integral therewith, and a plate cast integral with the point and capable of being removed, substantially as set forth.

4. A plowshare cast hollow at a point in the rear of its original point or nose whereby when the said original point or nose wears back to the hollow portion, the upper wall thereof may be removed to present a new point or nose, substantially as set forth.

708,808. VEHICLE-FASTENING FOR HARNESS. MINERAL MCHALLEY, St. Louis, Mo. Filed Mar. 5, 1902. Serial No. 96,732. (No model.)



Claim.—1. A vehicle-fastening for harness, comprising a longitudinal head of substantially conical shape, said head being provided with oppositely-disposed grooves, cylindrical bosses mounted upon said head adjacent to said grooves, and an ancillary member mounted upon said head and projecting therefrom in a plane substantially at right angles to the general axial direction of said bosses.

2. A vehicle-fastening for harness, comprising a longitudinal head of substantially conical shape, said head being provided with oppositely-disposed grooves, cylindrical bosses mounted upon said head adjacent to said grooves, and an ancillary member mounted upon said head and projecting laterally therefrom in a plane substantially at right angles to the general direction of said bosses, said ancillary member being provided with cylindrical bosses parallel with the bosses upon said longitudinal head.

3. A vehicle-fastening for harness, comprising a longitudinal head of substantially conical form, a pair of grooves disposed upon opposite sides of said head, beads disposed adjacent to said grooves, a pair of cylindrical bosses disposed upon opposite sides of said head and immediately adjacent to said grooves, a T-shaped member projecting laterally from one of the edges of said head and provided with bosses, said bosses being substantially in alinement with said beads for the purpose of bending the end of a strap.

708,809. SHIELD AND DRIP-CATCHER FOR CANDLES. HENRY S. HAGENBAST, Gardenville, Md. Filed Feb. 27, 1902. Serial No. 96,870. (No model.)

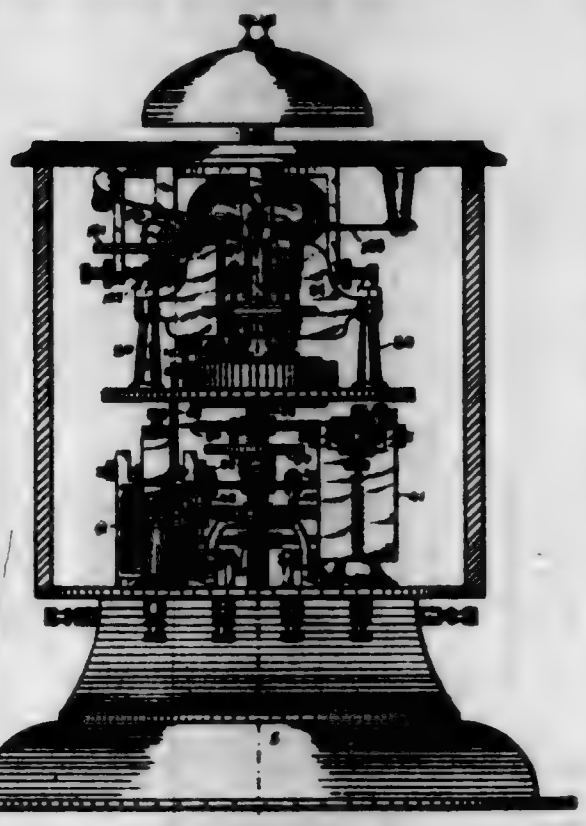
Claim.—1. A device for the purpose described, comprising a sleeve or holder adapted to be slipped over a candle and provided with a spring-pressed clamping-finger to secure it to the candle; a flame-shield carried by said holder; and a drip-catcher also carried by said holder, as set forth.

2. A device for the purpose described, comprising a holder adapted to be secured on a candle; a shield-supporting arm attached to said holder at one side thereof; a shield secured to said arm; and a drip-catcher secured to said holder substantially diametrically opposite said arm, as set forth.

3. A device for the purpose described, comprising a holder adapted to be secured to a candle; a shield carried by said holder; and a drip-catcher also carried by said holder in diametric relation to said shield and extending upwardly and outwardly therefrom in an oblique direction, as set forth.

4. A device for the purpose described, comprising a sleeve adapted to be slipped over a candle and provided with a clamping-finger to secure it to the candle; a supporting-arm attached to said holder and extending upwardly therefrom; a shield secured to the upper end of said arm; and a drip-catcher also attached to said sleeve, as set forth.

708,810. TELEGRAPHICALLY-OPERATED SIGNAL SYSTEM. Joseph E. Hewson, St. Louis, Mo. Filed Mar. 11, 1901. Renewed May 22, 1902. Serial No. 108,202. (No model.)



Claim.—1. A telegraphically-operated signal system, comprising a main wire, a key, a relay and a local-circuit sounder at the train-despatcher's office and also at a signal-station, a semaphore-controlled repeat-back mechanism and a relay in series at the signal-station, a local magnet on the station relay-circuit, a double-pointed contact on the local-magnet armature, actuating mechanism for a semaphore, a semaphore, and electrical connections for said semaphore by which said local-magnet armature controls said semaphore.

2. A telegraphically-operated signal system, comprising a main wire, a key, a relay and local-circuit sounder at the train-despatcher's office, and also at a signal-station, a semaphore-controlled repeat-back mechanism and a relay in series on said wire at the signal-station, a semaphore at said station, a local magnet on the local relay-circuit, a double-pointed contact on the local-magnet armature, actuating mechanism for the semaphore controlled by said local magnet, comprising a register having sliding bars operated by a space-circuit and a dot-and-dash circuit connected respectively to said double-pointed contact, and a semaphore electrically controlled through said register mechanism by said local magnet and its armature.

3. In a telegraphically-operated signal system, the combination with a semaphore-arm and an electric switch adjacent thereto, a pair of contacts, and their connections, of a link-detent pivoted to said arm adapted to support it and to throw said switch when disengaged, a trigger to hold said link, and an electromagnet controlling said trigger, substantially as described.

4. In a telegraphically-operated signal system, the combination with a semaphore-arm and an electric switch, of a slotted link pivoted to the said arm and having a notch at one side, and adapted to throw said switch, a guide-pin in said slot, a trigger pivoted near said pin and one end adapted to engage said notch, a spring-catch for the other end of said trigger, and an armature and electromagnet suitably connected to influence said spring and free said trigger.

5. In a telegraphically-operated signal system, the combination with a semaphore-arm, its horizontal shaft, and its weighted end on the opposite side of said shaft, of a slotted link pivoted to the weighted end, and having a notch and hook near its lower end, a guide-pin in said slot, a horizontal trigger pivoted near said pin with one end engaging said notch to support said link when the latter is raised, and engaged by the side of said link to raise the free end of said trigger when the link is down, a spring-supported armature vertically disposed, to engage the free end of the trigger, an electromagnet to attract said armature, and an actuating mechanism for said magnet, controlled telegraphically.

6. In a telegraphically-operated signal system, the combination with a counterbalanced semaphore-arm, a link-and-trigger mechanism for said arm, a spring-mounted armature and its electromagnet, controlling said trigger, of a call-box, having a spring winding-lever and repeating wheel, a pin on said link adapted to release said lever when the trigger is free, a relay in the train-despatcher's office, a sounder on the local circuit actuated by said relay, a telegraph-line from said relay to said call-box and means to free said trigger telegraphically.

7. In a signal system, the combination with a semaphore-arm, electrically-operated mechanism for said arm, actuating mechanism, a call-bell, a battery, a switch connected to the battery and shifted by the operated semaphore-arm, a pair of terminals for the switch connected to the actuating mechanism and the battery, respectively.

8. In a signal system, the combination with a semaphore-arm, and operative mechanism for said arm consisting of a link, a trigger and an electromagnet controlling said trigger, of actuating mechanism for said semaphore, telegraphically controlled, a call-bell, a battery, a switch connected to said battery through said actuating mechanism, and two terminals connected respectively to the electromagnet and the call-bell, and adapted to be cut in by the operation of said arm, substantially as described.

9. In a signal system, the combination with two semaphore-arms, a link, a trigger and electromagnet controlling said trigger for each arm, two switch-terminals, and a switch in the path of said link for each arm, of actuating mechanism electrically controlling the action of said arms, a battery, and a call-bell connected by a common conductor, to one terminal of each switch, the other terminal of each switch being connected to its respective electromagnet, substantially as described.

10. In a signal system, the combination with a semaphore, and its call-bell having a vibratory armature and an electromagnet suitably connected, of a ratchet-wheel and driven mechanism for stopping said call-bell, a hook-pawl for said ratchet-wheel and mounted on said armature, and a check for said wheel, substantially as described.

11. In a signal system, the combination with semaphore-arms, and operative mechanism for each arm, of actuating mechanism consisting of a winding mechanism, an escapement mechanism, telegraphically controlled and driven by the winding mechanism, a registering mechanism for the escapement mechanism, and a Morse-character form controlling each arm, and controlled by said registering mechanism, substantially as described.

12. A telegraphically-operated signal system, comprising a series of semaphore-arms, operative mechanism for each arm, actuating mechanism consisting of a winding mechanism, an escapement mechanism telegraphically controlled, an equalizing driving connection between said winding and escapement mechanisms, a registering mechanism for said escapement mechanism, a Morse-character form for each semaphore-arm and controlled by said registering mechanism, substantially as described.

13. In a telegraphically-operated signal system, the combination with the driving-wheel of the escapement mechanism, of a winding mechanism consisting of a motor having suitable battery connections, intergearing between said driving-wheel and the armature-shaft of said motor, a pair of rings concentric with the shaft and insulatingly mounted, conductors respectively connecting said rings and motor-commutator, a pair of brushes for said rings supporting said driving-wheel, and electrical conductors for said brushes completing the circuit.

14. In a telegraphically-operated signal system, the combination with the equalizing mechanism and the escapement mechanism driven thereby, of a winding mechanism, consisting of a motor and battery therefor, a pair of concentric rings insulatingly mounted and in series with said motor and battery, a pair of brushes for said rings, a driving-gear mounted on said brushes, intergearing between the armature-shaft and said gear, and contact-points on the equalizing mechanism and driving-gear respectively, having conductors completing the circuit to said brushes.

15. In a telegraphically-operated signal system, the combination with an escapement-wheel and a motor-driven winding mechanism having a driving-gear, of an equalizing mechanism consisting of an arm loosely mounted on the same axis as the said winding-gear and escapement-wheel, springs connecting said arm with said gear and wheel respectively, and contact-points carried by said arm and gear respectively, and in series with the motor and battery of the motor-circuit.

16. A telegraphically-operated signal system, comprising an escapement mechanism, a motor-driven winding mechanism, intermediate spring connections between said escapement mechanism and said winding mechanism, and electrical connections in series with the motor, whereby the escapement mechanism is driven with a yielding impulse and the motor is regulated, substantially as described.

17. A telegraphically-operated signal system, comprising an escapement mechanism consisting of a motor-driven escapement-wheel with ratchet-teeth, an armature having a check-tooth, an escapement pivoted to said armature and having a contact-arm insulatingly mounted, a contact insulatingly mounted on said armature for said escapement-arm, an electromagnet for said armature, and electrical connections for the said contact and escapement-arm for operating said escapement, substantially as described.

18. A telegraphically-operated signal system, comprising an escapement mechanism consisting of an escapement ratchet-wheel, means to drive it, an armature having a check-tooth, an escapement pivoted to said armature and having a spring-arm insulatingly mounted thereon, a contact-point insulatingly mounted on said armature adjacent to said arm, an electromagnet for said escapement, a local magnet and its armature having a common contact, and respective upper and lower contacts for said common contact and electrical connections, substantially as described.

19. In a telegraphically-operated signal system, an electromagnet in the local circuit, its armature having a common contact, upper and lower insulated contacts for said armature-contact, a driving escapement-wheel, an escapement-armature and its electromagnet, and electrical conductors from said upper and lower contacts respectively, for regulating the rotation of said escapement-wheel, substantially as described.

20. A telegraphically-operated signal system, comprising a signal, a ratchet-wheel for register-bars and means to rotate it, operative connections between said signal and ratchet-wheel, bars slidingly mounted in said wheel for indicating Morse characters, an encircling casing having a dividing-flange for separating the space-bars from dot-and-dash bars, a bar-switch in said casing to effect such separation, and means to operate said switch telegraphically, substantially as described.

21. In a telegraphically-operated signal system, the herein-described slidable bar having a T-head and stem to indicate a Morse character by its position, in combination with an encircling casing having a dividing-flange for said stems to support them when adjusted, and means to raise said bars, to register spaces in Morse characters, substantially as described.

22. In a telegraphically-operated signal system, the herein-described slidable bar for registering telegraphic characters, consisting of a shank 59 for slidingly mounting, a T-head with a sharpened stem 60 at one side for lifting it, and a downward projection on the other to steady it, substantially as shown and described.

23. In a telegraphically-operated signal system, the combination with a ratchet-wheel, means to rotate it, and slidable bars mounted in the ratchet-rim of said wheel, of a casing having a dividing-flange adjacent to said rim, a bar-switch, means to operate it, and a yielding point in line with said flange near said switch, substantially as described.

24. In a telegraphically-operated signal system, the combination with a ratchet-wheel and means to rotate it, of bars slidingly mounted in said wheel having stems projecting beyond its rim, a casing opposite said rim and having a dividing-flange, a bar-switch in said casing, means to operate it, and a yielding point for said flange formed by a rocker-arm adapted to yield circumferentially under engagement by a switched bar-stem, substantially as described.

25. In a telegraphically-operated signal system, the combination with the bar-wheel and slidable bars, of forms riding above said bars having Morse characters adapted to match with same characters when registered by the said bars, guides connected to said forms, a bridging-plate forming a support for said guides, opening arms mounted on said support and having insulating-stops, contacts carried by said guides, and electrical connections for said contacts, substantially as described.

26. In a telegraphically-operated signal system, the combination with the form-guides, bars and rotary bar-wheel, of a rotary disk mounted above said wheel, and cam-props pivoted to said guides and acted on by said disk, substantially as and for the purpose described.

27. In a telegraphically-operated signal system, the combination with a signal, and its connections; movable pieces designating Morse characters by their adjusted positions, an adjuster, and actuating mechanism for said adjuster telegraphically operated, of a cut-out shoe having a contact and determining the dash-bars, an opening arm normally closed on said shoe-contact except in dash characters, and in series with said actuating mechanism, substantially as described.

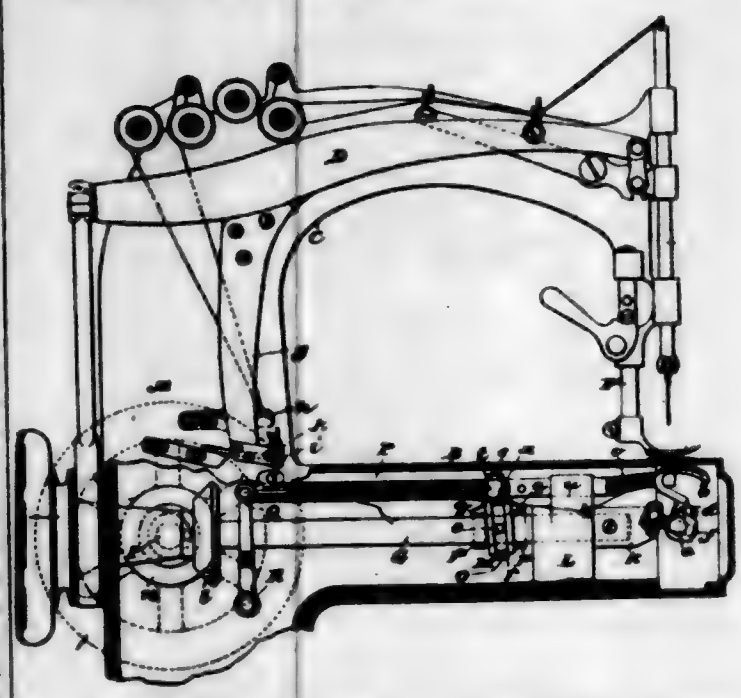
28. In a telegraphically-operated signal system, the combination with a ratchet-wheel, a wheel-casing, slidable bars corresponding to spaces and dots in the Morse code, and means to shift said bars, of a shoe mounted above said bars and normally riding on the space-bars, and adapted to drop down between the space-bars, substantially as and for the purpose described.

29. In a telegraphically-operated signal system, the combination with movable pieces and means to support them, of the herein-described shoe, consisting of a horizontally-pivoted arm mounted above said movable pieces, and having a block on the end substantially the width of three of the movable pieces as mounted, and normally riding on the tops of said pieces till a space is left for it to drop between, and electrical connections opened by the dropping of said shoe, substantially as described.

30. In a signal system, the combination with a motor connected to a source of electricity, and an escapement mechanism, and a driving mechanism for said escapement mechanism of variable-pressure contacts, in series with said motor and interposed between said escapement and driving mechanisms, for a current-regulator, substantially as described.

708,811. FEEDING MECHANISM FOR SEWING-MACHINES.

LAMBERT GOODNOUGH, Boston, Mass., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 2, 1896. Serial No. 574,539. (No model.)



Claim.—1. A feeding mechanism for sewing-machines, comprising a driving-shaft and a feed-dog-carrying bar, and an inclined eccentric pivoted upon the driving-shaft and operatively connected with the feed-dog-carrying bar, with means for adjusting said eccentric; substantially as described.

2. A feeding mechanism for sewing-machines, comprising a feed-dog-carrying bar pivoted at one end to a rocking support, a driving-shaft, an inclined eccentric pivoted on said shaft, and means for adjusting the inclination thereof, and connections between said inclined eccentric, and the feed-dog-carrying bar; substantially as described.

3. A feeding mechanism for sewing-machines, including a feed-dog-carrying bar, and means for operating the same, including an inclined eccentric with means for swinging it to vary the inclination, and means for rotating said eccentric, substantially as described.

4. A sewing-machine comprising a driving-shaft, a feed-dog-carrying bar parallel therewith, connections between the driving-shaft and said feed-dog-carrying bar, for giving the latter rising-and-falling, as well as forward-and-backward movements, said connections including an eccentric, pivotally mounted on the driving-shaft and operated by the latter to give the rise and fall and having a universal-joint connection with the feed-dog-carrying bar, with means for adjusting said eccentric on its pivot.

5. A feeding mechanism for sewing-machines comprising a driving-shaft, an eccentric pivoted thereon, a feed-dog-carrying bar, a universal-joint connection between said eccentric and the feed-dog-carrying bar, said connection being applied to the latter intermediate its ends, and means for securing the eccentric in any position to which it may be tilted; substantially as described.

6. A feeding mechanism for sewing-machines and the like comprising a driving-shaft, an eccentric, a pivotal pin for securing the eccentric to the shaft, lugs extending laterally from either side of said eccentric, screws passing through the driving-shaft and adapted to bear against the lugs to vary the angle of inclination of the eccentric with respect to the axis of the driving-shaft and operative connections between the eccentric and the feed-dog-carrying bar whereby the latter is reciprocated both vertically and longitudinally; substantially as described.

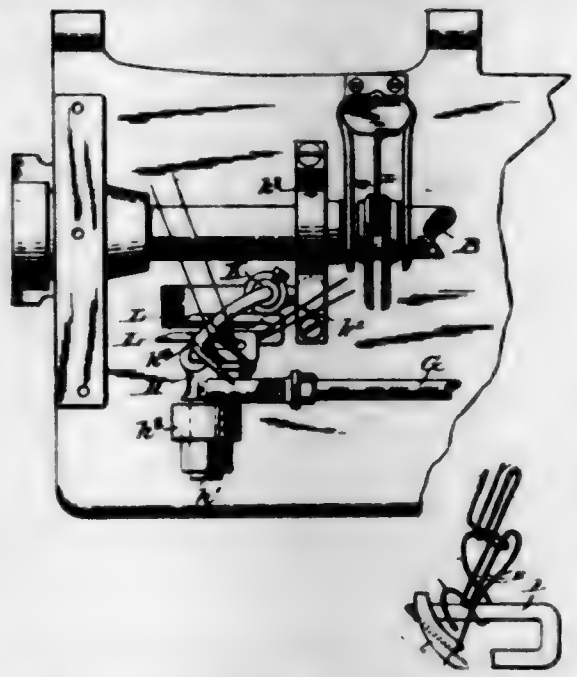
7. A feeding mechanism for sewing-machines and the like comprising a driving-shaft, an eccentric thereon set with its vertical axis at an oblique angle to the driving-shaft and having a circumferential groove, a strap embracing the eccentric and bearing in the groove and having an upwardly-extending lug or post provided with a ball, a feed-dog-carrying bar or rod having a socket for the reception of the said ball, and means for adjusting the inclination of the eccentric to the axis of the driving-shaft; substantially as described.

8. A feeding mechanism for sewing-machines and the like comprising a driving-shaft, an eccentric, a pivotal pin for securing the eccentric to the shaft, lugs extending laterally from either side of said eccentric, screws passing through the driving-shaft and adapted to bear against the lugs to vary the angle of inclination of the eccentric with respect to the axis of the driving-shaft, said eccentric having a circumferential groove, a strap embracing the eccentric and bearing in the groove, and a ball-and-socket connection between the strap and the feed-dog-carrying bar; substantially as described.

9. A sewing-machine feeding mechanism comprising a rocking frame, a feed-dog-carrying bar pivoted thereto and having a support at its forward end, a driving-shaft, an eccentric thereon, arranged with its axis inclined adjustably to the axis of the shaft, a strap embracing the eccentric and a ball-and-socket connection between the strap and the feed-dog-carrying bar; substantially as described.

10. In the herein-described mechanism the combination with the driving-shaft, inclined eccentric mounted thereon, of the feed-dog-carrying bar having at its forward end branches, a feed-dog secured thereto between the branches, said bar having secured to it a piece formed with the body, a socket, and a connecting member between the bar and eccentric having a ball fitting within said socket; substantially as described.

708,812. STITCH-FORMING MECHANISM FOR SEWING-MACHINES. LAMBERT OUDEKIRK, Boston, Mass., assignor to The Union Special Sewing Machine Company, a Corporation of Illinois. Filed Sept. 11, 1897. Serial No. 651,292. (No model.)



Claim.—1. A sewing-machine comprising a vibrating looper having a loop-taking and loop-shedding movement in the direction of its length, a spreader having movement across the line traversed by said looper in the direction of the length of said looper and arranged to seize and convey the looper-thread, and means for imparting to said spreader an amount of movement to cause it to pull through the looper a greater quantity of thread than the looper will take up in its backward movement; substantially as described.

2. A stitch-forming mechanism for sewing-machines, comprising a reciprocating thread-carrying needle, a coöperating thread-carrying looper, means for actuating the needle and looper, and a spreader with means for oscillating it to engage the looper-thread loop, and spread it for the passage of the needle, said looper and spreader being both adjustable whereby proper coöperation of the parts may be had; substantially as described.

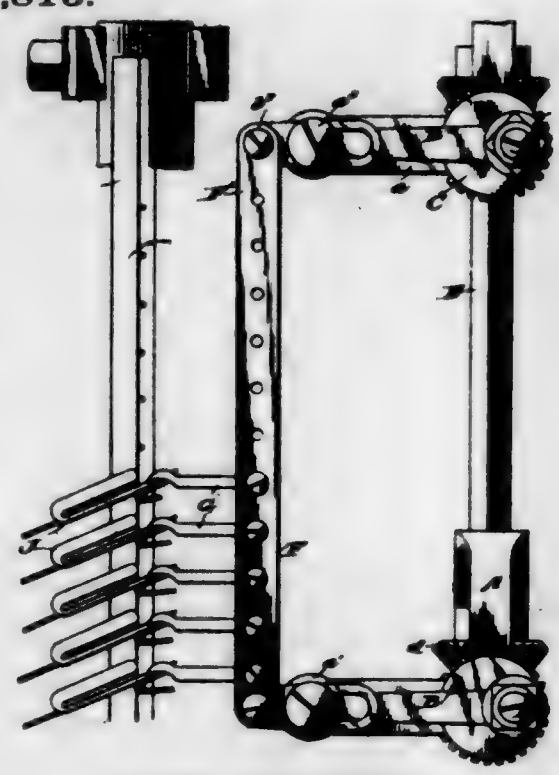
3. A stitch-forming mechanism for sewing-machines, comprising a reciprocating thread-carrying needle, a coöperating thread-carrying looper, means for actuating said needle and looper, a spreader for the looper-thread, a vertical shaft supporting the same, and means for oscillating said vertical shaft consisting of an eccentric, its strap, and a universal-joint and link connection between the strap and the spreader-support; substantially as described.

708,813. STITCH-FORMING MECHANISM FOR SEWING-MACHINES. LAMBERT OUDEKIRK, Boston, Mass., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 31, 1897. Serial No. 668,126. (No model.)

Claim.—1. In a sewing-machine, a looper, a support therefor upon which the looper is arranged, with its longitudinal axis diagonal to the direction of length of the support with means for oscillating said support, a loop-spreader support, and a spreader arranged thereon with its longitudinal axis at an angle to the longitudinal axis of the looper and means for reciprocating said latter support both in the direction of the length of the spreader, and transversely thereto; substantially as described.

2. In a sewing-machine, a driving-shaft, a bar or frame, having a pivotal sliding connection with a fixed part of the machine-frame, a crank for sliding and oscillating said bar or frame on its pivot, and a spreader-support pivoted to said bar or frame; a spreader thereon, and a looper and support therefor, with means for operating it substantially as described.

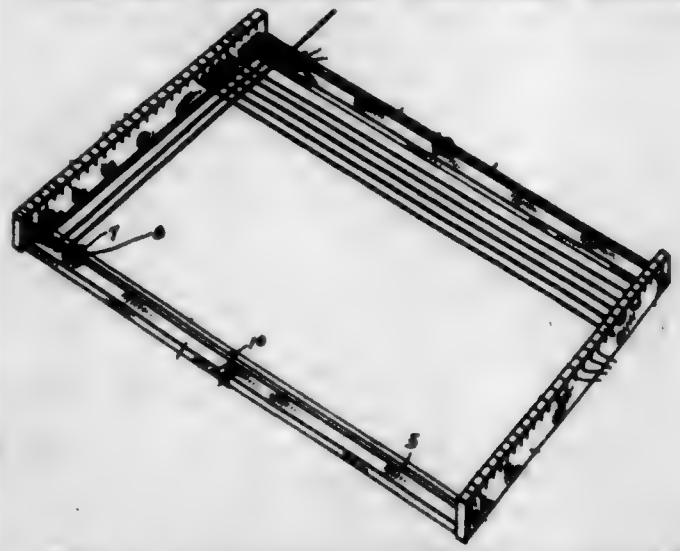
708,818.



708,814. PROCESS OF PRODUCING LONG AND SHORT FIBERS FROM REEDS, RUSHES, OR SIMILAR PLANTS. LUDWIG V. ORDODY, Budapest, Austria-Hungary. Filed Mar. 3, 1902. Serial No. 96,557. (No specimens.)

Claim.—The process of producing long and short fibers from reeds, rushes and similar stalky fibrous materials by macerating, draining, cutting into thin longitudinal strips, boiling in a mixture of two to three per cent. lye of potash or soda with an emulsion of petroleum and hydrate of lime, washing, separating into long and short fibers and purifying these two kinds of fibers in diluted solution of acid of vinegar, substantially as described.

708,815. KINDERGARTEN-LOOM. JONATHAN E. PAINTER, Minneapolis, Minn. Filed Feb. 21, 1902. Serial No. 95,034. (No model.)



Claim.—1. In a loom-frame, flexible side wires around which the weft-threads are passed, and clips carried by said frame and adapted to brace said wires against inward bending.

2. In a loom-frame, flexible side wires around which the weft-threads are passed, and adjustable clips provided on said frame and adapted to engage said wires and brace the same against inward bending.

3. A loom-frame, comprising head or end pieces adapted to support the warp-threads, side bars connecting said end pieces, flexible wires secured at one end, the opposite ends of said wires being free to be raised above the adjacent end piece, and slotted clips provided on said side bars and adapted to receive the free ends of said wires and prevent lateral movement thereof.

4. A loom-frame, comprising head or end pieces having saw-slits at intervals to receive the warp-threads, side bars connecting said end pieces, flexible wires around which the weft-threads are passed secured at one end, the opposite ends of said wires being free to be raised to permit the removal of the work therefrom, slotted clips provided on said bars and adapted to receive the free ends of said wires and prevent lateral move-

ment thereof, and bracing-clips provided on said bars to prevent inward bending of said wires.

5. A loom-frame, comprising end pieces having slits to receive the warp-threads, side bars connecting said end pieces, flexible wires or rods secured at one end and free to be raised at the other end, and a spool provided on said frame near the fixed end of said wires and having a series of annular spaces or grooves opposite the slits in the adjacent head and whereon the warp-threads are wound.

6. A loom-frame, comprising heads having a series of slits at intervals adapted to receive the warp-threads, bars connecting said heads, wires or rods secured at one end in one of said heads and free to be raised at the other end, bracing-clips adapted to prevent inward bending of said wires or rods, and a spool provided on said frame near the fixed ends of said wires and whereon the warp-threads are wound.

7. A loom-frame, comprising head or end pieces adapted to support the warp-threads, side bars connecting said end pieces, spring-wires secured at one end, the opposite ends of said wires being free to be raised above the adjacent end piece to permit the removal of the work, and clips carried by said side bars and adapted to brace said wires against inward bending.

8. A loom-frame, comprising head or end pieces to support the warp-threads, side bars connecting said end pieces, spring-wires secured at one end, the opposite ends of said wires being free to be raised above the adjacent end piece to permit the removal of the work, and adjustable clips provided on said side bars and adapted to engage said wires and brace the same against inward bending.

9. A loom-frame, comprising head or end pieces to support the warp-threads, side bars connecting said end pieces, flexible rods or wires secured at one end, and means preventing lateral movement of the opposite ends of said wires but permitting them to be raised above the adjacent end piece to permit the convenient removal of the work from the wires.

708,816. ADJUSTABLE SOCKET-WRENCH. JOHN L. PAXSON, Mobile, Ala. Filed Jan. 14, 1902. Serial No. 89,777. (No model.)

Claim.—1. A socket-wrench comprising opposite members having abutting centers, said abutments being flattened, half-sockets in the inner faces of each member at the ends thereof, and a sleeve surrounding said members, operatively engaging the same on both sides of the abutting centers, and capable of longitudinal movement thereon, whereby the ends of the members may be forced together to grip a nut or other object.

2. A socket-wrench comprising opposite members abutting at their centers, the inner faces of each member having bevels extending to each end, half-sockets at the ends of each member, tapering half-sockets in the rear of said end sockets, and a sleeve surrounding the said members capable of longitudinal movement toward each end, to cause said ends to approach each other and grip a nut or other object.

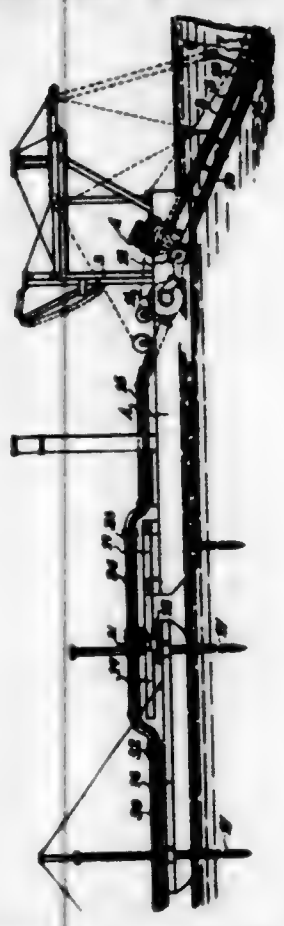
3. A socket-wrench comprising opposite members having a rocking engagement at their abutting centers, screw-threads on the exterior surface of each member, half-sockets in the inner face of each member at each end, a threaded sleeve or nut adapted to screw on the exteriorly-threaded members, and cause the ends of the opposite members to approach each other.

4. A socket-wrench comprising opposite members, projecting abutting centers, one or more pins projecting from the projecting center of one member, the opposite member being provided with one or more openings adapted to receive the said projecting pin or pins, half-sockets in the ends of each member, screw-threads on the exterior surface of each member extending on each side of the center thereof, and a nut surrounding the members and adapted to coact with the exterior threads on each member whereby longitudinal movement of said nut is permitted in either direction to cause the opposing socketed ends of the members to approach each other.

5. A socket-wrench comprising opposite members having flat abutting centers, bevels extending from said flat abutting centers toward the ends of each member, a swell or enlargement at one end of each member, half-sockets in said swells or enlargements, screw-threads on the exterior surface of each member extending from the said swells or enlargements, beyond the longitudinal center of the members, a pin projecting from the abutting center of one member, the opposite member being provided with an opening at its abutting center adapted to receive the said projecting pin, and a threaded sleeve or nut surrounding and engaging the threaded portion of the opposite members, whereby longitudinal movement of the said sleeve or nut toward each end is permitted to cause the opposing socketed ends of each member to approach each other.

6. A socket-wrench comprising opposite externally centrally threaded members provided with half-sockets in their inner faces at each end, and having a rocking engagement at their center, coinciding holes through each member near its end adapted to receive a pin whereby the turning leverage may be increased, and an internally-threaded sleeve surrounding said members, said sleeve being adapted to move longitudinally on said members and cause the ends to approach each other.

708,817. DREDGER. RAYMOND A. PERRY, San Francisco, Cal., assignor of one-half to Atlantic Gulf and Pacific Company, New York, N. Y., and San Francisco, Cal., a Corporation of West Virginia. Filed Nov. 6, 1900. Serial No. 35,630. (No model.)



Claim.—1. In a dredger, a means for making a succession of forward cuts centering from a fixed point at the rear of said dredge.

2. In a dredger, an excavator, suction and conducting pipes and a supporting-float, a fixed point behind the float around which the dredger swings, slidable joints in the conducting-pipes, and means for advancing the excavator and float in any direction with relation to said point while cutting.

3. In a dredger, an excavator, suction and conducting pipes and a support therefor, a fixed point in rear of said support around which the dredger swings, a slidably-extensible joint in the conductor, means by which the excavator and its support may be advanced to cut in different radial lines outwardly from the fixed point, and means for retracting these parts after each cut.

4. In a dredger, an excavator, a float and a ladder projecting forward of the float and upon which the excavator is carried, a suction-pipe having its mouth opening contiguous to the excavator, a discharge-pipe connecting therewith and leading rearwardly toward a fixed point, a fixed structure at the rear of the float, a turnable guide mounted thereon, and means for moving the float and the excavator in a forward direction away from and in line with the said fixed point during the cutting operation.

5. In a dredger and excavator, a float, a ladder hinged to the front thereof upon which the excavator is adjustably carried, a suction-pipe carried upon the ladder having its mouth contiguous to the excavator, a discharge-pipe leading rearwardly across the float having a telescopic slidable section thereon, a turnable guide mounted upon a fixed support axially in rear of the float, a ball-and-socket joint in the discharge-pipe having its axis coincident with that of the guide, and a means for advancing the float and excavator in radial lines from the guide and coincidently extending the discharge-pipe.

6. In a dredger, an excavator, a float having a ladder hinged to the front upon which said excavator is carried, a second float fixed at the rear of the first-named float having a turnable guide mounted thereon, a slidable beam fixed to the front float and movable through the turnable guides and means whereby said beam and the front float and excavator are advanced with relation to the guide.

7. In a dredger, a float having a ladder hinged to the front, an excavator carried upon the front of the ladder, and means for removing the excavated material, a second float fixed in line at the rear of the first float, and having a turnable guide mounted thereon, a beam slidable through said guide having its front end fixed to the forward float, a cable or the like connecting with the rear end of said beam and a winding-drum upon one of the floats to coil said cable, whereby said beam and the forward float are advanced with relation to the fixed float and the guide.

8. In a dredger, a float having a ladder hinged to the front, an excavator carried upon the front of the ladder, and means for removing the excavated material, a second float fixed in line at the rear of the first float and having a turnable guide mounted thereon, a beam slidable through said guide having its front end fixed to the forward float, a winding-drum and cables connected with the beam whereby the ladder, and the forward float may be advanced and retracted with relation to the fixed float.

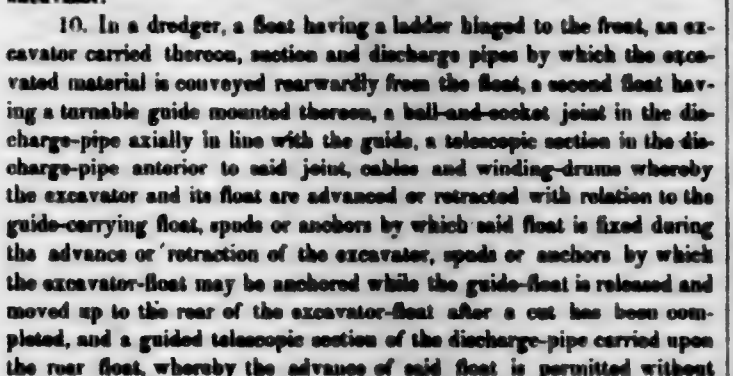
9. In a dredger, a float having a ladder hinged to the front, an excavator carried upon the front of said ladder, suction and discharge pipes by which the excavated material is transferredrearwardly from the excavator and float, a second float fixed at the rear of the first-named float having a turnable guide mounted thereon, a ball-and-socket joint in the discharge-pipe axially in line with said guide, and a beam or the like slidable through said guide having its forward end fixed to the excavator-float, cables and winding-drums whereby the beam and excavator-float are moved forward and back with relation to the guide, a slidable telescopic joint in the discharge-pipe anterior to the telescopic joint, whereby said pipe is lengthened in unison with the forward movements of the excavator.

10. In a dredger, a float having a ladder hinged to the front, an excavator carried thereon, suction and discharge pipes by which the excavated material is conveyed rearwardly from the float, a second float having a turnable guide mounted thereon, a ball-and-socket joint in the discharge-pipe axially in line with the guide, a telescopic section in the discharge-pipe anterior to said joint, cables and winding-drums whereby the excavator and its float are advanced or retracted with relation to the guide-carrying float, spuds or anchors by which said float is fixed during the advance or retraction of the excavator, spuds or anchors by which the excavator-float may be anchored while the guide-float is released and moved up to the rear of the excavator-float after a cut has been completed, and a guided telescopic section of the discharge-pipe carried upon the rear float, whereby the advance of said float is permitted without breaking the continuity of the pipe.

11. In a dredger, a float having a ladder hinged to the front, one or more excavators mounted upon a shaft journaled transversely across the front of the ladder, means for moving the float and the excavator in a forward direction away from and in line with a fixed point during the cutting operation, and toward said point after the completion of each cut, and a suction-pipe carried upon the ladder and having a mouth made divergent horizontally and coincident with and contiguous to the excavators.

12. In a dredger, a float having a ladder hinged to the front, one or more excavators mounted upon a shaft journaled transversely across the front of the ladder, mechanism by which power is transmitted to rotate said shaft and excavators, and means for advancing the float and excavators in the longitudinal line of the dredge so as to make a direct forward cut at each advance, a suction-pipe carried upon the ladder having divergent branches at the lower end, said branches having mouths in the form of flattened cones or hoppers divergent from the branches toward the front and contiguous to the excavator.

708,818. CAR-BRAKE. JOSEPH PLATTENBURG, McKeesport, Pa. Filed Feb. 21, 1902. Serial No. 95,087. (No model.)



Claim.—1. The combination with a longitudinal integral member provided with inclined faces, of an integral vertically-adjustable shoe adapted to be lowered into longitudinal alinement with and slide along said member and to engage said faces.

2. The combination with a longitudinal integral member provided with inclined faces, of an integral sliding shoe provided with similarly-inclined faces adapted to be lowered into longitudinal alinement with and slide along said member and to engage said faces, and means for raising and lowering the shoe.

3. The combination with a longitudinal member provided with inclined wedge-faces, of a shoe adapted to engage said faces, means for lowering and raising the shoe and flexible connections between the shoe and said raising means.

4. The combination with a longitudinal member provided with inclined wedge-faces, of a sliding shoe adapted to engage and bind upon said faces, a rack-bar, and intervening link connections, with means for raising and lowering the rack-bar.

5. The combination with a longitudinal member provided with inclined wedge-faces; of a sliding shoe adapted to engage and bind upon said faces, a rack-bar, and intervening link connections, a toothed pinion adapted to engage the rack-bar, and means for actuating the pinion.

6. The combination with a longitudinal member provided with inclined wedge-faces; of a sliding shoe adapted to engage and bind upon said faces, a rack-bar and intervening link connections; a shaft provided with a toothed pinion in engagement with the rack-bar, and worm-gearing for rotating the shaft.

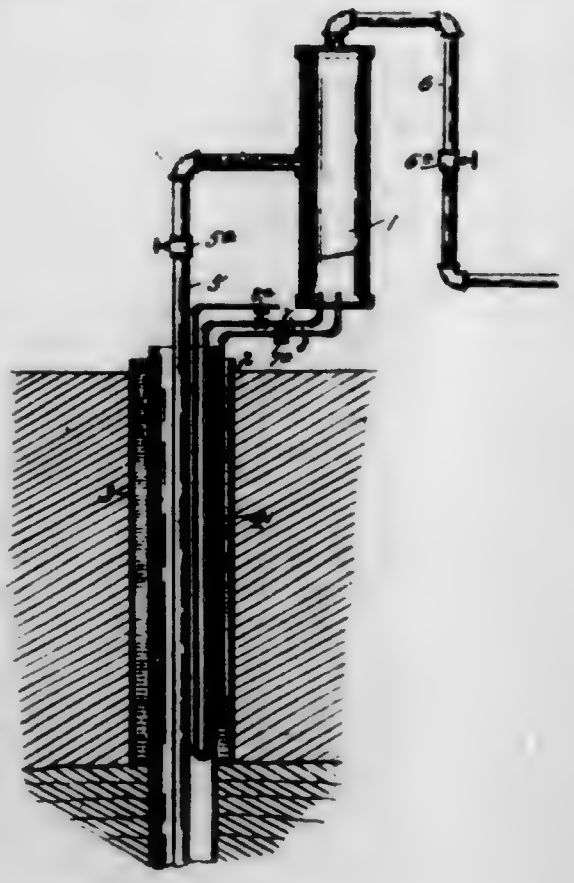
7. The combination with a longitudinal member provided with inclined wedge-faces; of a sliding shoe adapted to engage and bind upon said faces, a rack-bar and intervening link connections, a shaft provided with a toothed pinion in engagement with the rack-bar, and worm-gearing for rotating the shaft, with a case surrounding the worm-gearing adapted to contain a lubricant.

8. The combination with a longitudinal member provided with inclined wedge-faces; of a sliding shoe adapted to engage and bind upon said faces, a rack-bar and intervening link connections, a shaft provided with a pinion in engagement with the rack-bar, a worm-wheel mounted on the shaft, and a vertical shaft provided with a crank-handle and a worm in engagement with the worm-wheel.

9. The combination with a longitudinal member provided with inclined wedge-faces; of a sliding shoe adapted to engage and bind upon said faces, a rack-bar and intervening link connections, a shaft provided with a pinion in engagement with the worm-wheel, and a surrounding casing inclosing the worm-wheel and worm and adapted to contain a lubricant.

10. Apparatus for braking cars consisting of a longitudinal member mounted on the road-bed provided with inclined wedge-faces, a shoe provided with similarly-inclined wedge-faces, adapted to engage the faces of said member, a vertical rack-bar, flexible connections with the shoe, shaft provided with a toothed pinion in engagement with the rack-bar, and a worm-wheel, and a vertical turning shaft provided with a worm in engagement with said worm-wheel.

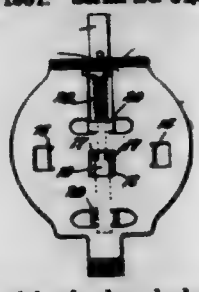
708,819. GAS, OIL, AND WATER SEPARATOR. JOSEPH M. POWELL, Orestes, Ind. Filed Jan. 24, 1902. Serial No. 91,104. (No model.)



Claim.—1. The combination with a well, of a well-pipe mounted to conduct gas and oil out of said well, a separating-tank connected to said well-pipe, a gas-pipe connected to said separating-tank, a liquid-pipe connected to said separating-tank with its mouth below said gas-pipe, said liquid-pipe extending down into said well and back to the surface so that the liquid retained therein will form a water seal to prevent the passage of gas therethrough, substantially as described.

2. The combination with a separating-tank, of a pipe connected to said separating-tank to conduct oil, gas and water thereinto, a gas-pipe connected to said separating-tank, and a liquid-pipe connected to said separating-tank below said gas-pipe, said liquid-pipe being U-shaped and arranged to hold liquid enough to form a seal to prevent the escape of gas from said separating-tank therethrough, substantially as described.

708,820. CHATELAINE-HOOK. LOUIS B. PRAHAR, Brooklyn, N. Y. Filed Nov. 28, 1901. Serial No. 84,015. (No model.)

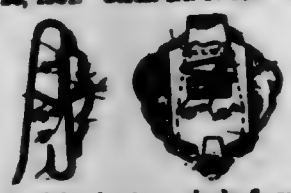


Claim.—1. In a chatelaine-hook, a body-section having opposing members, a tongue pivotally mounted on one member of the body, having an upward inclination and being normally in clamping engagement at its free end with the opposing body member, an actuating-bar mounted to slide on one of the members, a working connection between the actuating-bar and tongue at a point removed from the clamping edge of the tongue, whereby the tongue through its connection with the actuating-bar is carried to and from the member of the body of the hook with which it is adapted for clamping engagement, as specified.

2. In a chatelaine-hook, a body-section having opposing members, a clamping-tongue pivoted to one member of the body, which tongue extends in an upward direction normally to an engagement with the opposing member of the body of the hook, the said tongue having an extension from its pivoted portion, a spring-controlled actuating-bar mounted to slide upon one body member of the hook, being operatively connected with the said extension from the tongue to raise and lower the tongue, and means for operating the actuating-bar from the exterior of the body, as described.

3. In a chatelaine-hook, the combination with a body-section comprising a front, a rear and an upper connecting member, a tongue pivotally attached to the front member, which tongue extends in an upward direction, normally bridging the space between the front and rear members of the body to an engagement with the rear member, the said tongue being provided at its pivot portion with lugs which extend through an opening in the front member of the body-section, of a spring-controlled bar mounted to slide upon the front member of the body-section, the said bar being provided with surfaces for engagement with the lugs of the tongue, and means substantially as described, for operating the said bar from the exterior of the body-section, as described.

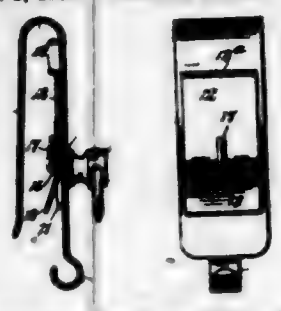
708,821. CHATELAINE-HOOK. LOUIS B. PRAHAR, Brooklyn, N. Y. Filed Dec. 26, 1901. Serial No. 87,287. (No model.)



Claim.—1. In chatelaine-hooks, a body-frame having connected front and back members, an angular tongue pivotally connected with one member of the frame, both sections of the tongue having an upward inclination, one section of the tongue being normally in engagement with the inner face of the rear member of the frame, a handle member in operative connection with the tongue, which handle member extends out through an opening in the front of the frame and is adapted to be raised and lowered, having suitable movement in the said opening, and a spring carried by the frame, acting to hold the rear section of the tongue in position to engage with the rear member of the frame, as described.

2. In a chatelaine-hook, the combination with a body-frame consisting of a back member and a front member, the front member terminating at its lower end in a hook, and an ornamental plate at the outer face of the front member of the frame, which plate and which front member are provided with registering openings, of a locking-tongue mounted in the said frame and provided with a handle-lever which extends out through the openings in the front member of the frame and the ornamental plate, the tongue having an upward and rearward inclination, normally engaging at its rear edge with the inner face of the rear member of the frame, and a spring mounted to normally hold the said tongue in contact with the said rear member of the frame, as and for the purpose set forth.

708,822. CHATELAINE-HOOK. LOUIS B. PRAHAR, New York, N. Y. Filed Mar. 5, 1902. Serial No. 96,799. (No model.)



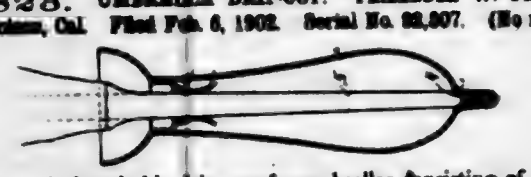
Claim.—1. A chatelaine-hook, consisting of front and rear frame members, an angular clamping member independent of the frame members and having rocking contact with one of them, and a manipulating member having movement in the frame and provided with a section arranged for depressing engagement with one or the other section of the clamping member, substantially as described.

2. A chatelaine-hook, consisting of front and rear frame members, an angular clamping member independent of the frame members and having rocking contact with one of them, and a manipulating member mounted to turn in the frame member and provided with a section, arranged to travel over and to have depressing engagement with one or the other section of the clamping member, substantially as described.

3. A chatelaine-hook, comprising front and rear connected frame members, a clamping member consisting of a head and a foot section at angles to each other, and a fulcrum-section in engagement with the frame member, and a manipulating member consisting of a pin loosely passed through a frame member and through the fulcrum-section of the clamping member, which pin is provided with an extension at angles to its main portion, which extension as the pin is turned has depressing engagement with one or the other section of the clamping member, for the purpose set forth.

4. A chatelaine-hook, consisting of front and rear members, an angular clamping member independent of the frame members and having rocking contact with the inner face of one of said frame members and means exteriorly operated over the rocking point of the clamping member to press one or the other of the sections of the angular clamping member against the frame member on which the clamping member is mounted, as and for the purpose described.

708,823. UMBRELLA DRIP-CUP. PHILANDER W. PRAY, San Francisco, Cal. Filed Feb. 6, 1902. Serial No. 92,807. (No model.)



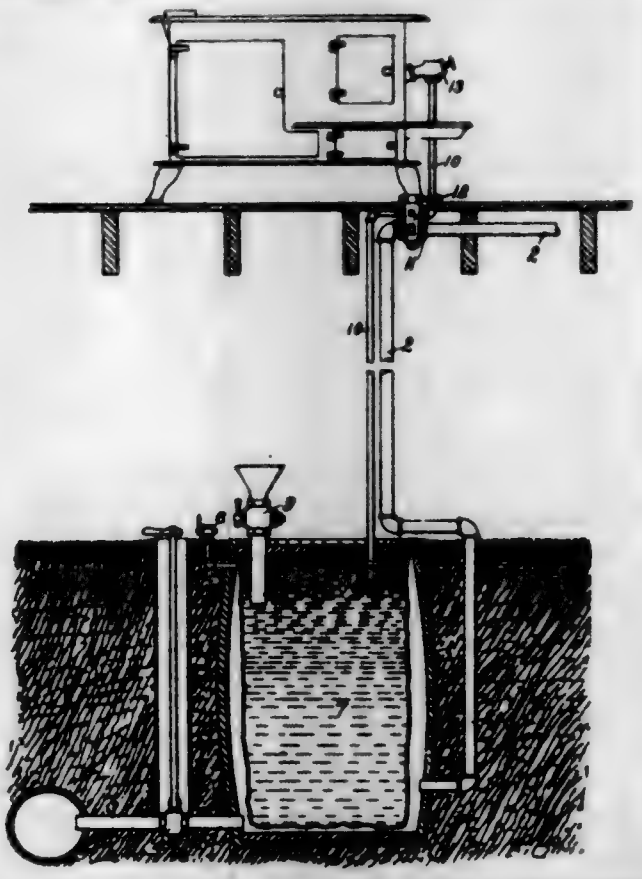
Claim.—A detachable drip-cup for umbrellas consisting of a metal receptacle adapted to slip on over the end of an umbrella-rod, an exterior projection of reduced diameter on the lower end of the cup, an enlarged, outwardly-flared, funnel-like flange on the upper portion of said cup, a recess in the bottom of said cup in which the umbrella-rod is adapted to rest and an annular series of curved springs having one end secured to the interior of the cup, the middle portion adapted to bear upon the umbrella-rod and their other ends unsecured and extending below their point of attachment.

708,824. WATER-PRESSURE SAFETY OIL-FEEDER. JOHN C. QUIRK, Port Costa, Cal. Filed Feb. 11, 1902. Serial No. 93,626. (No model.)

Claim.—1. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle and an inner collapsible receptacle for oil, and a water-supply pipe to the interior of the outer receptacle exterior to the inner one, and an oil-discharge pipe from the inner receptacle and a valve common to and controlling both of the pipes.

2. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle provided with a valved waste-pipe and an inner collapsible receptacle for oil having a valved supply-pipe, and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one, and oil-discharge pipe from the inner receptacle and a valve common to and controlling the water-supply and oil-discharge pipes.

3. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle provided with a valve-controlled air-inlet and an inner collapsible receptacle for oil and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one, and an oil-discharge pipe from the inner receptacle and a valve common to and controlling both of the pipes.



4. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle provided with a valved waste-pipe and a valve-controlled air-inlet, and an inner collapsible receptacle for oil having a valved supply-pipe, and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one, and an oil-discharge pipe from the inner receptacle and a valve common to and controlling the water-supply and oil-discharge pipes.

5. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle inclosed within an incombustible envelop and an inner collapsible receptacle for oil and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one and an oil-discharge pipe from the inner receptacle and a valve common to and controlling both of said pipes.

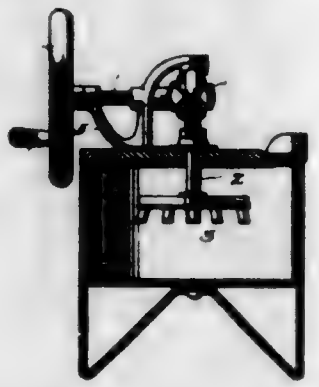
6. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle inclosed within an incombustible envelop and provided with a valved waste-pipe and an inner collapsible receptacle for oil having a valved supply-pipe and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one, and an oil-discharge pipe from the inner receptacle and a valve common to and controlling the water-supply and oil-discharge pipes.

7. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle inclosed within an incombustible envelop and provided with valve-controlled air-inlet and an inner collapsible receptacle for oil and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one, and an oil-discharge pipe from the inner receptacle and a valve common to and controlling both of the pipes.

8. A device for containing and supplying fuel-oil and like materials comprising an outer receptacle inclosed within an incombustible envelop and provided with a valved waste-pipe and a valve-controlled air-inlet and an inner collapsible receptacle for oil having a valved supply-pipe, and a water-supply pipe to the interior of the outer receptacle, exterior to the inner one, and an oil-discharge pipe from the inner receptacle and a valve common to and controlling the water-supply and oil-discharge pipes.

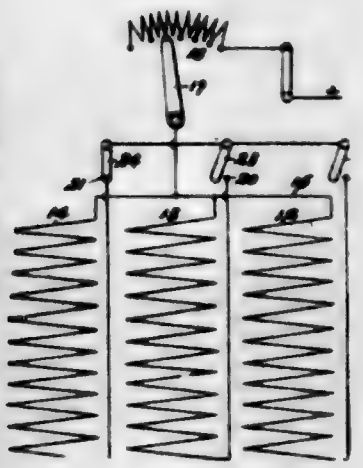
708,825. MECHANICAL MOVEMENT. JOHN QUIST and CHARLES QUIST, Mystic, Iowa, assignors of one-half to O. P. Pearson and Charles L. Berry, Mystic, Iowa. Filed Nov. 18, 1901. Serial No. 82,782. (No model.)

Claim.—1. A mechanical movement embodying an oscillatory shaft, a rotating shaft, the axes of the shafts being arranged at right angles to each other, a swinging yoke connected to the oscillatory shaft, a ball or spherical head connected to the rotating shaft and having a substantially S-shaped groove, and a shoe upon the yoke to traverse said groove, whereby oscillatory motion is imparted to the said oscillatory shaft and yoke, substantially as described.



2. The combination with a suitable bearing, an oscillatory shaft, and a rotating shaft journaled in said shaft being disposed at right angles to each other, of a yoke fixed to the oscillating shaft and mounted to swing upon said bearing, a ball or spherical head carried by the rotating shaft and having a substantially S-shaped groove, and a swiveled shoe upon the yoke traversing said groove, substantially as described.

708,826. ELECTRIC BATH APPARATUS. JAMES D. RANDALL, Memphis, Tenn., assignor of one-half to Joseph W. Buchanan, Memphis, Tenn.; Josephine E. Randall administratrix of said James Dennison Randall, deceased. Filed Feb. 5, 1901. Serial No. 46,062. (No model.)



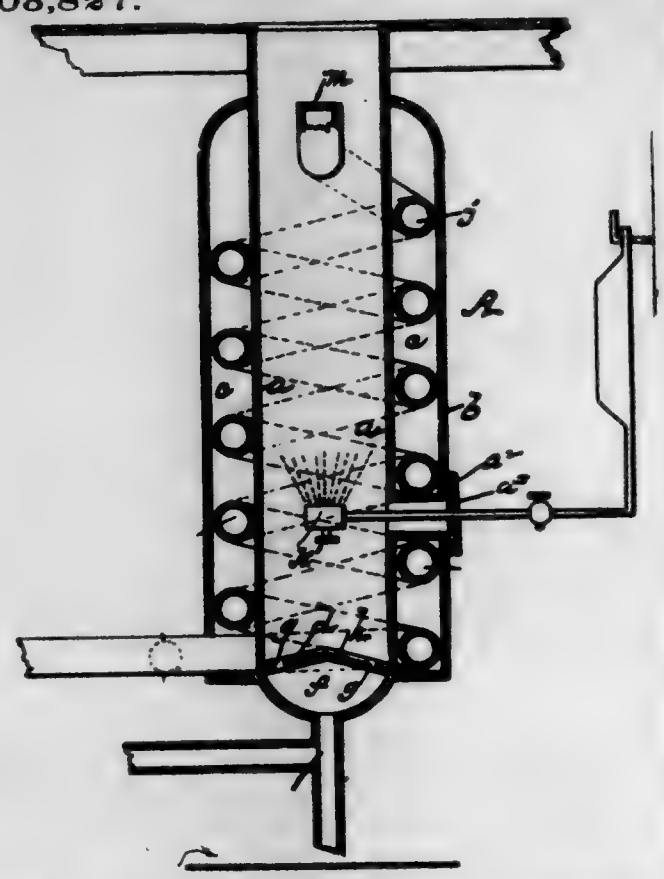
Claim.—1. An electric bath apparatus, comprising a cabinet open at the bottom and having a top closure provided with an opening, a plurality of electroheating helices arranged around the cabinet concentrically and insulated one from another, the several conductors having each one terminal connected to a wire adapted for connection with an electric line-wire, and switches for closing the other line-wire with the other terminals of the conductors.

2. An electric bath apparatus, comprising a rigid barrel-like body which is open at the bottom, to allow it to be placed over a patient, and having a top provided with an opening for the head of the patient, a plurality of electroheating helices arranged around such body concentrically and insulated one from another in the body of the same and having each one terminal connected to a wire adapted for connection with an electric line-wire, and a switch for closing the other line-wire with the other terminal, the conductors being slack as shown and described.

708,827. HEATING AND VENTILATING SYSTEM. JESSE O. RANDALL, Silversprings, N. Y. Filed Mar. 3, 1902. Serial No. 96,422. (No model.)

Claim.—The combination with the cylinder having double walls, spaced apart and a pipe *j* arranged within said space, and having its upper end extending into the space inclosed by said cylinder, of the inclined head at the lower end of said cylinder and provided with grooves *h* in its upper surface and perforations *g, g*, in its periphery, the outer head *e* spaced from said inner head, a drip-pipe attached to said outer head and in communication with the space between the heads, and a pipe *d'* connected to said drip-pipe and adapted to supply air thereto, substantially as described.

708,827.



of attachment of the spring-plate to the jamb-plate, and having an opening opposite the head of the screw-bolt whereby the tension of the spring-plate may be regulated, a friction-shoe secured to the lower end of the jamb-plate projecting upwardly in front of the spring-plate, and adapted to be pressed thereby against the edge of a sash, substantially as shown and described.

3. In a sash-holder the combination with a curved plate-spring secured at one end, of an oppositely-disposed and similarly-curved shoe of frictional material secured at one end, against which the said spring-plate is adapted to bear in parallel relation, substantially as shown and described.

4. A sash-holder consisting of a jamb-plate having a central box-like depression, a lug formed on the inner face of the depressed portion of said jamb-plate, a curved plate-spring secured at its upper end within the depression of the jamb-plate and bearing against said lug, an adjusting screw-bolt securing said spring to the jamb-plate, an upper cover-plate secured to the upper end of the jamb-plate, and having a downwardly-projecting portion extending below the point of attachment of the said spring-plate to the jamb-plate, said upper cover-plate having in its downwardly-projecting portion, a hole in line with and opposite the head of the screw-bolt, whereby a screw-driver may be inserted to turn the screw-bolt and regulate the tension of the curved spring-plate, substantially as shown and described.

5. A sash-holder comprising a plate provided with a lug or projection on its face, a curved metal plate-spring adjustably secured at one end to said plate and fulcrumed on said lug or projection, an oppositely-arranged and correspondingly-curved friction-shoe, secured at one end against the free end of which the said plate-spring is adapted to bear in parallel relation, substantially as shown and described.

708,828. ANKLE-SUPPORT. FREDERICK H. READ, Providence, R. I. Filed Feb. 24, 1902. Serial No. 96,291. (No model.)

Claim.—1. An ankle-support, comprising an instep-strap having at one end a buckle with which the other end of the strap engages for securing the strap around the instep, said strap being provided with a loop or eye, and an ankle-strap having one end fixedly secured to the instep-strap to stand at right angles thereto and provided at its other end with a hook for engaging the loop of the instep-strap, as set forth.

2. An ankle-support comprising an instep-strap provided at one end with a buckle, adapted to be engaged by the other end of the strap, the buckle having a loop at one side, and an ankle-strap of a width greater than the instep-strap and secured at one end to the instep-strap to stand at right angles thereto, the free end of the ankle-strap having a hook for engagement with the loop of the buckle, as set forth.

3. An ankle-support comprising an instep-strap provided at one end with a buckle, adapted to be engaged by the other end of the strap, the buckle having a loop at one side, and an ankle-strap of a width greater than the instep-strap and secured at one end to the instep-strap to stand at right angles thereto, the free end of the ankle-strap having a hook for engagement with the loop of the buckle, the said hook being adjustably held on the free end of the said ankle-strap, as set forth.

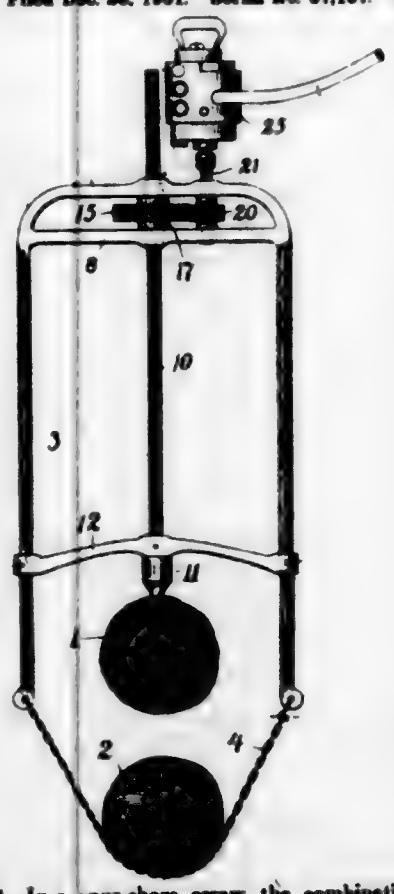
708,829. SASH-HOLDER. WILLIAM M. REELY, Spokane, Wash. Filed Oct. 3, 1901. Serial No. 77,449. (No model.)

Claim.—1. A sash-holder comprising a plate having a central depression provided with a lug or projection on its inner face, a plate-spring secured at one end to the jamb-plate and having a fulcrum bearing against said lug below the point of attachment of said spring, a friction-shoe secured to the jamb-plate in front of said plate-spring and adapted to be pressed thereby against a sash, an upper cover-plate extending below the upper wall of the central depression of the jamb-plate and provided with means whereby the tension of the plate-spring may be regulated, substantially as shown and described.

2. A sash-holder comprising a jamb-plate, having a central box-like depression, provided with a lug on its inner face and having a screw-hole near its upper wall, a plate-spring secured to said jamb-plate by a screw-bolt secured in said threaded opening and having a fulcrum bearing against the lug or projection of the jamb-plate, an upper cover-plate secured to upper end of the jamb-plate and projecting downwardly beyond the point

---

708,830. SPUR-SHORE SCREW. WILLIAM S. REBBLE, East Boston, Mass. Filed Dec. 26, 1901. Serial No. 87,167. (No model.)

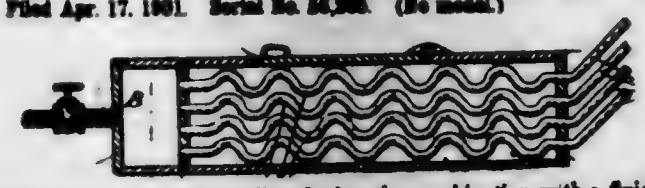


Claim.—1. In a spur-shore screw, the combination of the frame-work comprising the side bars and two closely parallel bars uniting the

same, the internally-threaded sleeve or nut rotatable in said parallel bars, the spur-gear rigid with said nut, the pinion meshing with said gear, a motor for turning said pinion, a power-screw fitted in said nut, the cross-bar rigid with said screw and sliding on said side bars, and a flexible means attached to the ends of said side bars for securing said frame to one of two piles while the power-screw engages the other pile, substantially as described.

2. In a spur-shore screw, the combination of the framework comprising the side bars and the two closely-located parallel bars uniting the same, the internally-threaded sleeve or nut rotatable in bearings in said parallel bars and having the shoulders keeping it from end play, the spur-gear rigid with said nut, the pinion meshing with said gear and having the outwardly-extended shaft, a motor secured to said shaft, a power-screw fitted in said nut and having a pointed head to engage a pile, a cross-bar having eyes slidable along said side bars and rigid with said screw, and a chain attached to the ends of said side bars to pass about the second of two piles designed to be pressed together, substantially as described.

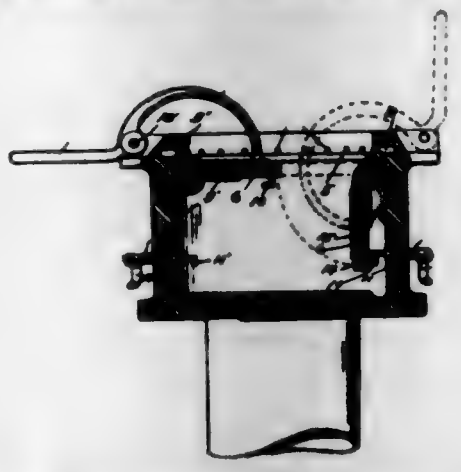
708,831. MINE-VENTILATOR. PETER T. REYNOLDS, Butte, Mont. Filed Apr. 17, 1901. Serial No. 56,205. (No model.)



Claim.—1. In a fluid-cooling device, the combination with a fluid-supply pipe and a cooling-mixture tank, of a rotatable tube passing through the interior of and passing through and journaled in the walls of said cooling-mixture tank, said tube within the interior of said tank provided with a series of sinuous bends in the same plane, one end of said tube communicating with said supply-pipe and the other end of said tube communicating with the atmosphere, substantially as described.

2. In a fluid-cooling device, the combination with a fluid-supply pipe and a cooling-mixture tank of a plurality of rotatable tubes arranged in vertical series passing through the interior of and passing through and journaled in the walls of said cooling-mixture tank, each of said tubes within the interior of said tank provided with a series of sinuous bends in the same plane, one end of each of said tubes communicating with said supply-pipe and the other ends of said tubes communicating with the atmosphere, substantially as described.

708,832. CASING-HEAD. CLARK F. RIDDY, New Martinsville, W. Va. Filed Oct. 31, 1901. Serial No. 79,251. (No model.)



Claim.—1. The combination of a casing-head, a valve-seat surrounding its upper open end, a vertically-swinging spring-actuated valve within the head and closing upwardly against the seat, and latch mechanism for holding the valve normally open.

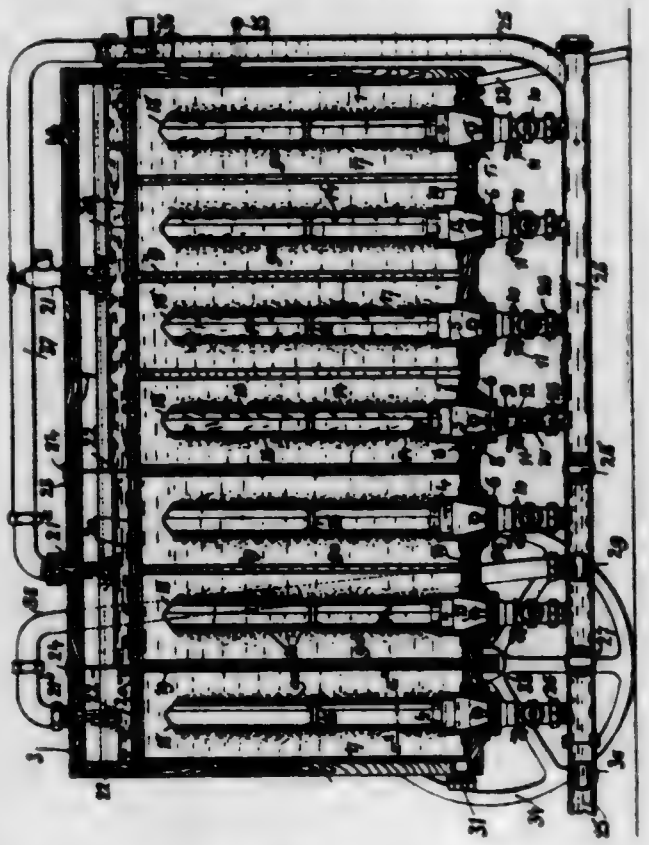
2. The combination of a casing-head, and vertically-swinging cooperating valve-sections at opposite sides of the upper open end of the head and adapted to close the same.

3. The combination of a casing-head, a vertically-swinging spring-actuated valve for closing the upper open end thereof, and a lever fulcrumed to the upper portion of the casing-head, the lever being constructed with an arm adapted to engage the upper surface of the valve, whereby when the lever is oscillated the valve is opened.

4. The combination of a casing-head, a horizontal valve-seat below the upper end of the head, a vertically-swinging valve below the seat and adapted to close upwardly thereagainst, the wall of the head above the valve being cored to form a steam-channel, a steam-supply connection for said channel, the wall being formed with openings extending from the channel to the inner face of the head.

5. A casing-head having a through-and-through vertical passage of sufficient size to pass drilling-tools and permit of the free operation of a drilling-cable, the casing-head being formed with lateral outlets and at its lower end adapted to unite with a well-casing, in combination with valve mechanism operatively mounted within the head and adapted to close over and seal the upper portion of the through-and-through passage above the lateral outlets, said valve mechanism when open being entirely out of the path of the tools and cable.

708,833. FILTERING APPARATUS. DAVID ROJAT, Rimos, France. Filed July 24, 1901. Serial No. 69,542. (No model.)



Claim.—1. In a filtering apparatus, the combination with the outer line casing or box and its cover, the slidable partitions 22 in said box for dividing the chamber therein into compartments, and the perforated plates 20, of a plurality of filtering elements mounted in said chambers and separated by said partitions, and pipes and cocks for conducting the liquid to be filtered from one compartment to another and controlling its flow, substantially as set forth.

2. In a filtering apparatus, the combination to form a filtering element, of the inner wall of perforated metal 14, forming a chamber, the spirally-disposed distancing-grid 16, about the outside of the metal 14, the gauze covering 17 over said grid, the fibrous filtering coating 90 of cellulose and asbestos, and the roof 18, said element having at its bottom an outlet for the filtered liquid, substantially as set forth.

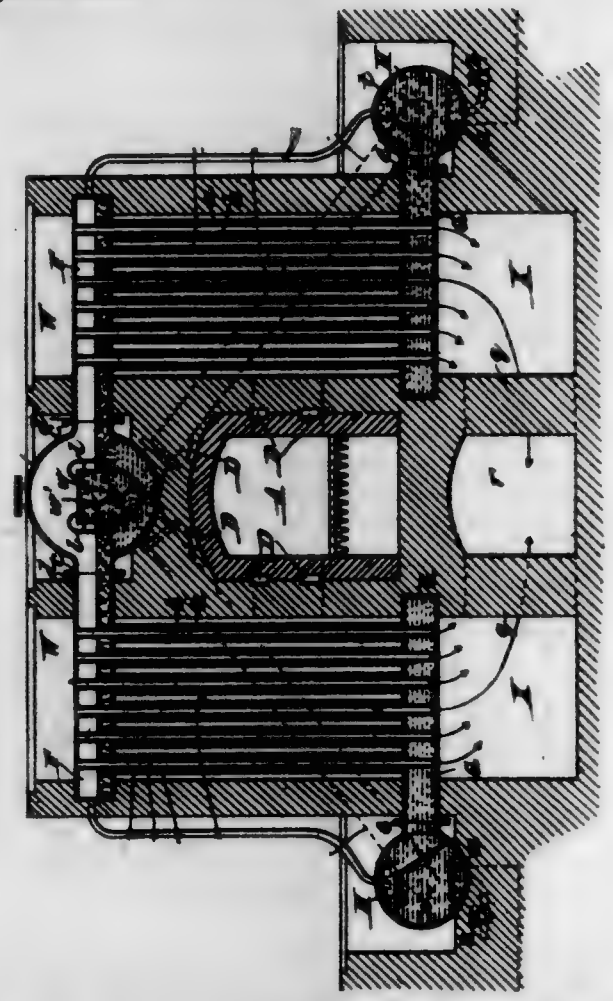
708,834. STEAM-GENERATOR. WASILY ROCHASSEV, Moscow, Russia. Filed May 18, 1900. Serial No. 17,248. (No model.)

Claim.—1. A combined water-tube and smoke-flue steam-generator, comprising a furnace and a boiler composed of independent members arranged on opposite sides of the furnace and separated therefrom by a poor heat-conductor, each member consisting of vertical double tubes consisting of an outer water-tube and an inner smoke-flue combined with upper and lower collecting members or drums, and means for causing the hot gases from the furnace to first flow around the outer surface of the water-tubes and then through the interior smoke-flues, all in combination with mud-collectors communicating with the lower drums or collectors, a steam-collector communicating with the upper drums and circulating-pipes for connecting the steam-collector with the mud-collectors.

2. The combination of a series of tubular boiler-sections, each section comprising a pair of drums connected by a plurality of tubes, a steam-collecting vessel and pipes connecting the same with said series of boiler-sections, a lower vessel located in proximity to the lower drums of said sections, a pipe connecting the end of each of said lower vessels with the lower part of said steam-collecting vessel, another set of sections and pipes connecting the drums of the said sections and the upper portions of the steam-collecting vessel, means for bringing the gases from said furnace in contact with the tubes of all said sections.

3. The combination of a series of boiler-sections, each section com-

prising a pair of drums connected by a plurality of tubes and flues passing through said tubes and drums, a steam-collecting vessel and pipes connecting the same with said series of boiler-sections, a lower vessel located in proximity to the lower drums of said sections, a pipe connecting the end of each of said lower vessels with the lower part of said steam-collecting vessel, another set of sections and pipes connecting the drums of said sections with the upper portions of the steam-collecting vessel, means for bringing the gases from said furnace into contact with the tubes of all said sections, and means for passing the gases through the flues passing through said tubes.

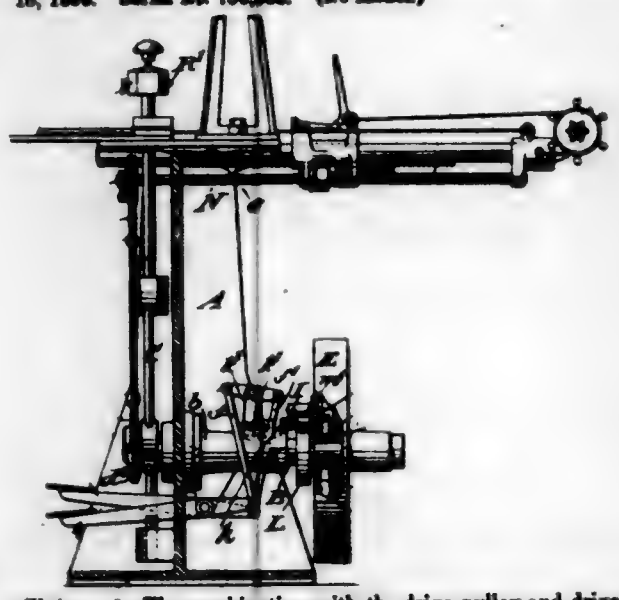


4. The combination of a series of boiler-sections, each section comprising a pair of drums connected by a plurality of tubes and interior flues passing through said tubes and drums, an upper steam-collecting vessel and pipes connecting said steam-collecting vessel at an intermediate portion with the upper drums of a part of said sections, a lower mud-collecting vessel and pipes connecting said mud-collecting vessel with the lower part of said steam-collecting vessel, pipes connecting the drums of another part of said sections with the upper portion of the steam-collecting vessel, means for bringing the gases from said furnace in contact with the tubes of all said sections, and means for passing the gases through said interior flues.

5. The combination of a series of boiler-sections, arranged in two sets, each section comprising a pair of drums connected by a plurality of tubes and flues passing through said tubes and drums, a furnace located between said sets of boiler-sections, a steam-collecting vessel and pipes connecting said steam-collecting vessel with a part of said sections, a lower vessel located in proximity to the lower drums of the sections that are connected with steam-collecting vessel, a pipe connecting the end of each of said lower vessels with the lower part of said steam-collecting vessel, pipes connecting the drums of another part of the sections, with the upper portions of the steam-collecting vessel, means for bringing the gases from said furnace into contact with the tubes of all said sections, and means for passing the gases through all said interior flues.

6. The combination of a series of boiler-sections, each section comprising a pair of drums connected by a plurality of tubes, flues passing through said tubes and drums, said sections being arranged in two sets, a furnace located between said sets, a steam-collecting vessel located over said furnace and between said sets of sections, pipes connecting said steam-collecting vessel at an intermediate portion with the upper drums of a part of said sections, a mud-collecting vessel located in proximity to the lower drums of each of said sets of sections that are connected with said steam-collecting vessel, a pipe connecting the end of each of said mud-collecting vessels with the lower part of said steam-collecting vessel, pipes connecting the drums of the sections not connected with said steam-collecting vessel and the upper portions of this vessel, means for bringing the gases from said furnace in contact with the tubes of all said sections, and means for passing the gases through all said interior flues.

708,885. BRAKE. VERNON ROYLE, Paterson, N. J. Filed Nov. 13, 1899. Serial No. 736,535. (No model.)



Claim.—1. The combination with the drive-pulley and drive-shaft, the former being free to rotate relatively to the latter, of clutch-shoes arranged to engage the drive-pulley, a spring-actuated hub mounted on the drive-shaft for locking and releasing the clutch-shoes, a brake under the control of said rocking hub to be set and released and means under the control of the operator for causing the said hub to rock in a direction to release the brake-shoes and set the brake, substantially as set forth.

2. The combination with the drive-pulley and drive-shaft, the former being free to rotate relatively to the latter, of a clutch arranged to engage the drive-pulley, a spring-actuated hub mounted on the drive-shaft for locking and releasing the clutch, a brake under the control of said hub to be set and released, hub-controlling means and a pair of pedals for positively operating the hub-controlling means to set the clutch and release the brake and to release the clutch and set the brake, substantially as set forth.

708,886. EXTENSION-LADDER. CHARLES H. SCHAEBERE, Warren, Pa. Filed Mar. 22, 1902. Serial No. 99,526. (No model.)

Claim.—1. In a device of the class described, the combination of the ladder-sections 1 and 2, the section 2 being capable of movement lon-

gitudinally of the section 1, the arms mounted on the section 1 and extending beyond the other section and provided with eyes, the locking-bars provided with eyes at their ends, the eyes at one side of the ladder being hinged to the eyes of the adjacent arms, and removable fastening devices engaging the eyes of the locking-bars and the arms at the other side of the ladder, substantially as described.

2. In a device of the class described, the combination of a ladder-section, an adjustable bracket slidably mounted on the ladder-section and projecting therefrom at one side thereof, a support depending from the bracket at the opposite side of the ladder, and hoisting mechanism connected with the bracket and with the ladder-section and having operating mechanism mounted on the bracket and located within reach from the support, substantially as described.

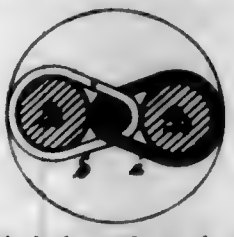
3. In a device of the class described, the combination of a ladder-section, an adjustable bracket slidably mounted thereon and projecting at one side of the ladder-section, a support mounted on the bracket at the opposite side of the ladder-section and composed of depending sides and a connecting-rung offset from the ladder-section, and a handle or grip mounted on the adjustable bracket and located above the support, substantially as described.

4. In a device of the class described, the combination of a ladder-section, a bracket adjustably mounted thereon and provided with arms having projections, a pivoted support composed of approximately L-shaped sides supported by the projections, and a rung connecting the sides, and a transverse bar located above the support and forming a grip or handle, substantially as described.

5. In a device of the class described, the combination of a ladder-section, a vertically-movable support mounted on the ladder-section and provided with an adjustable supporting portion having a roller for engaging a building, hoisting mechanism connected with the ladder-section and with the bracket and having shafts or windlasses mounted on both of such parts, and a support carried by the bracket, substantially as described.

6. In a device of the class described, the combination of the ladder-sections 1 and 2 detachably connected, an adjustable bracket mounted on the ladder-section 2, a lower hoisting mechanism connecting the ladder-sections, an upper hoisting mechanism connecting the bracket with the ladder-section 2 and provided at each end with means for operating it, and a support carried by the bracket, substantially as described.

708,837. MANUFACTURE OF BRAIDED CORDS OR CABLES FOR ELECTRIC LIGHTING OR LIKE PURPOSES. CARL SCHÜRHAMM, Dusseldorf, Germany. Filed Dec. 24, 1900. Serial No. 40,946. (No model.)



Claim.—1. A method of covering a plurality of conductors and a central core for electric-light cords, consisting in braiding a system of covering-threads around each conductor and the central core, and simultaneously interlooping the threads of the several systems, substantially as described.

2. A method of covering a plurality of conductors and a central core for electric-light cords, consisting in arranging the conductors in groups, braiding a system of covering-threads around each group and the central core, and simultaneously interlooping the threads of the several systems, substantially as described.

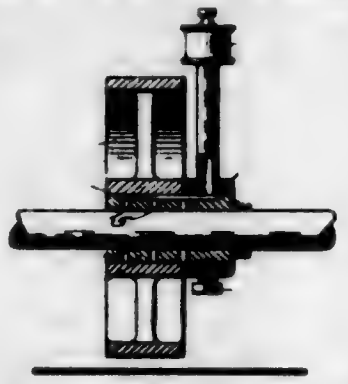
3. A plurality of conductors, a core, systems of threads, each system braided around a conductor and the core and interlooped with the other systems between said conductors, substantially as described.

4. A plurality of conductors arranged in groups, a core, and systems of threads, each system braided around a conductor and the core and interlooped with the other systems between said conductors, substantially as described.

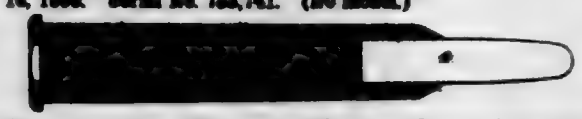
708,888. LUBRICATOR FOR LOOSE PULLEYS. CLAUDE S. SOMERS, Winchester, Ky. Filed Sept. 30, 1901. Serial No. 77,116. (No model.)

Claim.—In a lubricator of the class described, a sleeve having a longitudinal groove in its periphery and also having perforations certain of the perforations being in the groove and the remainder being in the plain or non-grooved portion of the sleeve, a collar separate from the sleeve and fitted thereon, means for holding the collar on the sleeve, and an oil-cup having a straight depending tube the lower end of which is fitted into an opening in the collar, and said opening being located over one end of the groove.

708,888.



708,889. CARTRIDGE. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Oct. 14, 1899. Serial No. 733,741. (No model.)



Claim.—1. A cartridge comprising two drawn sheet-metal tubes one having the head and the other the reduced and projectile-receiving neck, the two shells being fitted together and locked by engagement of one with the other, substantially as specified.

2. A cartridge comprising two drawn sheet-metal tubes, one having the head and the other having a thickened neck for receiving the projectile, said shells being fitted together and locked by engagement of one with the other, substantially as specified.

3. A cartridge having two shells, one with the head and the other with the projectile-receiving neck, said shells being fitted together so that one forms a lining for the other and being locked together so as to prevent their separation, substantially as specified.

4. A cartridge composed of two shells, one having a head and the other a projectile contracted receiving-neck, said shells being fitted together so that one forms a lining for the other, the inner end of said lining-shell abutting against the head of the shell at the base of the explosive-receiving chamber, substantially as specified.

5. A cartridge consisting of two shells, one having the head and the other the projectile contracted receiving-neck, said shells being fitted together so that one constitutes a lining for the other, the inner end of the lining-shell being contracted in diameter so as to serve also as a lining for the inner face of the head of the cartridge, substantially as specified.

6. A cartridge consisting of inner and outer shells, the inner shell having a projectile-receiving neck, a flaring shoulder, and a body portion which serves as a lining for the outer shell, and said outer shell having the head at one end and being bent in over the flaring shoulder of the inner shell at the other end, substantially as specified.

7. A cartridge having at one end a head and at the opposite end a contracted projectile-receiving neck, and, between the two, a body and a flaring shoulder portion both of which are double-walled throughout, substantially as specified.

8. A cartridge-shell having a shoulder for bearing against a shoulder in the cartridge-chamber of the gun, and a projectile-receiving portion contracted so as to fit the projectile and extending both forwardly and rearwardly beyond said shoulder.

9. A cartridge-shell having a double-walled explosive-chamber, an external shoulder, and a projectile-receiving portion extending both forwardly and rearwardly beyond said shoulder.

10. A cartridge having an external shoulder, a projectile-receiving portion contracted so as to fit the projectiles and extending both forwardly and rearwardly beyond said shoulder, and a series of projectiles disposed one in advance of another therein.

11. A cartridge having a double-walled explosive-chamber, an external shoulder, a projectile-receiving portion extending both forwardly and rearwardly beyond said shoulder and a series of projectiles disposed one in advance of another therein.

708,840. GUN-CARTRIDGE. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Nov. 13, 1899. Serial No. 737,510. (No model.)

Claim.—1. A cartridge-shell having a chamber for receiving explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, and a projectile-receiving portion of contracted diameter extending both forwardly and rearwardly beyond said external shoulder.

2. A cartridge-shell having a double-walled chamber for receiving

explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun and a projectile-receiving portion of contracted diameter extending both forwardly and rearwardly beyond said external shoulder.

3. A cartridge-shell having a chamber for receiving explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun and a projectile-receiving neck of contracted diameter extending both forwardly and rearwardly beyond said external shoulder, that portion of said neck between the external shoulder and the chamber for the explosive having thickened walls.

4. A cartridge-shell having a double-walled chamber for receiving explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun and a projectile-receiving neck of contracted diameter extending both forwardly and rearwardly beyond said external shoulder, that portion of said neck between the external shoulder and the chamber for the explosive also having thickened walls.

5. A cartridge having a chamber containing explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, a projectile-receiving portion of contracted diameter extending both forwardly and rearwardly beyond said external shoulder, and a series of projectiles disposed one in advance of another therein.

6. A cartridge having a double-walled chamber containing explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, a projectile-receiving portion of contracted diameter extending both forwardly and rearwardly beyond said external shoulder, and a series of projectiles disposed one in advance of another therein.

7. A cartridge having a chamber containing explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, a projectile-receiving neck of contracted diameter extending both forwardly and rearwardly beyond said external shoulder and having thickened walls in that portion between the external shoulder and the chamber for the explosive, and a series of projectiles disposed one in advance of another in said neck.

8. A cartridge having a double-walled chamber containing explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, a projectile-receiving neck of contracted diameter extending both forwardly and rearwardly beyond said external shoulder and also having thickened walls in that portion between the external shoulder and the chamber for the explosive, and a series of projectiles disposed one in advance of another in said neck.

9. A cartridge-shell having a casing for receiving explosive material, said casing being reduced in diameter to form a projectile-receiving neck, and an external ring fitted to said reduced neck so as to form in advance of the rear end of the contracted neck an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun.

10. A cartridge-shell having a double-walled chamber for receiving explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun and a contracted projectile-receiving neck extending both forwardly and rearwardly beyond said external shoulder, one of the elements of said shell being a ring applied to the same in advance of the chamber for containing explosive material and having a rearwardly-extending tube which constitutes one element of the double wall of said chamber.

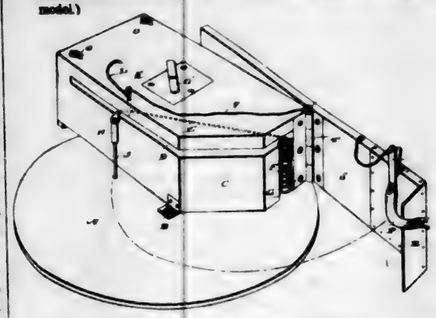
11. A cartridge-shell having a casing for receiving explosive material, said casing being reduced in diameter to form a projectile-receiving neck and having an external ring fitted to said reduced neck so as to form in advance of the rear end of the contracted neck an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, said ring having a rearwardly-extending tube which incloses the casing of the chamber for receiving explosive material and is confined thereto.

12. A cartridge having a casing containing explosive material and reduced in diameter to form a contracted projectile-receiving neck, a series of projectiles disposed one in advance of another in said neck, and an external ring fitted to said reduced neck and forming in advance of the rear end of the contracted neck an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun.

13. A cartridge having a double-walled casing containing explosive material, an external shoulder for bearing against the shoulder in the cartridge-chamber of the gun, a contracted projectile-receiving neck extending both forwardly and rearwardly beyond said external shoulder, and a series of projectiles disposed one in advance of another in said neck, one of the elements of the cartridge-shell being a ring disposed in advance of the chamber containing the explosive material and having a rearwardly-extending tube which constitutes one of the elements of the double wall of said chamber.

14. A cartridge having a casing containing explosive material and reduced in diameter to form a projectile-receiving neck, a series of projectiles disposed one in advance of another in said neck, and an external ring applied to the neck and serving to carry forwardly beyond the rear end of the same the external shoulder of the cartridge, said ring having a rearwardly-extending tube which incloses the casing containing the explosive material and is confined thereto.

703,841. AUTOMATIC FIRE-LIGHTER. ALBERT R. SHAHAN, Connellsville township, Pa. Filed Jan. 8, 1901. Serial No. 42,507. (No model.)

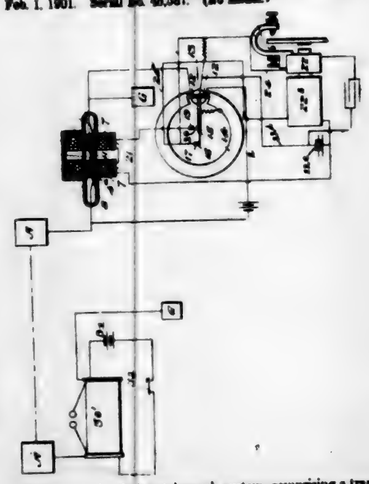


Claim.—1. An automatic fire-lighter, composed of a base-plate, a body adjustably connected thereto, a spring match-carrier mounted in the body, a lever connected to the body and carrying a lighter, and devices for retaining and releasing the match-carrier at the proper time to apply the match to the said lighter.

2. An automatic fire-lighter, composed of a base-plate, a body thereon, a lever hinged to the body, a spring-cushion at one end of said lever, a metal feeder at the other end, a lighter secured to the feeder, a spring-operated match-carrier in the body, a pin for holding the carrier with match, a clock connected with the pin to release the same at the set time to allow the carrier to apply the match to the lighter.

3. An automatic fire-lighter, composed of a base-plate, a body thereon, devices carried by the body for securing the clock, a spring match-carrier in the body, a cushioned lever hinged to the body and carrying a torch or lighter, devices for retaining the match-carrier, and devices connected with the clock mechanism for releasing the pin and allowing the carrier to strike the match and light the lighter or torch.

703,842. WIRELESS TELEGRAPHY. HARRY SHOEMAKER, Philadelphia, Pa., assignor to Marie V. Gehring, Philadelphia, Pa. Filed Feb. 1, 1901. Serial No. 46,587. (No model.)



Claim.—1. A wireless-telegraph system, comprising a transmitting apparatus and a receiving apparatus, said receiving apparatus, consisting of air and ground plates, a coherer connected therewith, decohering means surrounding the coherer, a circuit connected with said decohering means, a sounder having two windings, another circuit operated before the decohering-circuit is made to energize both windings, and a condenser-circuit energized when said last-mentioned circuit is made and adapted to discharge when the decohering-circuit is made, to energize one winding of the sounder.

2. A receiving apparatus, comprising an imperfect electrical contact, decohering means surrounding the contact, a circuit connected with said decohering means, another circuit energized before the decohering-circuit, a condenser in said last-mentioned circuit, a sounder in said last-mentioned circuit, and a separate circuit, formed when the condenser discharges, to form a hold-over circuit for the sounder.

3. A receiving apparatus for wireless telegraphy comprising a coherer, solenoids surrounding said coherer, a circuit connected to said solenoids, a sounder having a main and an auxiliary winding, another circuit connected with the windings adapted to be made before the circuit with the solenoids is made, and a condenser-circuit adapted to hold the magnetism over in the auxiliary winding after the decohering operation.

4. A receiving apparatus for a wireless-telegraph system, comprising a coherer-tube having located therein plugs, a pocket formed between the plugs, solenoids surrounding said tube, a decohering-circuit connected with said solenoids, a sounder composed of a main and an auxiliary winding, two circuits formed simultaneously to energize said windings, means for making said circuits and for making the decohering-circuit shortly after, and a condenser in circuit with the auxiliary winding to energize the same after the main circuit is opened.

5. In combination with solenoids, of a coherer comprising a non-conducting tube surrounded by said solenoids, a pair of silver plates, a pair of magnet-cores, and insulation between said cores and plates forming a pocket in said tube, said metallic particles located in said pocket.

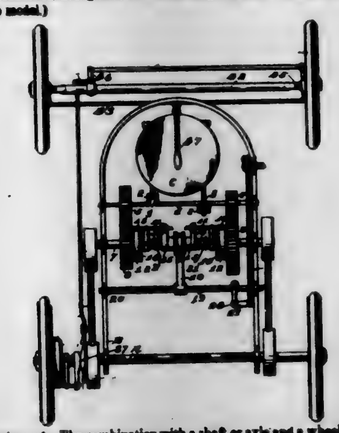
6. In a wireless-telegraph system, a transmitting and a receiving station; said receiving-station consisting of a coherer and a decoherer, comprising a tube, solenoids surrounding the tube, and a pocket formed in said tube to receive magnetic particles; a circuit formed before the solenoids are energized, a sounder operated by said circuit, and a condenser in said circuit adapted to operate the sounder after the main circuit is open.

703,843. TEMPORARY COUPLING FOR CHAINS, &c. STEPHEN SCOTT, Edinburgh, Scotland. Filed Jan. 8, 1902. Serial No. 89,010 (No model.)

Claim.—1. In a safety-coupling for the connection of chains, ropes and the like, the hook-link B formed with a doubled-back end portion *b*, substantially as and for the purposes set forth.

2. The combination of the S-formed hook-link B and a chain A′ to be coupled therewith having an end link C adapted to pass over the end *b* of said hook and a second link adapted to be inserted between the sides of the hook-link in parallel position in order to permit the end passage of the link C over and around the S-formed hook-link, as set forth.

703,844. RUNNING-GEAR FOR MOTOR-VEHICLES. FRANCIS J. STALLINGS, Effingham, Ill. Filed Aug. 31, 1901. Serial No. 73,982. (No model.)



Claim.—1. The combination with a shaft or axle and a wheel mounted loosely thereon, the wheel provided with a rim on one of its faces, of an individual clutch-band surrounding and continually supported by the rim, movable means located on the shaft or axle, a pair of jaws engaging the clutch-band, the jaws pivotally supported on a bracket, the bracket being independent of the clutch-band, the movable means adapted to engage the jaws whereby the clutch-band is tightened upon the rim.

2. The combination with a shaft or axle and a wheel loosely mounted thereon, the wheel provided upon one of its faces with a circular rim, of a clutch-band borne upon and entirely supported by the rim, a movable member mounted on the shaft or axle, an upstanding wedge-faced lug on the movable means, a bracket independently secured to the shaft or axle, jaws pivotally secured to the bracket, the forward ends of the jaws engaging the ends of the clutch-band, the wedge-faced lug received between and adapted to spread the rear ends of the jaws whereby to cause the forward ends to clamp the clutch-band to the rim and automatic means for returning the movable member to its normal position when it is desired to release the clutch-band from the rim.

3. The combination with a shaft or axle, and wheels loosely mounted thereon, the wheels each provided on its inner face with a circular rim, of clutch-bands held yieldingly thereon, a sleeve keyed to slide on the shaft or axle, the sleeve having arms on its ends provided with wedge-shaped faces, pivoted jaws likewise mounted on the shaft the jaws engaging loops on the clutch-bands, and adapted to be engaged in turn by the arms carried on the sleeve to force the clutch-bands to grip the rim when the sleeve is shifted toward the wheel to be clutched to the shaft or axle, and means for shifting said sleeve on the shaft or axle.

4. The combination with a shaft or axle, gear-wheels mounted loosely thereon, one of the gears being larger than the other, and circumferentially-grooved rims secured to the gear-wheels, of clutch-bands received in the grooves, the free ends of the bands projecting outward from the peripheries thereof, the free ends having loops formed therein, pivoted jaws supported on the shaft, the ends of the jaws entering the loops, a sliding sleeve keyed to the shaft and provided with arms having inclined faces, the arms adapted to engage the opposite ends of the jaws whereby to grip the clutch-bands on the rims and lock the gear-wheel to the shaft or axle.

5. The combination with a shaft or axle, a plurality of wheels loosely mounted thereon, and clutch mechanism whereby the wheels may be locked to the shaft or axle, of a sleeve keyed to slide on the shaft, means on the sleeve adapted to actuate the clutch mechanism, a spanner for operating the sleeve, a movable shaft to which the spanner is secured, and means for operating the movable shaft whereby the sleeve may engage either one of the wheels or may be assumed an intermediate position.

6. The combination with a shaft or axle, a plurality of wheels loosely mounted thereon, and clutch mechanism whereby the wheels may be locked to the shaft or axle, of a sleeve keyed to slide on the shaft means on the sleeve adapted to actuate the clutch mechanism, a spanner for operating the sleeve, a movable shaft to which the spanner is secured, guides for retaining the movable shaft, a lever secured to the shaft, a rod secured to the free end of the lever, the rod operated by suitable means whereby the sleeve is caused to engage or disengage the clutch mechanism from the wheels.

7. The combination with a shaft or axle, a plurality of wheels loosely mounted thereon, and clutch mechanism whereby the wheels may be locked to the shaft or axle, of a sleeve keyed to slide on the shaft means on the sleeve adapted to actuate the clutch mechanism, a spanner for operating the sleeve, a sliding movable shaft to which the spanner is secured, guides in which to retain the sliding movable shaft, a lever pivoted to the frame, one arm of the lever secured to the sliding shaft and the other arm attached to a rod secured to the free end of the lever, the rod operated by a lever whereby the sleeve is caused to engage or disengage the clutch mechanism from the wheels.

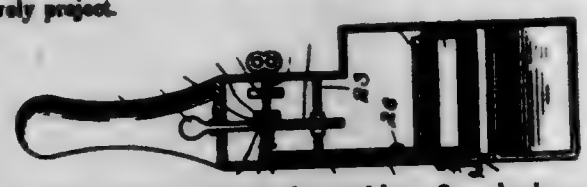
8. The combination with a shaft or axle and a wheel loosely mounted thereon, of clutch-rims secured to the wheel, clutch-bands surrounding and operating on the rims, pivoted jaws engaging the clutch-bands, an arm for actuating the jaws, a sliding sleeve to which the arm is connected, a movable spanner which bears against the sliding sleeve when forcing the arm into engagement with the pivoted jaws, and tension devices against which the arm is moved.

9. The combination with a shaft or axle and a wheel loosely mounted thereon, of clutch-rims secured to the wheels, clutch-bands surrounding and operating on the rims, pivoted jaws engaging and operating the clutch-bands, an arm for actuating the jaws, the arm mounted upon a sliding sleeve, a spanner located on and actuating the sliding sleeve to force the arm into engagement with the pivoted jaws, and actuating means for operating the spanner whereby the sliding sleeve is reciprocated.

703,845. SAFETY-RAZOR. MILES H. STANDISH, Biddeford, Maine. Filed Apr. 3, 1901. Serial No. 54,260. (No model.)

Claim.—1. A device of the class described comprising a rotatable drum having blades disposed longitudinally thereof and removably en-

gaged therewith, a spring-actuated shaft operatively connected with the drum for rotating it, means for controlling the shaft, and a casing inclosing the drum and having a slot through which the blades are adapted to successively project.



3. A device of the class described comprising a frame having a handle, a drum mounted in the frame at the opposite end from the handle and having blades disposed longitudinally thereof and removably mounted therein, said drum being removably mounted in the frame, a spring-operated drive-shaft operatively connected with the drum for rotating the latter, and a stopping device disposed adjacent to the handle and in operative relation to the drive-shaft to engage and release it.

3. A device of the class described comprising a frame having a handle, a drum mounted in the handle, blades removably engaged with the drum and extending longitudinally thereof, a casing for the drum and having a slot through which the blades are adapted to successively project, guides at the sides of the slot, a portion of the casing being removable to expose the drum, a drive-shaft in operative relation to the drum, and a stopping device adapted for movement into and out of operative relation to the drive-shaft.

4. In a device of the class described, a drum having an axle projecting from the ends thereof for supporting the drum rotatably, the axle at one end of the drum having a threaded portion, dovetail slots formed longitudinally of the drum and tapered away from the threaded end of the shaft, blades tapered to fit the slots, and a disk engaged with the threads of the shaft and adapted to impinge the ends of the blades and hold them in engagement with the slots.

708,846. APPARATUS FOR SEPARATING LIQUIDS FROM SOLIDS. DUNCAN STEWART, Glasgow, Scotland. Filed May 27, 1901. Serial No. 62,124. (No model.)

Claim.—1. Apparatus for separating liquids from solids comprising an endless apron or carrier consisting of chain-links having brackets to which wire-gauze is attached and permeable fabric held down on the gauze by suitable devices and arranged to travel around drums mounted at each end of a framing, vacuum-boxes and vacuum-pumps, washing-pipes and rakes arranged over the vacuum-boxes, steam drying boxes or coils, a scraper and revolving brush and appliances for cleansing and washing the apron, all arranged and operating substantially as and for the purposes set forth.

2. In apparatus of the character described, an apron consisting of chain-links having brackets to which wire-gauze is attached and of permeable fabric held down on the gauze by flanged clips connected by bent-leather filling-pieces which with the clips form sides to the apron, substantially as described.

708,847. HERNIAL TRUSS. LORENZO A. STEWART, Waukegan, Ill. Filed Aug. 17, 1900. Serial No. 27,201. (No model.)

Claim.—1. As a new article of manufacture, a truss-pad formed with a flat bearing-surface substantially circular in outline and an inflexible horn projecting therefrom, the horn being curved toward the body of the wearer and away from the supporting-strap, substantially as described.

2. A truss-pad comprising a body portion substantially circular in outline, a horn formed integral with the body portion and extending therefrom, the body portion adapted to be centrally pivoted to a securing-strap, thus enabling the horn to be brought to bear upon different portions of the anatomy about the body portion as a center, without altering the application of the body portion, substantially as described.

3. As a new article of manufacture, a truss-pad formed wholly of non-corrosive metal, and having a flat body portion, and a horn or finger, the pad being provided upon its back with projecting ribs, the said horn being curved and adapted to extend inward into contact with the body of the wearer, when the pad is in position, substantially as described.

4. In a truss, the combination with a securing-strap, of a pad, the body portion thereof presenting a flat bearing-surface substantially circular in outline, an inflexible horn integral with the body portion and projecting therefrom, said horn being curved inward toward the body of the wearer and away from the securing-strap and terminating beyond the plane of the bearing-surface of the body portion, the body portion centrally pivoted to the securing-strap, thus adapting the curved horn to be brought to bear upon different portions of the anatomy without altering the application of the body portion, substantially as described.

5. A truss comprising a pad formed with a flat body portion and a curved horn or finger hollowed out to form ribs extending therefrom, the said horn being curved and adapted to extend inward into contact with the body of the wearer, when the pad is in position, means for securing the pad to the body of the wearer, and yielding material interposed between the securing means and the ribs of the horn, substantially as described.

6. A truss comprising a waist-strap carrying a plate, a center strap also carrying a plate, a pad carried by the waist-strap, the pad having a flat body portion, and a curved horn or finger, the horn or finger having its back formed with one or more ribs and yielding material interposed between the waist-strap and the ribs, substantially as described.

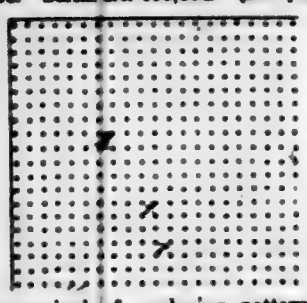
708,848. CONTINUOUS KILN. FRANK E. SWIFT, Washington, Iowa. Filed Sept. 10, 1901. Serial No. 74,944. (No model.)

Claim.—1. A continuous kiln comprising a series of kiln-chambers, each chamber having a furnace, a smoke-stack, and a flue having a controlling-damper and leading to the smoke-stack, combined with upper and lower passages between chambers, dampers controlling the upper passages, and means for introducing a combustible element for closing the lower passages, substantially as described.

2. In a continuous kiln, and in combination with adjoining chambers, upper and lower flues connecting the top and bottom portions of the chambers, a damper controlling the upper flue, and means for introducing a combustible element for closing the lower flue or flues, substantially as described.

3. In a continuous kiln, and in combination with adjoining chambers, upper and lower flues connecting the top and bottom portions of the chambers, a damper controlling the upper flue, and vertical chutes or passages leading to the lower flues, whereby a combustible substance, such as coal, may be introduced to close said flues, substantially as described.

708,849. METHOD OF PRODUCING WEAVING-DIAGRAMS. JAN SZCZEPANIK, Vienna, Austria-Hungary, assignor, by direct and mesne assignments, to the Barmer Bank-Verein, Hinsberg, Fischer & Comp., Barmen, Rhenish Prussia, Germany, a Corporation of Germany. Filed Dec. 20, 1898. Serial No. 699,304. (No specimens.)



Claim.—1. The method of producing patterns, which consists in focusing the object on a suitable focusing-plate, replacing the same by a sensitized medium, breaking up the image into a suitable number of divi-

sions and giving a different shape to groups of these divisions, substantially as set forth.

2. The method of producing patterns, which consists in focusing the object on a suitable focusing-screen, replacing the same by a sensitized medium, breaking up the image into a suitable number of divisions and giving a different shape to groups of these divisions by suitable diaphragms, substantially as set forth.

3. The method of producing patterns, which consists in focusing the object or figure on a screen, breaking up the image into a predetermined number of divisions by a perforated plate in the path of the light from the focused image, determining the form of these divisions on the sensitive medium by the form of the light-apertures, and intensifying certain sets of divisions by blocking out perforations in the screen, substantially as described.

4. The method of producing patterns, which consists in focusing the object or figure on a suitable screen, breaking up the image into a suitable number of divisions by a perforated plate in the path of light, determining the form of these divisions by the form of the light-apertures and varying the intensity of certain sets of divisions, substantially as set forth.

5. The method of producing patterns, which consists in focusing the object on a suitable screen, replacing the latter by a sensitive medium, breaking up the image into a suitable number of divisions by a perforated plate, determining the form of the divisions by the form of the light-aperture, and blocking out certain of them and varying the intensity of others by varying the intensity of light admitted through color-screens, substantially as set forth.

6. The method of producing patterns, which consists in focusing the object on a suitable screen and photographing the image thus produced by a series of pin-hole cameras, substantially as set forth.

7. The method of producing patterns, which consists in focusing the object on a suitable screen and photographing the image by a series of pin-hole cameras arranged in the order of a weaving-crossing, substantially as set forth.

8. The method of producing patterns, which consists in focusing an object on a screen and photographing the image by more than one series of pin-hole cameras arranged in the order of a weaving-crossing, each series of pin-hole cameras organized to produce images of different intensity from those of the other series, substantially as set forth.

9. The method of producing patterns, which consists in focusing an object and photographing the image formed, by a series of pin-hole cameras arranged substantially in the focal plane, substantially as set forth.

10. The method of producing patterns, which consists in focusing an object, photographing the image formed, by pin-hole cameras arranged substantially in the focal plane whereby the image is broken up into a number of parts corresponding to the number of pin-hole cameras, and determining the outline of the images formed by each pin-hole camera by the form of the bundle of rays of light to form the image, substantially as set forth.

11. The method of producing patterns, which consists in focusing an object, photographing the image formed, by one or more series of pin-hole cameras arranged substantially in the focal plane, thereby producing a subdivided image, varying the intensity of certain divisions of said image by varying sizes of the apertures of the pin-hole cameras, determining the form of the image produced by each pin-hole camera by the form of the bundle of rays of light admitted, and subdividing the images of the pin-hole cameras by subdividing the stop at the objective, substantially as set forth.

12. The method of producing patterns, which consists in focusing an object, subdividing the image by a perforated plate, producing an image subdivided into squares by means of a suitable diaphragm, and indicating binding-stitches by closing certain of the apertures in said perforated plate and subdividing each image behind the perforated plate and indicating thereon the particular stitch by a suitable diaphragm, substantially as set forth.

13. The method of producing patterns, which consists in forming on a sensitized medium an actinic impression to represent diagram-paper, transmitting light from a suitable object through a lens and a perforated plate to indicate said object on the representation of the diagram-paper on the sensitized medium, and also indicating binding-stitches thereon by suitable actinic impressions, substantially as set forth.

14. The method of producing patterns, which consists in forming on a sensitized medium an actinic impression to represent diagram-paper, transmitting light from a suitable object through a lens, a screen and perforated plate to indicate said object on the representation of the diagram-paper on the sensitized medium, and also indicating binding-stitches thereon, substantially as set forth.

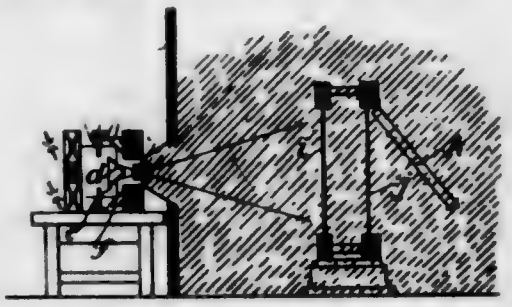
15. The method of producing patterns, which consists in forming on a sensitized medium an actinic impression to represent diagram-paper, transmitting light from a suitable object through a diaphragm, lens and a screen whose transparent portions are of different sizes, all those of the same size arranged in the order of a weaving-crossing and a perforated plate whose perforations register with the divisions of the representation of the diagram-paper, whereby actinic impressions are made in said divisions differing in intensity, those of the same intensity arranged in the order of a weaving-crossing, substantially as set forth.

16. The method of producing patterns, which consists in forming on a sensitized medium an actinic impression to represent diagram-paper, transmitting light from a suitable object, through a diaphragm and a lens, and a screen whose transparent portions are of different sizes, all those of the same size arranged in the order of a weaving-crossing, and a perforated plate whose perforations register with the divisions of the representation of said diagram-paper, the said diaphragm capable of subdividing each division of the representation of the diagram-paper and indicating in said division different weaving-crossings, substantially as set forth.

708,850. METHOD OF PRODUCING WEAVING-DIAGRAMS.

JAN SZCZEPANIK, Vienna, Austria-Hungary, assignor to Société des Inventions Jan Szczepanik & Co., Vienna, Austria-Hungary, a Firm

Filed Mar. 19, 1900. Serial No. 9,230. (No specimens.)



Claim.—1. The method of producing an image to indicate weaving crossings or stitches, which consists in transmitting light from separate portions of an object, each modified to indicate a weaving-crossing, through a lens common to all the images onto a sensitized medium, substantially as described.

2. The method of producing an image to indicate weaving crossings or stitches, which consists in simultaneously transmitting light from separate portions of an object each modified to indicate a weaving-crossing, through a lens common to all the images onto a sensitized medium, substantially as described.

3. The method of producing an image to indicate weaving crossings or stitches, which consists in forming a slide of each part of the object, modifying each slide to indicate a weaving-stitch and reflecting light therefrom through a lens common to all the parts onto a sensitized medium, substantially as described.

4. The method of producing an image modified in its parts to indicate weaving-crossings, which consists in forming a slide of each part, and projecting each part through ruled screens, then reflecting the light therefrom through a lens common to all the parts onto a sensitized medium, substantially as described.

5. The method of producing a composite modified image, which consists in reflecting the light from separate parts of the object through a screen indicating a weaving-crossing for each part and a lens common to all the parts onto a sensitized medium, substantially as described.

6. The method of producing weaving-patterns, which consists in reflecting light from separate parts of the object, each modified to indicate a weaving-crossing through a lens common to all the parts and then through a screen onto a sensitized medium, substantially as described.

7. The method of producing weaving-patterns, which consists in reflecting separate parts of the object modified to indicate weaving-crossings through a lens common to all the parts and a perforated plate, whereby each part of the image is broken up into a number of light parts corresponding to the number of holes of the perforated plate illuminated and projected onto a sensitized medium and thereby indicating a weaving-crossing in each part of the image and varying the outline of the light parts of the image by a suitably-shaped diaphragm, substantially as described.

8. The method of producing an image modified in its parts to represent weaving-crossings, which consists in reflecting light from separate portions of the object, each modified to indicate a weaving-crossing from a reflector, through a lens arranged to receive the reflected light from each portion and project it onto a sensitized medium, substantially as described.

9. The method of producing an image modified in its parts, each part broken up into points and the points in each differently grouped, which consists in reflecting light from suitable slides of the object to separate reflectors, thence through a lens arranged to combine all the images onto a sensitized medium, substantially as described.

10. The method of producing an image modified in its parts, which

consists in forming transparencies of the corresponding parts of the object, passing light through said transparencies and screens, reflecting the light thus modified from a reflector, thence through a lens arranged to combine all the images, and a perforated plate onto a sensitized medium, substantially as described.

11. The method of producing weaving-diagrams, which consists in forming a transparency of parts of the object, combining said transparencies with loom-stitch or crossing-indicating devices, reflecting the light passed through the combination, through a lens arranged to combine the images and then through a perforated plate onto a sensitized medium and varying the outline of the separate images of the crossing-indicating parts of the image thus formed, by suitable diaphragms, substantially as described.

12. The method of producing weaving-diagrams, which consists in forming a transparency of parts of the object, combining said transparencies with loom-stitch-indicating gratings, reflecting light passed through the combination, through a lens arranged to combine the images and then through a perforated plate onto a sensitized medium, thereby producing the design-indicating thread-crossing and determining the outline of the thread-crossing indications by a suitably-shaped diaphragm, substantially as described.

13. The method of producing weaving-diagrams, which consists in forming a transparency of parts of the design to be woven, combining each transparency with a suitable screen, passing light through the combinations, reflecting light through them on reflectors, thence through a lens arranged to combine all of the images and then through a perforated plate onto a sensitized medium, whereby each image of the transparencies is disintegrated to indicate weaving-crossing and determining the outlines indicating the weaving-crossings by suitable diaphragms, substantially as described.

14. The method of producing weaving-diagrams, which consists in forming photographic transparencies of the object to be represented in the design, each transparency consisting of those parts to be indicated by the same thread-crossing, combining with each transparency a suitable screen to indicate the respective thread-crossing, passing light through the combinations thus formed, through a lens arranged to combine images thereof and a screen or perforated plate beyond said lens onto a sensitized medium, the first-mentioned screens arranged to cause their opaque portions to render certain perforations in the perforated plate unillumined and varying the outline of the projections through the illumined apertures by the form of diaphragm-opening used, substantially as described.

15. The method of producing weaving-diagrams, which consists in forming transparencies of the object to be represented in the design, each transparency consisting of those parts to be indicated by the same thread-crossing, combining with each transparency a suitable screen to indicate the required thread-crossing, simultaneously passing light through the combinations thus formed and a lens arranged to combine images thereof, and a screen or perforated plate beyond said lens onto a sensitized medium, the screens and perforated plate being in fixed relation and proportion to each other, whereby the opaque portions of the screens will render certain perforations in the plate unillumined, substantially as described.

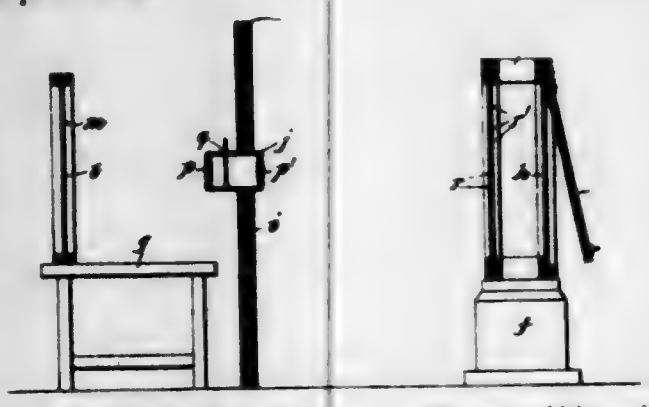
16. The method of producing weaving-diagrams, which consists in forming transparencies of the object to be represented in the design, each transparency consisting of those parts to be indicated by the same thread-crossing, combining with each transparency means to indicate the required thread-crossing, simultaneously passing light through the combinations thus formed to reflectors, and passing the reflected images through a lens common to all of them and a perforated plate onto a sensitized medium, the said screens and perforated plate being in fixed relation and proportion to each other, whereby the opaque portions of the screens will render certain perforations in the plate unillumined and varying the outline of the projections through the illumined perforations by the form of the diaphragm-opening, substantially as described.

708,851. METHOD OF PRODUCING WEAVING-DIAGRAMS. JAN SZCZEPANIK, Vienna, Austria-Hungary, assignor to Société des Inventions Jan Szczepanik & Cie., Vienna, Austria-Hungary, a Firm. Filed May 22, 1900. Serial No. 17,602. (No specimens.)

Claim.—1. The method of producing weaving-patterns, which consists in passing the light from the object through a diaphragm and perforated plate to a sensitized medium, the plate provided with perforations arranged to form a loom-stitch pattern, and varying the exposure to light at the diaphragm-opening, substantially as set forth.

2. The method of producing weaving-diagrams, which consists in passing the light from an object through a lens, a diaphragm, only a portion of the diaphragm being exposed, and a perforated plate to a sensitized medium, said plate provided with perforations arranged to form a loom-stitch pattern, said portion of the diaphragm-opening being proportional to the image formed, substantially as set forth.

3. The method of producing weaving-diagrams, which consists in passing the light from an object through a lens, diaphragm and perforated plate to a sensitized medium, the perforations in said plate arranged to form a loom-stitch pattern, and the opening in the diaphragm divided into fields varying in degree of transparency, substantially as and for the purpose set forth.



4. The method of producing weaving-diagrams, which consists in passing light from a suitable object through a lens, a diaphragm and a suitable perforated plate to a sensitized medium, the opening in said diaphragm divided into fields of varying transparency and overexposing the sensitized medium by the light through one or more of said fields, substantially as set forth.

5. The method of producing weaving-diagrams, which consists in passing light from a suitable object through a lens, a diaphragm and a perforated plate, the perforations in said plate arranged to form a loom-stitch pattern and the opening in said diaphragm divided in fields of different intensity, and overexposing the sensitized medium to the light passing through one or more of said fields, substantially as set forth.

6. The method of producing weaving-diagrams, which consists in passing light from an object through a diaphragm-opening, and a plate having light-transmitting openings arranged to form a weaving-pattern onto a sensitized medium, said diaphragm-opening divided into as many fields of different transparency as there are points between adjacent light-transmitting openings in said plate, substantially as set forth.

7. The method of producing weaving-diagrams, which consists in passing light from an object through a diaphragm-opening, and a plate having light-transmitting openings arranged in the order of a satin weaving-crossing, onto a sensitized medium, said diaphragm-opening divided into as many fields of different transparency as there are points between adjacent threads in the same row, substantially as set forth.

8. The method of producing weaving-diagrams, which consists in passing light from a suitable object through a diaphragm-opening, and a plate having light-transmitting openings arranged in the order of a five-point satin-crossing, onto a sensitized medium, said diaphragm-opening divided into five fields of different transparency, whereby a weaving design can be produced in which all of the five points are differently indicated, substantially as set forth.

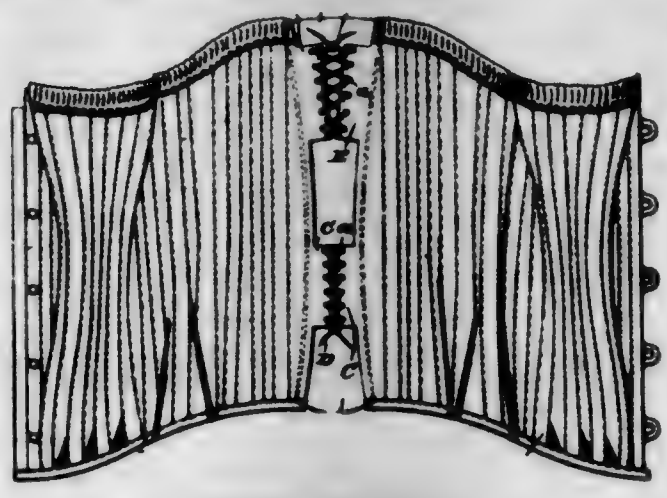
9. The method of producing weaving-diagrams, which consists in passing light from a suitable object through a lens, a diaphragm-opening and a plate provided with light-transmitting openings arranged in the order of a five-point satin-crossing, onto a sensitized medium, said diaphragm-opening divided into five fields of different transparency, and overexposing the sensitized medium to the light from two or more of said fields, whereby a weaving-diagram indicating five different thread-crossings can be produced, substantially as set forth.

10. The method of producing weaving-diagrams, which consists in passing light from a suitable object through a diaphragm-opening, and a plate provided with light-transmitting openings arranged in the order of weaving-crossings, onto a sensitized medium, the diaphragm-opening being divided into as many fields of different transparency as there are points between adjacent warp-threads of a row, and varying the exposure of the sensitized medium to overexpose the impression of one or more of the fields on said medium to vary the weaving-crossing, as many weaving-crossings being capable of being indicated as there are points between the light-transmitting openings of said plate, substantially as set forth.

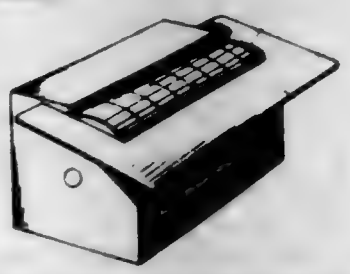
708,852. CORSET. HETTIE TEMPLE, Stockton, Cal. Filed Feb. 15, 1902. Serial No. 94,594. (No model.)

Claim.—The herein-described corset comprising sections A, the lower rear corners of which are arranged a suitable distance apart and are free to move toward and from each other, short lacing-tabs extending laterally from the rear edges of the sections at the waist-line of the corset, a lace connecting the said tabs, lacing-tabs extending laterally from the rear edges of the sections at a point intermediate of the waist-line tabs and the upper end of the corset, and separated from the waist-line tabs by a space

of greater length than said waist-line tabs, and a lace connecting the said upper tabs.



708,858. MECHANICAL BILL-CARRYING APPARATUS. ANTHONY W. THIERKOFF, Redding, Cal. Filed Mar. 7, 1902. Serial No. 97,047. (No model.)



Claim.—1. An apparatus for mechanically carrying bills and accounts comprising a surface having offsets, clamping-plates hinged to the edges of the offsets having their free edges adapted to rest upon the surface below, each plate forming a practical continuation of the surface above, and springs by which the free edges of said plates are drawn so as to clamp bills upon the surfaces.

2. An apparatus for mechanically carrying bills and accounts comprising a revoluble drum having its periphery formed with a series of tabular surfaces with intermediate connecting-offsets, clamping-plates having hinges by which they are turnably attached to the edges of the offsets, and forming a smooth continuation with the surfaces above, springs located interior to the drums and connections between said springs and the plates whereby the edges of the latter are drawn down to clamp bills or slips upon the drum-surfaces.

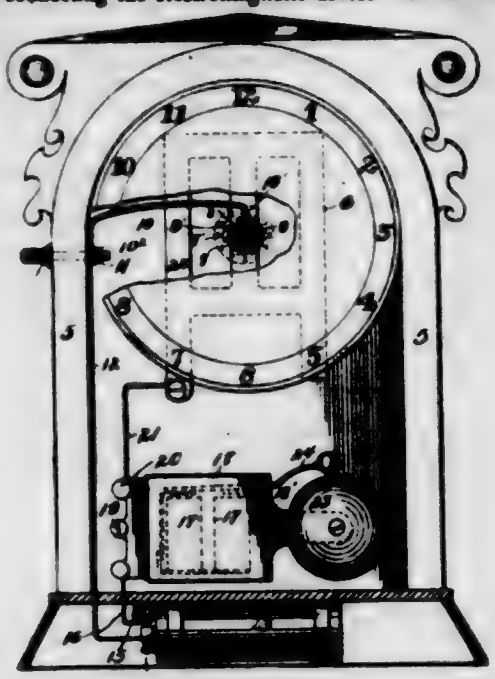
3. The combination of a revolubly-mounted drum having tabular surfaces extending from end to end of its periphery and offsets intermediate between said surfaces, of spring-pressed plates hinged to the edges of the offsets forming a continuation of the tabular surfaces, said plates having their free edges pressing upon the surfaces adjacent to their hinge-points and adapted to clamp bills or slips thereon.

4. In a bill or document carrying device, a series of surfaces with intermediate offsets, clamping-plates hinged to the edges of the offsets and forming continuations of the surfaces, springs located interior to the plates and means connecting the springs with the plates at one side of the hinged points of the latter whereby the springs hold the plates open or closed.

708,854. ELECTRIC ALARM-CLOCK. WILLIAM B. TERRY and WILLIAM S. INGRAHAM, Bristol, Conn., assignors to the E. Ingraham Company, Bristol, Conn., a Corporation of Connecticut. Filed Feb. 26, 1902. Serial No. 95,582. (No model.)

Claim.—1. In an alarm-clock, the combination, with a clock-casing, of a resilient arm projecting laterally from the interior of said clock-casing and carrying a rider at its free end; clock mechanism; a setting-dial; a cam-disk of insulating material carried by the arbor of the setting-dial and with which the rider of said resilient arm is in engagement; an electric battery; a bolt connecting said arm to the clock-casing; a pair of electromagnets; an electric circuit, of which the clock-frame constitutes a part, controlling said magnets; and a switch connected to said bolt for establishing the circuit through the clock-frame when the rider of the resilient arm enters the notch of the cam-disk and engages the arbor of the clock.

2. In an alarm-clock, the combination, with clock mechanism, of a recessed cam composed of insulating material carried by an arbor of said clock mechanism; a resilient, metallic arm having a rider in engagement with the cam and adapted to engage said arbor when it enters the recess of the cam; a clock-casing; a bolt for securing the resilient metallic arm to said clock-casing; a switch in engagement with said bolt; a contact device secured to the clock-casing, and with which said switch is adapted to engage; a wire leading from said contact device to the battery; a battery; an electromagnetic device; a wire connecting said electromagnetic device and battery; an alarm controlled by the electromagnetic device; and a wire connecting the electromagnetic device with the clock-frame.



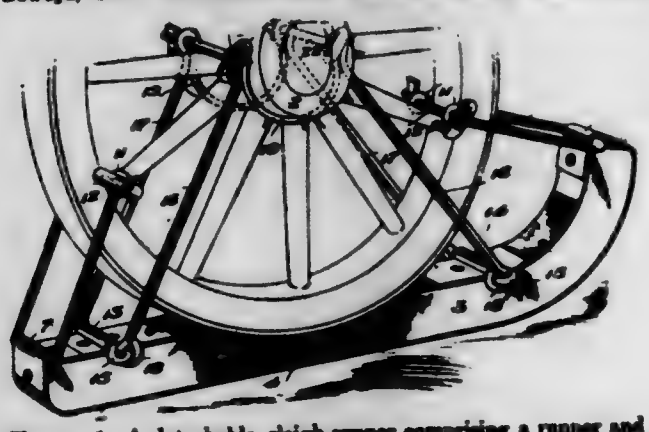
708,855. AIR-VALVE ATTACHMENT FOR TRAPS. CHARLES A. TILLY, Brooklyn, N. Y. Filed Apr. 2, 1901. Serial No. 54,084. (No model.)

Claim.—1. An air-valve attachment for water seals comprising a tube adapted to be connected therewith, a plug or block detachably mounted upon the upper end of the said tube and ranging above the same, and having downwardly-directed inlets in the sides thereof, and a central bore with which they communicate, a shield detachably mounted upon the upper end of the said plug or block and projecting downwardly to inclose the said plug or block, a cylinder detachably mounted in the end portion of said plug or block and provided in its upper end with a bore communicating with the bore of the said plug or block and a laterally-enlarged suction-chamber in the lower or main portion thereof, a vertically-grooved valve-stem mounted in the said cylinder and having its upper portion slidable in the bore thereof, and formed intermediate of its ends with a valve operating against the roof of the suction-chamber, an expansible spring mounted in the said suction-chamber and surrounding the valve-stem beneath the valve and normally holding it in contact with its seat, and a screw-cap adjustably mounted upon and inclosing the lower end of the cylinder to form a closure for the suction-chamber and adapted to adjust the tension of the spring and formed centrally with an aperture corresponding to the bore of the upper portion of the cylinder and forming a guide or bearing for the vertically-grooved valve-stem.

2. An air-valve attachment for water seals comprising a vertical tube *f* adapted to be connected therewith and exteriorly screw-threaded upon its upper edge an interiorly-threaded coupling *g* adjustably mounted upon the said screw-threaded edge, a plug or block *h* screwed into the upper end of the said coupling *g* and approximately conical in form to be contracted above the same and having downwardly-directed inlets *k* in its

contracted portion and a central bore *i* with which they communicate, said bore extending but partially through the said plug or block, a shield *p* detachably mounted upon the top of the said plug or block and projecting downwardly to inclose the same and protect the inlets, a cylinder *m* screw-threaded in the lower portion of the plug or block A and provided in its upper end with a central bore communicating with the bore of the said plug or block A and formed with a laterally-enlarged suction-chamber m^2 in the lower or main portion thereof, a vertically-grooved valve-stem mounted in said cylinder and having its upper portion slidable in the bore thereof and formed intermediate of its ends with a valve *o* operating against the roof of the suction-chamber, an expansible spring o^2 mounted in the suction-chamber and surrounding the valve-stem beneath the valve and normally holding it in contact with its seat, and a screw-cap *n* adjustably mounted upon and housing the lower end of the cylinder to form a closure for the suction-chamber and adapted to adjust the tension of the spring and formed centrally with an aperture corresponding to the bore of the upper portion of the cylinder and forming a guide or bearing for the vertically-grooved valve-stem.

708,856. DETACHABLE SLEIGH-RUNNER. WILLIS W. TOPLIFF, Dewey, Mont. Filed Feb. 5, 1902. Serial No. 92,637. (No model.)



Claim.—1. A detachable sleigh-runner comprising a runner and a side brace hinged at one end to the runner and adapted for connection at its other end to the wheel of the vehicle and arranged to swing downwardly and outwardly on its hinged connection aforesaid from the plane of the wheel.

2. A detachable sleigh-runner comprising a runner and side braces hinged at one end to the runner and adapted for connection at their other ends to the wheel of the vehicle, said side braces being arranged to swing downwardly on their hinged connections aforesaid in opposite directions from each other on opposite sides of the runner and outwardly from the plane of the wheel.

3. A detachable sleigh-runner comprising a runner, side braces hinged at one end to the runner and located on opposite sides of the vehicle-wheel and adapted to swing downwardly on their hinged connections aforesaid and in opposite directions from each other and outwardly from the plane of the wheel, detachable connections between said braces which extend over the spokes of the wheel, and braces hinged to the runner and adapted to straddle the wheel-felly, and detachable fasteners extending over the spokes of the wheel and connecting the portions of the end braces together.

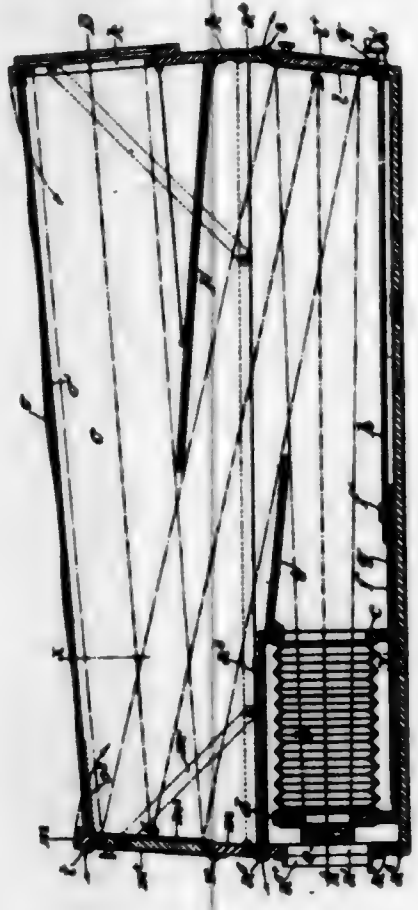
4. A detachable sleigh-runner comprising a runner, side braces located on opposite sides of the vehicle-wheel and consisting of rods having their end portions hinged to the runner and provided with intermediate bent portions which embrace the hub of the vehicle-wheel, said side braces being adapted to swing downwardly on their hinged connections aforesaid in opposite directions from each other and outwardly from the plane of the wheel, and detachable fastenings connecting the bent portions of the braces over the spoke of the wheels.

708,857. ELECTROMETALLURGICAL TREATMENT OF ZINC ORES AND ESPECIALLY BLENDE. CONSTANTIN J. TEISSIER, Paris, France. Filed Aug. 6, 1901. Serial No. 71,105. (No specimens.)

Claim.—1. For the electrolysis of the sulfate and other salts of zinc, the process whereby a practical reduction of the voltage below two and three-tenths volts is obtained by the aid of sulfurous acid as a depolarizer, the said process being divided into two parts to avoid the decomposition of said sulfurous acid and consisting as to one part in the electrolysis of the zinc salt with corresponding solution of copper anodes and formation of copper salt, and as to the second part in the electrolytic reconstitution of the said copper anodes by decomposition of the so-formed copper salt in a solution preliminarily charged with sulfurous acid, substantially as described.

2. For the electrolysis of metals, to wit, nickel, cobalt, cadmium, and the like, as well as zinc, which can be electrolytically deposited in metallic form at the cathode and whose salts have a voltage of decomposition too high to avoid the decomposition of sulfurous acid in the medium of the electrolyte, the process whereby said electrolysis is practically effected with a voltage effectively lowered by the employment of sulfurous acid as a depolarizer, the said process being divided into two parts to avoid the decomposition of said sulfurous acid and consisting as to one part in the electrolysis of the salt of such a metal with corresponding solution of copper anodes and formation of copper salt, and as to the second part in the electrolytic reconstitution of the said copper anodes by decomposition of the so-formed copper salt in a solution preliminarily charged with sulfurous acid, substantially as described.

708,858. PHOTOGRAPHIC CAMERA. AUGUSTE VAUTIER, Grandson, Switzerland. Filed Mar. 19, 1902. Serial No. 98,872. (No model.)



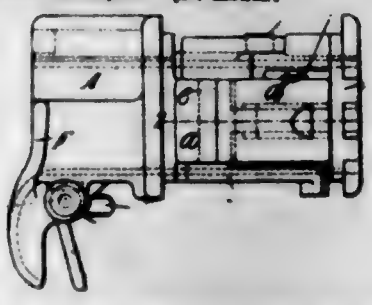
Claim.—1. In a photographic apparatus, the combination with a lens, a bellows, a box and means for adjusting the position of said lens, of a mirror set in the said box at an inclination to the axis of said lens, a mirror set parallel to the aforesaid mirror, and means secured in said frame for holding a photographic film, substantially as specified.

2. In a photographic apparatus, the combination with a lens, a bellows, a box and means for adjusting the position of said lens, of a mirror set in the said box at an inclination to the axis of said lens, a mirror set parallel to the afore said mirror, means secured in said frame for holding a photographic film, and means for preventing the light passing through the lens from directly striking the said photographic film, substantially as set forth.

3. In a photographic apparatus, the combination with a lens, a bellows, a box and means for adjusting the position of said lens, of a mirror set in the said box at an inclination to the axis of said lens, a mirror set parallel to the aforesaid mirror, means for adjusting the relative positions of said mirrors, means secured in said frame for holding a photographic film, and means for preventing the light passing through the lens from directly striking the said photographic film, substantially as specified.

4. In a photographic apparatus, the combination with a box *a*, bellows *b*, lens *c* and means for adjusting the position of said lens, of a mirror *l* set in said box at an inclination to the axis of the lens *c*, a frame *m* hinged to the box *a*, a mirror m^2 in said frame *m*, means for adjusting the positions of said mirrors *l* and m^2 so that they are parallel to each other, a frame *k* hinged to said box *a*, means in said frame *k* for holding a photographic film, screens *i* and *p* to prevent the rays of light passing through the lens from falling directly on the photographic film, and a flexible covering for the top of the instrument, the said frames and screens being adapted to fold in against the box when the instrument is not in use, substantially as specified.

708,859. **FEEDING MECHANISM FOR AUTOMATIC GUNS.** ALBERT VICKERS, Westminster, England, assignor to Vickers Sons & Maxim, Limited, Westminster, London county, England. Filed Nov. 1, 1901. Serial No. 80,818. (No model.)



Claim.—1. In a feed-block, the combination with the body portion, the slide carrying the feed-pawls, and the retaining-pawls; of slide-actuating levers formed in one piece with their stem and of a gapped bearing for said stem, substantially as herein shown and described.

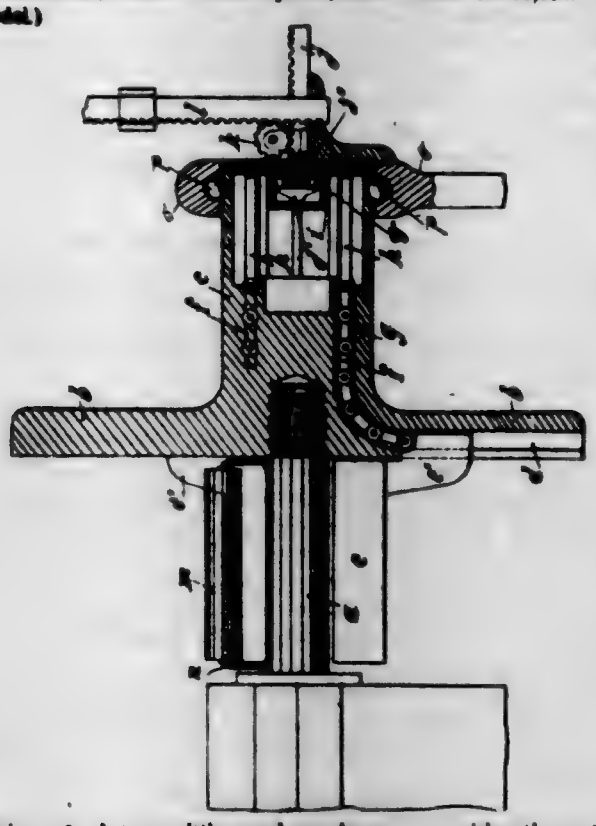
2. In a feed-block, the combination with the body portion, the slide carrying the feed-pawls, and the retaining-pawls; of slide-actuating levers formed in one piece with their stem, of a gapped bearing for said stem and of a sliding piece for closing the gap in the bearing substantially as described.

3. In a feed-block, the combination with the body portion, the slide carrying the feed-pawls, and the retaining-pawls; of slide-actuating levers formed in one piece with their stem, of a gapped bearing for said stem, of a sliding piece for closing the gap in the bearing and of means for retaining said sliding piece in place substantially as described.

4. In a feed-block, the combination with the body portion, the slide carrying the feed-pawls, and the retaining-pawls; of slide-actuating levers formed in one piece with their stem, of a gapped bearing for said stem, of a sliding piece for closing the gap in the bearing and of a detachable flexible finger for retaining said sliding piece in place substantially as described.

5. In a feed-block, the combination with the body portion, the slide carrying the feed-pawls, the slide-actuating levers, and the retaining-pawls; of detachable springs for the feed-pawls, comprising flexible members adapted to bear on the pawls and a transverse piece connecting the said flexible members and adapted to fit into a groove in the slide and to be maintained in such position by bearing-surfaces on the pawls substantially as described.

708,860. **EXPANSIBLE PULLEY FOR MOTOR-VEHICLES.** PAUL I. VIEL, Paris, France. Filed Apr. 10, 1901. Serial No. 55,167. (No model.)



Claim.—1. A transmitting and speed gear, comprising the motor-shaft *a*, the disk *b* carried by said shaft, and having grooves *d* formed therein, the sectors *e* adapted to slide within the said grooves, said sectors being arranged to receive a transmission-belt coupling the driving-shaft to the driven one in order to vary the speed of the latter, chains *f* connected with said sectors, rods *h* connected with the chains, supports *n* carried by the shaft, rollers *m* mounted to revolve on said supports between the sectors and adapted to receive the belt when the sectors are retracted, and a shifting device for the sectors connected with the said rods.

2. An expanding pulley, comprising a rotatable body, belt-engaging portions slidable in and out on said body, means for adjusting said belt-engaging portions, and rollers carried by said body between the belt-engaging portions and adapted to hold the belt out of driving engagement with the pulley when said slidable belt-engaging portions are retracted.

3. An expanding pulley, comprising a rotatable body, belt-engaging slides movable in and out on said body, the latter being provided with curved channels, a follower or piston movable lengthwise of the pulley's axis of rotation, means for adjusting said follower, and chains each connected at one end with said follower, and at the other end with one of the belt-engaging slides, said chains moving in said curved channels.

4. In an expansible pulley, the combination with the rotatable body, of the belt-engaging slides, movable in and out on said body, means for holding the belt out of driving engagement with the body when said slides are retracted, the follower or piston, connections between said follower and the belt-engaging slides, a rack connected with the piston, a pinion for moving the rack, and a second rack for rotating the pinion.

5. In an expansible pulley, the combination with the rotatable body, of the belt-engaging portions, movable in and out on said body, chains connected with the belt-engaging portions and extending in channels formed in the body, rods connected with the said chains, and means connected with the said rods for adjusting the belt-engaging portions.

708,861. **ELECTROLYTIC CELL AND ELECTRODE THEREFOR.** ADOLF A. VOSMAER, Dresden, Germany, assignor, by mesne assignments, to William Lobin, Nottingham, England. Filed Mar. 5, 1901. Serial No. 49,578. (No model.)

Claim.—1. In an electrode, the combination of a series of supporting-bars, electrode-strips covering the sides thereof, and conducting-strips integral with such electrode-strips and passing through said electrode between said bars, substantially as described.

2. In an electrode, the combination of a supporting-body composed of superposed bars of suitable material, conducting-strips on the faces of certain of said bars at opposite sides of the electrode, and means for electrically connecting said strips, substantially as described.

3. In an electrode, the combination of superposed bars of insulating material, electrode-strips held in position against the face of the electrode by said bars and conducting portions situated between said bars, substantially as described.

4. In an electrolytic cell, the combination of electrodes at each end thereof, electrode-strips on the face of said electrodes, means for connecting said strips with the external circuit, intermediate electrodes having corresponding electrode-strips on their opposite faces unconnected with the external circuit, means for connecting the electrode-strips upon such opposite faces, and means for holding said electrodes in place at different levels, substantially as described.

5. In an electrode for the purposes mentioned, the combination of superposed bars of suitable material and of approximately square section, conducting-sheaths around certain of said bars, and means for holding said bars together, substantially as described.

6. In an electrolytic cell, the combination of terminal electrodes built up of alternate insulating and conducting bars, the latter being sheathed in platinum-foil, intermediate electrodes formed of superposed insulating-bars only some of which are sheathed in platinum-foil, means for holding said bars together, and means for connecting the sheathings of the terminal electrodes with the external circuit, substantially as described.

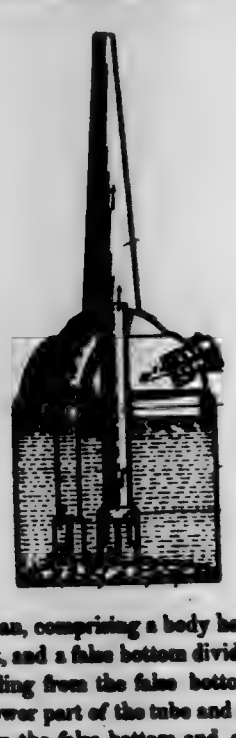
7. In an electrolytic cell, the combination of an outer cell, distance-strips cemented to the sides of said cell, electrodes consisting of superposed bars fitted between said strips, platinum strips secured against opposite sides of said electrodes, and integral connecting portions extending between opposite strips and passing through the electrodes, substantially as described.

8. In an electrolytic cell, the combination of terminal electrodes each consisting of alternate insulating and leaden bars superposed on each other, the latter being sheathed in platinum, a lead backing forming an electrical connection between said leaden bars and the external circuit, intermediate electrodes each consisting of insulating-bars superposed on each other and alternately sheathed in platinum-foil, an outer cell containing said electrodes, distance-strips cemented inside said cell between said electrodes, and fillings of Portland cement in the grooves between said strips, substantially as described.

9. In an electrode, the combination of a series of bars sheathed with inert metal, a series of unsheathed bars alternating therewith, and means for securing said bars together, substantially as described.

10. In an electrolytic cell, the combination of ... outer cell, distance-strips at the sides of said cell, and electrodes between said strips, each of said electrodes consisting of plain or unsheathed bars alternating with bars sheathed in metal, substantially as described.

703,862. OIL-CAN. THOMAS VOITA, Mound City, S. D. Filed Nov. 14, 1901. Serial No. 82,219. (No model.)



Claim.—1. An oil-can, comprising a body having a flexible bottom and provided with a spout, and a false bottom dividing the body into two compartments, a tube leading from the false bottom and projecting into the spout, a valve in the lower part of the tube and opening into the same, a second tube leading from the false bottom and opening into the lower compartment, said tube having its upper end extending into the upper portion of the body, and a downwardly-opening valve in the second tube, as set forth.

2. An oil-can, comprising a body having a flexible bottom and provided with a spout and a false bottom dividing the body into two compartments, a tube leading from the false bottom and projecting into the spout, a spring-pressed valve in the lower portion of the tube and opening into the same, a second tube leading from the false bottom and having its open upper end extending into the upper portion of the body and adjacent to the first-named tube, and a spring-pressed valve in the lower end of the said second tube and opening into the compartment below the false bottom, as set forth.

3. An oil-can consisting of a body having a flexible bottom and provided with a spout and a false bottom dividing the body into two compartments, a tube leading from the false bottom and projecting a short distance into the spout of the body, a spring-pressed valve in the lower portion of the tube and opening into the tube, a second tube leading from the false bottom to the upper portion of the body, a spring-pressed valve in the lower portion of the tube and opening into bottom compartment of the body, and an inwardly-opening valve in the upper portion of the body for the admission of air, as set forth.

703,868. EMBOSSED WALL-COVERING. RICHARD VÖLKER, Budapest, Austria-Hungary. Filed Apr. 3, 1902. Serial No. 101,132. (No model.)

Claim.—1. A wall-covering consisting of a suitable backing carrying a compound consisting of magnesite, asbestos, gypsum, dextrine and magnesium chlorid.

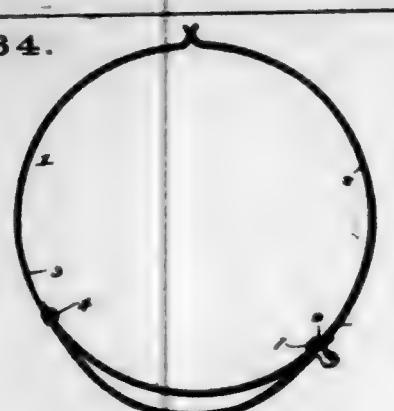
2. A wall-covering consisting of a backing of woven fabric, and a plastic composition secured thereto consisting of magnesite, asbestos, gypsum, dextrine and magnesium chlorid.

3. A wall-covering consisting of a backing of suitable material and a plastic composition secured thereto, consisting of twenty parts of magnesite, ten parts of asbestos, thirty parts gypsum, twenty parts of dextrine and twenty parts of magnesium chlorid.

703,864. NAPKIN-SUPPORT. WILLIAM R. WALKER, Sabula, Iowa. Filed Mar. 25 1902. Serial No. 99,937. (No model.)

Claim.—A napkin holder and support consisting of a spring-band formed of two sections, one of said sections having an intermediate slot and connected at one end to the intermediate portion of the other section, the latter having an end overlapping the first-named section and forming a spring-clasp, and a stud carried by the free end of said clasp and sliding in said slot, substantially as set forth.

703,864.



703,865. GRATE. THOMAS J. WALTON, Corsicana, Tex. Filed Jan. 28, 1902. Serial No. 91,796. (No model.)

Claim.—1. A grate having a body, ribs connected to the body and converging toward the top of the grate, a crown-piece connected with the upper ends of the ribs and rings surrounding the ribs and located in superposed order and being of progressively-decreasing diameter from the bottom toward the top, combined with a spindle for rotatively supporting said grate.

2. A grate having a body, ribs connected to the body and converging toward the top of the grate a crown-piece connected with the upper ends of the ribs and rings surrounding the ribs and located in superposed order and being of progressively-decreasing diameter from the bottom toward the top, combined with a spindle for rotatively supporting said grate, and a base-piece having a perforation to receive the spindle and the latter being keyed in place.

3. A grate having a body, ribs connected to the body and converging toward the top of the grate, a crown-piece connected with the upper ends of the ribs, rings surrounding the ribs and located in superposed order and being of progressively-decreasing diameters from the bottom toward the top, and a squared extension upon the crown-piece for receiving a poker.

4. A grate having a body, ribs connected to the body and converging toward the top of the grate a crown-piece connected with the upper ends of the ribs, rings surrounding the ribs and located in superposed order and being of progressively-decreasing diameters from the bottom toward the top, and a squared extension upon the crown-piece for receiving a poker and its upper end being shouldered and the crown-piece having holes for the insertion of a poker.

5. A spindle having weakened portions at its upper end combined with a grate having a socket to receive said upper end, and means adjustably carried by the spindle to support the grate.

6. A base-piece having a vertical spindle provided with deep annular grooves at its upper end combined with a grate having a socket to receive said upper end, and a collar adjustable on the spindle for supporting the grate.

703,866. TYPE-WRITING MACHINE. GEORGE B. WEBB, Westfield, N. J., assignor to Wyckoff, Seamans & Benedict, Ilion, N. Y., a Corporation of New York. Original application filed Mar. 2, 1897, Serial No. 625,724. Divided and this application filed Feb. 21, 1902. Serial No. 671,026. (No model.)

Claim.—1. In a type-writing machine, the combination of the roller-bearing carriage 2, the platen-carrier 3 hinged or pivotally connected there-

to, roller-bearings for supporting the vertical component of the weight of the same, and additional rollers for supporting the turning moment of said weight and without adding to the pressure on the first-named supporting-rollers.

2. In a type-writing machine, the combination of the roller-bearing carriage 2, a platen-carrier hinged or pivotally connected thereto, roller-bearings for supporting the vertical component of the weight of the same, and additional means for supporting the turning moment of said weight and without adding to the pressure on said roller-bearings.

3. In a type-writing machine, the combination of a roller-bearing carriage, a shifting platen-carrier pivotally connected or hinged thereto, roller-bearings for supporting the vertical component of the weight of the same, and additional means for supporting the turning moment of said weight without adding to the pressure on said roller-bearings, and means for holding the carriage in position when the carriage is shifted violently.

4. In a type-writing machine, the combination of a roller-bearing carriage, a shifting platen-carrier pivotally connected or hinged thereto, roller-bearings for preventing lateral vibration of said carriage and for supporting the weight of the same, and additional means for preventing said carriage from being lifted from its roller-bearings.

5. In a type-writing machine, the combination of a roller-bearing carriage, a shifting platen-carrier pivotally connected or hinged thereto, roller-bearings for sustaining the weight of the carriage, additional means for preventing said carriage from being lifted from its roller-bearings and additional means for preventing said carriage from turning when the platen-carrier is shifted violently.

6. In a type-writing machine, the combination of a roller-bearing carriage having a horizontal top and two depending vertical sides, a fixed track or way having a horizontal bearing and a vertical bearing, rolls or balls within the rectangular space formed by said top and one of said sides and by the horizontal and vertical bearings of the fixed rail, a ball or roller for the other depending side of said carriage, and a fixed bearing therefor.

7. In a type-writing machine, the combination of a roller-bearing carriage having a horizontal top and two depending sides, a platen-carrier hinged or pivotally connected to said carriage, a fixed rail having adjacent bearings arranged at right angles to each other and opposing the bearings formed by the under side of the said top and the inner face of one of said depending sides, rolls or balls arranged to contact with said bearings, a ball or roller for the other depending side of said carriage, and a fixed bearing therefor.

8. In a type-writing machine, the combination of a roller-bearing carriage having a horizontal top and two depending sides one of which is longer than the other, a platen-carrier hinged or pivotally connected to said carriage, a fixed rail having two bearing-faces opposing the bearing-faces formed by the under side of the top and the inner side of the shorter depending side of the carriage, rolls or balls interposed between said bearings, and a ball or roller bearing for the longer depending side of said carriage.

9. In a type-writing machine, the combination of a roller-bearing carriage comprising a horizontal top and two depending sides, a fixed rail having a horizontal bearing and a vertical bearing, rolls or balls for said bearings and for the bearings formed by the said top and one of said sides, a roller attached to the other one of said depending sides, and a fixed bearing for said roller.

10. In a type-writing machine, the combination of a roller-bearing carriage comprising a horizontal top and two depending sides, a fixed rail having a horizontal bearing and a vertical bearing, rolls or balls for said bearings and for the bearings formed by said top and one of said sides, a roller attached to the other one of said depending sides, a fixed bearing for said roller, and a platen-carrier hinged or pivotally connected to said carriage.

11. In a type-writing machine, the combination of a roller-bearing carriage comprising the top 13, the two depending sides 14 and 15, the fixed rail having the bearings 17 and 18, the interposed rolls or balls, the bearings 29, the roll 26, the hook 25, and the groove in the fixed rail.

12. In a type-writing machine, the combination of a roller-bearing carriage comprising a horizontal top and two depending sides, a shifting platen-carrier hinged or pivotally attached thereto, a fixed rail having bearings 17, 18 and 29 and the groove 27, the interposed pairs of rolls 20 22 arranged crosswise of each other, the roll 26, and the hook 25.

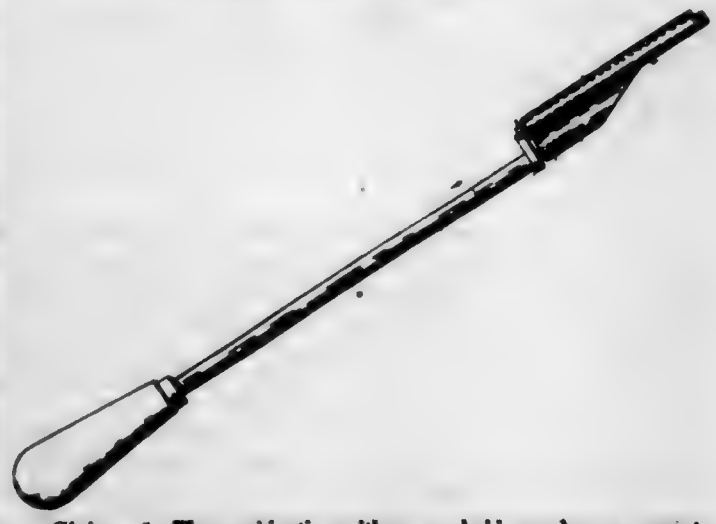
13. In a type-writing machine, the combination of a carriage, a set of roller-tracks or bearing-surfaces, a set of rollers for sustaining the vertical component of the weight of the carriage, and another set of crosswise rollers, as 22, 26 for preventing vibration of the carriage in a horizontal plane.

14. In a type-writing machine, the combination of a carriage, a set of roller tracks or bearings, a set of rollers for sustaining the vertical component of the weight of the carriage, and a set of crosswise rollers, as 22, 26, for preventing the carriage from either vibrating in a horizontal plane or swinging upon the first-mentioned set of rollers.

15. In a type-writing machine, the combination of a set of roller-tracks, a carriage overhanging forwardly of said tracks, a set of rollers for sustaining said carriage, and a set of crosswise rollers for preventing either lateral vibration or tipping of said carriage.

16. In a type-writing machine, the combination of a set of tracks or bearing-surfaces, a carriage, rollers for sustaining said carriage, and crosswise rollers for preventing lateral vibration of said carriage, each of said rollers being held in contact with its coacting track or bearing-surface by the weight of said carriage.

703,867. VETERINARY SURGEON'S FLOAT. PAUL J. WEBER, Chicago, Ill., assignor to Sharp & Smith, Chicago, Ill., a Firm. Filed Dec. 28, 1901. Serial No. 87,500. (No model.)



Claim.—1. The combination with a rasp-holder, and a rasp mounted thereon, of means for engaging the upper surface of the rasp, a handle bar or rod rotatably secured to one end of said holder, and a device integral with said bar or rod and adapted upon the rotation thereof to contact the under face of the rasp and force it upward into binding engagement with the said means for engaging the upper surface of the rasp, substantially as specified.

2. The combination with a rasp-holder consisting of a plate provided with grooved side flanges, and a rasp slidingly mounted thereon, of a handle bar or rod rotatably secured to one end of said holder and provided with an integral lug adapted to be forced against the under face of the rasp, substantially as specified.

3. The combination with a rasp-holder consisting of a plate provided with grooved side flanges, and a rasp slidingly mounted thereon, of a handle bar or rod rotatably secured to one end of said holder and provided with an integral lug having a cam-face, said rod or bar being adapted to be moved to force said cam-face against the under face of the rasp, substantially as specified.

4. The combination with a rasp-holder consisting of a plate provided with grooved side flanges, and a rasp mounted thereon with its edges within the grooves in said flanges and its rear edge projecting beyond the rear end of the holder, said grooves being unobstructed at each end, of a handle bar or rod rotatably secured to the rear end of said holder, and a lug carried by said handle bar or rod and adapted upon the rotation of said bar or rod to contact the under surface of the projecting lower end of the rasp and force said rasp up into binding engagement with the upper faces of the grooves in the side flanges, substantially as specified.

708,868. VETERINARY SURGEON'S FLOAT. PAUL J. WEBER, Chicago, Ill., assignor to Sharp & Smith, Chicago, Ill., a Firm. Filed Jan. 16, 1902. Serial No. 89,993. (No model.)

Claim.—1. The combination with a holder adapted to receive a rasp and provided with a socket, of a sliding pressure device within the socket adapted to exert pressure upon the face of the rasp, a handle bar or rod adjustably connected with said sliding pressure device, and means for com-

pelling a movement of said pressure device in an opposite direction to the movement of the handle bar or rod when said handle bar or rod is being adjusted to an operative position, substantially as specified.

2. The combination with a holder adapted to receive a rasp, of a handle bar or rod adapted to be attached at one end of said holder, movable means carried by said holder and adapted to be pressed against one face of the rasp to cause the opposite face of said rasp to engage said holder, means for adjustably connecting said handle bar or rod with said movable means, whereby, upon the adjustment of said handle bar or rod, said movable means will be forced into position to secure said rasp in place, substantially as specified.

3. The combination with a holder, and a rasp mounted thereon, said holder being provided with a socket, of a pressure device within said socket, a screw-threaded shank connected with said pressure device, a handle bar or rod adapted to be screwed upon said shank, and means for causing the device within the socket to move and exert a pressure upon the face of the rasp carried by the holder when the handle bar or rod is screwed up on said shank, substantially as specified.

4. The combination with a holder, and a rasp mounted thereon, said holder being provided with a socket, of a pressure device within said socket, a screw-threaded shank connected with said pressure device, a handle bar or rod adapted to be screwed upon said shank, means for preventing rotation of said shank, and means for causing the device within the socket to exert a pressure upon the face of the rasp carried by the holder when the handle bar or rod is screwed up on said shank, substantially as specified.

5. The combination with a holder adapted to receive a rasp, said holder having a socket near one end and a slot in its end wall, and provided also with a plurality of bearing-faces, of a pressure device within said socket, a screw-threaded shank attached at one end to said pressure device and projecting through said slot, and a handle bar or rod screw-threaded onto the other end of said shank and adapted to be screwed up against one of said bearing-faces, substantially as specified.

6. The combination with a holder having grooved side flanges 8 adapted to receive the side edges of a rasp, and having a socket near one end and a slot in the rear wall communicating with said socket, of a head located in said socket, a screw-threaded shank connected with said head and extending through said slot, a handle adapted to be screwed upon said shank, and means for causing said head to move and exert a pressure upon the under face of the rasp to bind it in the grooves of said side flanges, substantially as specified.

7. The combination with a holder adapted to receive a rasp, said holder being provided on one end with a plurality of bearing-faces, of a handle bar or rod adapted to be forced and held against any of said bearing-faces, and means for locking said rasp in the holder, said locking means being connected with said handle bar or rod and caused to move and lock the rasp upon said handle bar or rod being forced against any of said bearing-faces, substantially as specified.

8. The combination with a holder adapted to receive a rasp, said holder being provided on one end with a plurality of bearing-faces, of a handle bar or rod adapted to be forced and held against any of said bearing-faces, locking means carried by the holder and located below the seat for the rasp, and a connection between said locking means and handle bar or holder, said locking means being adapted to move and exert a pressure against the face of the rasp upon said handle bar or rod being forced against any of said bearing-faces, substantially as described.

9. The combination with a holder adapted to receive a rasp, said holder having a socket near one end, of a movable plate located above said socket, a pressure device within said socket adapted to be forced against said plate, a screw-threaded shank connected with said pressure device, a handle bar or rod adapted to be screwed upon said shank, and means for causing the pressure device within the socket to move against the plate and force it upward when the handle bar or rod is screwed up on said shank, substantially as specified.

10. The combination with a holder adapted to receive a rasp, said holder having a socket near one end, of a plate located above said socket and provided with an inclined face, a pressure device within said socket adapted to be forced against said plate, a screw-threaded shank connected with said pressure device, a handle bar or rod adapted to be screwed upon said shank, and means for causing the pressure device within the socket to move against the inclined face of the plate and force it upward when the handle bar or rod is screwed up on said shank, substantially as specified.

11. The combination with a holder adapted to receive a rasp, the said holder having a socket near one end and a slot in its end wall, of a movable plate, a pressure device within said socket adapted to be forced against said plate, a screw-threaded shank connected with said pressure device, a handle bar or rod adapted to screw upon said shank, and means for causing the pressure device within the socket to move against the plate and force it upward when the handle bar or rod is screwed up on said shank, substantially as specified.

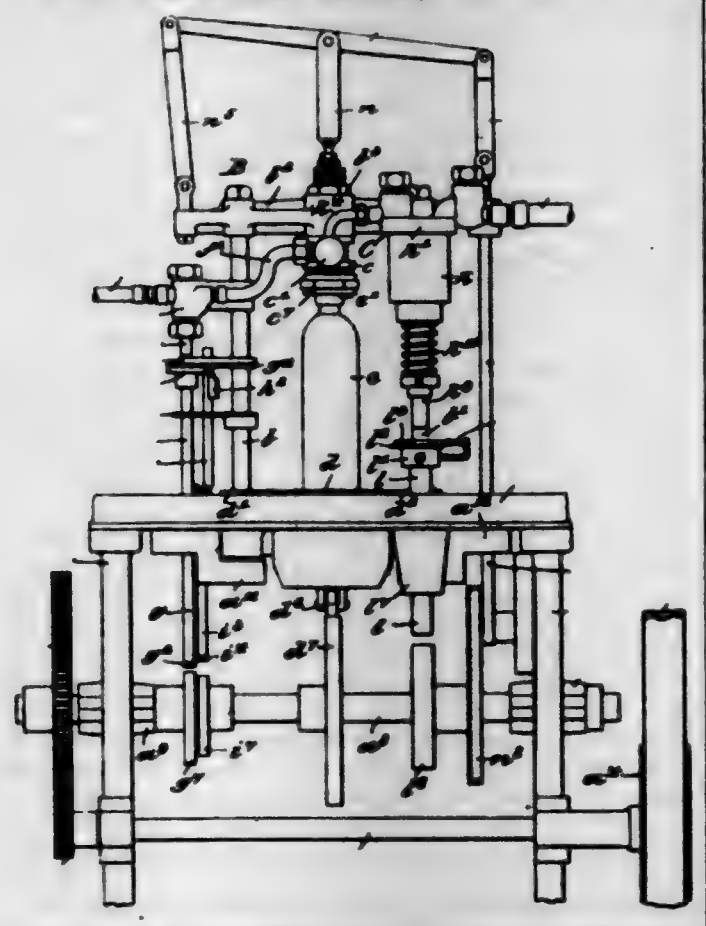
708,869. VETERINARY SURGEON'S FLOAT. PAUL J. WEBER, Chicago, Ill., assignor to Firm of Sharp & Smith, Chicago, Ill. Filed Feb. 19, 1902. Serial No. 94,752. (No model.)

Claim.—1. In a handle, the combination with a tubular portion having its outer end slit to form lips, and a block secured on the inner face of one of said lips, of a stem or shank in said tubular portion adapted to be moved longitudinally thereof, said stem or shank having a longitudinal channel or groove and said block being slidable in said channel or groove whereby considerable adjustment of said tubular portion and stem or shank is obtained, a movable sleeve surrounding said tubular portion and provided with an inclined slot, and a projection on said tubular portion that enters said slot, substantially as specified.

2. In a handle, the combination with a tubular portion having at its outer end a lip, and a block on the under face of said lip, said combined lip and block being thicker at the outer end than at the inner end, of a stem or shank in said tubular portion adapted to be moved longitudinally thereof, said stem or shank having a longitudinal channel or groove and said block being slidable in said channel or groove whereby considerable adjustment of said tubular portion and stem or shank is obtained, and a movable sleeve surrounding said tubular portion and adapted to force said block tightly into said channel or groove, substantially as specified.

3. In a handle, the combination with a tubular portion having its outer end slit to form lips, and a block thicker at its outer end than at its inner end secured to the inner face of one of the lips, of a stem or shank in said tubular portion and adapted to be moved longitudinally thereof, said stem or shank having a longitudinal channel or groove adapted to receive said block, a removable stop in said channel or groove near the rear end thereof, and a movable sleeve surrounding said tubular portion and adapted to force said block tightly into said channel and serving also as a cover for an opening in the tubular portion through which the said stop is adapted to be entered and removed, substantially as specified.

708,870. **BOTTLE-FILLING MACHINE.** JACOB E. WEBB, Philadelphia, Pa., assignor of one-half to S. Tyrtchell Company, Camden, N. J., and Philadelphia, Pa., a Corporation of New Jersey. Filed Mar. 6, 1902. Serial No. 96,579. (No model.)



Claim.—1. In a bottle-filling machine, in combination with a filling head, a yielding support upon which the bottle is placed and located below the filling-head, an inlet for the liquid to the filling-head, a valve controlling said inlet, a stem projecting from said valve, a plate arranged to oscillate beneath said stem, a shaft, a cam located on said shaft and arranged normally to operate the valve-stem through said plate to control said valve, a cam arranged on said shaft and adapted to elevate and depress the yielding support, said support having a movement independent of the movement imparted to it by said cam and shaft, and means controlled by the independent movement of said support and arranged to oscillate said plate to disconnect the valve-stem from its operating-cam.

2. In a bottle-filling machine, a filling-head and means for supplying the same with a liquid, a cooling-plunger traversing the filling-head, in combination with a support, a yielding table for the bottle arranged within the support and having a movement independent of said support, means controlled by the operation of the machine and arranged to elevate and depress the support and to reciprocate the cooling-plunger, mechanism actuated by the operation of the machine and arranged to control the liquid-supply to the filling-head and means actuated by the independent movement of the table and arranged to control said mechanism.

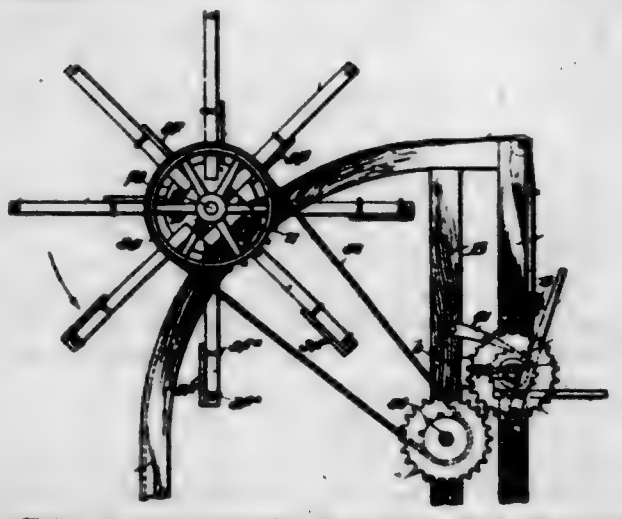
3. In a bottle-filling machine, a filling-head and means for supplying the same with a liquid, in combination with a support, a yielding table for the bottle arranged within the support and having a movement independent of said support, means controlled by the operation of the machine and arranged to elevate and depress the support, mechanism actuated by the operation of the machine and arranged to control the liquid-supply to the filling-head, and means actuated by the independent movement of the table and arranged to control said mechanism.

4. In a bottle-filling machine, a filling-head, an inlet for liquid to said head and an inlet for syrup to said head, in combination with a support, means controlled by the operation of the machine and arranged to elevate and depress said support, a yielding table for the bottle having a movement in the support independent of the elevation and depression of said support, mechanism actuated by the operation of the machine and arranged to control the liquid and syrup inlets, and means actuated by the independent movement of the yielding table and arranged to control said mechanism.

5. In a bottle-filling machine, a filling-head, an inlet for liquid to said head, a valve controlling said inlet, a plunger controlling said valve, a shaft, and intermediate mechanism adapted normally to elevate and depress said plunger, an oscillating plate interposed normally between the plunger and said intermediate mechanism, a yielding support for the bottle adapted to be elevated and depressed by said shaft, and intermediate means controlled by the support arranged to withdraw said oscillating plate when the support is elevated, whereby operation of said inlet-valve is prevented.

6. In a bottle-filling machine, a filling-head, an inlet for liquid to said head, an inlet for syrup to said head, a valve controlling each inlet, a plunger controlling each valve, a shaft and intermediate mechanism adapted normally to elevate and depress said plungers, an oscillating plate normally interposed between each plunger and its intermediate operating mechanism, a yielding support for the bottle, means controlled by said shaft for elevating and depressing said support, and intermediate means controlled by the upward movement of the support arranged to withdraw both oscillating plates to thereby prevent the operation of both inlet-valves.

708,871. **CURRENT-WHEEL.** JAMES A. WELLS and JESSE D. SEGRAVE, Knight, Tex. Filed Aug. 7, 1901. Serial No. 71,188. (No model.)



Claim.—1. The combination of a frame provided with spaced and curved standards having longitudinal channels in their outer faces, sliding bearings mounted in the channels of the standards, a water-wheel mounted in the said bearings and having a sprocket-wheel on one end of its shaft, a driven shaft provided with a sprocket-wheel and a gear-wheel, a chain belt passing around the said sprocket-wheels, a winding-shaft mounted in the frame and provided with drums, a ratchet-wheel, and a gear-wheel for meshing with the gear-wheel of the driven shaft, one end of the said shaft having sliding movement in its bearing, a pawl engaging the ratchet-wheel, a lever pivoted to the frame and connected with the end of the sliding shaft whereby the shaft may be moved to throw its gear-wheel in and out of mesh with the gear-wheel of the driven shaft, and cables having one end secured to the sliding bearings of the water-wheel shaft passed over roller-guides and their other ends secured to the drums of the winding-shaft, substantially as herein shown and described.

2. The combination of a frame provided with spaced standards having channels in their outer faces, sliding blocks mounted in the channels of the standards, a water-wheel mounted in said blocks, a driven shaft provided with a gear-wheel at one end, gearing between the said shaft and the shaft of the water-wheel, a winding-shaft mounted in the frame and provided with a ratchet-wheel, and a gear-wheel, one end of the said shaft having sliding movement in one of the bearings therefor, a pawl engaging the said ratchet-wheel, a lever pivoted to the frame and connected with the sliding end of the said shaft, whereby the shaft can be moved to throw the gear-wheel carried thereby into and out of mesh with the gear-wheel of the driven shaft, and cables having one end secured to the sliding blocks passed over guides and their other ends connected with the winding-shaft, substantially as described.

708,872. **TRACTION-ENGINE.** JESSE O. WELLS, Des Moines, Iowa. Filed Oct. 1, 1900. Serial No. 31,837. (No model.)

Claim.—1. In an automobile, fire-engine or motor-vehicle, the combination of the wheeled truck, the engine on said truck, reducing-gear connections between said engine and the traction-wheels of the truck, gear connections between said engine and the machine to be driven and means for elevating said traction-wheels.

2. In an automobile, fire-engine or motor-vehicle, the combination of the traction-truck, the engine thereon, the machine to be driven, means

for elevating the traction-wheels and shiftable power-transmitting connections between the engine and traction-wheels and between the engine and machine to be driven.

3. In a traction-engine the combination of the traction-truck, lifting-jacks hinged adjacent to the rear axle of the truck and arranged for manual actuation independent of each other whereby said traction-truck may be elevated to clear the traction-wheels from the tread-surface and means for attaching said traction-engine to a machine to be driven.

4. In a traction-engine the combination of the traction-truck, the pick-wheel hinged to and arranged for vertical oscillation or adjustment on the rear axle of said truck and geared thereto; and a clutch connecting the gearing of the pick-wheel to the rear axle of the truck and arranged to be disconnected from said pick-wheel at times, and means for connecting said traction-engine to a machine to be driven.

5. In a traction-engine the combination of the traction-truck, the pick-wheel hinged and geared to the rear axle of said truck and clutch mechanism interposed between said pick-wheel gear and rear axle.

6. In a traction-engine the combination of the traction-truck, the lifting-jacks hinged thereto and arranged in divergent planes relative to each other and means for attaching said traction-engine to a machine to be driven.

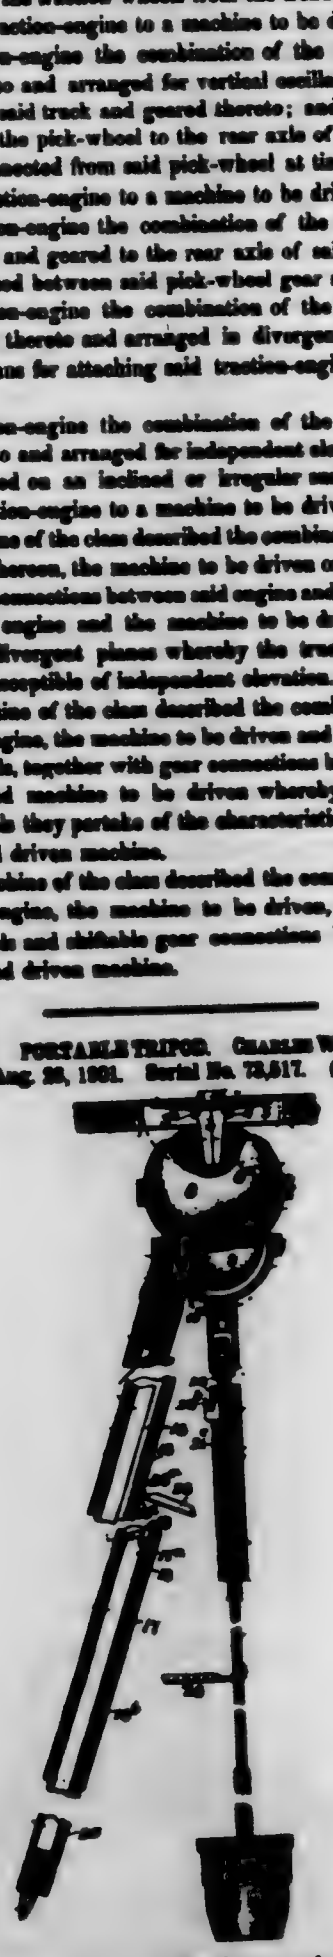
7. In a traction-engine the combination of the traction-truck, the jacks hinged thereto and arranged for independent elevation whereby the truck may be leveled on an inclined or irregular surface and means for attaching said traction-engine to a machine to be driven.

8. In a machine of the class described the combination of the wheeled truck, the engine thereon, the machine to be driven carried on said truck and shiftable gear connections between said engine and the traction-wheels and between said engine and the machine to be driven, together with jacks located in divergent planes whereby the truck may be elevated, which jacks are susceptible of independent elevation.

9. In a machine of the class described the combination of the traction-wheels, the engine, the machine to be driven and means for elevating said traction-wheels, together with gear connections between said engine, traction-wheels and machine to be driven whereby in the elevation of said traction-wheels they partake of the characteristics of balance-wheels for the engine and driven machine.

10. In a machine of the class described the combination of the traction-wheels, the engine, the machine to be driven, means for elevating said traction-wheels and shiftable gear connections between the engine, traction-wheels and driven machine.

703,873. PORTABLE TRIPOD. CHARLES WHITHAM, Rankin, Canada. Filed Aug. 28, 1901. Serial No. 73,017. (No model.)



Claim.—1. In a tripod of the character described, the combination with a head having a tapered socket; of a supporting member having a tapered plug, said plug consisting of two pieces each independently hinged to swing up into the same horizontal plane and down into a vertical plane with their contiguous edges abutting, whereby to provide a member adapted to fit the tapered socket and means on the supporting member for maintaining the two plug members at their different adjusted positions, substantially as shown and for the purposes described.

2. In combination with a tripod-head, a hinged leg, having an outer hemispherical convex surface depending from the base of the head; an inner hemispherical shell at a suitable distance from the same, and having its concave interior and convex exterior surfaces concentric with the first-named convex surface; the said outer hemispherical shell having three elongated openings or slots; three hinge-pieces, said hinge-pieces being sections of a hemispherical shell of the thickness of the space between said hemispherical surfaces, each hinge-piece having an outwardly-projecting pin passing through the slots; tripod-legs attached to said projecting pins, and having their upper ends shaped to conform to the outer spherical hinge-surface, all being arranged substantially as shown and for the purposes described.

3. In a tripod of the class described, legs made in two lengths, the lower telescoping within the upper; a solid end in the upper end of each upper length, hinged to the head; a longitudinal division-plate in the upper length, preserving a uniform tube-section for the lower length to slide within; a pivoted spring-latch adapted to check the upward movement of the lower length, within the upper leg length, but allowing free downward movement, such latch being reversible on its pivot so as to resist downward, while allowing free upward movement; apertures in the upper length above and below the pivot to allow the latch to engage the lower length within the upper tubular length, in either position of the latch, and means in the lower length to engage and retain the lower length, when telescoped within the upper length, all substantially as described.

4. In a tripod as described, having hollow telescopic legs working on a hemispherical hinge-surface, in combination, a depending tubular spring-casing attached to the under side of the hinge-surface, and approximately half the length of the upper leg member; an internally-screwed sleeve fixed in the upper end of this tube; a screw in the lower center of the outer hinge-surface, countersunk on the inside, to attach, by the screwed sleeve, the tube to the head; a bushing screwed in the lower end of the spring-tube; a stem sliding within such bushing and having at its upper end a screwed portion to engage the lower half of the screwed sleeve, and just below such screwed portion a fixed collar slidable within the tube; a spiral spring surrounding the stem and within the tube; a reduced portion on the stem exterior to the tube, having a shoulder at the change of diameter, a spreader device having apertured end members, said reduced portion passing through the apertures in the ends of the spreader; a shoulder below the spreaders and a bottom ferrule secured to slide over the ends of the legs when closed, all substantially as described.

5. In a tripod, telescopic leg members, a center stem, a spreader-strut hinged at one end to about the middle of each upper leg length and having the other end flattened and provided with an oval hole, the minor axis of which is the diameter of the center stem on which it slides, and the major axis twice that; said strut having a right-angled upward bend across the center of the oval hole, adapted to allow the struts when free on the center stem to assume positions parallel to or at right angles to it, and shoulders on the center stem adapted to engage the ends of the spreader-struts and push them up or pull them down, as described.

6. A tripod of the class described, comprising leg members each formed of telescopic upper and lower sections, a central stem, a spreader-strut hinged to each upper leg-section, said spreader having its inner ends flattened and said flattened ends each having an oval aperture, the width and length of which is respectively the diameter and twice the diameter of the reduced portion of the central stem which it engages and slides in, and the said ends also having upwardly-bent right-angle portions, substantially as shown and for the purposes described.

7. In a tripod having inwardly-closing legs, a device for holding and releasing the legs consisting of a spring-controlled central stem having an end ferrule to secure the leg ends; a hook-sleeve actuated by such spring having equally-disposed outwardly-projecting and upwardly-directed hooks; a spring-casing having slots through which such hooks project and have a limited vertical movement, and means on each leg whereby the hooks may engage and retain the legs to the central stem and close to one another.

8. In a tripod of the class described, a headpiece having a socket, a member adapted to be attached to the article to be held, a tapered plug consisting of half-sections, each being independently pivoted to the said member to swing outward and against the said member, and to close toward and against each other, and pendent from said member whereby to adapt the plug to enter the socket in the headpiece, as set forth.

9. In a tripod of the character described, the combination with the socketed headpiece; of the object-holder *b*, the tapered plug-sections 3 hinged on the lower side of the holder to swing upward and outward from each other to a horizontal position and downward against each other to a vertical position, and means for sustaining said sections in either position, as set forth.

10. In a tripod of the character described, a headpiece having a pendent convex surface, a shell concaved on a plane concentric with the pendent head-surface, and having elongated openings, hinge-pieces slidable between the convexed and concaved members, said pieces having pins projected through the openings in the shell, and tripod-legs secured to the said pins, as set forth.

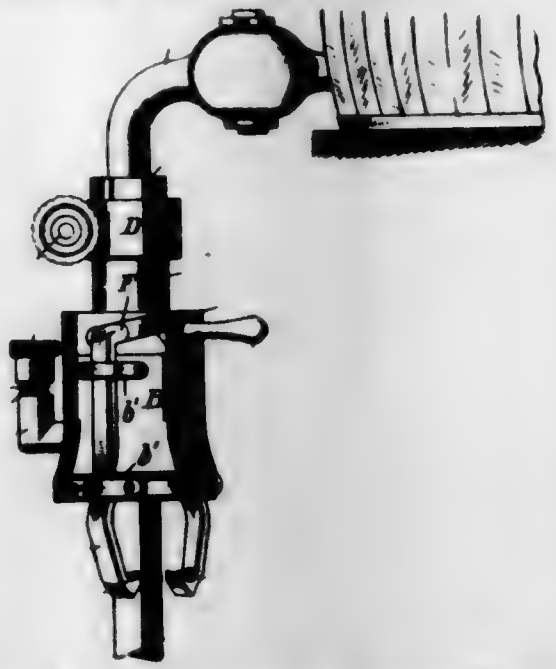
11. In a tripod of the character described, a headpiece having a pendent convexed inner shell, an outer shell concentric with the inner shell, and having longitudinally-elongated openings, members movably held between the inner and outer shells, and having studs or pins projected through the openings in the outer shell, tripod-legs detachably secured to the projecting ends of said pins, the attached ends of said legs being shaped to snugly bear against the outer shell, all being arranged substantially as shown and described.

12. In a tripod or supporting apparatus of the character described, the combination with the headpiece, the spherical bearing and the attaching members for joining the legs to the head, slidable on the spherical bearing; of leg members, each having a solid end adapted to detachably connect with the slidable members, said legs consisting of two lengths telescopically joined, and a reversible spring-latch device on the leg members for holding the lower leg-section to its closed-in or extended position, for the purposes specified.

13 In an apparatus as described, the combination with the head, the hinged legs and the centrally-pendent tubular stem; of spreader-struts each consisting of a body portion concaved in cross-section adapted to close up against the tubular stem, one end of said struts having a hinged connection with the legs, the other end having a pivotal and slidable connection with the tubular stem, all being arranged substantially as shown and for the purposes described.

14. In combination with the head of a tripod of the class described, a square tapered socket in the head; a plug or stem designed to fit such socket and composed of two pieces contiguous in a vertical plane through the axis of the plug; a hinge-pin at the outer edge of the base of the taper in each piece; a suitable mounting for the same, having a recess in the walls of which the hinge-pins pivot; and a flat spring in the bottom of the recess, bearing on the square outer corners of the base of the plug members and having an aperture in the center of the recess, substantially as described.

708,874. BOTTLE-FILLING DEVICE. CHARLES T. WHITE, South Bend, Ind., assignor of one-half to Abner B. Graham, South Bend, Ind. Filed Oct. 14, 1901. Serial No. 78,647. (No model.)



Claim.—1. In a bottling device, the combination of the body having an air-chamber, adjustable bottle-clamps slidably attached to the body and depending below the same, a gasket around the mouth of the chamber at the lower end of the body, and a cam-ring rotatably mounted on the body engaging and operating said clamps, substantially as described.

2. In a bottling device, the combination of the body having an air-chamber, a gasket around the mouth of the air-chamber, a filling-tube extending through the body, vertically-movable bottle-holding clamps slidably attached to the sides of the body, a cam-ring rotatably mounted on the body provided with cam-grooves engaged by the clamps, and an air-vent tube communicating with the chamber, and provided with means for regulating the escape of air, substantially as described.

3. In a bottling device, the combination of the body having an air-chamber, means for attaching the body to a faucet, a filling-tube extending through the air-chamber, a gasket around the mouth of the chamber at the lower end of the body, vertically-adjustable bottle-clamps slidably attached to the body and depending below the same, and a cam supported on the body and engaging and operating said clamps, substantially as described.

4. In a bottling device, the combination of the body having an interior air-chamber, a gasket around the mouth of the chamber, vertically-adjustable bottle-clamps slidably attached to the sides of and depending below said body, a cam-ring above the air-chamber for simultaneously operating said clamps, so as to cause them to engage the bottle-neck and hold it tightly against the gasket, an air-venting pipe communicating with the chamber, a valve therein and means for regulating the pressure of the valve, substantially as described.

5. In a bottling device, the combination of the body having an interior air-chamber, a filling-tube extending through said chamber, and a gasket around the mouth of the chamber; with vertically-movable bottle-clamps slidably attached to the sides of the body and depending below the same having bottle-catching hooks on their lower ends, the cams above the air-chamber engaging the bottle-clamps, the air-vent attached to the body and communicating with the air-chamber thereof, a valve in said vent, a spring for seating said valve and means for regulating the pressure of the spring, substantially as described.

6. In a bottling device, the combination of the body having an air-chamber, a gasket around the mouth of the air-chamber, a filling-tube extending through the body, opposite bottle-holding clamps attached to the sides of the body, and a ring provided with cams adapted to be engaged by the clamps; with an air-vent pipe communicating with the chamber having a threaded end provided with venting-slots, and a screw-cap fitted on the threaded end of the pipe to regulate escape of air therefrom.

7. In a bottle-filling device, the combination of the body having an interior air-chamber, a sleeve connected to the body and provided with means for attachment to a faucet, a filling-tube for conducting liquids from said sleeve through the air-chamber, and a gasket around the mouth of the air-chamber; with vertically-adjustable bottle-clamps attached to the body, a ring surrounding the sleeve having cams engaging the said clamps, to actuate the latter, a vent-pipe communicating with the chamber, having air-slots, and an adjustable cap on the slotted end of the vent-tube, substantially as described.

8. In a bottle-filling device, the combination of the body having an interior chamber, means for attaching the body to a faucet, a filling-tube communicating with the faucet and extending through the air-chamber, and a gasket around the open mouth of the air-chamber; with sliding bottle-clamps on the sides of the body having their lower ends adapted to engage the neck of a bottle, a ring rotatably mounted on the body having cams engaging said clamps, a vent-pipe attached to the body and communicating with the air-chamber, said pipe having a threaded and slotted end, a screw-cap adjustably fitted on the threaded end of the vent-pipe, and a valve in the vent-pipe, all substantially as and for the purpose described.

9. In a bottle-filling device, the combination of the body, having an interior chamber, a split sleeve connected to one end of the body, a gasket therein and a clamp on the sleeve for attaching it to a faucet, a filling-tube communicating with the sleeve and extending through the air-chamber, and a rubber gasket around the open mouth of the air-chamber; with sliding bottle-clamps on the sides of the body having hooks or teeth on their lower ends to engage the neck of a bottle, a ring rotatably mounted on the body having cam-slots engaging said clamps, a vent-pipe attached to the body and communicating with the air-chamber, said tube having a threaded and slotted end, a screw-cap adjustably fitted on the threaded end of the vent-pipe, a ball-valve in the vent-pipe and a spring for seating the valve confined by said cap, all substantially as and for the purpose set forth.

708,875. ACTIVE MATERIAL FOR STORAGE BATTERIES AND PROCESS OF MAKING SAME. WALTER R. WEMPLE, San Francisco, Cal. Filed Mar. 14, 1901. Serial No. 51,300. (No specimens.)

Claim.—1. The process of forming an active material for storage batteries, consisting of suitably binding a mass of lead salt which will retain its conformation after immersion, and reducing it by electrolysis to spongy lead in an electrolyte which is a solvent for the lead salt, and from which solution lead trees essentially parallel to each other are plated out within the mass.

2. The process of forming an active material for storage batteries consisting of suitably binding a mass of lead oxids, rendering its surface electrically conductive, and reducing by electrolysis to spongy lead in an alkaline forming-bath, which is a solvent for the lead salt and from which solution lead trees essentially parallel to each other are plated out within the mass.

3. The process of forming an active material for storage batteries consisting in mixing an oxid of lead with a suitable binder whereby the

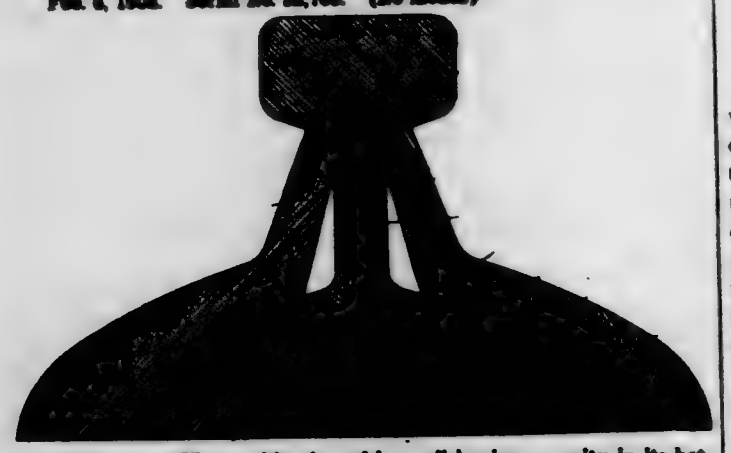
mass is rendered electrically conductive, and reducing it to spongy lead composed of lead trees essentially parallel to each other, by electrolysis, in an alkaline forming-bath.

4. The process of forming an active material for storage batteries, consisting in mixing an oxid of lead with a glycerin solution, and reducing the wet mass by electrolysis in an alkaline forming-bath in which the lead salt is soluble, and from which solution lead trees essentially parallel to each other are plated out within the mass.

5. The process of forming an active material for storage batteries, consisting in rendering a mass of a suitable lead salt electrically conductive, and reducing it to spongy lead, consisting of a mass of lead trees essentially parallel to each other by electrolysis in a forming-bath in which the lead salt is soluble.

6. An active material for storage batteries, composed of a compact mass of lead trees running essentially parallel to each other and perpendicular to its exposed surfaces, said mass occupying the volume of the unreduced salt from which it is formed.

708,876. RAIL-JOINT. SAMUEL M. WILSON, Marcus, Iowa. Filed Feb. 6, 1902. Serial No. 92,703. (No model.)



Claim.—1. The combination with a rail having a cavity in its bottom, of two joint-sections lying one on each side of the rail and having longitudinally-extending interlocking parts to fasten them together, and an upwardly-projected stud on one joint-section and adapted to enter the cavity, the cavity being larger than the stud, for the purpose specified.

2. A rail-joint, comprising two joint-sections with means for fastening them together, said sections lying on opposite sides of the rails and having portions lying under the base-flanges of the rails and also having upwardly and inwardly inclined flanges which engage the rails, for the purpose specified, and two studs carried on one fastener-section at opposite points thereon, said studs being located under the base-flanges of the rail-sections and being projected upward into cavities formed in the under faces of the base-flanges of the rail-sections.

3. The combination with rail-sections, each having a cavity in its bottom, of two joint-sections lying one on each side of the rail-sections and having means for fastening them together, and two upwardly-projected studs on one joint-section, said studs being adapted respectively to enter the cavities in the said rail-sections, and said cavities being larger than the studs, for the purpose specified.

708,877. HINGED GATE. ISAAC WOLVERTON, Portland, Oreg. Filed Feb. 6, 1902. Serial No. 92,801. (No model.)

Claim.—1. The combination with the hinged gate, and the foldable member A, disposed at an acute angle to the hinged end of the gate, and hinged at its lower end to swing upward; of the sliding latch *g*, and the double crank *e*, connected to the latch and the upper end of member A substantially as shown and described.

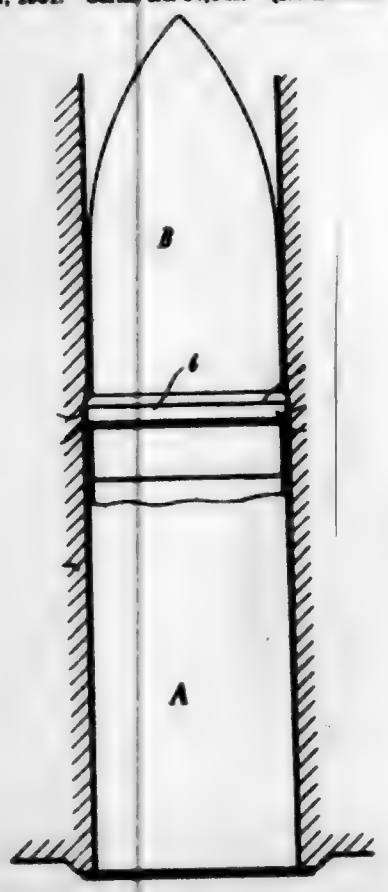
2. The combination with the hinged gate, the post *c*, and the foldable member A, hinged to post *c*, and arranged substantially as described; of the latch *g*, the double crank *e*, arranged in a vertical plane and having one member connected to the inner end of the latch and the other member connected to the outer end of the foldable member A, all being arranged substantially as shown and described.

3. The hereinbefore-described improved gate, comprising a gate hinged to tilt its upper part sidewise while moving to an open position, a foldable lever hinged at its outer end to project at an acute angle to the hinged end of the gate, said lever consisting of two sections *a a'*, the latter being hinged to fold flatwise on the former, the double crank *e* having one member adapted to join with the outer end of lever-section *a'*, the sliding latch *g*, with its inner end connected to the other crank member, the pivoted lever *q*, the pull-ropes and the guides therefor, all being arranged substantially as shown and described.

708,878. MEANS FOR SECURING STRAPS TO BUCKLES. FREDERICK WOODWARD, South Yarra, near Melbourne, Victoria, Australia. Filed Apr. 8, 1902. Serial No. 101,913. (No model.)

Claim.—In a device for securing straps to buckles, the combination with a buckle, of a base-plate consisting of a strip of material bent upon one end of the buckle and upon itself, means for rigidly securing together the bent portions of the strip, a pair of keepers formed of a flat strip of material depending from the lower face of the base near each end thereof, a stud depending from the base between the said pair of keepers, and a keeper of greater width than the first-mentioned keepers projecting from the upper face of said base a suitable distance from each end thereof, said keeper projecting from the upper face of the base formed of a flat piece of material, substantially as herein shown and described.

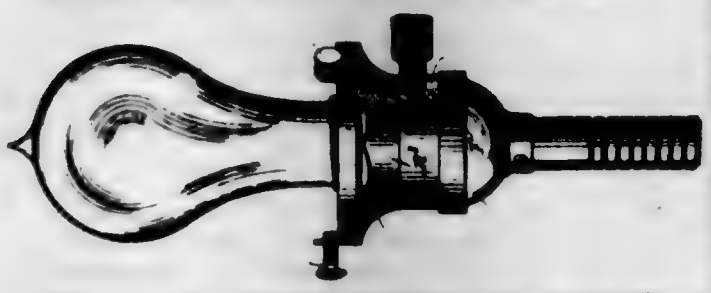
708,879. CARTRIDGE FOR ORDNANCE. ALFRED WAHSER, Rittenscheid, Germany, assignor to Fried. Krupp, Essen, Germany. Filed Apr. 27, 1901. Serial No. 57,646. (No model.)



Claim.—1. A cartridge for ordnance comprising a projectile having one or more driving-bands and a case having an enlargement at its mouth into which one or more of said bands are inserted and the outer wall of the case adjacent to the enlargement being adapted to engage with the surrounding bore of the barrel, substantially as and for the purpose specified.

2. A cartridge for ordnance comprising a projectile having one or more driving-bands and a case having an enlargement at its mouth into which one of said bands is inserted, and said inserted band being provided with a shoulder adapted to rest upon the outer edge of the cartridge-case, substantially as described.

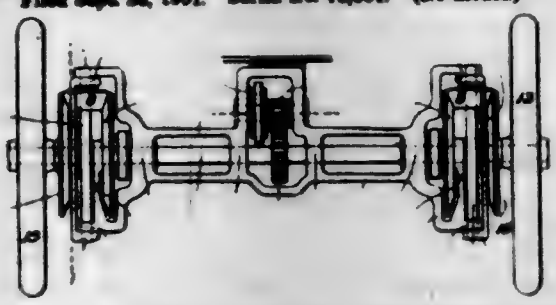
708,880. SOCKET-COVER AND GLOBE-HOLDER. JOHN F. WEIDE, Brooklyn, N. Y., assignor of one-half to Oliver R. Bonner, Brooklyn, N. Y. Filed Sept. 20, 1901. Serial No. 75,698. (No model.)



Claim.—1. As an article of manufacture an electric-light fixture comprising a cap adapted to serve as a support and provided with a screw, a socket-cover provided with a bayonet-slot for engaging said screw, said socket-cover being provided with a cylindrical portion and with a ring integrally connected with said cylindrical portion by a flaring neck, portions of said neck being cut and formed into a substantially cylindrical portion, the same forming an extension of said first-named cylindrical portion and located within said ring and concentric thereto, and a socket located partly within said cylindrical portion and partly within said cylindrical extension thereof.

2. An electric-lamp fixture comprising a combined socket-cover and globe-holder having a cylindrical portion to fit over the socket and a flaring portion connecting said cylindrical portion with the globe-holder and having portions of the flaring portion separated at their upper ends and at their sides and bent inwardly at their free ends to approximately coincide with the cylindrical portion which fits over the socket whereby to form a prolongation of said cylindrical portion toward the outer end of the fixture substantially as and for the purposes set forth.

708,881. DRIVING-GEAR FOR MOTOR-VEHICLES. KARL H. WEISZ, Rochester, Pa., assignor of one-half to Phillip Lee, Rochester, Pa. Filed Sept. 26, 1901. Serial No. 76,801. (No model.)



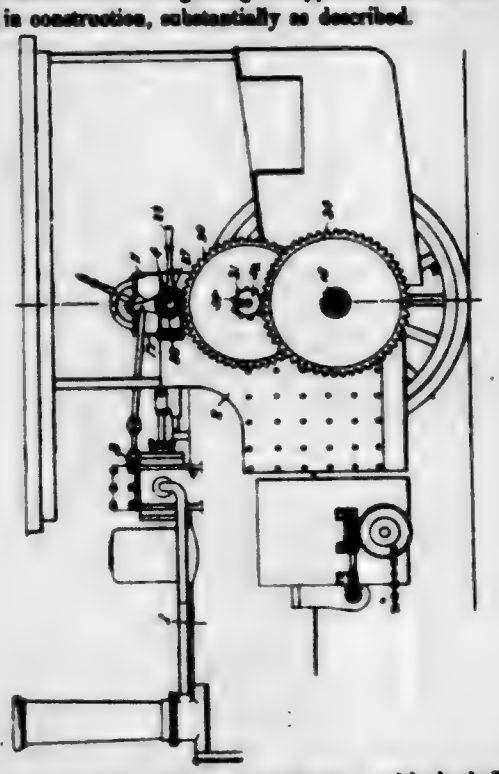
Claim.—1. In driving mechanism for motor-vehicles, the combination of a main framework, a rotatable shaft mounted in bearings therein provided with bevel-wheels at each end, traction-wheel bracket-bearings pivotally mounted in each outer end of the framework provided with clearance-openings, traction-wheels rotatably mounted on said bearings provided with bevel-wheels, pivotal shafts connecting the traction-wheel bracket-bearings with the main frame and carrying bevel-wheels intermeshing with the driving and driven bevel-wheels and extending through said clearance-openings, with means for transmitting motion to the main shaft.

2. In driving mechanism for motor-vehicles, the combination of a main framework, a rotatable shaft mounted in bearings therein provided with bevel-wheels at each end, supplemental shaft-bearings outside of the driving-bevels, traction-wheel bracket-bearings pivotally mounted in each outer end of the framework provided with clearance-openings, traction-wheels mounted thereon provided with bevel-wheels, pivotal shafts connecting the traction-wheel bracket-bearings, with the main frame and carrying bevel-wheels intermeshing with the driving and driven bevel-wheels and extending through said clearance-openings, with means for transmitting motion to the main shaft.

3. In driving mechanism for motor-vehicles, the combination of a main framework, a rotatable shaft mounted in bearings therein provided with bevel-wheels at each end, traction-wheel bracket-bearings pivotally mounted in each outer end of the framework provided with clearance-openings, and having extended steering-arms with steering mechanism connected thereto, traction-wheels rotatably mounted on said brackets provided with bevel-wheels, pivotal shafts connecting the traction-wheel bracket-bearings with the main frame and carrying bevel-wheels intermeshing with the driving and driven bevel-wheels and extending through said clearance-openings, with means for transmitting motion to the main shaft.

708,882. STEAM ROAD-ROLLER. THOMAS WRIGHT, Springfield, Ohio. Filed Feb. 26, 1902. Serial No. 95,791. (No model.)

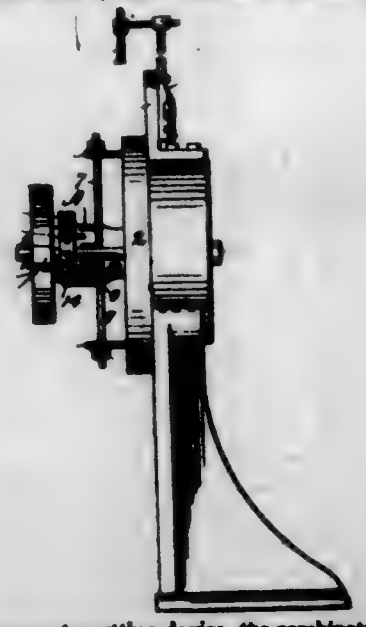
Claim.—1. In a steam road-roller, the combination, with a rear axle, and driving-wheels mounted thereon and capable of independent motion, each driving-wheel being provided with a gear, of an engine-shaft provided with independent driving-pinions, an intermediate shaft provided at each end with a gear to mesh with said pinion and with a pinion to mesh with the driving-wheel gear, each intermediate gear and pinion being connected to move in unison with each other and independently of the intermediate gear and pinion at the other end of the intermediate shaft, and independent means for controlling the driving connection between the respective engine-shaft pinions and the gearing driven therefrom, said driving-wheel gears being similar, and the gears and pinions at the opposite ends of the engine and intermediate shafts being also similar, whereby the two trains of gearing on opposite sides of the machine are identical in construction, substantially as described.



2. In a steam road-roller, the combination, with the boiler and its extension or horn plates, of a vertical integral housing secured to each extension-plate and having bearings therein for the engine-shaft, intermediate shaft and rear axle, an engine-shaft, intermediate shaft and rear axle mounted in said bearings in vertical alinement, driving-wheels mounted on the axle, and suitable gearing mounted on the engine and intermediate shaft and driving-wheels, substantially as described.

3. In a steam road-roller, the combination, with a boiler and extension-plates, of side housings mounted on the extension-plates, cross-plates connecting the upper ends of the side housings and provided with a central housing, said cross-plates being disconnected from the boiler, and an engine-shaft having its end bearings in the side housings and central bearing in said central housing, substantially as described.

708,883. SPOKE-SETTING MACHINE. GEORGE P. TRAUB, Norristown, Pa. Filed Mar. 8, 1902. Serial No. 97,302. (No model.)



Claim.—1. In a spoke-cutting device, the combination with a disk bearing a flange constructed to fit snugly the end of a hub, a disk bear-

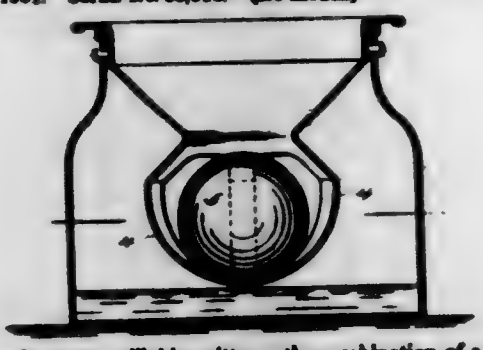
ing a flange constructed to fit snugly the other end of a hub and a bolt passing through the bore of said hub and through central apertures in said disks to clamp said hub in place and hold it from splitting, substantially as described.

2. In a spoke-setter, the combination with a standard, of a disk mounted on said standard and bearing a flange constructed to fit over the end of the hub to hold it from splitting, guide-pins seated in said disk, a second disk slidingly mounted on said guide-pins and bearing a flange constructed to fit over the end of said hub to hold it from splitting, and a clamping-bolt passing through apertures in said disks and through the bore of said hub, substantially as described.

3. In a spoke-setting device, the combination with a standard, of a disk bearing a flange designed to fit snugly over the end of a hub, a second disk set parallel to said first-mentioned disk and bearing a flange designed to fit over the other end of said hub, means for clamping said disks on said hub, and a gage by which to set the spokes in said hub, substantially as described.

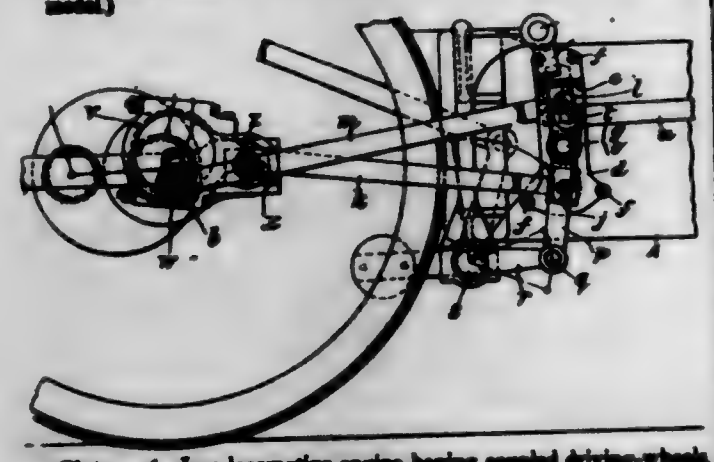
4. In a hub-setting device, a first disk bearing a circular flange designed to fit snugly over one end of a hub, a second disk bearing a flange designed to fit over the other end of said hub, a ring designed to fit over said hub on one side of the spoke-sockets and a second ring designed to fit over the hub on the other side of the spoke-sockets, and means for clamping said disks together, substantially as described.

708,884. CUSPIDOR. RAYMOND A. YOUNIS, Pittsburg, Pa. Filed May 13, 1901. Serial No. 60,016. (No model.)



Claim.—In a non-spillable spittoon, the combination of a bowl having an integral contracted neck portion with bayonet-shaped slots formed on opposite sides thereof, of a mouthpiece having an outwardly-extended flange for engagement with the end of the contracted neck portion and extending thereheyond, said flange of the mouthpiece carrying an integral right-angular downwardly-extending flange for engagement with the said interior of the contracted neck portion, headed pins carried by said right-angular flange of the mouthpiece and operating in said slots, said mouthpiece carrying a downwardly-extending contracted portion, a pair of outwardly-extending integral strips formed integral with the said contracted portion, said strips having spaces therebetween and being bowed intermediate of their ends to form a semicircular valve-seat, the strips crossing one another at right angles, and a hollow flexible ball-valve in said seat for engagement with said contracted portion of the mouthpiece, substantially as described.

708,885. SLIDE-VALVE GEAR. SAMUEL S. YOUNGHUSBAND, Darlington, England. Filed Sept. 4, 1901. Serial No. 74,272. (No model.)

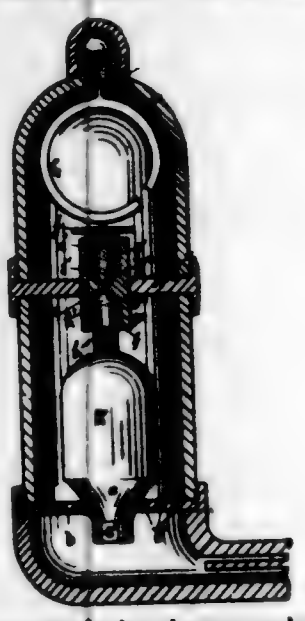


Claim.—1. In a locomotive-engine having coupled driving-wheels, inside cylinders and outside valve-chests, the combination with the link-motion and with the coupling-rod crank-pin, of a link-operating mechanism consisting of a sheave eccentric to the wheel-axle, and a stud eccentric both to the sheave and wheel-axle, said stud and sheave being formed in one with a return crank-arm and with the coupling-rod crank-pin, substantially as specified.

2. In a locomotive-engine of the class described, the combination with the link-motion, and the driving-wheel coupling-rod, of a link-operating mechanism consisting of an eccentric carried by the coupling-rod crank-pin and provided with a stud eccentric thereto, as set forth.

3. In a locomotive-engine of the class described, the combination with the link-motion, and the driving-wheel coupling-rod, of a link-operating mechanism consisting of an eccentric provided on one face with a crank-arm secured to the coupling-rod crank-pin, and on its other face with a stud projecting eccentrically therefrom, as set forth.

708,886. AIR AND VACUUM VALVE. EVERETT P. ALLEN, Chicago, Ill., assignor, by direct and mesne assignments, to R. M. Wilbur, Chicago, Ill. Filed Mar. 25, 1901. Serial No. 52,703. (No model.)



Claim.—1. In an automatic air and vacuum valve, the combination of a hollow base or cap, a cylinder or shell mounted on the base and having communication therewith, a cross partition or wall dividing the interior of the cylinder or shell into an upper and a lower chamber, a fixed vertical plug on the cross partition or wall, having an air-eduction port and passage therein furnishing communication between the two chambers of the cylinder or shell for venting air from the lower chamber into the upper chamber, a controlling pin-valve entering loosely into the eduction-passage and consisting of an outer disk or head and a body or stem, with the body or stem downwardly projecting into the air-passage for its seating end when seated to close the port and passage and when unseated to open the port and passage and having the valve held normally seated by air-pressure on the outer face of its head or disk and raised to unseat its seating end by pressure in the lower chamber against its seating end and the under face of the disk or head, a vent or outlet from the upper chamber, and a thermostatic expansible ring member adjustably suspended from the top of the cylinder or shell above the free air-valve, normally out of contact with the valve and operating under expansion to engage the valve and seat its seating end to close the air port and passage in the plug and shut off communication between the two chambers and prevent the admission of air to the lower chamber after the air is expelled therefrom, substantially as described.

2. In an automatic air and vacuum valve for radiators, the combination of a hollow base or cap, a cylinder or shell mounted on the base and having communication therewith, a cross partition or wall dividing the interior of the cylinder or shell into an upper chamber and a lower chamber, a fixed vertical plug on the cross partition or wall, having an air-eduction port and passage therein furnishing communication between the two chambers of the cylinder or shell for venting air and steam from the lower chamber into the upper chamber, a controlling pin-valve entering loosely into the eduction-passage and consisting of an outer disk or head and a body or stem, with the body or stem downwardly projecting into the air-passage for its seating end when seated to close the port and passage and when unseated to open the port and passage and having the valve held normally seated by pressure on the outer face of its head or disk within the upper chamber and raised to unseat its seating end by pressure in the lower chamber against its seating end and the under face of the disk or head, a vent or outlet from the upper chamber, and a thermostatic expansible split-ring member adjustably suspended from the top of the cylinder or shell above the free air-valve, normally out of contact with the valve permitting the pressure to unseat the valve and vent the air into the upper chamber from the lower chamber and expansible with the admission of steam into the upper chamber to engage the valve and seat its seating end closing the air port and passage between the two chambers and preventing the admission of air to the lower chamber from

the upper chamber after the expulsion of air from the lower chamber substantially as described.

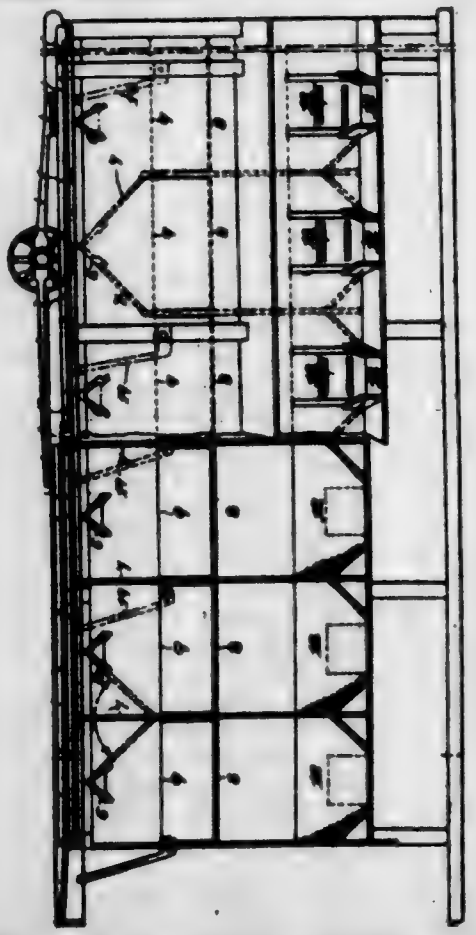
3. In an automatic air and vacuum valve for radiators, the combination of a hollow base or cup, a perforated plate or partition across the base or cup at the upper end thereof, a cylinder or shell mounted on the base or cup and having communication therewith through the perforated plate or partition, a cross plate or partition dividing the interior of the cylinder or shell into an upper chamber and a lower chamber, a fixed vertical plug on the cross plate or partition, having an air-eduction port and passage therein furnishing communication between the two chambers of the cylinder or shell for venting air from the lower chamber into the upper chamber, a controlling pin-valve entered loosely into the eduction-passage and consisting of an outer disk or head and a body or stem, with the body or stem downwardly projecting into the air-passage for its acting end when seated to close the port and passage and when unseated to open the port and passage and having the valve held normally seated by air-pressure in the upper chamber on the outer face of the head or disk and having the valve raised to unseat its acting end by pressure in the lower chamber against its acting end and the under face of the disk or head, a vent or outlet from the upper chamber, and a thermostatic expansible split-ring member adjustably suspended from the top of the cylinder or shell above the free air-valve, normally out of contact with the valve and expansible with the admission of steam to the upper chamber to engage the valve and seat its acting end to close the air port and passage in the plug and shut off communication between the two chambers preventing the admission of air to the lower chamber from the upper chamber, substantially as described.

4. In an automatic air and vacuum valve for radiators, the combination of a hollow base or cup, a plate or partition across the base or cup at its upper end, a port in the plate or partition, a cylinder or shell mounted on the base or cup and having communication therewith, a cross plate or partition dividing the interior of the cylinder or shell into an upper chamber and a lower chamber, a fixed vertical plug on the cross plate or partition, having an air-eduction port and passage therein furnishing communication between the two chambers and having the port intermediate of the passage for venting air from the lower chamber into the upper chamber, a controlling pin-valve entered loosely into the upper portion of the eduction-passage and consisting of an outer disk or head and a body or stem, with the body or stem downwardly projecting into the air-passage for its acting end when seated to close the midway port of the passage and having the valve held normally seated by air-pressure in the upper chamber on the outer face of the head or disk and having the valve raised to unseat its acting end by pressure in the lower chamber against its acting end and the under face of the disk or head, a vent or outlet from the upper chamber, a thermostatic expansible ring member adjustably suspended from the top of the cylinder or shell above the free air-valve, normally out of contact with the valve and operating under expansion to engage the valve when raised and seat its acting end to close the air port and passage on the upper side of the port and shut off communication between the two chambers preventing the admission of air to the lower chamber after air is expelled therefrom, a float in the lower chamber, a pin-valve fixed to the upper end of the float and entering the lower portion of the passage in the plug for its acting end to close the midway port of the passage from below with the raising of the float from the rise of the water of condensation in the cup and lower chamber, substantially as described.

5. In an automatic air and vacuum valve for radiators, the combination of a hollow base or cup, a perforated plate or partition across the base or cup at its upper end, a port in the plate or partition, a cylinder or shell mounted on the base or cup and having communication therewith, a cross plate or partition dividing the interior of the cylinder or shell into an upper chamber and a lower chamber, a fixed vertical plug on the cross plate or partition having an air-eduction port and passage in the plug furnishing communication between the two chambers and having the port intermediate of the passage for venting air from the lower chamber into the upper chamber, a controlling pin-valve entered loosely into the upper portion of the eduction-passage and consisting of an outer disk or head and a body or stem, with the body or stem downwardly projected into the air-passage for its acting end when seated to close the midway part of the passage on the upper side and having the valve held normally seated by air-pressure in the upper chamber on the outer face of the head or disk and having the valve raised to unseat its acting end by pressure in the lower chamber operating against its acting end and the under face of the head or disk, a vent or outlet from the upper chamber, a thermostatic expansible ring member adjustably suspended from the top of the cylinder or shell above the free air-valve, normally out of contact with the valve and operating under expansion to engage the valve when raised and seat its acting end to close the air port and passage on the upper side of the port and shut off communication between the two chambers preventing the admission of air to the lower chamber after the air is expelled therefrom, a float in the lower chamber, a pin-valve fixed to the upper end of the float and entering the lower portion of the passage in the plug for its acting end to close the midway port of the passage from below with the raising of the float from the rise of the water of condensation in the base and lower chamber, substantially as described.

6. In an automatic air and vacuum valve for radiators, the combination of a hollow base or cup, a perforated plate or partition across the base or cup at its upper end, a port in the plate or partition, a steam-passage and a water-passage both leading into the base or cup, a cylinder or shell mounted on the base or cup and having communication therewith through the perforated plate or partition and divided into an upper chamber and a lower chamber having an air and steam passage between them, a port in the passage having a seat on both its upper and lower sides, a loose pin-valve having its body or stem entered into the upper portion of the passage for its acting end to seat and close the port on the upper side, a vent or outlet from the upper chamber, a thermostatic member adjustably suspended from the top of the cylinder or shell above the free air-valve, normally out of contact with the valve and expansible with the admission of steam to the upper chamber to engage the valve and seat its acting end, a float in the lower chamber, a pin-valve carried by the float on its upper end to have its acting end seat against the under face of the port in the air and steam passage, and a valve carried by the float on its lower end to open and close the port in the partition of the base or cup, substantially as described.

708,887. **FRUIT-GRADER.** WILLIAM C. ANDERSEN, San Jose, Cal., assignor, by mesne assignments, to Anderson-Barngrover Mfg. Co., San Jose, Cal., a Corporation of California. Filed May 1, 1901. Serial No. 58,254. (No model.)



Claims.—1. In an apparatus for grading prunes, the combination of two series of perforated screens, a shorter upper series, and a longer lower one, the screens in each series having perforations increasing in size from the receiving end of the machine and the screens in the upper series adapted to deliver the fruit simultaneously upon an equal number of the lower screens, whose perforations also increase from the head end of the machine, said last-named screen having its perforations smaller than the perforations in the screen immediately above it and substantially corresponding in size with the perforations of a screen of the upper series preceding it, and means whereby the screens are given a longitudinal shaking movement.

2. In an apparatus for grading prunes, the combination of two series of screens, an upper series and a longer lower and parallel series, said screens in each series having perforations of smallest diameter in the screen nearest the feed end of the apparatus, the perforations in the succeeding screen of successive larger diameters, the perforations in the upper screens relatively larger than the perforations in the screens immediately beneath, and means whereby the fruit is made to travel over these screens.

3. In an apparatus for grading prunes, the combination of two series of screens, one above the other, the uppermost having perforations of smallest diameter in the screen at the head of the machine and gradually increasing in size through the remaining screens, said screens adapted to pass successively two or more grades of fruit therethrough, a second series of screens beneath the upper series, having perforations of smallest diameter in the screen at the head of the machine, and gradually increasing in size through the remaining screens said screens adapted to pass successively but a single grade of fruit therethrough, and means by which these screens are given a longitudinally-shaking movement.

4. The combination in a fruit grading and classifying apparatus of grading-screens and blending means centrally below the same consisting of divergent transversely-disposed surfaces beneath the screens, and hinged counting dividers interposed between adjacent blending means by which varying properties of the product of adjacent screens may be mingled or diverted.

5. In a prune-grading apparatus, the combination of a plurality of horizontal perforated screens in line and forming an upper series, a second longer series of perforated screens below and parallel with and extending beyond the first series, said lower screens arranged in line with each other, the perforations in the screens in each series increasing in diameter from the receiving to the opposite end, the perforations in the upper series relatively larger and varying in wider proportion than the perforations in the lower screens, frames within which these two series are secured, a shaft centrally disposed of these frames and connections with the frame upon either side of the shaft whereby the frames are reciprocated.

6. An apparatus for grading and classifying prunes, consisting of two series of horizontally-disposed contiguous shaking screens having perforations of gradually-increasing diameter from the commencement to the discharge end, said series consisting of a shorter upper one and a longer lower one, the screens in the upper series having perforations relatively larger than the perforations in the lower screens, roof-like sections transverse to, beneath and central of each of the lower screens, and dividers by which the product of any screen, or any proportion of said product may be mingled with the discharge from adjacent screens.

7. The combination in an apparatus for grading and classifying prunes of a shorter upper and a longer lower series of approximately horizontal shaking screens, with perforations of different sizes and increasing in diameter from the receiving to the opposite end, the screens in the upper series adapted to deliver the fruit simultaneously upon an equal number of the lower series, double inclined roof-like sections located transversely beneath the central portions of the lower screens, transverse sections hinged in line beneath the meeting edges of the screens, and turnable to divert a portion of the discharge of contiguous screens to either side, a longitudinally-disposed partition centrally located beneath said grading-sections, and sections hinged to its upper edge and turnable to divert the fruit to discharge upon either side of the apparatus.

8. In a prune-grading machine, the combination of two series of screens, one above the other, said screens in each series having perforations of smallest diameter in the screens at the head of the machine, and increasing in size in the succeeding screens, each successive lower screen having its perforations corresponding in size to those in the screen above the immediate predecessor of said lower screen.

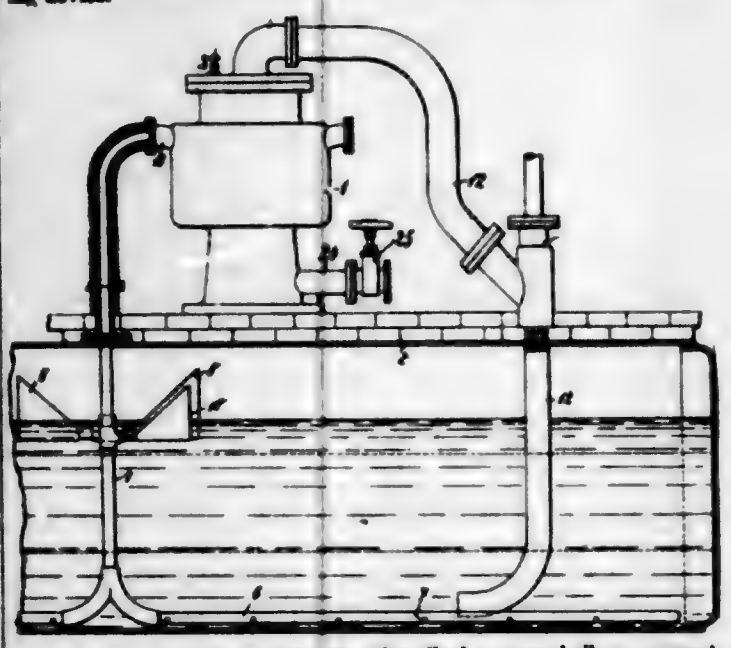
9. The combination in a fruit grading and classifying apparatus, of grading-screens, fixed divergent, transversely-disposed surfaces located beneath the screens intermediate of their ends, and boards hinged in line beneath the junction of contiguous screens and turnable to form continuations of the divergent surfaces beneath either of said screens.

10. The combination in a fruit grading and classifying apparatus, of grading-screens, transverse downwardly-divergent surfaces fixed beneath the screens intermediate of their ends, transverse boards having their lower edges turnably supported approximately in planes below the junction of contiguous screens, whereby the upper edges may approach and form continuations with the divergent surfaces upon either side.

11. The combination in a fruit grading and classifying apparatus of grading-screens, fixed, downwardly-divergent, transversely-disposed surfaces centrally beneath the screens, transversely-hinged dividers coacting with said surfaces to mingle or divert the products of contiguous screens, longitudinally-divided bins, and longitudinally-hinged tilting boards, turnable to receive the blended product and divert it to the bins on either side.

708,888. WATER-PURIFYING APPARATUS FOR STEAM-BOILERS. JOSEPH BÖHA, Thann, Germany. Filed Oct. 15, 1901. Serial No. 78,734. (No model.)

Claim.—1. In an apparatus of the class described, a steam-boiler, a separating and filtering device, a plurality of raising-tubes connected with said separating and filtering device, and the lower ends of which are located in superposed planes, a deposit-collecting member connected with one of said pipes at the lower end thereof, a second deposit-collecting member located above the other one and connected with said other raising-pipe, and means for conveying water from said separating and filtering device.



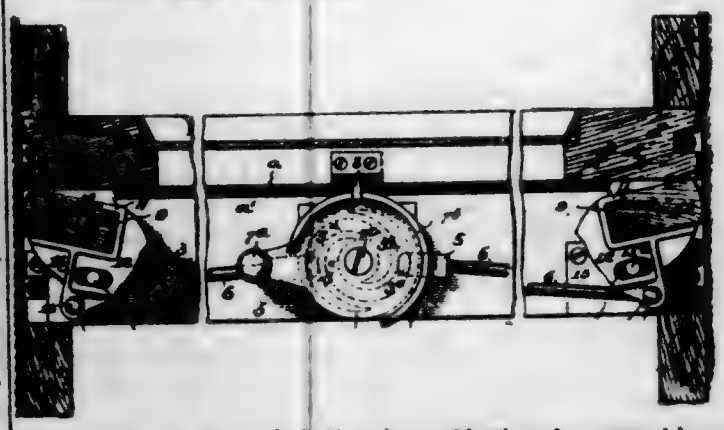
2. In an apparatus of the class described, a steam-boiler, a separating and filtering device, raising-pipes connected with said separating and filtering device, and one of them having a deposit-collecting tube, and the others having oppositely-facing funnels, and the funnels being located above said tube, and means for conducting water from said separating and filtering device.

3. In an apparatus of the class described, a steam-boiler, a separating and filtering device, raising and return pipes connected with said device, and adapted to be also connected with said steam-boiler, and a spiral pipe surrounding the return-pipe.

4. In an apparatus of the class described, a separating and filtering device, having a scum-chamber, an inverted cone arranged above said scum-chamber, a separating-chamber in connection with the scum-chamber and inclosing said cone, an annular chamber having an inlet, a spiral passage connecting the annular chamber with the separating-chamber, and a tapered chamber having reticulated top and bottom, and located above and in connection with said separating-chamber.

5. In an apparatus of the class described, a separating and filtering device, having a scum-chamber, an inverted cone arranged above said scum-chamber, a separating-chamber in connection with the scum-chamber and inclosing said cone, an annular chamber having an inlet, a spiral passage connecting the annular chamber with the separating-chamber, a tapered chamber having reticulated top and bottom, and located above and in connection with said separating-chamber, a cone in said tapered chamber, and a valved outlet for the scum-chamber.

708,889. SASH-HOLDER. BENJAMIN D. BERRY, Chester, Pa., assignor of one-half to William H. Berry, Chester, Pa. Filed June 4, 1901. Serial No. 63,105. (No model.)



Claim.—1. In a sash-holder, the combination of upper and lower sash frames, guides for the same, pivoted division-strips between the sash-frames adapted to engage by their edges with the side bars of said sash-frames and press them against the guides, and means for rocking said division-strips, substantially as set forth.

2. In a sash-holder, the combination of upper and lower sash frames, guides therefor, a vertically-pivoted inclined division-strip on each side of and between the sash-frames, a plate pivoted at each end of the horizontal meeting-bar of one of the sash-frames, said plate loosely engaging the adjacent division-strip and adapted to slide thereon when the sash-frame

is raised or lowered, and means for rocking the plates and division-strips, substantially as set forth.

3. In a sash-holder, the combination of upper and lower sash frames, guides for the same, pivoted division-strips, and means for rocking said division-strips, substantially as set forth.

4. In a sash-holder, the combination of upper and lower sash frames, their guides, a vertically-pivoted inclined division-strip on each side of and between the sash-frames, a plate pivoted at each end of the horizontal meeting-bar of one of the sash-frames, said plate loosely engaging the adjacent division-strip and adapted to slide thereon when the sash-frame is raised or lowered, a rotatable plate pivoted to the horizontal bar and having cam-grooves formed thereon, and rods connecting said pivoted plates to the cam-plate, substantially as set forth.

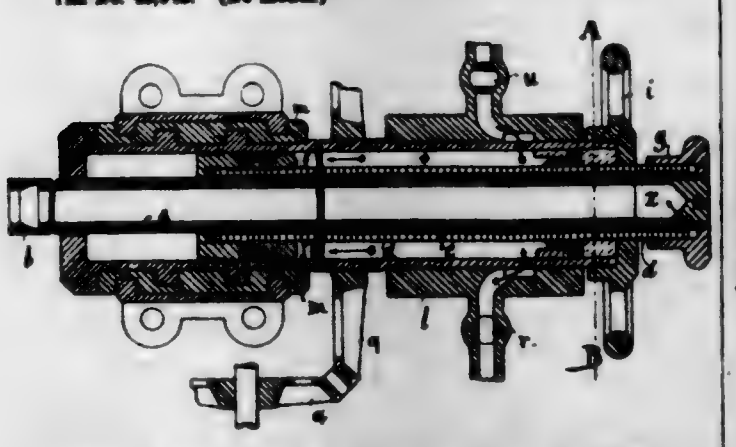
5. In a sash-holder, the combination of upper and lower sash frames, their guides, vertically-pivoted division-strips adapted to force by their edges the side bars of the sash-frames into closer contact with the guides, a catch on the lower horizontal bar of the upper sash, a rotatable plate pivoted to the upper horizontal bar of the lower sash, said rotatable plate being provided with cam-grooves and an inclined flange by means of which the division-strips are forced against the guides and the sashes locked together by the one operation, substantially as set forth.

6. In a sash-holder, the combination of upper and lower sash frames, their guides, pivoted division-strips adapted to engage by their edges with the side bars of the sash-frames and press them against the guides, a plate loosely engaging each division-strip and adjusted to slide thereon, and means for rocking the plates and the division-strips, substantially as set forth.

7. In a sash-holder, the combination of upper and lower sash frames, their guides, pivoted division-strips between the sash-frames and having a slight inclination toward the upper sash, and means for rocking said division-strips whereby they are caused to impinge or bear on the sash-frames first at the extreme ends and finally for their whole length, substantially as set forth.

8. In a sash-holder, the combination of upper and lower sash frames, their guides, pivoted division-strips, a cam-plate pivoted at the center of the upper horizontal bar of the lower-sash frame, a plate pivotally secured at each end of said bar, each engaging a division-strip and adapted to slide thereon with the lower-sash frame, and connections between the cam-plate and said pivoted plates whereby, upon the rotation of the cam-plate, said division-strips may be turned upon their pivots, substantially as set forth.

708,890. ROCK-BORING MACHINE. JOSEF BEHOUBA, Strasburg, and EDUARD SCHELTE, Duesseldorf, Germany. Filed Jan. 19, 1901. Serial No. 43,945. (No model.)



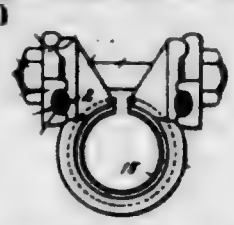
Claim.—1. In combination in a boring-machine, a boring-rod *a*, a cylinder *k*, a piston-head *f* within the said cylinder, a piston-rod *d* connected to the piston and within which the boring-rod is located and a connection between the hollow piston-rod and the boring-rod, said connection being detachable and outside the rear end of the cylinder, substantially as described.

2. In combination in a boring-machine, a boring-rod, a cylinder *k*, a piston-head *f* within the said cylinder, a piston-rod *d* connected to the piston and within which the boring-rod is located and a connection between the hollow piston-rod and the boring-rod, said connection comprising the head *g*, the pin *h* and the screw-plug *c*, substantially as described.

3. In combination, the rotary cylinder, the piston and hollow piston-rod therein, the boring-rod within the hollow piston-rod, a coupling-nut *w* between the rotary cylinder and the hollow piston-rod to turn the latter and a connection between the hollow piston-rod and the boring-rod, said connection comprising the screw-plug *c*, engaging the inner rear end of the boring-rod, substantially as described.

4. In combination, a cylinder *k*, means for rotating the same, a piston *f* working within and in contact with the cylinder, a hollow piston-rod, a boring-rod within the hollow piston-rod, a connection between the hollow piston-rod and boring-rod and a connection between the cylinder and hollow piston-rod comprising the nut *w* having portions to engage flat parts on the hollow piston-rod, said nut being connected to the cylinder, substantially as described.

708,891. CYCLE SADDLE ATTACHMENT. JOHN B. BROOKS and JOHN HOLT, Birmingham, England. Filed Feb. 15, 1902. Serial No. 94,255. (No model.)

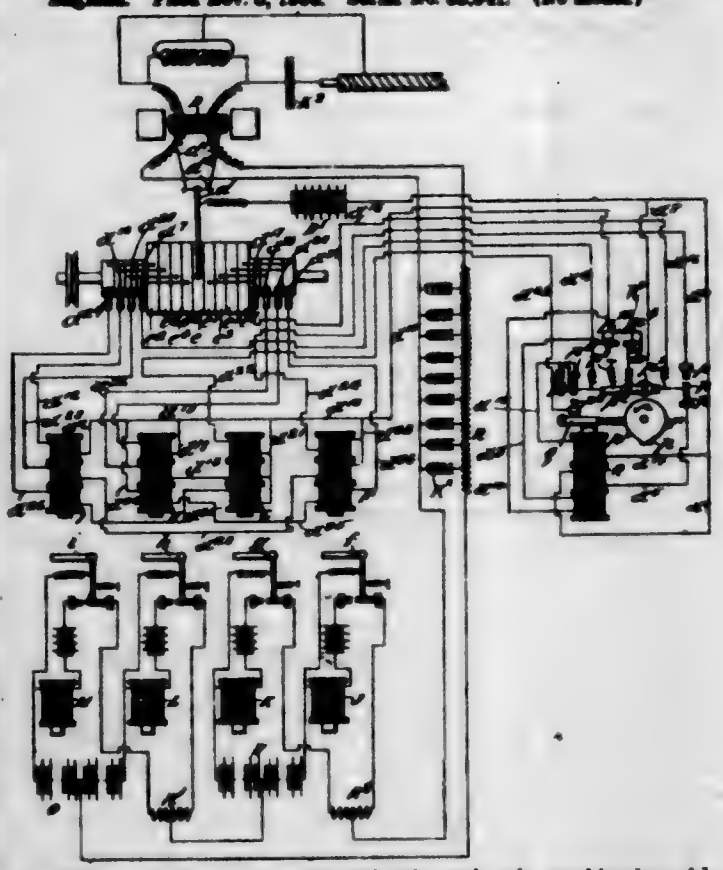


Claim.—1. In a cycle saddle attachment, the combination of a clip or body portion, a split sleeve or lining for said body portion, said body portion being angularly adjustable on said sleeve, means for contracting said body portion and sleeve, and means for connecting a cycle-saddle to said body portion.

2. In a cycle saddle attachment the combination of a clip or body portion, a split sleeve or lining for said body portion, said body portion being angularly adjustable on said sleeve or lining, means for preventing lateral movement of said body portion on said sleeve, means for contracting said body portion and sleeve, and means for attaching a cycle-saddle to said body portion.

3. In a cycle saddle attachment, the combination of a clip or body portion, a sleeve or lining for said body portion, on which said body portion is angularly adjustable, the exterior of said sleeve being round or concaved, and the interior of said body portion being hollowed or convexed to fit said sleeve, means for preventing lateral displacement of said body portion on said sleeve, and means for attaching a cycle-saddle to said body portion.

708,892. ELECTRIC TELEGRAPHY. SIDNEY G. BROWN, London, England. Filed Nov. 5, 1900. Serial No. 35,541. (No model.)



Claim.—1. In a system of electric telegraphy, the combination with the line or cable, of a plurality of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instrument, a corresponding number of recording instruments actuated by the combined effect of positive and negative impulses simultaneously transmitted by the transmitting instruments and adapted to simultaneously register signals on one or other side of their zero-lines in accordance with the polarity or direction of the currents leaving their respective transmitting instruments, substantially as described.

2. In a system of electric telegraphy, the combination with the line or cable, of a plurality of transmitting instruments, a corresponding number of batteries each of different signaling power and adapted to be worked in series by said transmitting instruments, a corresponding number of re-

cording instruments actuated by the combined effect of positive and negative impulses simultaneously transmitted by the transmitting instruments and adapted to simultaneously register signals on one or other side of their zero-lines in accordance with the polarity or direction of the currents leaving their respective transmitting instruments, substantially as described.

3. In a system of electric telegraphy, the combination with the line or cable, of a plurality of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instruments, a suspended coil-relay adapted to be moved onto one or other side of its zero-line by the effect of combined signaling currents from the transmitting-batteries, and means operated by said relay for simultaneously and separately recording the signals sent by each transmitting instrument, substantially as described.

4. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instruments, a relay adapted to be worked by the arrival signaling currents, a closed-circuited inductive-coil short-circuiting said relay, and means operated by the said relay for separately recording the signals sent by each of the transmitting instruments, substantially as described.

5. In a system of electric telegraphy, the combination with the line or cable and the receiving-condenser, of a plurality of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instruments, a relay adapted to be worked by the effect of the combined signaling-currents from the transmitting-batteries, means operated by said relay for simultaneously and separately recording the signals sent by each transmitting instrument, and means operated by said relay for sending a local current through said relay to make up any loss of current caused by the gradual charging-up of the receiving-condenser by part of a succession of received signaling-currents each of the same sign and value, substantially as described.

6. In a system of electric telegraphy, the combination with the line or cable, of a plurality of transmitting instruments, a corresponding number of batteries each of different signaling power and adapted to be worked in series by the transmitting instruments, a receiving-relay adapted to be moved onto one or other side of its zero-line by the effect of combined signaling-currents from the transmitting-batteries, and means operated by the receiving-relay for simultaneously and separately recording, in accordance with the amplitude of the movement of the said relay, the signals simultaneously sent by each transmitting instrument, substantially as described.

7. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries each of different signaling power adapted to be worked in series by said transmitting instruments, a receiving-relay adapted to be operated by the arrival signaling-currents, means operated by the amplitude of the movement of the tongue of said relay for separately recording the signals sent by each of the transmitting instruments, and means operated by said relay for sending a local current through said relay to overcome "varying zero," substantially as described.

8. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries each of different signaling power adapted to be worked in series by the said transmitting instruments, a receiving-relay adapted to be operated by the arrival signaling-currents, a closed-circuited inductive-coil short-circuiting said relay, means operated by the amplitude of the movement of the tongue of said relay for separately recording the signals sent by each of the said transmitting instruments, and means operated by the said relay for sending a local current through said relay to overcome "varying zero," substantially as described.

9. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series with one another by said transmitting instruments, a relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and upon the surface of which the tongue of the said relay bears, and means connected to the sections of said rotary contact for separately recording the signals sent by each of the said transmitting instruments, substantially as described.

10. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series with one another by said transmitting instruments, a relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and upon the surface of which the tongue of the said relay bears, means connected to the sections of said rotary contact for separately recording the signals sent by each of the said transmitting instruments and for sending a local current through said relay to overcome "varying zero," substantially as described.

11. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instruments, means for receiving the signaling-currents and separately recording the signals sent by each of the said transmitting instruments, local batteries at the receiving end of the said line or cable which batteries are connected in series and have their circuits arranged to include the said receiving means, means included in the circuits of said local batteries for producing the same time retardation to the currents from said batteries as the line or cable affords to the signaling-currents, and means for operating the said local batteries when signaling-currents are received, substantially as described.

12. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series with one another by the said transmitting instruments, a relay adapted to be worked by the arrival-signaling currents, local batteries connected in series and having their circuits arranged to include the coil of the said relay, means included in the circuits of said batteries for producing the same time retardation to the currents from said batteries as the line or cable affords to the signaling-currents, means operated by the said relay for separately recording the signals received from each of the transmitting instruments, and means operated by said relay for closing the circuit of the local batteries when signaling-currents are received so as to send a current from said local batteries through the coil of the said relay in the same direction to that in which the signaling-currents pass through said relay, substantially as described.

13. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instruments, a receiving-relay adapted to be moved on both sides of its zero-line worked by the arrival-signaling currents, secondary relays adapted to be worked by the said receiving-relay, and means operated by the secondary relays for separately recording the signals received from each of the transmitting instruments, substantially as described.

14. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series by said transmitting instrument, a receiving-relay adapted to be worked by the arrival-signaling currents, secondary relays adapted to be worked by the said receiving-relays for sending a current through the receiving-relay to overcome varying zero, and means operated by the secondary relays for separately recording the signals received from each of the transmitting instruments, substantially as described.

15. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries adapted to be worked in series by the transmitting instruments, a receiving-relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and on the surface of which the tongue of the receiving-relay bears, secondary relays connected to the sections of said rotary contact, and means operated by said secondary relays for separately recording the signals sent by each of the transmitting instruments, substantially as described.

16. In a system of electric telegraphy, the combination with a line or cable, of a number of transmitting instruments, a corresponding number of batteries each of different signaling power and adapted to be worked in series by the transmitting instruments, a receiving-relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and upon which the tongue of the receiving-relay bears, recorders connected to the sections of said rotary contacts for separately recording the signals sent by each of the said transmitting instruments, and a contact-maker interposed between the sections of the said rotary contact and the recorders and operated by the receiving-relay in such manner that it closes the circuit of the recorders only when the tongue of the receiving-relay reaches its point of maximum deflection, substantially as described.

17. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries each of different signaling power and adapted to be worked in series by the transmitting instruments, a receiving-relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and upon the surface of which the tongue of the receiving-relay bears, secondary relays connected to the sections of the rotary contact, a contact-maker interposed between the sections of the rotary contact and the secondary relays and adapted to operate in such manner that the secondary relays are operated only when the tongue of the receiving-relay reaches its point of maximum deflection on the surface of the rotary contact, and means operated by said secondary relays for separately recording the signals transmitted by each of the transmitting instruments, substantially as described.

18. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries each of different signaling power and adapted to be worked in series by the transmitting instruments, a receiving-relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and upon which the tongue of the receiving-relay bears, secondary relays connected to the sections of the rotary contact, a contact-making lever interposed between the secondary relays and the sections of the rotary contact, an electromagnet also interposed between the sections of the rotary contact and the secondary relays, an armature adapted to be operated by said electromagnet, a rotary cam which is normally held stationary by said armature but is released and operates the contact-making lever when the said electromagnet is energized in such manner that only such secondary relay or relays are operated as are connected to the section of the rotary contact upon which the tongue of the receiving-relay bears when it reaches its point of maximum deflection, and means operated by the secondary relays for separately recording the signals sent by each of the transmitting instruments, substantially as described.

19. In a system of electric telegraphy, the combination with the line or cable, of a number of transmitting instruments, a corresponding number of batteries each of different signaling power and adapted to be worked in series by the transmitting instruments, a receiving-relay adapted to be worked by the arrival-signaling currents, a rotary contact provided with sections insulated from one another and upon which the tongue of the receiving-relay bears, secondary relays connected to the sections of the rotary contact, a contact-making lever interposed between the secondary relays and the sections of the rotary contact, an electromagnet also interposed between the sections of the rotary contact and the secondary relays, an armature adapted to be operated by said electromagnet, a rotary cam which is normally held stationary by said armature but is released and operates the contact-making lever when the said electromagnet is energized in such manner that only such secondary relay or relays are operated as are connected to the section of the rotary contact upon which the tongue of the receiving-relay bears when it reaches its point of maximum deflection, means operated by the secondary relays for sending a current through the receiving-relay to overcome "varying zero," and means operated by the secondary relays for separately recording the signals sent by each of the transmitting instruments, substantially as described.

20. In a system of electric telegraphy, the combination with the line or cable of a number of transmitting instruments, a corresponding number of batteries adapted to be controlled in series by said transmitting instrument, a receiving-relay adapted to be moved on both sides of its zero-line by the arrival-signaling currents, recording instruments operated by said receiving-relay, and means interposed between the receiving-relay and the recording instruments whereby said recording instruments are operated only at or about the middle of the arrival-signaling currents, substantially as and for the purpose specified.

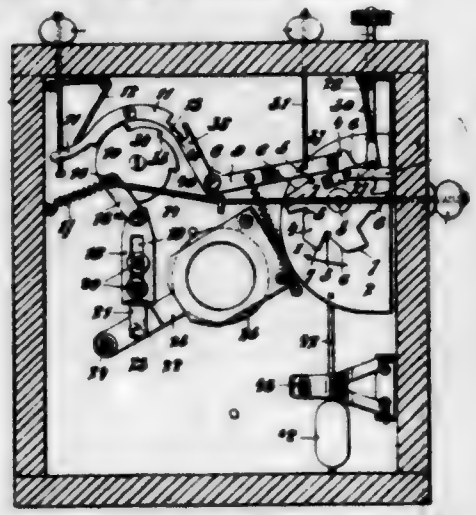
21. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, a pair of transmitting instruments adapted to work said batteries in series with one another, a single perforated signaling-tape adapted to simultaneously operate both said transmitting instruments, means for receiving the signals, and means for separately recording the signals sent by each transmitting instrument, substantially as described.

22. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, two pairs of signaling-levers adapted to simultaneously work said batteries in series with one another, two pairs of needles adapted to operate said signaling-levers, a single perforated signaling-tape adapted to operate both pairs of said needles, means for receiving the signals, and means for separately recording the signals sent by each transmitting instrument, substantially as described.

23. In a system of electric telegraphy the combination with the line or cable, of a pair of transmitting-batteries, a pair of transmitting instruments adapted to work said batteries in series, a single perforated signaling-tape adapted to simultaneously operate said transmitting instruments, a toothed wheel engaging said tape, a rotatable shaft which carries said toothed wheel, a ratchet-wheel carried by said shaft, a sleeve loosely mounted on said shaft, a pawl carried by said sleeve and engaging the ratchet-wheel, a crank-arm carried by said sleeve, means for imparting reciprocating movement to said crank-arm, means for receiving the signals, and means for separately recording the signals sent by each of the transmitting instruments, substantially as described.

24. In a system of electric telegraphy the combination with the line or cable, of a pair of transmitting-batteries, two pairs of signaling-levers adapted to simultaneously work said batteries in series with one another, two pairs of needles adapted to work said signaling-levers, a single perforated signaling-tape adapted to operate both pairs of said needles, a toothed wheel engaging said tape, a rotatable shaft which carries said toothed wheel, a ratchet-wheel carried by said shaft, a sleeve loosely mounted on said shaft, a pawl carried by said sleeve and engaging the ratchet-wheel, a crank-arm carried by said sleeve, means for imparting reciprocating movement to said crank-arm, means for receiving the signals, and means for separately recording the signals sent by each of the transmitting instruments, substantially as described.

703,898. AUTOMATIC SHUTTER-OPERATING DEVICE FOR PHOTOGRAPHIC CAMERAS. FRIEDRICH RUDOLF, Ruhla, Germany. Filed Mar. 6, 1902. Serial No. 96,851. (No model.)



Claim.—1. In an automatic shutter-operating device for photographic cameras, a wheel provided with inclined contacting surfaces and peripheral surfaces of suitable width, mechanism for rotating said wheel, a lever suitably engaging said wheel, a ratchet-wheel connected with the shutter of the camera, a pawl adapted to engage said ratchet-wheel and lever, means for operating said lever causing thereby the operation of the pawl, and means for positioning said ratchet-wheel so that when released by said pawl its movement will cause the automatic operation of the shutter, substantially as herein shown and described.

2. In an automatic shutter-operating device for photographic cameras, a wheel provided with notches, inclined contact-surfaces and peripheral surfaces of suitable width, mechanism for rotating the said wheel, a spring return-lever suitably engaging with the said wheel during the operation thereof, a three-toothed ratchet-wheel, a pawl adapted to engage in the teeth of said ratchet-wheel and operated by said lever, means for disengaging said lever from said notched wheel causing thereby the disengagement of the pawl with the ratchet-wheel to permit of the operation of the latter, means for connecting said ratchet-wheel to the shutter of the camera, and means for positioning the ratchet-wheel so that when released by said pawl its movement will cause the operation of the shutter.

3. In an automatic shutter-operating device for photographic cameras, a wheel provided with notches, inclined contact-surfaces and peripheral surfaces of suitable width, mechanism for suitably rotating said wheel, a spring-actuated mechanism connected with and adapted to operate the shutter of the camera, and mechanism engaging with the said notched wheel and with the shutter-operating mechanism for operating the latter when the notched wheel is operated.

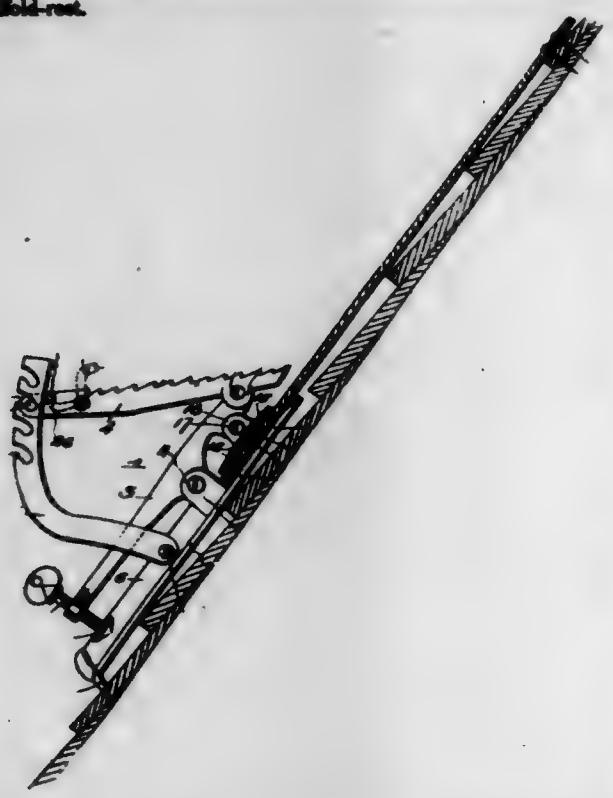
4. In an automatic shutter-operating device for photographic cameras, a wheel provided with notches, inclined contact-surfaces and peripheral surfaces of suitable width, a spring-actuated mechanism connected with the shutter of the camera for operating it, and means engaging the contact and peripheral surfaces and in the notches of the said wheel for causing the operation of the said spring-actuated mechanism.

708,894. SHINGLING-BRACKET. MICHEL CROQUETTE, Kankakee, Ill. Filed Sept. 25, 1901. Serial No. 76,515. (No model.)

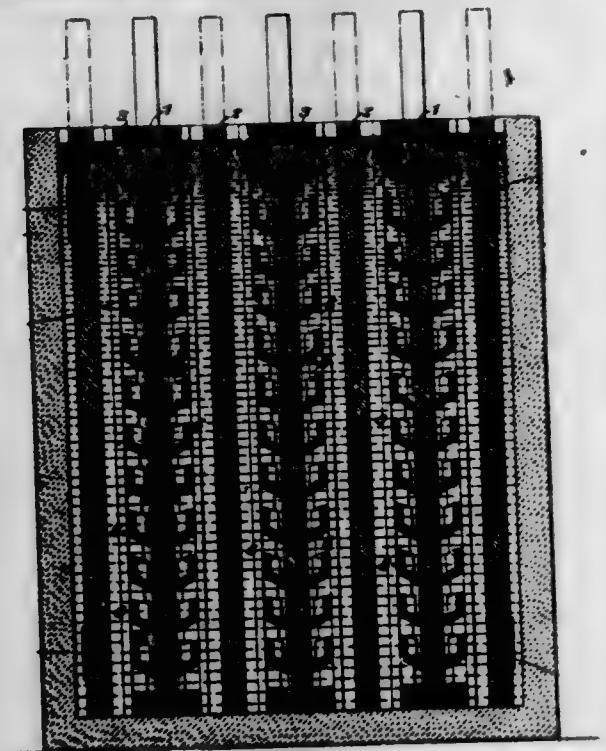
Claim.—1. A shingling-bracket comprising a base member provided at one end with a toothed extension for insertion beneath the free edges of a shingle and at its opposite end with prongs, a clamping member pivoted to the base member and carrying a movable toothed jaw, a scaffold-rest carried by one end of the clamping member, a rest-adjusting link carried by the base member and provided with seats or recesses to be engaged by offsets carried by the scaffold-rest, and means for adjusting the clamping member with relation to the base member.

2. A shingling-bracket comprising a base member provided at one end with a toothed extension for insertion beneath the free edges of a shingle and at its opposite end with prongs, a clamping member pivoted to the base member and carrying a movable toothed jaw, a scaffold-rest

carried by one end of the clamping member, a rest-adjusting link carried by the base member and provided with seats or recesses to be engaged by offsets carried by the scaffold-rest, means for adjusting the clamping member with relation to the base member, and locking means carried by the scaffold-rest.



708,895. SEPARATOR-PLATE FOR SECONDARY BATTERIES. ARNOLAH F. CLARK, Philadelphia, Pa., assignor to J. Horace Harding, Philadelphia, Pa. Filed Oct. 18, 1900. Serial No. 33,470. (No model.)



Claim.—1. As a new article of manufacture, a separator for use in connection with secondary-battery grid-plates, said separator comprising a frame, a series of cross-bars secured to said frame and a series of supporting-bars at the back of and embedded in the cross-bars, each of said cross-bars forming, with the grates of the grid, a series of pockets, substantially as described.

2. As a new article of manufacture, a separator for use in connection with secondary-battery grid-plates, said separator comprising a frame, a series of cross-bars secured to said frame and spaced apart to permit a circulation of the electrolyte, and a series of supporting-bars at the back of and embedded in the cross-bars, said cross-bars adapted to form with the grates of the grid, pockets, substantially as described.

3. As a new article of manufacture, a separator-plate for use in connection with the grid-electrodes of secondary batteries, said separator-plate comprising a series of vertical rods, and a series of cross-bars in which portions of said vertical rods are embedded, said cross-bars being spaced apart to permit the circulation of the electrolyte and having a portion contacting with the grates of the grid whereby supporting-shelves are disposed adjacent thereto, substantially as described.

4. As a new article of manufacture, a separator for use in connection with secondary-battery grid-electrodes, said separator comprising a frame, a series of vertical rods secured to said frame, and a series of cross-bars mounted on said rods, the latter being embedded in the cross-bars which are also secured to the frame, said bars being spaced apart to permit a circulation of the electrolyte and arranged to form a series of shelves or pockets adapted to coact with the grates of the grid with which they are used, substantially as described.

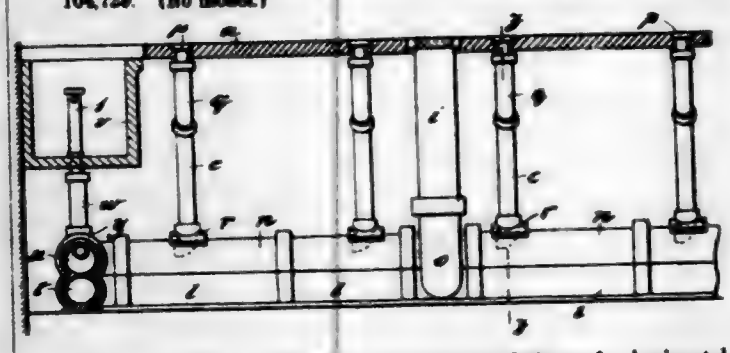
5. The combination in a storage-battery cell, of the negative electrodes, positive electrodes in the form of grids having active material pressed into the interstices thereof, and separating-plates arranged between said electrodes, said plates carrying a series of shelves or pockets the edges of which are in contact with the grates of the grid, said shelves or pockets serving to receive any portion of the active material that may break away from the grid, substantially as described.

708,896. MANUFACTURE OF GOLF-BALLS. JAMES P. COCHRANE, Edinburgh, Scotland. Filed Mar. 22, 1902. Serial No. 99,533. (No model.)

Claim.—1. In the manufacture of golf-balls, softening the gutta-percha rod with hot water, manipulating it to make it round, and sprinkling the surface with sulfur, substantially as hereinbefore described.

2. In the manufacture of golf-balls softening the gutta-percha rod with hot water, manipulating it to make it round, and sprinkling the surface with sulfur, rolling the piece over a hot plate so that the outer skin or surface of the gutta-percha gets impregnated with the sulfur and becomes vulcanized and thereby rendering it very hard without in any way neutralizing the rebounding and elastic nature of the gutta percha, substantially as hereinbefore described.

708,897. FITTING FOR LABORATORIES OR THE LIKE. ARTHUR W. COOKSEY, London, England. Filed Apr. 25, 1902. Serial No. 104,729. (No model.)



Claim.—1. The combination in laboratory-fittings of a horizontal fume-duct *l*, side passages *o*, vertical fume-duct *i*, ventilating-hood *b* and conducting-cap *j k*, with a horizontal waste-trough *n*, bridge-piece *r*, vertical drain-pipe *c q*, drain-funnels *p*, benches *a* and trays *d*, substantially as described.

2. The combination in laboratory-fittings of a horizontal fume-duct *l*, side passages *o*, vertical fume-duct *i*, ventilating-hood *b* and conducting-cap *j k*, with a horizontal waste-trough *n*, bridge-piece *r*, and vertical drain-pipe *c*, *q*, substantially as described.

3. The combination in laboratory-fittings of a horizontal fume-duct *l*, side passages *o*, vertical fume-duct *i*, with a horizontal waste-trough *n*, bridge-piece *r* and vertical drain-pipe *c q*, substantially as described.

4. The combination in laboratory-fittings of a horizontal fume-duct *l*, side passages *o*, with a horizontal waste-trough *n*, substantially as described.

5. The combination in laboratory-fittings of a horizontal fume-duct *l* with a horizontal waste-trough *n*, substantially as described.

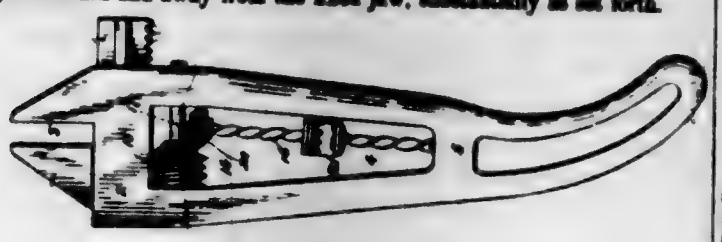
6. The combination in laboratory-fittings of a horizontal waste-trough *n*, bridge-piece *r* and vertical drain-pipe *w*, substantially as described.

7. In laboratory-fittings the ventilating-hood *b* and conducting-cap with a depressed central portion *k*, substantially as described.

708,898. WRENCH. JOHN C. DAVISON, Friendsville, Md., assignor of one-half to E. C. W. Ryland, Friendsville, Md. Filed Nov. 21, 1901. Serial No. 83,188. (No model.)

Claim.—In a wrench of the character described, the combination with the handle provided with an opening and with a cross-piece and formed at its outer end with a head and with a fixed jaw, said head being provided with a longitudinal opening the side walls of which are formed with guide-grooves, of a movable jaw sliding upon said head and having an

angular shank to engage the aperture in the head, said shank being provided with ribs to engage said guide-grooves and with worm-teeth on its lower edge, a shaft, a worm-wheel and beveled pinion loosely mounted upon said shaft and locked to rotate in unison, a swiveled screw, a beveled gear fixed to said screw and engaging the beveled pinion, and a nut mounted upon said screw to rotate the same and thereby slide the movable jaw toward and away from the fixed jaw, substantially as set forth.



708,899. BALL-AND-SOCKET JOINT FOR DOLLS OR THE LIKE.

EDUARD DENZ, Blankenese, near Hamburg, Germany, assignor to Heinrich Eckert, Munich, Germany. Filed Dec. 19, 1901. Serial No. 86,561. (No model.)

Claim.—1. A ball-and-socket joint for dolls and the like, consisting of an articulated part having a spherical cavity and an intermediate elastic socket seated in said spherical cavity, the latter adapted to receive the ball of another articulated part.

2. In a ball-and-socket joint for dolls and the like, an articulated part having a spherical cavity and an intermediate socket of elastic material to permit the ball of the other articulated part to be forced into the spherical cavity of the intermediate socket.

3. In a ball-and-socket joint for dolls and the like, an articulated part having a spherical cavity, a ball on another articulated part, and an elastic covering for said ball to permit the latter to be forced into and out of said spherical cavity.

708,900. GUN-CARRIAGE.

KARL DEMLER, Pilsen, Austria-Hungary, assignor to Skodawerke Actiengesellschaft in Pilsen, Pilsen, Austria-Hungary, a Firm. Filed Dec. 26, 1901. Serial No. 87,260. (No model.)

Claim.—In a top carriage for ordnance carrying a recoil-checking means, the combination of a hollow body provided with a longitudinally-extending slot, a recoil-checking means mounted in said hollow body, provided with a pair of projections adapted to extend through said slot and engage with a gun to cause the operation of the recoil-checking means during the action of firing, a plate conforming to the top of the hollow body and adapted to be carried by the forward part of the underneath portion of the gun and moving with the latter for closing the exposed part of said slot, means arranged in said hollow body and surrounding said recoil-checking means for guiding the same, and a pair of V-shaped closure-plates mounted upon the hollow body and adapted to close the joint between said body and gun, substantially as herein shown and described.

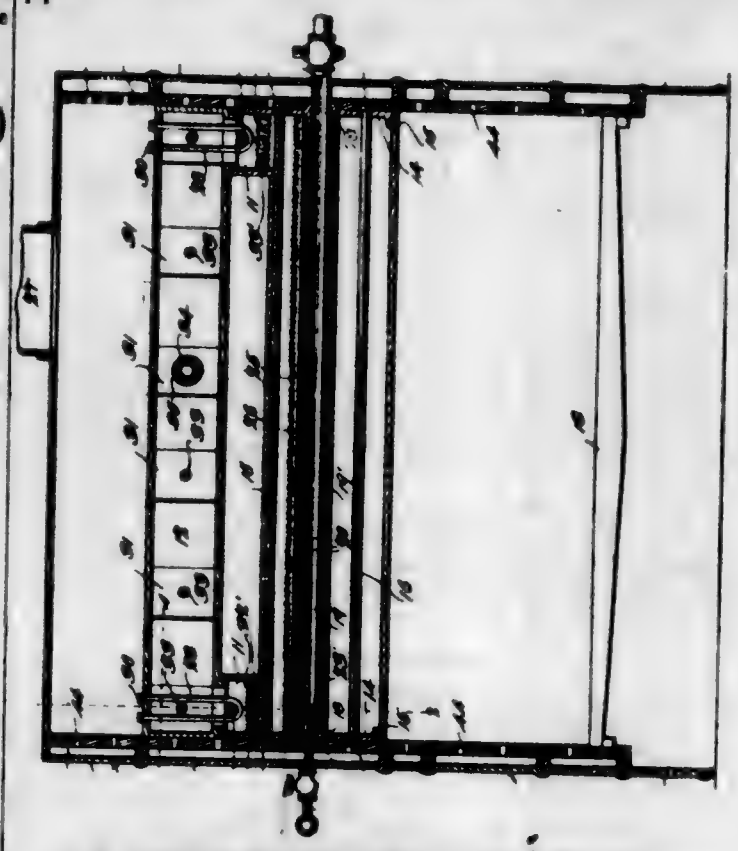
708,901. APPARATUS FOR MAKING OIL-GAS.

ROBERT DEMPSTER, Marietta, Ohio, assignor to Mary Dempster, Henry H. Burns, and Norman Morrow, Marietta, Ohio. Filed Nov. 5, 1901. Serial No. 81,246. (No model.)

Claim.—1. In a device of the class specified, a retort, means for heating the same, a perforated pipe centrally disposed within said retort and forming a primary vaporizing-chamber, an oil-feeding device situated at one end of said pipe, and a second perforated pipe surrounding said primary vaporizing-chamber.

2. In a device of the class specified, a retort, means for heating the same, two concentrically-arranged perforated pipes arranged within said retort, and devices for supplying a liquid hydrocarbon to the inner of said pipes, substantially as specified.

3. In a device of the class specified, a retort, means for heating the same, two concentrically-arranged and perforated pipes located within said retort, means for supplying liquid hydrocarbon to the inner pipe, and a packing or filling of asbestos fiber arranged in the space between said pipes.



4. In a device of the class specified, a retort, a filling of asbestos fiber arranged within the retort, means for heating the retort, two concentrically-disposed pipes arranged within said retort and perforated for the passage of oily vapor, and means for supplying liquid hydrocarbon to the inner of said pipes.

5. In a device of the class specified, a retort having an asbestos filling, a reticulated shield or guard for confining said filling in place, a perforated primary vaporizing-chamber located within said retort, means for supplying liquid hydrocarbon to said primary vaporizing-chamber, and means for heating the retort.

6. In a device of the class specified, a retort having a filling of asbestos fiber, reticulated screens arranged within the retort and adapted to hold the fiber in position and to form a free gas-passage, a perforated primary vaporizing-chamber located within said retort, means for supplying liquid hydrocarbon to said primary vaporizing-chamber, and means for heating said retort.

7. In a device of the class specified, a retort having a filling of asbestos fiber, two concentrically-disposed and perforated tubes arranged centrally within the retort, the space between said tubes being filled with asbestos fiber, means for supplying liquid hydrocarbon to the inner of said tubes, and means for heating said retort.

8. In a device of the class specified, a retort having a filling of asbestos fiber, reticulated screens for confining said fiber in position, two concentrically-disposed perforated tubes arranged centrally within the retort, the space between said tubes being filled with asbestos fiber, means for supplying liquid hydrocarbon to the inner of said tubes, and means for heating said retort.

9. In a device of the class specified, a retort, means for heating the same, a perforated tube arranged centrally within said retort and forming a primary vaporizing-chamber, and an oil-feed tube extending partly within said perforated tube and having a reduced-end discharge-opening.

10. In a device of the class specified, the combination with a retort of a superheater arranged above and connected with the retort, and a filtering-screen formed of asbestos fiber arranged in the passage between the retort and the superheater.

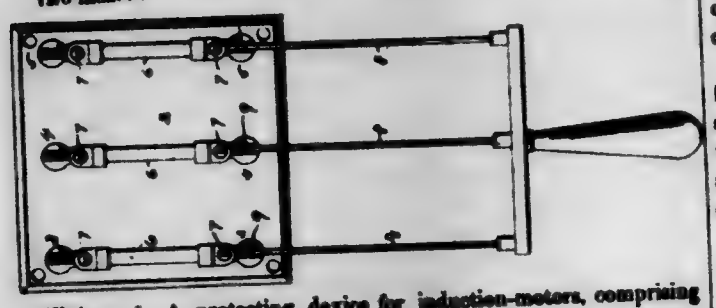
11. In an oil-gas apparatus, a retort, a primary vaporizing-chamber arranged within the same, a superheater disposed above and connected with the retort, reticulated screens arranged in the passage between the retort and the superheater, and a filtering-bed, formed of asbestos fiber, arranged between said reticulated screens, substantially as specified.

12. In a gas apparatus, a superheater, a perforated escape-pipe arranged therein, a second perforated pipe arranged around the escape-pipe, and an asbestos filling disposed in the space between said pipes, substantially as specified.

13. In a device of the class specified, a superheater, two concentrically-disposed and perforated pipes arranged within said heater, an as-

bestos fiber forming a packing or filling in the space between said pipes and a gas-escape pipe connected to the inner of said concentric pipes.

708,902. PROTECTING DEVICE FOR INDUCTION-MOTORS. JOHN H. DIEGLE, Lasalle, Ill. Filed Oct. 21, 1901. Serial No. 79,444. (No model.)



Claim.—1. A protecting device for induction-motors, comprising fuses connected with the terminals of the switchboard, and pivoted independent fuses and a handle carrying the same to bring them in line with and over the first-mentioned fuses, substantially as and for the purpose specified.

2. A switchboard having an insulating-base, terminals, fuses connected to said terminals, and pivoted fuses to lie in the plane with and adapted for use in connection with said fuses or removable to allow the said fuses to act independently after the motor has acquired the predetermined speed, as set forth.

703,908. DISCHARGE DEVICE FOR CONVEYERS. JAMES M. DODGE, Philadelphia, Pa., assignor to the Link Belt Engineering Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Feb. 6, 1901. Serial No. 46,218. (No model.)

Claim.—1. The combination in a conveyer having a horizontal or a substantially horizontal run, of a chain, a bucket pivoted longitudinally thereon so as to swing around the chain, with means for turning the buckets to discharge the material contained therein when the said buckets are on each horizontal or substantially horizontal run, substantially as described.

2. The combination in a discharge device for an endless-chain conveyer having a horizontal or substantially horizontal run, of a chain, a bucket pivoted longitudinally thereon so as to swing laterally around the chain, means for turning the bucket laterally on the chain so as to reverse it, said bucket being turned from the position with its mouth uppermost to an inverted position while on a run which is horizontal or substantially horizontal, substantially as described.

3. The combination in a discharge device for an endless-chain conveyer having a horizontal or substantially horizontal run, of a chain, a series of buckets pivoted thereto, a guide for the chain, a guide curved over the chain, a projection on each bucket engaging with said curved guide so as to turn the buckets laterally on the chain as a pivot to discharge the contents of the buckets while on a horizontal or substantially horizontal run, substantially as described.

4. The combination in a conveyer, of a chain, a bucket pivoted longitudinally thereon so as to swing around the chain, with means for turning the bucket to discharge the material contained therein, said means being longitudinally adjustable with respect to the conveyer, substantially as described.

708,904. APPARATUS FOR THE TRANSMISSION OF POWER IN VARYING DIRECTIONS. ARTHUR H. EDWARDS, London, England. Filed Jan. 2, 1902. Serial No. 88,186. (No model.)

Claim.—1. In an apparatus for transmitting power, the combination with a flexible inner member, of a flexible outer member comprising a plurality of sections separable from and unconnected to each other, one of said members being slidable longitudinally of the other.

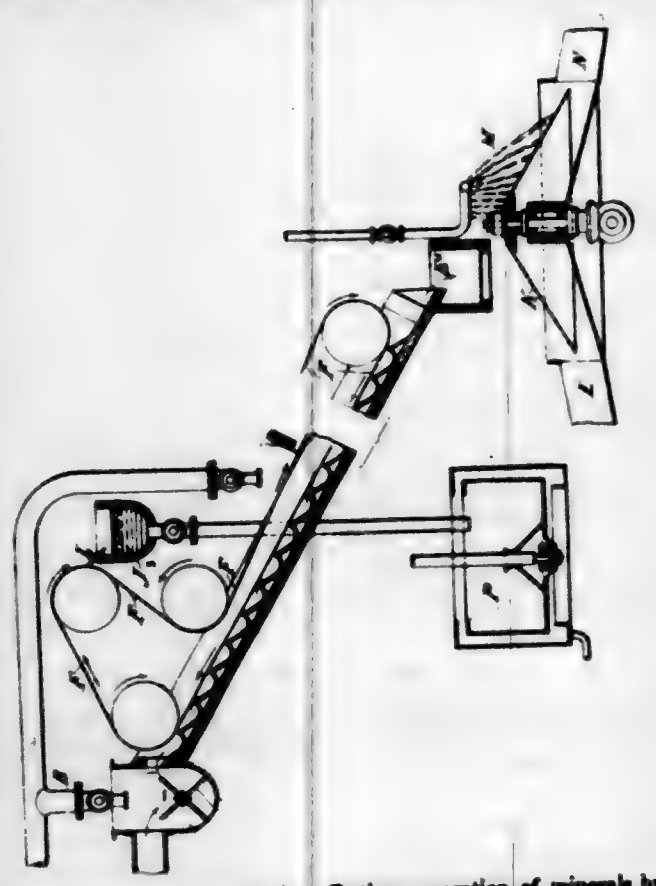
2. In an apparatus for transmitting power, the combination with a flexible outer member comprising a plurality of sections separable from and unconnected to each other, of a flexible inner member inclosed in and longitudinally movable of said outer member.

3. In an apparatus for transmitting power, the combination with a flexible outer member comprising a plurality of sections separable from and unconnected to each other, and having an aperture extending longitudinally thereof, of an inner member comprising a wire or the like passing through said aperture and movable longitudinally thereof.

4. In an apparatus for transmitting power, the combination with a flexible inner member, of a flexible outer member comprising a plurality of sections fitting within but separable from and unconnected to each other, one of said members being slidable longitudinally of the other.

5. In an apparatus for transmitting power, the combination of a flexible outer member comprising a plurality of sections fitting within but separable from and unconnected to each other, said sections being provided with an aperture therethrough, and an inner member comprising a wire or the like mounted in and longitudinally movable through said outer member.

703,905. APPARATUS FOR THE SEPARATION OF MINERALS BY THE SELECTIVE ACTION OF OILS, &c. ALEXANDER S. ELMORE, London, England. Filed Aug. 3, 1901. Serial No. 71,271. (No model.)



Claim.—1. Apparatus for effecting separation of minerals by the selective action of oils and like substances, comprising a mixer of the oil with the aqueous pulp of pulverized mineral an incline for downflow of the mixture having steps or baffles, an endless apron, means for distributing oil over it and means of causing it to travel in a direction opposite to the said downflow, a conical revolving sieve adapted to receive the discharge from the incline, a nozzle for delivering a shower of water over one side of the sieve, and two launders, the one lined with blanket adapted to remove the matters that pass through the sieve and the other to remove the matters that are washed over the sieve, substantially as described.

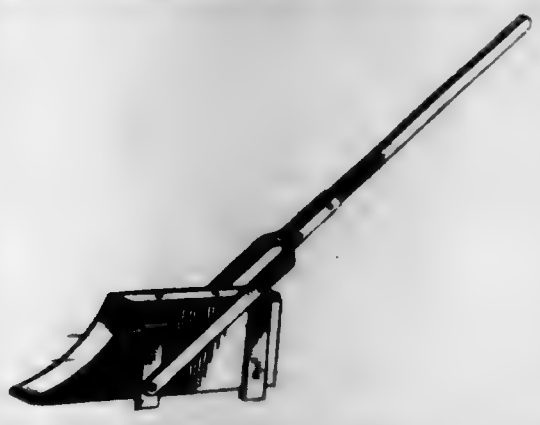
2. In apparatus for effecting separation of minerals by the selective action of oils and like substances, the combination of a stepped incline for downflow of the mixed pulp and oil with a traveling apron arranged over and in suitable proximity to the said stepped incline and provided with a distributer of oil over its surface, substantially as described.

3. In apparatus for effecting separation of minerals by the selective action of oil and like substances, the combination of a receiving-trough with a perforated bottom, a conical revolving metal sieve partly under the trough and partly under a distributer, of a water-shower, a launder adapted to lead off the matters washed over the sieve, and a launder lined with blanket adapted to lead off the matters that pass through the sieve, substantially as described.

708,906. RAILWAY-CAR CHOCK. ALONZO D. FAULKNER, Meyersdale, Pa., assignor to George H. Duncombe, Meyersdale, Pa. Filed Feb. 4, 1902. Serial No. 92,568. (No model.)

Claim.—1. A car-chock having two pairs of jaws, one pair being rigid, and the other pair expansible and retractible, and means straddling the last-named jaws and designed to force them against the sides of the rails.

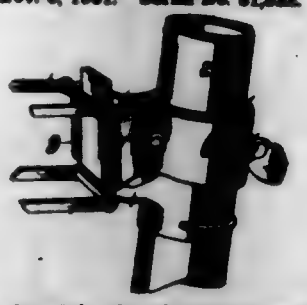
2. A car-chock comprising a rigid pair of jaws and an expansible and retractible pair of jaws, and a bifurcated lever designed to straddle the last-named pair of jaws and force them against the sides of a rail.



3. A car-chock comprising a body, a pair of plates carried thereby and having depending ends designed to overlap the tread of a rail, plates secured to the other end of the body and loosely mounted thereon to form expansible and retractible jaws, and means for forcing said plates against the sides of the rail whereby the body will be rigidly secured thereto.

4. A car-chock comprising a body, a pair of vertically-arranged plates carried thereby and having depending ends adapted to overlap the tread of a rail, a pair of vertically-arranged plates secured to the body and loosely carried thereby, said plates also having depending ends adapted to fit over the tread of a rail, and a bifurcated lever designed to straddle the block and last-named plates and force them in rigid contact with the rail.

708,907. BICYCLE-LAMP LOCK. AUGUSTUS FELLOWS, Washington, D. C. Filed Nov. 6, 1901. Serial No. 81,222. (No model.)



Claim.—1. A device of the class described comprising a band whose sides are arranged normally parallel throughout their entire length, lamp-connecting fingers formed integral with and at one end of the band, said fingers being arranged one at the top and the other at the bottom of the said end of the band, a reinforcing-plate carried by the said end and the said fingers, fastening means arranged at the opposite end of the band and means connected with the band for forming a loop at each end thereof.

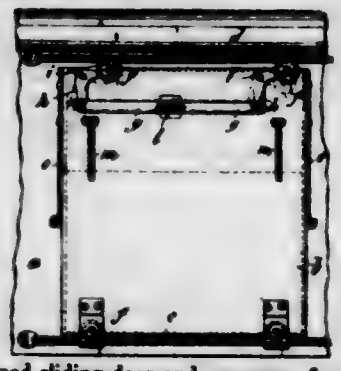
2. A device of the class described comprising a band whose sides are arranged normally parallel throughout their entire length, lamp-connecting fingers formed integral with and at one end of the band, said fingers being arranged one at the top and one at the bottom of the band, fastening means arranged at the opposite end of the band, and means for contracting the normally parallel sides of the band one toward the other whereby a loop is formed at each end of the band.

3. A device of the class described comprising spaced members, said spaced members being arranged an equal distance from each other throughout their entire length, a web for connecting respective ends of the spaced members, said web being formed integral with the spaced members and having integral lamp-connecting fingers, one of said fingers extending above the spaced members, and one extending below the spaced members, means for fastening the opposite ends of the spaced members one upon the other, and means connected with the spaced members for drawing each one toward the other, whereby a loop is formed at each end of the spaced members.

708,908. SLIDING DOOR FOR RAILWAY GOODS-VANS. ARTHUR FISCHER, Augsburg, Germany. Filed Feb. 13, 1902. Serial No. 93,947. (No model.)

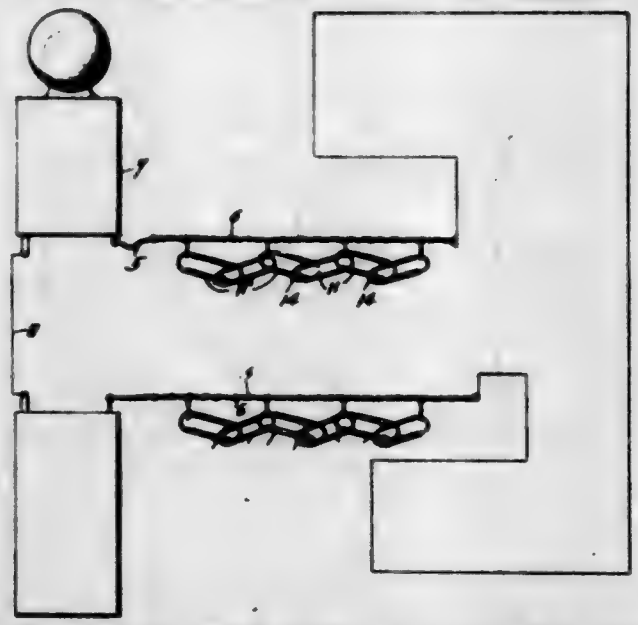
Claim.—1. A combined sliding door and gangway for cars comprising a door slidably mounted on guide-rods at top and bottom said door being connected to the lower guide-rod so as to pivot thereon when swung downward and means for releasing the top of said door from engagement with the guide-rod.

2. A combined sliding door and gangway for cars consisting of a door slidably mounted on guide-rods at top and bottom, said door being connected to, and adapted to pivot on the lower guide-rod, and means for disengaging the upper rollers from their guide-rod to permit the door to be swung outward and downward.



3. A combined sliding door and gangway for cars consisting of a door provided with rollers, guide-rods engaging the grooves in said rollers, said door being connected to, and adapted to pivot on, the lower guide-rod, bends in the upper guide-rod, a sliding guard-rail adapted to overhang the upper part of the rollers and provided with recesses corresponding with the bends in the guide-rod, to permit the door to be swung outward and downward when the recesses, bends and rollers are brought into registration.

708,909. AUTOMATIC FIRE-ALARM. MASON K. PEEK, Bandera Tex. Filed Mar. 22, 1902. Serial No. 99,533. (No model.)



Claim.—1. An automatic fire-alarm system, comprising two line-wires arranged in a circuit including a source of electrical energy and alarm, loops formed on such line-wires, links carried by the loops and normally held from electrical contact, said links having uninsulated portions adapted to make contact and close the circuit by gravity when subjected to an abnormal increase in temperature.

2. An automatic fire-alarm, comprising two line-wires arranged in a circuit including a source of electrical energy and an alarm, uninsulated loops formed on such line-wires, partially-insulated links carried by the loops, a destructible means for connecting the insulated portions of such links, said links having uninsulated portions adapted to make contact and close the circuit by gravity when subjected to an abnormal increase in temperature.

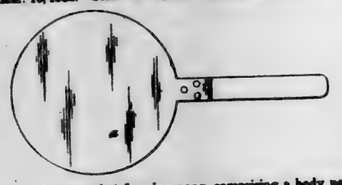
3. An automatic fire-alarm, comprising a pair of twisted line-wires having alternately-disposed uninsulated loops, partially-insulated links in electrical contact with said loops, each loop supporting a plurality of links, and the links of the opposing line-wires being connected together to form a continuous system of circuit-closers, a destructible means for connecting the insulated portions of such links, said links having uninsulated portions adapted to make contact and to close the circuit by gravity when subjected to an abnormal increase in temperature.

708,910. UMBRELLA-FRAME. SAMUEL S. PEEVY, Philadelphia, Pa. Filed Oct. 24, 1901. Serial No. 79,294. (No model.)

Claim.—The combination with a paragon rib, of a paragon stretcher the bullion of the rib and stretcher lying away from each other when the umbrella is closed, a forked end of said stretcher, the forks of which lie

at either side of said rib at the place of the hinge-joint between the rib and stretcher and a lap surrounding the rib and having its ends folded inside the said rib at said hinge, a link stretcher having a perforated end lying between the infolded ends of the lap, and a pivot-pin extending through the said rib lap, end of link stretcher, and the forked ends of the stretcher, said stretcher being sufficiently wide to receive the side walls of the rib within its trough, and forming a tube when the umbrella is closed within which the link stretcher will lie, substantially as described.

708,911. BAT OR RACKET FOR GAME KNOWN AS PING-PONG OR TABLE-TENNIS. JOHN GIBBWOOD, Edinburgh, Scotland. Filed Mar. 10, 1902. Serial No. 97,540. (No model.)



Claim.—A bat or racket for ping-pong, comprising a body portion, a lug or projection integral with said body portion, and a handle suitably attached to the said lug or projection, said handle being permanently disposed at an angle to the body portion.

708,912. SHOW-TOP. CORNELIA H. GOLDSMAN, St. Louis, Mo. Filed Nov. 7, 1901. Serial No. 81,435. (No model.)

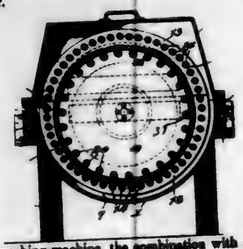
Claim.—1. A show-top comprising a suitable frame, a fixed and sliding panel for the same, parallel grooves in the sides of said frames, and a groove at the bottom thereof, an upper rail forming one of the members of the sliding-panel and having a lower groove for the reception of the upper edge of the glass forming said panel, a tongue at each end of said rail, and supporting metallic strips having openings for the free passage of the tongues, the latter operating in the grooves formed in the lateral bars of the frame, substantially as set forth.

2. A show-top comprising a suitable frame, a stationary and a sliding panel for the same, parallel grooves in the sides of the frame, and a groove at the bottom thereof for the reception of the lower edge of the stationary panel, an upper rail forming one of the members of the sliding panel and having a lower groove for the reception of the upper edge of the glass forming said panel, a tongue at each end of said rail forming a continuation of the rail, and having a shoulder at the base of the lower edge thereof whose horizontal or lower edge forms a continuation of the base of the groove formed in said upper rail, supporting metallic strips having openings for the free passage of the tongues, and bearing against the vertical edges of the shoulders, the glass or panel being respectively embraced by said strips, and by the walls of the groove formed in said upper rail, the tongues operating in the grooves formed in the lateral bars of the frame substantially as set forth.

708,913. WASHING-MACHINE. JAMES P. GORDON, Florence, Colo. Filed July 13, 1901. Serial No. 68,175. (No model.)

Claim.—1. In a washing-machine, the combination with a tub, of an open-work washing-cylinder rotatably mounted therein, an open-work clothes-cylinder loosely supported upon the inner periphery of the washing-cylinder, and an open-work clothes-containing bag to embrace the clothes-cylinder, and provided at one end with hooks for connection therewith.

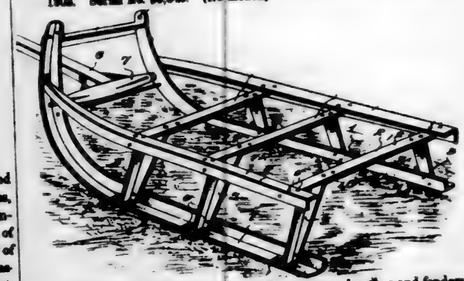
2. In a washing-machine, the combination with a tub, of an open-work washing-cylinder rotatably mounted therein, an open-work clothes-cylinder loosely supported upon the inner periphery of the washing-cylinder, and an open-work clothes-containing bag to snugly embrace the clothes-cylinder and formed from a sheet of netting, having opposite edges provided with mutually-cooperating fastening devices, and one of its other edges being provided with hooks for engagement with the open-work clothes-cylinder.



3. In a washing-machine, the combination with a tub, of an open-work washing-cylinder rotatably mounted therein, an open-work clothes-cylinder loosely supported upon the inner periphery of the washing-cylinder, and an open-work clothes-containing bag to snugly embrace the clothes-cylinder, and formed from a sheet of netting having its edges provided with marginal binding-strips, one of said strips being provided with buttonholes, buttons provided upon the opposite portion of the netting corresponding to the buttonholes, and a plate loosely connected to one of the other edges and provided with hooks for engagement with the open-work clothes-cylinder.

4. In a washing-machine, the combination with an open-work clothes-cylinder, of a clothes-confining bag provided at one end with hooks to engage with the clothes-cylinder, the bag to be of a length to pass entirely around the cylinder and to overlap the hooks.

708,914. SLEIGH. PETER R. GWYN, Delmont, Pa. Filed Jan. 9, 1902. Serial No. 89,049. (No model.)



Claim.—1. A sleigh-frame comprising runners, benches and fenders rigidly assembled, and knees provided at each terminal with an outturned toe, one of which is secured to the bottom flange of the runner and the other to the under side of the benches, the flanges of the knees gradually increasing in width from the runners to the benches, all of the parts being constructed of L angle-iron, substantially as and for the purpose specified.

2. A sleigh-frame comprising runners having upturned ends connected by a cross-brace, fenders having one terminal secured to the upturned portion of the runners, benches secured to the fenders, and knees secured to the runners and to the benches, the flanges of the knees gradually increasing in width from the runners to the benches, all of the parts of the structure being made of L angle-iron, substantially as and for the purpose specified.

708,915. CIGARETTE-ROLLER. JAMES G. HALÁPLENS, Toledo, Ohio. Filed Nov. 8, 1901. Serial No. 81,900. (No model.)

Claim.—1. A cigarette-roller comprising a casing composed of two hinged sections, and a roller-apron coöperating therewith, the end pieces of said sections being formed by slitting the body portions of the sections upon opposite sides of their longitudinal centers and bending the end portions thereof at right angles thereto, and said end pieces being formed with integral, right-angular abutting stops to limit the closing of said sections and prevent excess tension on the cigarette-wrapper, substantially as specified.

2. A cigarette-rolling device comprising in its construction two segmental sections, each of said sections having right-angularly-bent end walls formed by slitting the body portion of said section upon opposite sides of its longitudinal center and bending the ends thereof at right angles thereto, the said end pieces being provided at their inner and outer ends with perforated ears and at their inner edges with stops adapted to abut to positively limit the closing of the sections, a pintle connecting the ears upon the inner ends of said end walls and hinging the sections together, guide-rods mounted in the ears upon the outer ends of the end walls, and an apron passing through the spaces between said guide-rods and the outer longitudinal edges of the sections, said edges being bent into channeled form to provide enlarged bearings for said apron, substantially in the manner set forth.

708,916. ORANGE OR LEMON CLEANER. JAMES T. HALEY, Alhambra, Cal. Filed Nov. 3, 1900. Serial No. 35,430. (No model.)

Claim.—1. An orange-washer comprising a water-tank; a hollow cylinder set aslant in the water-tank and furnished with an internal cylindrical brush-surface; a screw conveyer having brush-surface and rotating in said cylinder to convey the fruit downward through the cylinder; and an elevator mounted above the lower end of the cylinder to discharge the fruit from the machine.

2. An orange and lemon cleaner comprising a water-tank; a hollow brush-cylinder in the water-tank; a brush screw conveyer in the cylinder; and a rotary elevator in the tank above the discharge end of the cylinder to gather the fruit and discharge it from the machine.

3. In a fruit-cleaner, the combination of a water-tank; a hollow brush-cylinder set aslant in the water-tank; a brush screw conveyer to rotate in the hollow brush-cylinder; a screen below the discharge end of the cylinder; and a rotary elevator above the discharge end of the cylinder.

4. A fruit-cleaner comprising a water-tank; a hollow brush-cylinder set aslant in the water-tank; a brush screw conveyer to rotate in the brush-cylinder; a rotary elevator in the tank above the discharge end of the cylinder; and a spring-pressed guide to guide the fruit onto the backs of the rotary elevator.

5. In an orange and lemon cleaner, the combination of a water-tank; a hollow brush-cylinder mounted aslant in the tank; a brush screw conveyer in the cylinder to convey fruit through the cylinder and discharge it at its lower end; and a water-wall above the cylinder to prevent the return of the water over the cylinder toward the feed end.

6. In an orange and lemon cleaner, the combination of a water-tank; a hollow brush-cylinder set aslant in the water-tank; a brush screw conveyer to rotate in the brush-cylinder; a water-wall in the tank above the cylinder; a screen in the tank below the discharge end of the cylinder; and a screen in the tank below the cylinder and near the feed end thereof.

7. The combination of the water-tank; a hollow brush-cylinder located in the water-tank the inner surface of said hollow cylinder being a brush-surface; a screw conveyer to convey fruit through the cylinder within the tubular brush formed thereby; and an elevator in the tank at the discharge end of the cylinder to discharge fruit from the tank.

8. The combination of a water-tank; a hollow brush-cylinder set aslant in the water-tank; a screw conveyer for conveying fruit through the cylinder; means in the tank for driving the shaft of the screw conveyer; and a partition in the tank between the screw conveyer and such means.

9. The combination of a water-tank; a hollow cylinder in the tank furnished with a side extension at one end and a brush screw conveyer to rotate in the cylinder, and extending beneath the side extension.

10. The combination of a water-tank; a hollow brush-cylinder in the tank and furnished at one end with a side extension; a screw brush conveyer in the cylinder and extending beneath the side extension; and means for rotating the screw conveyer to convey fruit through the cylinder from the end having the side extension.

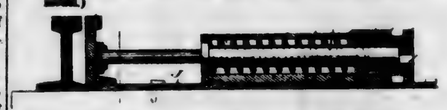
11. In a fruit-cleaner, the combination of a water-tank; cleats set aslant on the opposite sides of the tank-walls; a semicylindrical trough with internal brush-surface and side flanges, set with the flanges resting on the cleats respectively; an inverted semicylindrical trough with internal brush-surface and with side flanges set on the flanges of the first-named trough; and cleats to hold the flanges in place, thus forming a hollow brush-cylinder substantially as and for the purpose set forth.

708,917. SWITCH. SAMUEL J. HARRIS, Lake City, Fla. Filed Jan. 14, 1902. Serial No. 89,769. (No model.)

Claim.—1. The herein-described safety appliance for switches consisting essentially of the casing having a smooth bore, and also having its forward end open, and its rear end provided with a central aperture, the rod for exerting thrust against a switch-point, formed of one piece of material and disposed in the casing with its rear end guided in the central aperture of the casing, and having the integral collar at an intermediate point of its length snugly fitting and movable in the smooth bore of the casing, and the coiled spring surrounding the rod within the casing and interposed between the integral collar of the rod and the rear end of the casing.

2. The combination of the switch-point having the socket at one side, the casing disposed at right angles to the point, and having a smooth bore, and also having its forward end open, and its rear end provided with a central aperture, the rod for exerting thrust against the switch-point having its forward end arranged in the socket on the point; the said rod being formed of one piece of material, and being disposed in the casing with its rear end guided in the central aperture thereof, and having the integral collar at an intermediate point of its length snugly fitting and movable in the smooth bore of the casing, and the coiled spring surrounding the rod within the casing and interposed between the integral collar of the rod and the rear end of the casing.

708,918. SAFETY APPLIANCE FOR SWITCHES. SAMUEL J. HARRIS, Lake City, Fla. Filed May 2, 1902. Serial No. 105,696. (No model.)

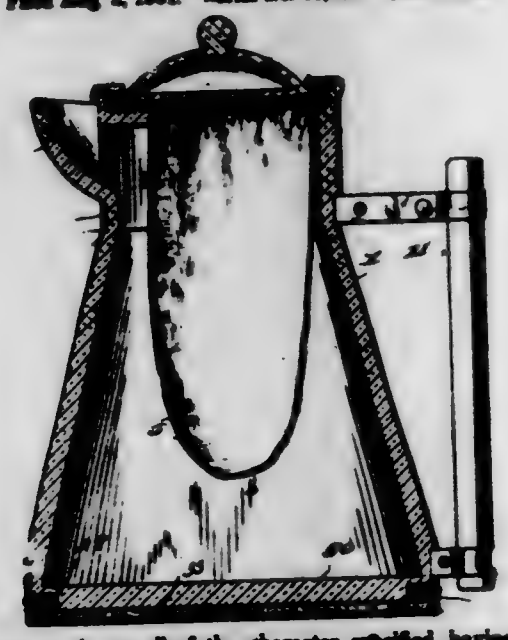


Claim.—1. The combination with a movable switch-point; of the attachment comprising the cylinder disposed at an angle to the point, and having the smooth bore in its forward portion, and its rear end interiorly threaded, an exteriorly-threaded nut arranged in said threaded end of the cylinder, and having a central smooth bore extending throughout its length, the thrust-rod formed of one piece and having its forward end arranged to press against the point, and its rear end guided in the smooth bore of the nut, and also having the collar at an intermediate point of its length snugly fitting in the smooth bore of the casing, and a coiled spring surrounding the rod within the casing, and interposed between the collar of the rod and the nut.

2. The combination with a movable switch-point; of the attachment comprising the cylinder disposed at an angle to the point, and having the smooth bore in its forward portion, and its rear end interiorly enlarged

and threaded, an exteriorly-threaded nut arranged in said enlarged and threaded end of the cylinder, and having a central smooth bore extending throughout its length, a jam-nut mounted on the exteriorly-threaded nut and arranged to bear against the cylinder, the thrust-rod formed of one piece and having its forward end arranged to press against the point, and its rear end guided in the smooth bore of the exteriorly-threaded nut, and also having the collar at an intermediate point of its length snugly fitting in the smooth bore of the casing, and a coiled spring surrounding the rod within the casing, and interposed between the collar on the rod and the exteriorly-threaded nut.

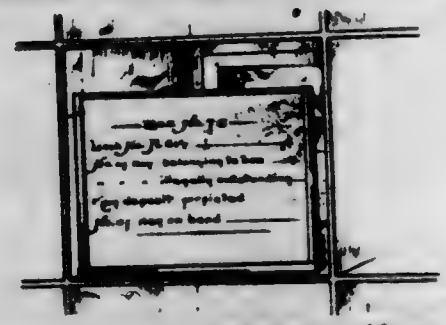
708,919. TEA OR COFFEE POT. FRANK A. HARRISON, Keokuk Iowa. Filed Aug. 2, 1901. Serial No. 70,648. (No model.)



Claim.—1. A utensil of the character specified, having its body portion provided near its top and bottom with a circumferential groove, in combination with bands seated in the grooves and having their terminals arranged parallel with each other, a handhold carrying clamping-bands having their terminals arranged parallel with each other and embracing those of the body-bands, a reinforcing-plate carried by each end of the handhold and disposed between the terminals of the body-bands and the clamping-bands, and fastening means passing through the said terminals and the reinforcing-plates.

2. A utensil of the character specified, having its body portion provided near its top and bottom with a circumferential groove, in combination with body-bands seated in the grooves and having their terminals arranged parallel with each other, a handhold provided near its terminals with circumferential grooves, clamping-bands engaging the grooves and having their terminals parallel with each other and embracing those of the body-band, a reinforcing-plate carried by each end of the handhold and disposed between the terminals of the body-bands and the clamping-bands, and detachable fastening means passed through the said terminals and the reinforcing-plates.

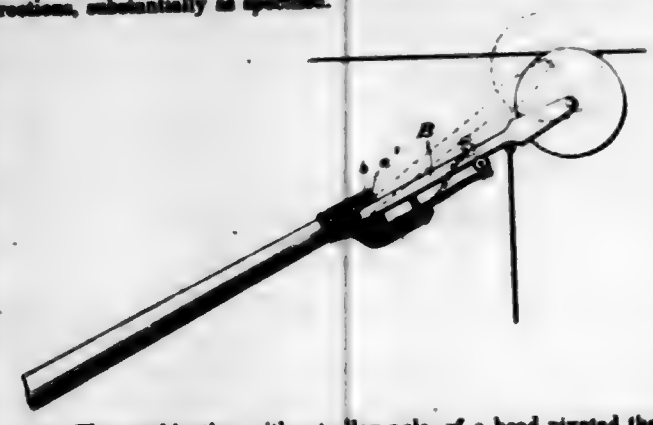
708,920. INDICATOR FOR MAIL-BOXES. CHARLES E. HERD, Middlesboro, Ky. Filed Dec. 18, 1901. Serial No. 86,427. (No model.)



Claim.—An indicator for mail-boxes comprising an approximately rectangular frame, constructed of a single piece of wire, of a hinged label-holder on one end thereof provided with an internal flange on one of its sides to form grooves to receive a removable card, and a rearwardly-turned flange on the top of the label-holder embracing the end bar of the frame and a hinged indicating device on the opposite end of the frame.

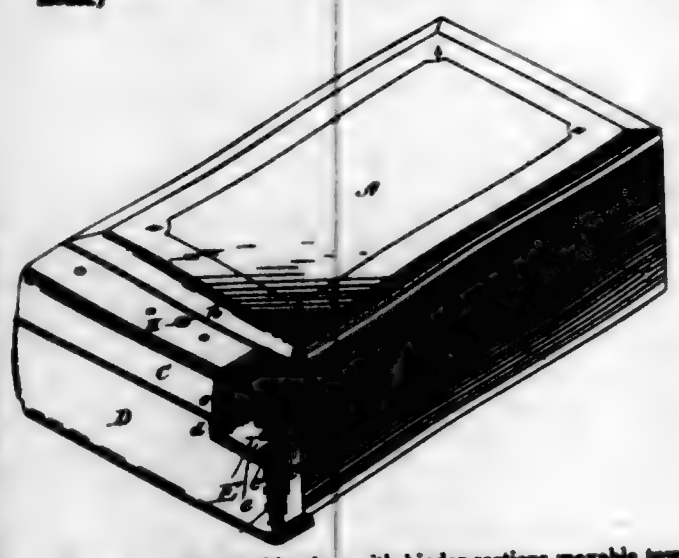
708,921. TROLLEY-POLE. JOHN B. HEDELAS, Anderson, Ind. Filed Oct. 11, 1901. Serial No. 78,282. (No model.)

Claim.—1. The combination with a trolley-pole, of a head pivoted thereto, the plate-spring carried by said pole, and having the bracing-roller at its upper end engaging said head, and preventing lateral displacement thereof, and stops for limiting the swing of said head in both directions, substantially as specified.



2. The combination with a trolley-pole, of a head pivoted thereto, the plate-spring carried by said pole, and having the bracing-roller at its upper end engaging said head, the securing-bolt for said spring extended to form a stop for limiting the downward swing of said head, and the stop for limiting the upward swing of said head, substantially as specified.

708,922. LOOSE-LEAF-LEDGER BINDER. HERMANN H. HOFFMANN, Chicago, Ill. Filed May 21, 1901. Serial No. 61,335. (No model.)



Claim.—1. The combination, with binder-sections movable toward and from each other to clamp the sheets or leaves between them and release the same respectively, of a rotary ratchet-forming screw, mounted on one section, and a nut-forming pawl mounted on the other section in engagement with the screw-threads, whereby a quick closing may be had and thereafter a final screw-and-nut compression; substantially as described.

2. The combination, with binder-sections, movable toward and from each other to clamp the sheets or leaves between them and release the same respectively, of a rotary ratchet-forming screw mounted on one section, a nut-forming pawl on the other section in engagement with said screw, and means for releasing the pawl from the screw to allow of separation of the binder-sections; substantially as described.

3. The combination, with binder-sections movable toward and from each other, of a rotary ratchet-forming screw mounted on one section and grooved longitudinally, a nut-forming pawl mounted on the other section, and provided with a releasing-dog actuated by one wall of the groove, upon a reverse turn of the screw, to disengage the pawl from said screw to allow of a quick opening of the binder; substantially as described.

4. The combination, with binder-sections movable toward and from each other, and springs to force the binder-sections apart, of a rotary ratchet-forming screw mounted on one binder-section and provided with longitudinal grooves, a nut-forming pawl mounted on the other binder-section in engagement with said screw, and a releasing-dog having a tooth to enter a groove in said screw, and by a reverse movement of the latter throw the pawl out of engagement with said screw, whereupon the springs will suddenly force the binder-sections apart; substantially as described.

5. The combination with the binder-sections movable toward and from each other, telescopic rods and tubes mounted on the respective binder-sections, springs in said tubes pressing the said rods or plungers outwardly, of a telescopic tubular lock-case having its members connected at their opposite ends to the respective binder-sections, a rotary ratchet-forming screw swiveled at its outer end in one case member, and provided

with longitudinal grooves, a nut-forming pawl pivoted in the other casing member, and engaging said screw, a releasing-dog pivoted to the lower end of the pawl and having a tooth engaging the screw for operation by a reverse movement thereof, to release the pawl, and a spring pressing the dog and the pawl toward the screw; substantially as described.

6. A binder comprising upper and lower sections formed of angle-plates overlapped at their back flanges to slide one upon the other, the vertical end edges of the lower back flange being bent around and inclosing the corresponding edges of the upper back flange, telescopic angular end posts connected at their ends to the horizontal flanges of the binder-sections to slide therewith, the vertical edges of the inwardly-projecting flanges of the lower post members being bent around the corresponding edges of the upper post members, and means for locking the binder-sections together; substantially as described.

7. A locking and releasing mechanism for binders comprising a telescopic case, a rotary ratchet-forming screw swiveled in one member of the case, a nut-forming pawl in the other case member and engaging the screw, and means for disengaging the pawl from the screw upon reversing the rotation thereof; substantially as described.

8. A locking and releasing mechanism for binders comprising a telescopic case, a rotary, longitudinally-grooved, ratchet-forming screw swiveled in one member of the case, a nut-forming pawl pivoted in the other case member, and engaging the said screw, a pawl-releasing dog pivoted to the said pawl to engage the screw-groove and by a reverse movement of the screw throw the pawl away from the screw; substantially as described.

9. A locking and releasing mechanism for binders comprising a telescopic case, a rotary, longitudinally-grooved, ratchet-forming screw swiveled in one member of the case, a nut-forming pawl pivoted in the other case member, and engaging the said screw, a pawl-releasing dog pivoted to the said pawl to engage the screw-groove and by a reverse movement of the screw throw the pawl away from the screw, and a plate-spring bearing at its free end on the rear edge of the dog and throwing it and the pawl toward the screw; substantially as described.

10. A locking and releasing mechanism for binders, comprising a telescopic case formed of two tubular members formed respectively with longitudinally-extending guide-slots and ribs, a rotary, ratchet-forming screw swiveled in one member of the case, a nut-forming pawl in the other case member, and engaging the screw, and means for disengaging the pawl from the screw upon reversing the rotation thereof; substantially as described.

11. The combination with binder-sections, movable toward and from each other to clamp the sheets or leaves between them and release the same respectively, of a locking mechanism including a ratchet device upon one section and a ratchet-engaging device on the other section, whereby a quick closing may be had, and means for imparting to the locking mechanism a final compression, and means whereby when the locking mechanism is released, the parts are separated quickly; substantially as described.

12. The combination with binder-sections movable toward and from each other to clamp the sheets or leaves between them and release the same respectively, of a locking mechanism including a rotary ratchet-forming screw mounted on one section, and means mounted on the other section for engaging the screw-threads of the ratchet-forming screw, whereby a quick closing may be had and thereafter a final screw compression; substantially as described.

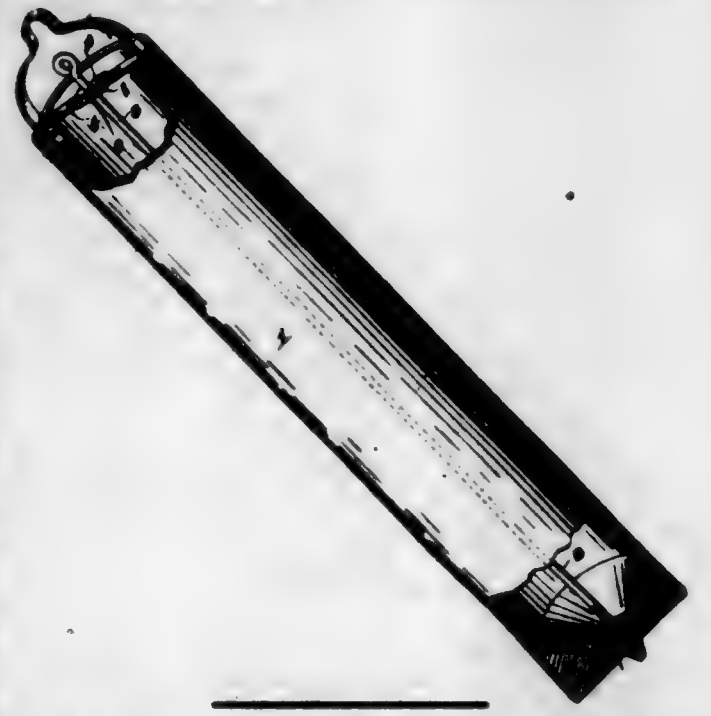
13. The combination with the L-shaped or angular binder-sections, having overlapping sliding back pieces, one of which has its end edges bent around to inclose the end edges of the other section, whereby a telescopic or sliding connection is established between the two sections, and a locking mechanism; substantially as described.

708,923. WELL-BUCKET. HERBERT W. HOLLIS, Kingsland, Ark. Filed Feb. 6, 1902. Serial No. 93,230. (No model.)

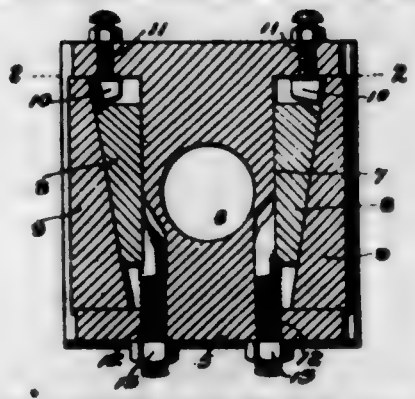
Claim.—1. The combination of a bucket having a valve-seat in its lower end, a valve for said seat provided with a rod, a cross-bar secured to said bucket at its upper end and provided with a notch into which the valve-rod projects, and a clasp for closing said notch and maintaining the valve-rod in a vertical position, substantially as set forth.

2. The combination of a bucket having a valve-seat in its lower end, a valve for said seat provided with a rod, a cross-bar secured to said bucket at its upper end and provided with a notch into which the valve-rod projects, and a clasp for closing said notch or recess for holding the valve-rod in vertical position and having a sliding engagement upon said bar for frictionally locking said rod in an elevated position, substantially as set forth.

3. The combination of a bucket having a valve-seat in its lower end, a valve for said seat provided with a rod, a cross-bar secured to said bucket at its upper end and provided with a notch into which the valve-rod projects, and a clasp mounted to slide upon said rod and adapted to engage said bar for closing said notch to hold the rod in an upright position, substantially as set forth.

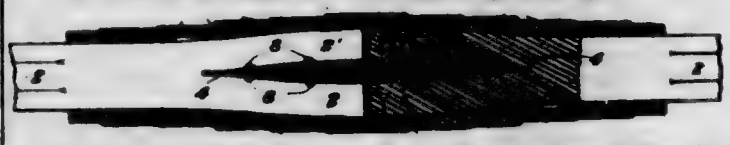


708,924. LINK-MOTION BLOCK. OLIVER D. HOLT, Braman, Okla. Filed Feb. 21, 1902. Serial No. 95,166. (No model.)



Claim.—The combination of the link-block having a central pivot-opening and provided at its opposite sides with recesses 7, laterally-movable wearing-blocks 9 having flat bearing-faces projecting slightly beyond the mouth of the recesses, said bearing-blocks being of a length and width approximately equal to the length and width of the recesses and each being provided at its narrower end with an inwardly-projecting lug 10, set-screws 11 carried by the link-block and adapted to engage with said lugs, wedge-blocks 8 situated between the inclined faces of the wearing-blocks and the inner walls of the recesses, said wedge-blocks each being provided with a recess 19 for the reception of the lugs 10, threaded stems 12 forming part of wedge-blocks and extending out through guiding-openings in the lower portion of the link-block, and nuts adapted to said threaded stems for adjusting the position of the wedge-blocks.

708,925. COUPLING FOR CONNECTING-RODS. JAMES HOSKLEY, Glade Mills, Pa., assignor of one-half to John B. Gregory, Glade Mills, Pa. Filed Jan. 6, 1902. Serial No. 88,541. (No model.)



Claim.—1. A device for connecting sections of rods consisting of a tubular shell, and a wedge adapted to be passed therethrough provided with overlapping flanges.

2. A device for connecting sections of rods consisting of a tubular shell provided with interior corrugations, and a double-sided wedge provided with vertical ribs adapted to be inserted through the shell provided with an upwardly-extending support and means for securing the wedge in position.

3. A device for connecting sections of rods consisting of a tubular shell and a wedge adapted to be inserted therethrough, provided with vertical ribs and an upwardly-extending support, and means for securing the wedge in position.

4. A device for connecting sections of rods consisting of a tubular shell having an interior maximum cross-area at its middle portion and diminishing toward the ends, provided with longitudinal upper and lower wedge-openings, and a wedge adapted to pass through such openings provided with an upwardly-extending pivotal support, and means for securing the wedge in position.

5. A device for connecting sections of rods consisting of a tubular interiorly-corrugated shell having an interior maximum cross-area at its middle portion and diminishing toward the ends, provided with longitudinal upper and lower wedge-openings, and a wedge adapted to pass through such openings provided with an upwardly-extending pivoted support and means for securing the wedge in position.

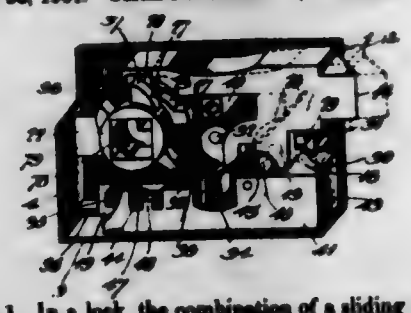
6. The combination, with the slotted ends of a connecting-rod, of a surrounding tubular shell having an internal middle space to admit of the separation of the divided ends diminishing in area toward each end and provided with an upper and lower longitudinal wedge-opening, and a wedge extending through such opening and between the divided ends, with means for supporting the wedge and securing it in position.

703,926. GARMENT-SUPPORTER. WILLIAM S. HERKIN, Merriam Park, Minn. Filed Apr. 25, 1902. Serial No. 104,601. (No model.)

Claim.—1. A garment-supporter comprising a belt, studs attached thereto at the outer surface of said belt, projections from said studs to the inner surface of said belt forming buttons, said stud coöperating with a frame E attached to a nether garment by means of a pair of pins F hinged at the lower enlarged end of said frame and engaging with tangs at the edge of the narrower portion of said frame; substantially as described.

2. A garment-supporter loop comprising a continuous sheet-metal body having a central opening therein, said opening being larger at one end than at the other and entirely surrounded by the sheet-metal body, said body being broader at one end than at the other, a bushing arranged at the broader end of said body, a pin hinged in said bushing and retaining-tangs on said body at the narrow end thereof to receive the ends of said pin; substantially as described.

703,927. LOCK. CHARLES S. HUNTINGTON, Los Angeles, Cal. Filed July 30, 1901. Serial No. 70,286. (No model.)



Claim.—1. In a lock, the combination of a sliding bolt capable of a limited reciprocation to operate as a latch, and adapted also to have an increased or extended reciprocation to serve as a locking-bolt, and the independently-movable inner and outer knobs provided with means for actuating the said bolt, substantially as described.

2. In a lock, the combination of a sliding bolt having a limited reciprocation to form a latch and capable also of an increased or extended reciprocation to serve as a locking-bolt, a spring for automatically moving the bolt outward when the same operates as a latch, an outer knob, and a hub or sleeve connected with the outer knob and provided with lugs arranged to move the bolt inward against the action of the spring, and adapted to throw the bolt outward to its extended position, said bolt, when extended, being arranged beyond the reach of the said lugs, substantially as described.

3. In a lock, the combination of a sliding spring-actuated bolt having a limited reciprocation to operate as a latch and capable of increased or extended reciprocation to operate as a locking-bolt, said bolt being provided near its rear end with a shoulder, a hub or sleeve provided with lugs arranged to engage the shoulder to move the bolt backward against the action of the spring, said lugs being also arranged to engage the rear end of the bolt to throw the latter to its extended position beyond the reach of the said lugs, and means for operating the hub or sleeve, substantially as described.

4. In a lock, the combination of a sliding spring-actuated bolt, capable of a limited reciprocation to operate as a latch and of an extended reciprocation to serve as a locking-bolt and provided with a key-engaged portion adapted to enable it to be returned from its extended position, and a hub or sleeve provided with a lug arranged to move the bolt inward against the action of the spring and adapted to throw the bolt outward to its extended position, substantially as described.

5. In a lock, the combination of a sliding bolt capable of a limited reciprocation to form a latch and of an extended reciprocation to serve as a locking-bolt, an outer knob, a hub or sleeve connected with the outer knob and provided with a lug arranged to engage the bolt to move the same inward against the action of the spring, and adapted to throw the bolt outward to its extended position, said bolt, when extended, lying beyond the reach of the lug, and means for limiting the forward rotation of the outer knob to prevent the bolt from being accidentally thrown to its extended position, substantially as described.

6. In a lock, the combination of a sliding bolt, capable of a limited and of an extended reciprocation, an outer knob, a hub or sleeve connected with the outer knob and provided with a lug arranged to engage the bolt to move the same inward against the action of the spring and adapted to throw the bolt to its extended position, and a movable latch arranged to engage the knob, to limit the forward rotation thereof, substantially as and for the purpose described.

7. In a lock, the combination of a sliding bolt having a limited and an extended reciprocation, an outer knob provided at its shank with a shoulder, a hub or sleeve having a lug arranged to throw the bolt to its extended position, a latch pivotally mounted adjacent to the outer knob and arranged to engage the shoulder to limit the forward rotation of the said knob, and adapted to be lifted out of such engagement, and a stop for limiting the movement of the latch, substantially as described.

8. In a lock, the combination of a sliding spring-actuated bolt capable of a limited reciprocation to form a latch and of an extended reciprocation to operate as a locking-bolt, a spindle extending through the lock, an inner knob arranged on the inner portion of the spindle, an outer knob arranged on the outer portion of the spindle, and a hub or sleeve connected with the inner knob and provided with lugs or arms arranged to engage the bolt and adapted to move the same to any of its positions, substantially as described.

9. In a lock, the combination of a sliding spring-actuated bolt capable of a limited and of an extended reciprocation, the spindle extending entirely through the lock, the independently-movable inner and outer knobs arranged on the inner and outer portions of the spindle, the outer hub or sleeve connected with the outer knob and having a lug adapted to move the bolt inward against the action of the spring, and capable of throwing the bolt to its extended position, and an inner hub or sleeve connected with the inner knob and provided with lugs arranged to move the bolt to any of its positions, substantially as described.

10. The combination in a lock, of a sliding spring-actuated bolt capable of a limited and an extended reciprocation and provided at its back with recesses 20 and 21, forming shoulders, the independently-movable inner and outer knobs, the outer hub or sleeve connected with the outer knob and provided with lugs arranged to engage the bolt at the recess 21 and adapted to move the same inward against the action of the spring, and capable of throwing the bolt to its extended position beyond the reach of the lugs, and an inner hub or sleeve connected with the inner knob and provided with a lug for throwing the bolt outward, and having an extended lug operating in the recess 20, and adapted to return the bolt from its extended position, substantially as described.

11. The combination of a sliding spring-actuated bolt capable of a limited and of an extended reciprocation, the independently-movable inner and outer knobs, the outer hub or sleeve connected with the outer knob and having a lug for throwing the bolt to its extended position, an inner hub or sleeve having lugs for engaging the bolt, one of the lugs of the inner hub or sleeve being extended to return the bolt from its extended position, and an arm carried by the bolt and arranged to be engaged by a key, whereby the bolt is returned from its extended position at the exterior of a door, substantially as described.

12. In a lock, the combination of a sliding bolt capable of a limited and an extended reciprocation to enable it to operate either as a latch or as a locking-bolt, a spring engaging the bolt and adapted to throw the same outward when the bolt operates as a latch, a catch or detent arranged to lock the bolt in its extended position and capable of permitting a free reciprocation of the bolt when the same operates as a latch, and means for actuating the bolt, substantially as described.

13. In a lock, the combination of a sliding spring-actuated bolt capable of a limited and of an extended reciprocation to enable it to operate either as a latch or as a locking-bolt, the independently-movable inner and outer knobs provided with means for actuating the bolt, and a catch or detent arranged to lock the bolt in its extended position and capable of permitting a free reciprocation of the bolt when the latter is operated as a latch, substantially as described.

14. In a lock, the combination of a sliding spring-actuated bolt, capable of a limited and of an extended reciprocation, the independently-movable inner and outer knobs provided with means for actuating the

bolt, an arm carried by the bolt and arranged to be engaged by a key to return the bolt from its extended position, and a catch or detent arranged to lock the bolt in its extended position, substantially as described.

15. In a lock, the combination of a sliding bolt capable of a limited and of an extended reciprocation and provided with a key engaged arm and having a lug or projection, a catch or detent movably mounted and provided with a shoulder for engaging the lug or projection to lock the bolt in its extended position, said catch or detent being also provided adjacent to the shoulder with an inclined face arranged to be engaged by the lug or projection to enable the bolt in moving outward to lift the catch or detent, and means for actuating the bolt, substantially as described.

16. In a lock, the combination of a sliding spring-actuated bolt capable of a limited and of an extended reciprocation to enable it to operate either as a latch or as a locking-bolt, said bolt being provided with a depending key-engaged arm having a laterally-extending lug, and a catch or detent movably mounted and provided at its outer portion with a bend forming an outer shoulder and providing an inclined face, said shoulder and inclined face being located beyond the lug, when the bolt operates as a latch, substantially as described.

17. In a lock, the combination of a sliding spring-actuated bolt, capable of a limited and an extended reciprocation to operate either as a latch or as a locking-bolt, a catch or detent pivoted between its ends and having its outer portion arranged to engage the bolt to lock the latter in its extended position, and a spring engaging the inner portion of the catch or detent and also engaging the bolt, substantially as described.

18. In a lock, the combination of a sliding spring-actuated bolt, capable of an extended and a limited reciprocation and provided with a depending key-engaged arm having a laterally-extending lug, a catch or detent pivoted between its ends and provided at its outer portion with a shoulder for engaging the lug to lock the bolt in its extended position, said catch or detent having its outer arm located above the said lug and provided with an inclined face to enable the lug to lift it automatically when the bolt is moved outward, and means for actuating the bolt and for holding the catch or detent in its engaging position, substantially as described.

19. In a lock, the combination of a sliding spring-actuated bolt having a limited and an extended reciprocation and provided with a depending key-engaged arm having a laterally-extending lug, a catch or detent pivoted between its ends and having its outer arm located above the lug and adapted to engage the same to lock the bolt in its extended position, said catch or detent having its inner portion laterally offset and provided with an opening, a spring extending through the opening and engaging the inner arm of the catch or detent, and also engaging the shoulder of the bolt, and nuts for actuating the bolt, substantially as described.

20. In a lock, the combination of a sliding bolt, a knob-spindle, a catch or detent arranged to lock the bolt in its extended position, a movable keyhole-guard, a sleeve or hub arranged on the knob-spindle and provided with means for operating the bolt and arranged to engage both the catch or detent and the keyhole-guard, substantially as described.

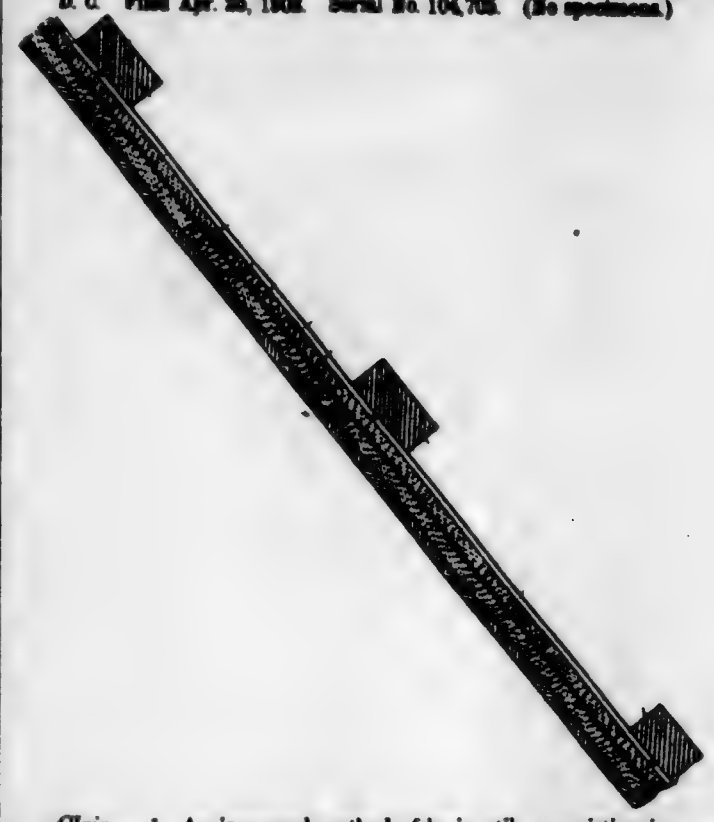
21. In a lock, the combination of a reciprocating bolt, a sliding keyhole-guard, a catch or tumbler pivoted between its ends and arranged to engage the bolt and the keyhole-guard, and a hub or sleeve provided with means for actuating the bolt and the keyhole-guard and for swinging the catch or tumbler out of engagement with the same, substantially as and for the purpose described.

22. In a lock, the combination of a reciprocating bolt provided with a key-engaged portion, a catch or tumbler pivoted between its ends and provided at its front end with means for locking the bolt in its extended position, and having a projection at its rear portion, a sliding keyhole-guard provided with a recess and having a lug arranged to be engaged by the projection of the catch or tumbler, and a hub or sleeve provided with means for actuating the bolt and having an arm or lug arranged to engage the catch or tumbler and adapted to operate in the said recess to engage the opposite walls thereof to reciprocate the keyhole-guard, substantially as described.

23. In a lock, the combination of a casing, a sliding bolt, inner and outer hubs or sleeves provided with means for engaging the bolt, a spindle extending through the hubs or sleeves and engaging the outer one, a bracket mounted on the casing and extending between the hubs or sleeves and having a curved flange, a cylindrical sleeve or barrel arranged on the spindle and interlocked with the said flange, inner and outer knobs capable of independent rotation, and a polygonal sleeve connected with the inner knob and interlocked with the inner hub or sleeve, substantially as described.

24. In a lock, the combination of a casing, a reciprocating bolt, inner and outer hubs or sleeves provided with means for engaging the bolt, a spindle extending through the hubs or sleeves, the inner and outer knobs capable of independent movement, the outer knob being provided with an extended shank having a concealed portion secured to the spindle, said knobs being connected with the inner and outer sleeves or hubs, and means for securing the inner knob to the spindle, substantially as described.

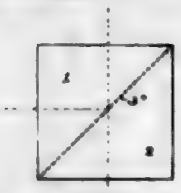
708,928. METHOD OF LAYING TILES. ELIAS S. HUTCHISON, Washington, D. C., assignor of one-half to Samuel Ross, Washington, D. C. Filed Apr. 28, 1902. Serial No. 104,705. (No specimens.)



Claim.—1. An improved method of laying tiles, consisting in providing a backing, applying thereto an isolating substance to prevent an absorption of the moisture of the second plastic coating, applying to the isolating substance a second coating and laying the tiles therein while it is moist.

2. An improved method of laying tiles, consisting in providing a backing, applying thereto a coating of impervious material, applying to the impervious material while wet, a suitable quantity of sand to form a key for a coating of plastic material, and applying thereto, a coating of plastic material and then laying the tiles upon the plastic material.

708,929. PHOTOCHROMOSCOPIC AND TRICHROMATIC APPARATUS. FREDERIC E. IVES, Philadelphia, Pa. Filed May 21, 1902. Serial No. 108,384. (No model.)



Claim.—1. In apparatus of the character described, a compound prism with internal light reflecting and transmitting surface as a means of dividing the rays of light which form two colored images.

2. In apparatus of the character described, a compound prism with internal light reflecting and transmitting surface as a means of dividing the rays of light to form two images, in combination with appropriate color screens for said divided rays.

3. In apparatus of the character described, the combination of a compound prism with internal light reflecting and transmitting surface for dividing the rays which form two images, and a plate-reflector for separating from the incident rays those which form a third image.

4. A light reflecting and transmitting device consisting of a prism having its inclined face provided with an opaque film, having breaks or openings therein distributed throughout the area of the film.

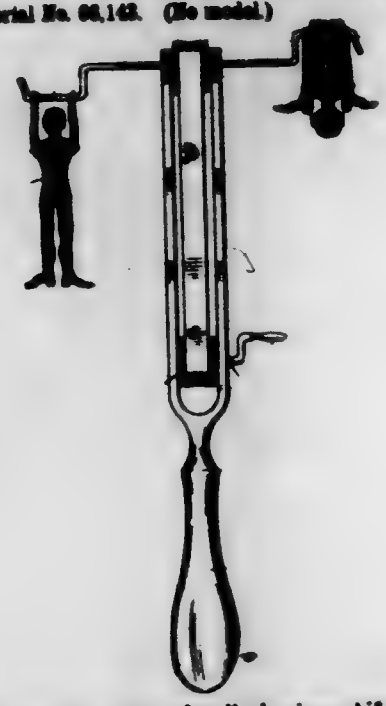
5. A light reflecting and transmitting device consisting of a compound prism formed of two prisms with their diagonal faces secured together, one of such faces having an opaque film with breaks or openings therein distributed throughout the area of the film.

708,930. PROCESS OF MANUFACTURING ROTARY CUTTERS. ERNST JANSEN, Mettingen, Germany. Filed July 6, 1901. Serial No. 67,360. (No specimens.)

Claim.—A process of manufacturing rotary cutters, which consist in melting down a charge composed of a material containing the percentage of carbon intended to be contained in the finished cutter until the said charge is thoroughly liquefied to insure a uniform distribution of the

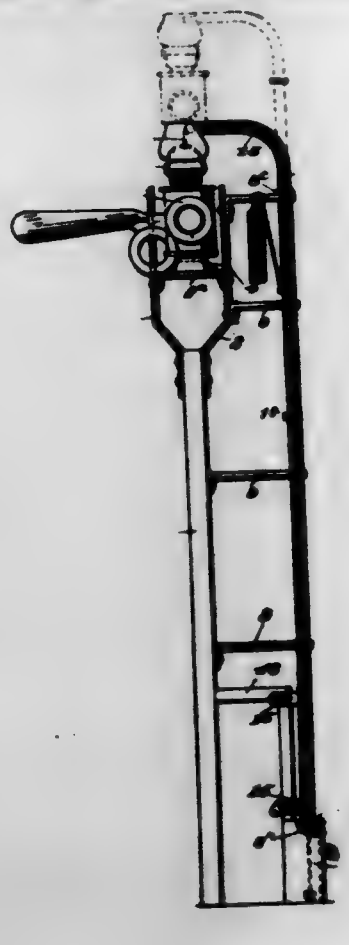
carbon in the material, then puddling the entire fused charge by vigorous stirring so as to cause the excess of carbon to be burned by the oxygen of the atmosphere through which the temperature of the charge is raised whereby the latter is kept thoroughly liquid until after the oxidation of all the excess of carbon and the fused metal recommences to become thick, adding aluminium to prevent disengagement of gases or porosity while casting, and then suitably casting the fused metal.

708,981. TOY. HATTIE JENSON, Sturgeon Bay, Wis. Filed June 26, 1901. Serial No. 66,142. (No model.)



Claim.—A toy comprising a handle having a bifurcated extension providing a pair of arms, a driving-shaft journaled at the inner end of the extension and provided with a crank having an operating-handle, a pulley fixed to the driving-shaft between the arms, a driven shaft journaled at the outer end of the extension and formed with a crank at each end projecting in opposite directions, a projection on each crank parallel with the driven shaft, and an inbent guiding end on each projection, a pulley fixed to the driven shaft between the arms, a belt connecting the pulleys, and jointed figures having arms fastened to the projections so as to turn therewith and to fold thereover.

708,982. SEMAPHORE. ABRAHAM C. JOHNSON, Winona, Minn. Filed Feb. 26, 1902. Serial No. 96,602. (No model.)



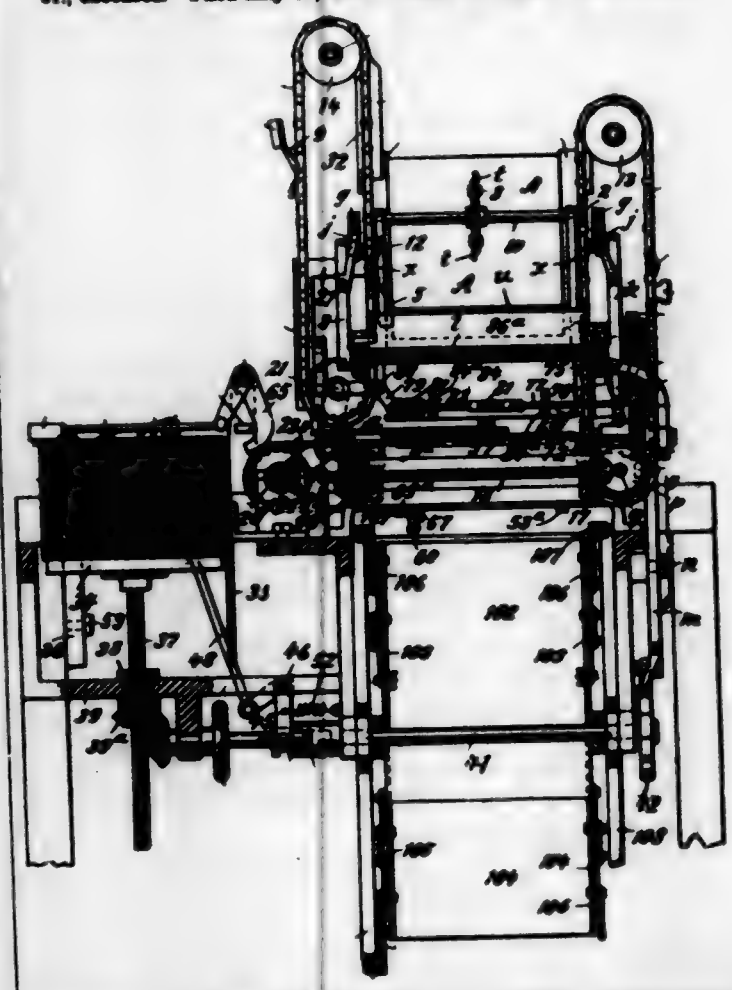
Claim.—1. In a semaphore, means for first raising the signal-lantern vertically from its pole or support, such means being adapted to be turned to one side in a horizontal plane to clear the lantern from its support, to lower the lantern to the ground below, to raise it again, to return it over its support, and to lower it thereupon, substantially as specified.

2. In a semaphore, the signal-lantern, the rope or cable connected thereto, the slidable and rotatable guide and protecting-tube for such rope, and means for locking such tube in lowered position, substantially as specified.

3. In a semaphore, the signal-lantern, the rope or cable connected thereto, the slidable and rotatable guide and protecting-tube for said rope and having the guide wings or flanges, means for counterbalancing said tube, and means for locking such tube in lowered position, substantially as specified.

4. In a semaphore, the signal-lantern, the rope or cable connected thereto, the slidable and rotatable guide and protecting-tube for said rope, and having the guide wings or flanges, a lock-box at the base of such tube, and arranged to receive the lower end thereof, and of the rope or cable, a door for said box arranged to engage said tube when closed to secure the same in lowered position, and means for counterbalancing such tube, substantially as specified.

708,983. BOOK-BINDING-MACHINE. WILLIAM G. JOYCE, Jr., New York, N. Y.; William Joyce administrator of said William G. Joyce, Jr., deceased. Filed May 17, 1901. Serial No. 60,728. (No model.)



Claim.—1. The combination of the book-feeding way adapted to receive the uncovered and back-rounded books in series and set upright on their backs, means for intermittingly feeding them along sidewise, vertical endless chains and gripping-pads thereon adapted to receive the books endwise successively at the end of the feedway, and pasting-rolls receiving the books from the chains and pasting the sides of the books preparatory to receiving the covers.

2. The combination of the book-feeding way adapted to receive the uncovered and back-rounded books in series and set upright on their backs, means for intermittingly feeding them along sidewise, vertical endless chains and gripping-pads thereon adapted to receive the books endwise successively at the end of the feedway, and the automatic gage at the end of the feedway controlling the books preparatory to their engagement by the chains.

3. The combination of the book-feedway adapted to receive the uncovered and back-rounded books in series and set upright on their backs, means for intermittingly feeding them along sidewise, vertical endless chains and gripping-pads thereon adapted to receive the books endwise successively at the end of the feedway, the automatic gage at the end of the feedway controlling the books preparatory to their engagement by

the chains and while being delivered by the chains, said stop consisting of the rotating device having ends adapted for one effect and sides adapted for the other effect, and means for periodically shifting it by toothed spurs on the chain.

4. The combination of the book-feeding way adapted to receive the uncovered and back-rounded books in series and set upright on their backs, means for intermittingly feeding them along sidewise, vertical endless chains and gripping-pads thereon adapted to receive the books endwise successively at the end of the feedway, pasting-rolls receiving the books from the chains and pasting the sides of the books preparatory to receiving the covers, cover-pressing rolls under the pasting-rolls, and means for placing the covers on said pressing-rolls preparatory to receiving the books, and so as to be pressed on the books by said pressing rolls.

5. The combination of the book-feeding way adapted to receive the uncovered and back-rounded books in series and set upright on their backs, means for intermittingly feeding them along sidewise, vertical endless chains and gripping-pads thereon adapted to receive the books endwise successively at the ends of the feedway, pasting-rolls receiving the books from the chains, and having the grooves for the bulging angles of the rounded books, said rolls adapted for pasting the uncovered sides of the books preparatory to receiving the covers.

6. The combination with the pasting-rolls, cover-pressing rolls, means for supplying the books and means for supplying the covers thereto, of the guide and paper smoothing and protecting plates intermediate of said pasting and pressing rolls.

7. The combination with the cover-pressing rolls, of the cover-receiving ways, cover-carrying chains, automatic closing grippers on said chains, means for opening the grippers and means for thrusting the covers into the grippers, and means for opening the grippers for release of the covers and the gage for stopping and centering the covers.

8. The combination with the cover-feeding chains and grippers thereon, of the gripper-opening studs, cover-pullers, rock-shaft and connections for operating the cover-pullers, and the tappets on the cover-grippers for operating the rock-shaft.

9. The combination with the feedway for the books through the pasting-rolls and with said pasting and cover-pressing rolls, of the cover-centering gage normally allowing overfeeding of the covers, and the roller-stud connected to said gage and subject to reverse movement by the books entering into the covers for centering said covers.

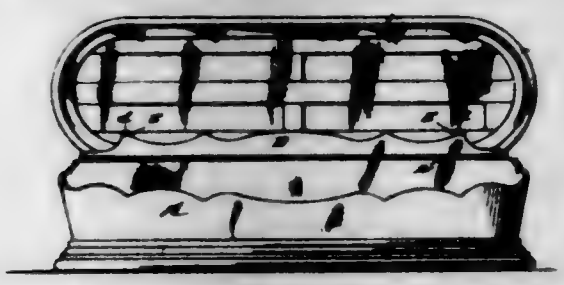
10. The combination with the pasting and cover-pressing rolls, of the series of intermittingly-rotating book receiving and clamping racks adapted for successively receiving, pressing, carrying, and delivering the books and provided with creasing devices adapted for producing the joint-creases of the book-covers.

11. The combination with the pasting and cover-pressing rolls, of the series of intermittingly-rotating book receiving and clamping racks, each comprising a plate fixedly attached to the rotating shaft, parallel with and radially thereto, another plate parallel to the first-mentioned plate, and lazy-tongs links connecting the ends of the two plates, each system of links having a roller-stud terminal, and stationary cams engaging said studs to close the clamps to grip the books, and releasing the same for the discharge of the books.

12. The combination with the pasting-rolls, cover-pressing rolls, means for supplying the books, means for supplying the covers thereto and the springs for checking the covers when thrust up by the pressing-rolls.

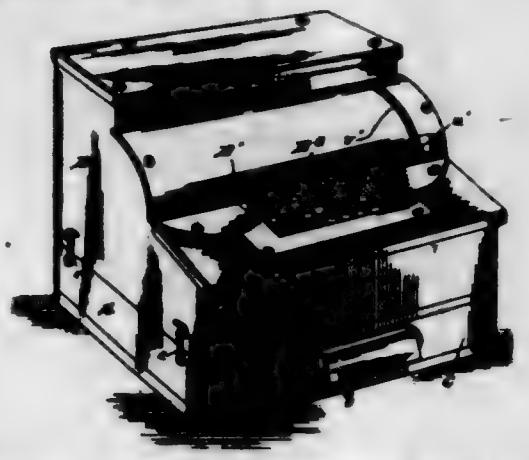
13. In a bookbinding-machine, the combination with feeding devices for the partly-bound books, of a pair of pasting-rolls, said rolls having the grooves for the bulging angles of the books, means for placing the covers under said rolls to receive the books, and rolls under the pasting-rolls for pressing the covers on the books.

708,934. BURIAL-CASE. CARL D. KOEHLER, Oshkosh, Wis., assignor to the Rockwell Edwards Co., Oshkosh, Wis. Filed Mar. 4, 1902. Serial No. 96,992. (No model.)



Claim.—A burial-casket comprising, in its construction, a body, a hinged top and a rear bracket hinged to braces of the top so as to depend in a vertical line with the body back when open, and swing forward to clear the body as the casket is closed, substantially as shown.

708,935. RECORDING-MACHINE. EDWARD LARSEN, Alta, Iowa. Filed Sept. 23, 1901. Serial No. 76,214. (No model.)



Claim.—1. In a machine for the purpose described, the combination of a case having an opening in its top, a support disposed in the case below said opening, a printing-cylinder mounted within the case and equipped to print column-headings or other matter on a strip or web of paper precedent to the passage of the same beneath the opening in the top of the case, and also equipped to leave blank spaces on the strip or web of paper immediately before the column-headings or other printed matter, a take-up roll, and means for turning the take-up roll step by step, and for also turning it a comparatively long distance incident to each of its revolutions, the latter to quickly carry the blank spaces and the headings on the paper past the opening in the top of the case.

2. In a machine for the purpose described, the combination of a take-up roll, a disk fixed with respect to said roll and having teeth, and also having a notch, a lever, a dog carried thereby and arranged to engage the teeth and drop into the notch of the disk, and a stop for limiting the rearward movements of the dog.

3. In a machine for the purpose described, the combination of a frame, a take-up roll mounted therein, a disk fixed with respect to said roll, and having teeth, and also having a notch, a lever fulcrumed at a suitable point, a pivoted dog carried by the lever and arranged to engage the teeth and drop into the notch of the disk, and a stop-lever fulcrumed on the frame, and disposed above the dog and having shoulders for the engagement thereof.

4. In a machine for the purpose described, the combination of the case having an opening in its top, a support in the case below said opening, a printing-cylinder mounted within the case in a position to enable it to print a strip or web of paper precedent to the passage of the same beneath the opening in the top of the case, a take-up roll, a ratchet-disk fixed with respect thereto, a lever, a dog carried thereby and arranged to engage said disk, and a driving connection between the take-up roll and the printing-cylinder.

5. In a machine for the purpose described, the combination of a case having an opening in its top, a support disposed in the case below said opening, a printing-cylinder mounted within the case, and equipped to print column-headings or other matter on a strip or web of paper precedent to the passage of the same beneath the opening in the top of the case, and also equipped to leave blank spaces on the strip or web of paper immediately before the column-headings or other printed matter, a take-up roll, a disk fixed with respect to said roll and having teeth and a notch, a lever, a dog carried by the lever and arranged to engage the teeth and drop into the notch of the disk, and a driving connection between the take-up roll and the printing-cylinder.

6. In a machine for the purpose described, the combination of a case having an opening in its top, a support disposed in the case below said opening, a printing-cylinder mounted within the case, and having peripheral rules for ruling columns, and also having type for printing headings at the upper ends of said columns, on a strip or web of paper precedent to the passage of the same beneath the opening in the top of the case, a take-up roll, and means for operating said take-up roll and printing-cylinder.

7. In a machine for the purpose described, the combination of a case having a drawer-compartment, and also having an opening in its top, a support arranged in the case below said opening, a drawer arranged in the drawer-compartment, a paper-supporting roll mounted in the case, a take-up roll for drawing a web or strip of paper off the paper-supporting roll and over the support, a cylinder for printing said strip or web of paper, means intermediate of the drawer and the take-up roll for turning said roll, and a driving connection between the take-up roll and the printing-cylinder.

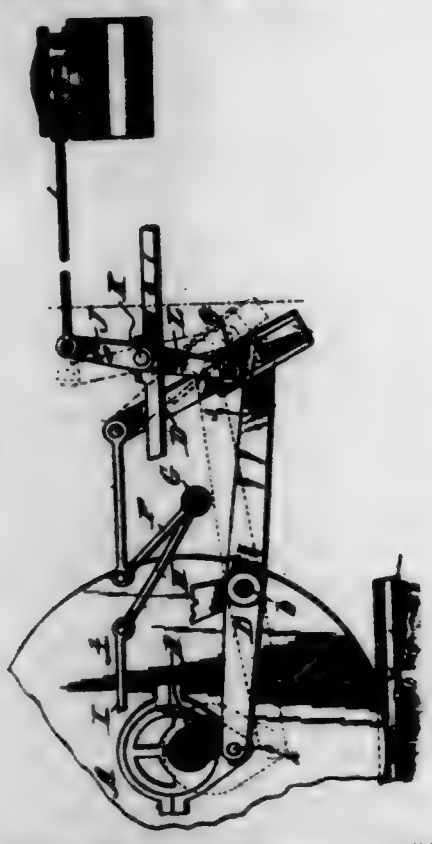
8. In a machine for the purpose described, the combination of a case having an opening B' and a slot a' in its top, and also having a drawer-compartment, a drawer therein, a support arranged in the case below the

opening B', a paper-supporting roll mounted within the case, a printing-cylinder also mounted within the case and equipped to print column-headings or other matter on a web or strip of paper precedent to the passage of the same beneath the opening in the top of the case, and also equipped to leave blank spaces on the strip or web of paper immediately before the column-headings or other matter, a take-up roll, a driving connection between the take-up roll and printing-cylinder, disks fixed with respect to the take-up roll at the ends thereof and having teeth and notches, levers carrying dogs arranged to engage the teeth and drop into the notches of the disks; one of said levers extending through the slot s' in the case, and the other being arranged to be engaged by the drawer, and stops for limiting the rearward movements of the dogs on the levers.

9. In a machine for the purpose described, the combination of a case having an opening in its top, a support disposed in the case below said opening, a printing-cylinder mounted within the case and equipped to print column-headings or other matter on a strip or web of paper precedent to the passage of the same beneath the opening in the top of the case, and also equipped to leave blank spaces on the strip or web immediately before the column-headings or other printed matter, a take-up roll, means for turning the take-up roll step by step, and for also turning it a comparatively long distance incident to each of its revolutions, the latter to quickly carry the blank spaces and the headings on the paper past the opening in the top of the case, a driving connection between the take-up roll and the printing-cylinder, and a paper-cutting device carried by the take-up roll, and arranged to rest beneath the blank spaces of the paper wound thereon.

10. In a machine for the purpose described, the combination of a case having an opening in its top, a support arranged below said opening, a paper-supporting roll mounted within said case, a printing-roll also arranged within the case in a position to print a web or strip of paper precedent to the passage of the same over the support, an inking-roll yieldingly pressed against the periphery of the printing-cylinder, a roll disposed upon the printing-cylinder and arranged in front of the support, a swinging, spring-pressed frame carrying said roll, a take-up roll located in rear of the support, means for turning said take-up roll, and a driving connection between the take-up roll and the printing-cylinder.

708,936. REVERSING VALVE-GEAR. ANDREW R. LEITWEIN, Pueblo, Colo., assignor of one-half to Emmett H. Scantlin, Pueblo, Colo. Filed Mar. 4, 1902. Serial No. 96,977. (No model.)



Claim.—1. A reversing-gear, comprising a reversing-slide, a guide-shoe embracing the same, a rocking arm pivoted to the reversing-slide and connected with the valve-rod, a lever jointed to the shoe and adapted to oscillate it, and means for reversing the inclination of the shoe and slide substantially as described.

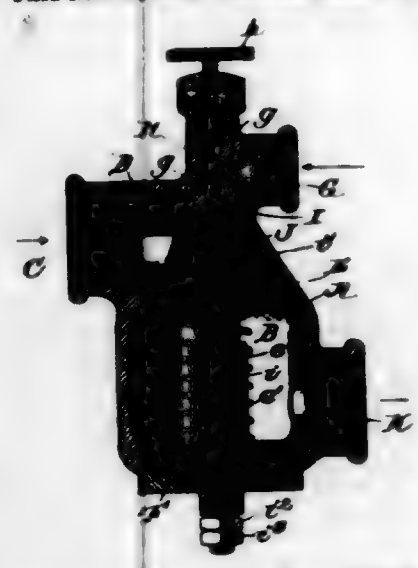
2. A reversing-gear, comprising a reversing-slide, a guide-shoe embracing the same, a rocking arm pivoted to the reversing-slide and connected to the valve-rod, a lever jointed to the shoe and adapted to oscillate it, an eccentric for oscillating the lever, and means for reversing the inclination of the shoe and slide substantially as described.

3. A reversing-gear, comprising a reversing-slide, a guide-shoe embracing the slide, a rocking arm pivoted to the reversing-slide and connected to the valve-rod, a lever jointed to the shoe and adapted to oscillate it, a connecting-rod jointed to the top of the reversing-slide, and means for adjusting the same to reverse the inclination of said slide and shoe substantially as described.

4. A reversing-gear comprising a reversing-slide, a guide-shoe embracing the slide, a rock-shaft with one arm extending down to and jointed to the slide and another arm extending upwardly and connected to the valve-rod, a lever fulcrumed in the middle and jointed at one end to the shoe, an eccentric connected to the opposite end of said lever, a rod connected to the top of the reversing-slide, and a rock-shaft with an arm jointed to said connecting-rod and provided with operating mechanism under the control of the engineer substantially as described.

5. A reversing-gear, comprising a guide and a rectilinear slide moving therein, a supporting device for the guide pivoted thereto and arranged to vibrate the same over the slide, means for reversing the inclination of the guide and slide and an arm jointed to the slide and connected to the valve-rod substantially as described.

708,987. VAPORIZER FOR EXPLOSIVE-ENGINES. JOSEPH LIBOTTE, Quincy, Mass., assignor of one-half to Mellen H. Bray, Boston, Mass. Filed Nov. 21, 1901. Serial No. 83,088. (No model.)



Claim.—1. In a vaporizing device the combination of a mixing-chamber, an air-chamber, above the mixing-chamber, an air-valve between said chambers provided with a stem extending outside the mixing-chamber, a gasolene-valve above the air-valve having a stem extending through the stem of the air-valve and provided with a shoulder for determining the movement of the air-valve with relation to the gasolene-valve, a spring between the valves, and a spring for holding the air-valve to its seat, substantially as described.

2. In a vaporizing device the combination of a mixing-chamber an air-chamber, an air-valve between said chambers, a gasolene-valve above said air-valve having a spreading-surface extending substantially to the periphery of the air-valve, and connections between said valves whereby the air-valve opens before and closes after said gasolene-valve, substantially as described.

3. In a vaporizing device the combination of an air-valve having a stem, a gasolene-valve on the opposite side of the air-valve from said stem, a spring tending to separate said valves, and a connection between said valves allowing a limited relative movement between said valves, substantially as described.

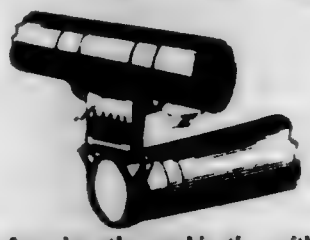
4. In a vaporizing device the combination of a mixing-chamber B, an air-chamber D, an air-valve E between the chambers provided with a stem *e* extending outside the chamber B, a gasolene-valve I above valve E having a stem *i* extending through stem *e* and provided with an adjustable shoulder i^3, a spring i' between the valves and a spring e' for holding valve E to its seat, substantially as described.

5. In a vaporizing device the combination of an air-valve provided with a hollow stem, a gasolene-valve having a stem extending through said hollow stem and having a shoulder for engaging the end of said hollow stem, and a spring between said valves, substantially as described.

708,988. NECK-YOKE ATTACHMENT. DAVID H. LUSE, Chinook, Mont. Filed Mar. 20, 1902. Serial No. 100,599. (No model.)

Claim.—1. The combination of the tongue, the thimble fitting on the point of the tongue and having a forwardly-facing shoulder, and a bayonet-slot in advance of said shoulder, the coupling-sleeve provided internally with a pin to enter said slot, the bracing band or ring secured

around the front end of said sleeve and provided at its upper side with an extension elongated laterally providing a cross-bar for the connecting-strap, the neck-yoke, and the connecting-strap connected with the neck-yoke and looped around the cross-bar of the bracing-ring substantially as set forth.



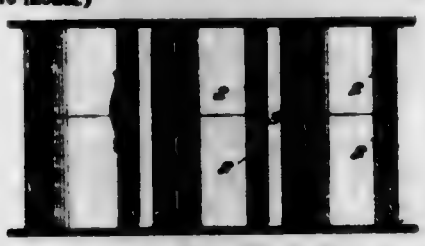
2. In a neck-yoke fastening, the combination with the pole, of the thimble upon and at the extremity of the point thereof, the sleeve fitted over and secured to said thimble, the bracing-ring secured upon the said sleeve and provided at its upper side with an extension, and the neck-yoke-connecting devices secured to said extension, substantially as set forth.

3. The combination of the sleeve to fit and be secured upon the end of the pole, the bracing band or strap secured upon and rigidly to said sleeve and spaced at its upper side away from and above the sleeve to afford means for engagement by the neck-yoke connection, the neck-yoke, and the neck-yoke connection secured to the spaced-away portion of the bracing-band substantially as set forth.

4. The combination of the pole or tongue provided on its tip end with a thimble and with a forwardly-facing shoulder, the coupling-sleeve fitting on said thimble and against said shoulder, the bracing band or ring secured around the thimble and having at its upper side a spaced-away portion, the neck-yoke, and the neck-yoke connection secured to said spaced-away portion, substantially as set forth.

5. In a neck-yoke fastening the combination of the neck-yoke, the coupling-sleeve to fit on the pole, the bracing-band secured for a portion of its length to the band and having a portion extended above and spaced away from the band, and the neck-yoke connection secured to the said spaced-away portion, substantially as set forth.

708,939. DEVICE FOR SUPPORTING PHONOGRAPH-RECORDS. GEORGE MADISON, Sandusky, Ohio. Filed Feb. 17, 1902. Serial No. 94,429. (No model.)



Claim.—1. A device for storing and transporting phonograph-records, and similar articles, consisting of a two-part holder or supporter, each part being provided with an equal number of record-supporting cylinders, correspondingly arranged, said cylinders having an outer surface of yielding material and provided at their bases with a head or flange, the cylinders of each part being adapted to fit into the opposite ends of the records, said cylinders being so arranged as to hold said records out of contact with each other.

2. A device for storing and transporting phonograph-records, and similar articles, consisting of a two-part holder or supporter, each part being provided with an equal number of record-supporting cylinders, correspondingly arranged, said cylinders having an outer surface of yielding material, and provided at their bases with a head or flange, the cylinders of one part having their outer ends rabbeted to fit the corresponding cylinders of the other part, the cylinders of each part being adapted to fit into the opposite ends of the records, and so arranged as to hold their record-surfaces out of contact with each other.

3. A device for storing and transporting phonograph-records, and similar articles, consisting of a two-part holder or supporter, each part composed of a suitable base and an equal number of record-supporting cylinders correspondingly arranged thereon, the cylinders of each part being slightly greater in length than one-half the length of the record, so as to support the ends of the records free from the bases, said cylinders provided with an outer surface of yielding material, and the corresponding cylinders of each part adapted to fit into the opposite ends of the records, all constructed and arranged to hold the records out of contact with each other.

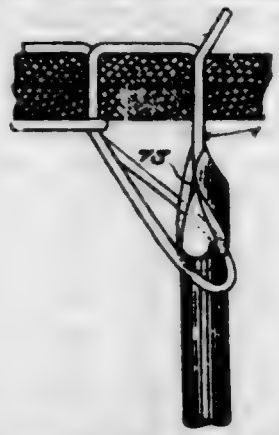
4. A device for storing and transporting phonograph-records, and similar articles, consisting of a two-part holder or supporter, each part being provided with a number of record-supporting cylinders, correspondingly arranged, the cylinders of each part being adapted to fit into the opposite ends of the records and hold them out of contact, and a slidable spring mounted in each cylinder adapted to assist in holding the cylinders in position when the device is in position to support a record, and to be slid into the cylinder when not in use.

708,940. PROCESS OF THE FUSION OF METALS. HERMANN A. E. MEYER, Creusthal, Germany, assignor to Cöln-Müsener Bergwerks Action Verein, Creusthal, Westphalia, Germany. Filed Dec. 12, 1901. Serial No. 85,640. (No specimens.)

Claim.—1. The process of effecting the fusion of hardened masses, particularly the residues or slag in furnaces, which consists in supplying a jet of gas under pressure to said masses, said jet containing sufficient oxygen to burn the components of said mass and being of such a high pressure as to remove the molten masses out of the pit formed by said masses when melted, substantially as described.

2. The process of effecting the fusion of hardened masses particularly the residues or slag in furnaces which consists in applying a jet of gas under pressure to said masses, said jet being composed of any combustible gas and a surplus of oxygen to melt said masses and burn the components thereof, said jet being of such a high pressure as to remove the molten masses out of the pit formed by said masses when melted.

708,941. SEWING-MACHINE NEEDLE. FRANK W. HERRICK, Boston, Mass. Filed June 24, 1901. Serial No. 65,737. (No model.)



Claim.—1. A straight hooked sewing-machine needle, having a thread deflecting and detaining flange between its barb and point, substantially as described.

2. A straight hooked sewing-machine needle, having a spiral thread deflecting and detaining flange between its barb and point, substantially as described.

708,942. ELECTRIC-MOTOR POWER-TRANSMITTING DEVICE. EVERETT S. MILLER and GUSTAVE C. MARX, Elizabeth, N. J., assignors to Diehl Manufacturing Company, a Corporation of New Jersey. Filed Nov. 30, 1901. Serial No. 84,258. (No model.)

Claim.—1. The combination with a sewing or other machine to be driven, of an electric motor the shaft of which is separate from said machine and which motor-shaft is provided with a brake-wheel, a brake to

engage said wheel and which is mounted on the motor-frame, and a switch, to make and break the electric circuit, connected with said brake so that when the circuit is broken the said brake will be applied to said brake-wheel, and when the circuit is closed the said brake will be removed from said wheel.

2. The combination with a sewing or other machine to be driven, of an electric motor the shaft of which is separate from said machine and which motor-shaft is provided with a pulley and a brake-wheel, a brake to engage said brake-wheel and which brake is mounted on the motor-frame, a switch, to make and break the electric circuit, connected with said brake so that when the circuit is broken the said brake will be applied to said brake-wheel, and when the circuit is closed the said brake will be removed from said wheel, and a rheostat having a series of contacts with any one of which the said switch may be placed in contact when the circuit is to be closed.

3. The combination with a sewing or other machine to be driven, of an electric motor separate from said machine and the shaft of which is provided with a pulley and a brake-wheel, a brake to engage said brake-wheel and which brake is mounted on the motor-frame, a switch, to make and break the electric circuit, connected with said brake so that when the circuit is broken the said brake will be applied to said wheel, and when the circuit is closed the said brake will be removed from said wheel, a rheostat having a series of contacts with any one of which the said switch may be placed in contact when the circuit is closed, and a heel-and-toe treadle positively connected with said brake.

4. An electric motor the shaft of which is provided with a pulley for transmitting power and with a brake-wheel, combined with a spring-pressed brake-lever mounted on the motor-frame and provided with a brake normally pressed against said brake-wheel by its controlling-spring.

5. The combination with a stand or table comprising side frames or legs and a brace connecting the same, of a machine to be driven mounted on said stand or table and provided with a pulley, an electric motor having a hinged or pivoted connection with the said brace and the shaft of which motor is provided with a pulley to be belted to the said first-named pulley, so that by changing the position of said motor, by swinging it on its hinged or pivotal connection with said brace, the belt connecting said pulley may be tightened or loosened, and means for securing said motor in any desired position of adjustment.

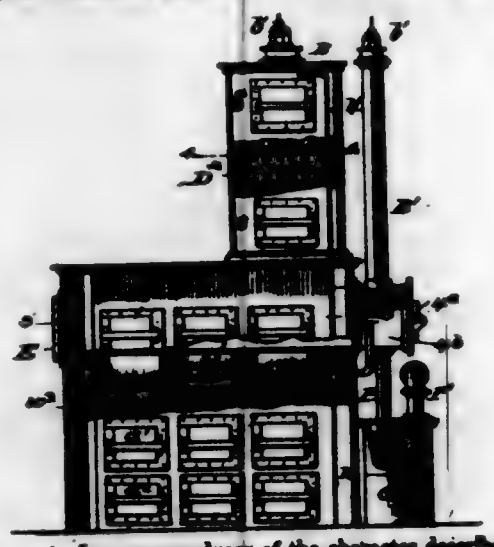
6. The combination with a sewing-machine stand comprising legs or side frames and a connecting-brace, said stand being provided with a treadle, of an electric motor pivotally mounted in said stand and provided with a pulley and a brake-wheel, a sewing-machine supported by said stand and having a pulley to be driven, a brake to engage said brake-wheel, means for adjusting said motor on its hinged or pivotal mounting on said stand and for holding said motor in any desired position of adjustment, and a rheostat having a series of contacts to be engaged by said switch; the parts being so arranged that when said treadle is moved to disengage said brake from the brake-wheel the current may be turned onto said motor and so that the electric circuit may be broken when the said brake is applied to said brake-wheel.

7. The combination with a sewing-machine or similar stand or table provided with a treadle and with means for mounting a treadle-operated driving-wheel in or on said stand or table, of an electric motor provided with means whereby it may be attached to said stand or table interchangeably with and in the place at which the said driving-wheel is normally mounted, so that the motor-attaching devices occupy the position usually occupied by the driving-wheel mountings when the said electric motor is employed as a substitute for foot-power.

8. The combination with a stand or table provided with bearings suitable for receiving the hand-wheel shaft and driving-wheel of a treadle driving device, and with a treadle mounted in the lower portion of said stand or table, of a machine to be driven mounted on said stand or table, an electric motor having a frame provided with journals fitted to said hand-wheel shaft-bearings, means for maintaining said motor-frame stationary upon said stand or table when applied thereto, means for controlling the operation of said motor, a connection from said controlling means to said treadle, and a connection from said motor to said machine to be driven.

9. The combination with a stand or table and a machine to be driven mounted thereon, of an electric motor the shaft of which is separate from the shaft of the machine to be driven and which motor-shaft is provided with a brake-wheel, a brake mounted on the motor-frame adjacent to said brake-wheel, and a treadle mounted in the lower part of said stand or table and positively connected with said brake so that the frictional pressure of said brake on said brake-wheel may be controlled by said treadle.

708,948. GAS-PRODUCING APPARATUS. JOHN H. MILLER, Jr. Irwin, Pa. Filed Jan. 24, 1902. Serial No. 91,067. (No model.)



Claim.—1. In a gas-producer of the character described, the combination with the main structure including the vertical walls thereof, a vertically-disposed generating-chamber, a valved stack therefor, and means for feeding vaporized oil into the said vertical chamber; of the horizontal chamber, consisting of a metal shell endwise slidable and detachably supported in the vertical walls of the main structure, said shell having an intake in communication with the generating-chamber, a closure-cap for one end of said shell, and an extension for the other end, provided with a valved draft flue or stack and gas-outlet, all being arranged substantially as shown and for the purposes described.

2. In a gas-producing apparatus of the character described, comprising in combination, a main structure, having a series of parallel vertically-disposed generating-chambers 1, 2 and 3, a blast and a steam-injector means cooperatively joined therewith, the division-walls between the chambers 1, 2 and 3 having openings for joining said chambers, the horizontal chamber 4, having an opening in communication with the chamber 3, and having an extension provided with a valved stack and an outlet, the vaporizer-chamber D, in communication with the chamber 1, and having a valved draft-stack and an oil-supply for said chamber D, all being arranged substantially as shown and for the purposes described.

708,944. NON-REFILLABLE BOTTLE. CHARLES F. MITCHELL. Baltimore, Md. Filed June 4, 1901. Serial No. 63,069. (No model.)

Claim.—1. A non-refillable bottle substantially as described having its neck composed of upper and lower sections weakened at the juncture of such sections and provided internally with a hateful groove or chamber, the plug fitting in said neck and provided with a groove for the locking-bails and with a socket leading from such groove for the ends of the bails, and the locking-bails having their ends seated in said sockets

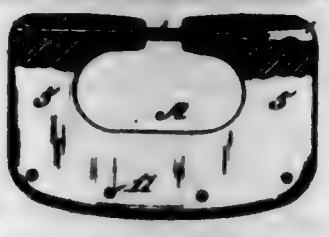
and arranged to be compressed entirely within the outer circle of the plug and to spring outwardly into locking engagement within the lateral groove or chamber within the neck substantially as set forth.

2. The combination of the bottle, the plug having circumferential grooves and provided at the ends thereof with sockets, and the balls having their body portions fitted to be housed in the grooves of the plug and their ends journaled and fitting in all positions of the balls in the sockets at the ends of said grooves, substantially as set forth.

3. A non-refillable bottle comprising the neck the plug fitted to close said neck and the locking-balls carried by the plug and pivotally connected at their ends therewith whereby they may be adjusted to lock the plug in the bottle-neck or to position to serve as handles for withdrawing the plug substantially as set forth.

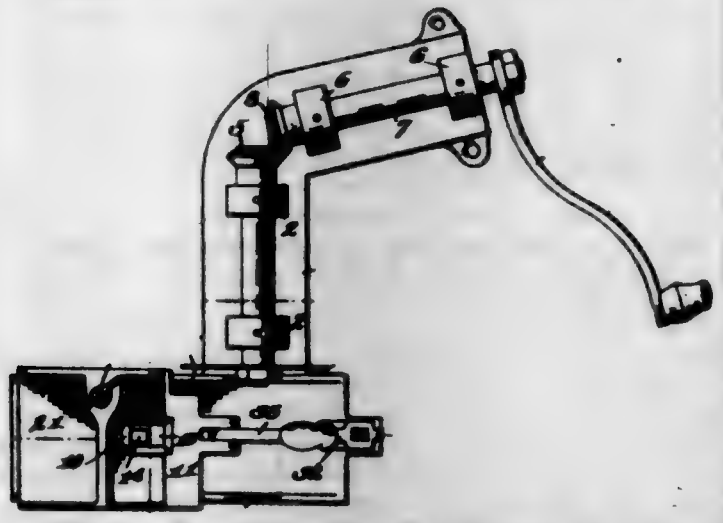
4. The combination of the bottle having an external downwardly-facing shoulder and the guards extended over the ends of the neck at right angles to each other, and having their side bars provided at their lower ends with practically rigid arms projecting beneath and extended circumferentially under the shoulders of the neck, substantially as set forth.

708,945. CALF-WEANER. GEORGE W. HOOBY, Newmire, Colo. Filed Dec. 24, 1901. Serial No. 87,062. (No model.)



Claim.—In a calf-weaner, a barbed body having arms arranged to enter the nostrils, and arranged to straddle the wall thereof, and each of said arms being bored, a pin adapted to have its ends seated in the bores and to extend through the said wall, and having a notch, and a protuberance in the bore arranged to enter said notch.

708,946. METAL-SAWING APPARATUS. CHARLES O. HORGAN, Redwood Falls, Minn. Filed Apr. 3, 1902. Serial No. 101,264. (No model.)



Claim.—1. In a sawing-machine, the combination with a base or framework having upwardly-extending parallel rails thereon, a saw-shaft at right angles to said rails and a saw carried thereby, of a longitudinally-movable work-table mounted upon said rails, having depending flanges which bear against the sides of said rails for preventing lateral movement of said table, and having an elongated slot therein, a support secured to said base between said rails, a projection upon the upper end of said support extending through said slot and a spring-washer upon the upper end of said projection engaging the upper side of said table, as and for the purpose set forth.

2. In a sawing-machine, the combination with a base or framework, having upwardly-extending parallel rails thereon, a saw-shaft at right angles to said rails, and a saw carried thereby, of a longitudinally-movable work-table, mounted upon said rails, having depending flanges thereon, which bear against the sides of said rails for preventing lateral displacement of said table and having a longitudinal depression therein provided with an elongated slot in its bottom wall forming ledges or shoulders, a support secured to said base between said rails, a projection on the upper end of said support extending through said slot and a washer on the upper end of said projection bearing against said shoulders or ledges for preventing the upward movement of said table.

3. In a sawing-machine, the combination with a base or framework having upwardly-extending parallel rails thereon, a saw-shaft at right angles to said rails and a saw carried thereby, of a longitudinally-movable work-table mounted upon said rails, having depending flanges thereon which bear against the sides of said rails for preventing lateral displacement of said table, and having a longitudinal depression therein provided with an elongated slot in its bottom wall forming ledges or shoulders, a support secured to said base between said rails, a projection on the upper end of said support extending through said slot, a spring-washer surrounding said projection and bearing against said shoulders or ledges, and a nut upon the upper end of said projection, as and for a purpose set forth.

4. In a metal-sawing machine, the combination with a base having two sets of uprights thereon, of a saw-shaft mounted to turn in one set of said uprights having a saw upon one end and a pinion upon the other, a drive-shaft mounted to turn in the other set of said uprights, set at an angle to said saw-shaft and having a pinion on one end meshing with the pinion on said saw-shaft, and a crank on the other end, a pair of rails secured to said base, a work-table mounted to slide on said rails, means for clamping the work to said table, an operating-lever fulcrumed to said base, and a link connecting said lever with said work-table for moving the same longitudinally toward and away from said saw.

708,947. COMBINED FIRE POKER AND TONGS. JAMES O. MOYER, Burlington, Iowa. Filed Mar. 3, 1902. Serial No. 96,418. (No model.)

Claim.—1. The combined fire tongs and poker, comprising the bar having spring bifurcations at one end portion thereof, and the slidable sleeve adapted to inclose and convert said bifurcations into a rigid rod, substantially as specified.

2. The combined fire tongs and poker, comprising the bar having spring bifurcations at one end portion thereof, the slidable sleeve adapted to inclose and convert said bifurcations into a rigid rod, and means for locking said sleeve in position at the limit of its forward movement, substantially as specified.

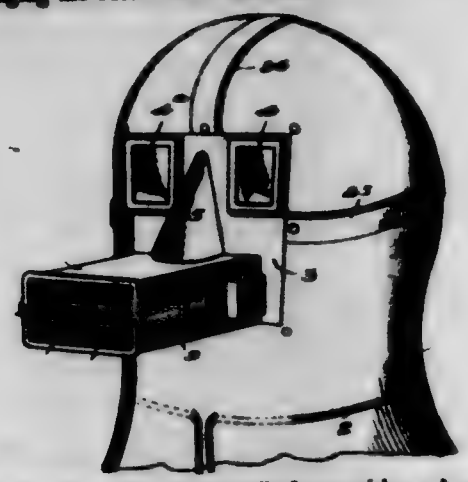
3. The combined fire tongs and poker, comprising the bar having spring bifurcations provided with end portions adapted to come together to form a solid end, and having stop-shoulders, the slidable sleeve for closing said bifurcations, and abutting at the limit of its forward movement against said stop-shoulders, substantially as specified.

4. The combined fire tongs and poker, comprising the bar having the spring bifurcations at one end and the handle extension at the opposite end portion, the slidable sleeve adapted to inclose and convert said bifurcations into a rigid rod, and having an elongated slot and a pin connection with said bar, said slot having a locking-offset at one end, substantially as specified.

708,948. RESPIRATOR. LOUIS H. A. HUTH, Winona, Minn. Filed Feb. 4, 1902. Serial No. 92,889. (No model.)

Claim.—1. A device of the character described comprising a hood adapted to cover the head of the wearer, a metallic plate forming a portion of said hood and provided with window-openings; a hollow projection adapted to fit the nose; springs secured to the opposite sides of the inner surface of said projection; a box projecting from said metallic plate; valves within said box; a sleeve fitting within the outer end of said box

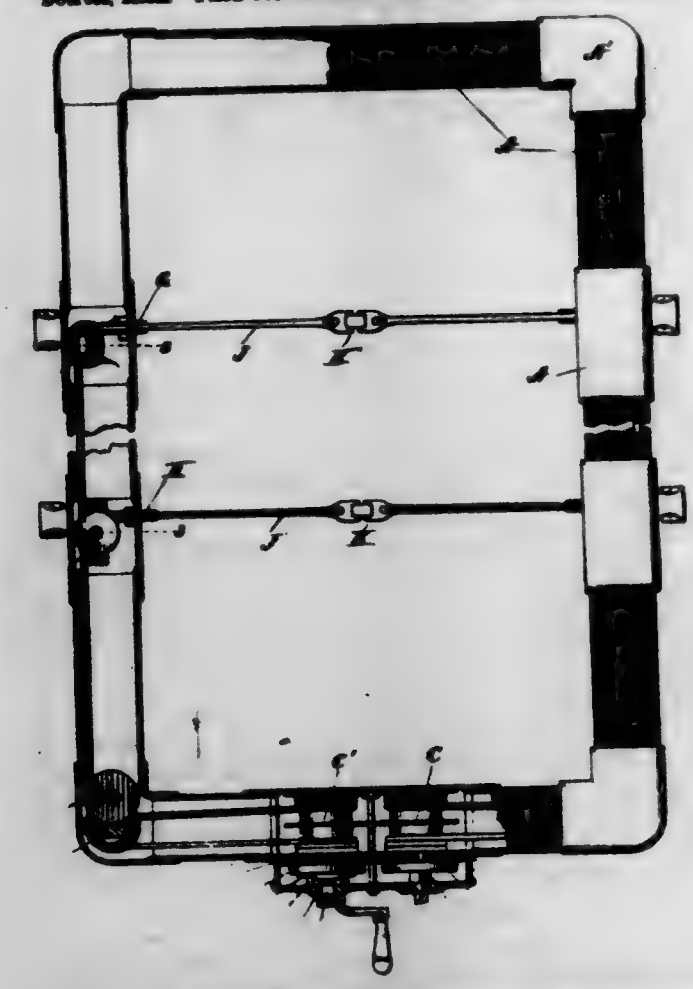
and closed by a screen; and oppositely-disposed springs secured to the box and engaging the outer end of the sleeve.



2. A device of the character described comprising a hood, a metallic plate forming a portion of the hood and having windows, a box projecting from said metallic plate, a filter-casing within said box, a valve controlling said filter-case, a laterally-extending exhalation-passage, a valve for said passage, a sleeve extending within the outer end of the box and fitting over the filter-casing, and means for detachably securing said sleeve in position.

3. A device of the character described comprising a hood, a metallic plate forming a portion of the hood and provided with window-openings, a hollow projection adapted to fit over the nose of the wearer, springs oppositely disposed within said hollow projection, a box projecting from the metallic plate below the nose projection, a filter-case within said box formed with a contracted inner end, an inwardly-opening valve at the inner end of the filter-casing, a mouthpiece at the inner end of said box, a laterally-extending exhalation-pipe, an outwardly-opening valve at the end of said pipe, a sleeve fitting over the filter-casing and closed by a screen, and means for detachably securing said sleeve within the outer end of the box.

708,949. CASKET-LOWERING DEVICE. HORACE B. MURDOCK, Detroit, Mich. Filed Oct. 16, 1901. Serial No. 78,856. (No model.)



Claim.—1. In a casket-lowering device, the combination of a spring-operated drum, a second drum operatively connected to said first drum ropes carried by said drums, and means for regulating the speed of said drums.

2. In a casket-lowering device, the combination with a spring-operated drum, a second drum operatively connected to said first drum, a friction-clutch engaging said second drum for regulating the speed of said drums, and ropes carried by said drums.

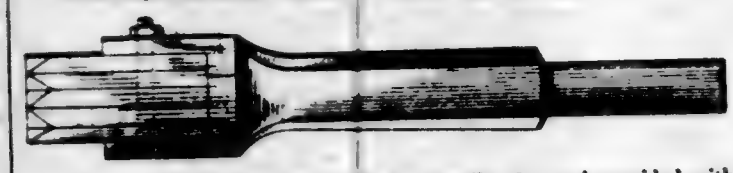
3. In a casket-lowering device, the combination with the frame, of a hollow chamber formed in said frame, a pair of shafts revolubly mounted in said hollow chamber, a spring-operated drum secured fast to one of said shafts, a second drum operatively connected to said first drum loosely mounted on the other of said shafts, ropes carried by said drums, and means engaging said second drum for regulating the speed of said drums.

4. In a casket-lowering device, the combination with the frame, of a hollow chamber formed in said frame, a pair of shafts revolubly mounted in said hollow chamber, a drum secured fast to one of said shafts, a second drum, operatively connected with said first drum, loosely mounted on the other of said shafts, a wedge-plate mounted on said second shaft and operative longitudinally thereof, clutches in said second drum, engaging said wedge-plate, means for operating said wedge-plate for regulating the speed of said drums, and ropes carried by said drums.

5. In a casket-lowering device, the combination with the frame, of a pair of revoluble drums, provided with an enlarged annular casing at one end thereof, mounted in said frame, a coiled spring inclosed in the casing of one of said drums, secured at its ends to said casing and frame, a clutch mechanism in the annular casing of said other drum, for controlling the speed of said drums, and ropes carried by said drums.

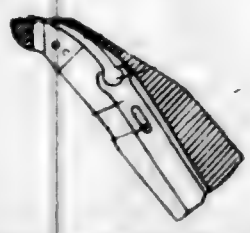
6. In a casket-lowering device, the combination with the hollow frame, of an enlarged chamber formed in said frame, a pair of shafts revolubly mounted in said enlarged chamber, a drum secured fast to one of said shafts, a second drum operatively connected with said first drum, loosely mounted on the other of said shafts, screw-threads on said second shaft, a wedge-plate mounted on said second shaft, engaging said screw-threads, clutches in said second drum, engaging said wedge-plate, pulleys suitably disposed in said hollow frame, and ropes reeving over said pulleys and connected to said drums.

708,950. BUSH-CHISEL. JOHN W. MCCLURE, Richmond, Ind. Filed Sept. 10, 1901. Serial No. 74,971. (No model.)



Claim.—The combination with the handle of a tool provided with integral ears and formed with a longitudinal groove or channel at its end, located between said ears, of tools having shanks, said tools having tenons and said tools located between the ears and seated with their tenons in said groove and having their cutting edges arranged in zigzag fashion, and a through-bolt for clamping the tools to said ears, substantially as set forth.

708,951. PEG-CUTTER FOR HORNS OF PEGGING-MACHINES. JOHN R. BICKFORD, Whitman, Mass. Filed Jan. 6, 1902. Serial No. 88,695. (No model.)

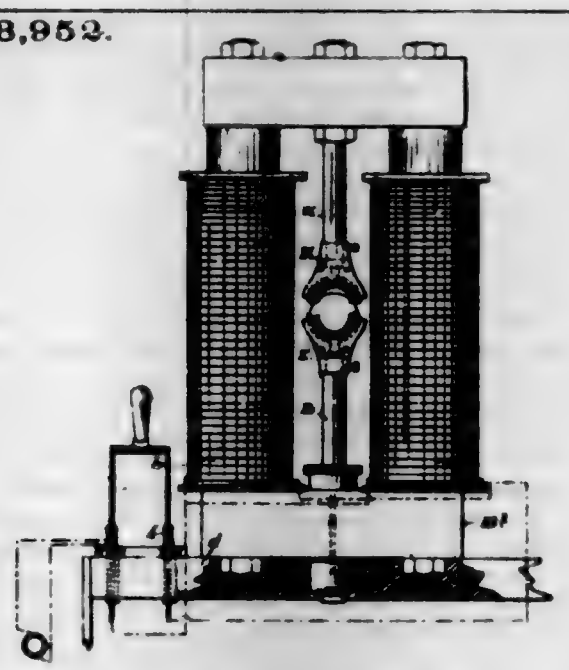


Claim.—In a rotating-horn pegging-machine; a peg-cutting knife adapted to move forward toward and over the edge of a stationary knife, thereby pressing into the leather of the shoe, whereby the peg is sheared from the surface of the said leather; and mechanism for operating said knife; a stationary knife adapted to coöperate with the moving knife, substantially as and for the purpose set forth.

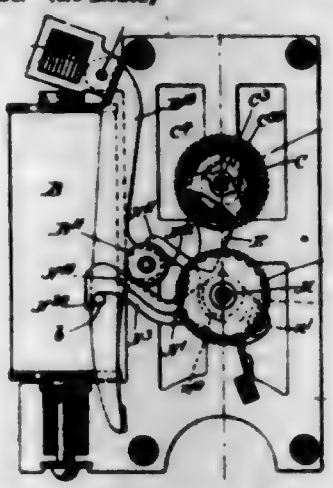
708,952. ELECTROMAGNETIC CAPPING-MACHINE. LOUIS J. BORIE, San Francisco, Cal. Filed Oct. 8, 1901. Serial No. 77,972. (No model.)

Claim.—In a capping-machine comprising a stationary head supporting a jaw or die, and a movable head carrying a similar jaw or die, of means for adjusting one jaw relatively to the other to vary the degree of pressure exerted on the piece of work introduced between the jaws consisting of a rod supporting one jaw having a screw-threaded end portion, an aperture in the head through which the rod is fitted to slide, a cup-shaped cap on the threaded end, a spring interposed between the head and the cap, and a nut on the threaded portion of the rod above the head having a bearing on the top face of the head, for operation as set forth.

708,952.



708,953. SELF-WINDING ELECTRIC CLOCK. CHARLES M. CROCK, Bristol, Conn., assignor to the National Self Winding Clock Company, Elgin, Ill., a Corporation of Illinois. Filed Mar. 9, 1901. Serial No. 50,428. (No model.)



Claim.—1. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; a striking-train and its motor and winding device; mechanism by which the electromagnet operates the winding device; said winding device comprising a non-continuous ratchet which is actuated in one direction in the winding action and in the reverse direction in the running down of the train.

2. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; a strike-train and its motor and winding device; mechanism by which the electromagnet operates the winding device, said device comprising a non-continuous ratchet which is actuated in one direction in the winding action and in the reverse direction in the running down of the train; a pawl engaging the ratchet in the direction for winding up, and means for causing the pawl to be withdrawn out of the range of the ratchet in its retracting movement.

3. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; a time-train and a striking-train and their respective motors and winding devices; mechanism by which the electromagnet operates both winding devices; the winding device of the striking-train comprising a non-continuous ratchet which is moved in one direction in winding up, and in the opposite direction in the running down of the train.

4. In an electrically-wound clock, an electromagnet and its armature, and the circuit in which the magnet is energized; a time-train and a striking-train, and their respective motors and winding devices; mechanism by which the same movement of the armature winds the motors of both trains; the winding device of the striking-train comprising a non-continuous ratchet which is moved in one direction in winding up and in the opposite direction in the running down of the train.

5. In an electrically-wound clock, an electromagnet and its armature, and the circuit in which the magnet is energized; a striking-train and its motor and winding device, and means by which the movements of the armature operate said winding device; the latter comprising a non-continuous ratchet-wheel which is actuated in one direction in the winding action and in the opposite direction in the running down of the train; and a pawl for engaging the ratchet in the direction for winding up; and means for causing the pawl to be withdrawn out of the range of the ratchet in its retracting movement.

6. In an electrically-wound clock, an electromagnet and a circuit in which it is energized; a time-train and a striking-train and their respective motors and winding devices; the armature of the electromagnet and a lever-arm extending therefrom actuating the winding-up devices of both trains; circuit making and breaking devices in the time-train for periodically causing the magnet to be energized; the winding devices of the striking-train comprising a non-continuous ratchet-wheel which is actuated in one direction in the winding action, and in the reverse direction in the running down of said train; and means causing the pawl to withdraw out of the range of the ratchet in its retracting movement.

7. In an electrically-wound clock, in combination with the winding-shaft and the ratchet thereon, a lever fulcrumed on the shaft and a pawl fulcrumed on the lever; the winding-magnet and its armature; the lever-arm on the armature having an abutment which engages with the pawl in the winding movement in direction to throw it into winding engagement with the ratchet, whereby the lever is actuated through the medium of the pawl after the latter is engaged by the ratchet, and the reverse movement takes the pawl out of the range of the ratchet.

8. In an electrically-wound train, in combination with the winding-shaft and ratchet thereon, a winding-lever; a stop for its retreating movement; a pawl fulcrumed on the lever; the armature-lever arm arranged to encounter the pawl in the winding movement and throw it into engagement with the ratchet; said pawl having an arm which is actuated by the armature-lever in its retreating movement to hold the pawl out of engagement with the ratchet after the winding-lever is stopped.

9. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; the winding-shaft drum or barrel, and the lever-arm for rotating the same to wind the motor device; said arm having a cam-track or face which is substantially straight; the armature of the electromagnet, and lever-arm extending therefrom, having an abutment which bears against the straight face or cam-track of the winding-arm; the proportions of the parts and the relation of the armature-lever fulcrum to the winding-shaft axis being such as to cause the abutment on the armature-lever to move in a path whose chord makes an acute angle with the position of the straight face or cam-track of the winding-lever at the commencement of the winding action, and a greater angle, approximating a right angle therewith, at the culmination of said action.

10. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; the winding-shaft drum or barrel, and the lever-arm for rotating the same to wind the motor device; said lever-arm having a cam-track or face which is substantially straight and radial to the shaft; the armature-lever having an abutment which bears against the said radial face or cam-track of the winding-lever; the length of the armature-lever arm being sufficiently different from the distance between its fulcrum and the winding-shaft axis to permit the abutment to clear said shaft as the lever swings in toward the latter in its winding action, whereby the path of the abutment makes an acute angle with the radial face of the lever at the commencement of the winding action, and approximately a right angle therewith at the culmination of said action.

11. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; a time-train and a striking-train, and their respective motors and winding devices; the armature of the electromagnet, and a lever-arm extending therefrom, and winding-levers for the winding devices of the time and striking trains respectively, arranged to be encountered by an abutment on the armature-lever as the armature approaches the magnet, the parts being so disposed that the points of contact of the abutment with the levers approach the shaft respectively in the winding action, and so that the encounters of the armature-lever with such winding-levers are successive and not simultaneous; the winding-lever first encountered being so disposed with respect to the armature-fulcrum that the abutment passes the point of nearest approach to the shaft and commences to recede therefrom before the culmination of the winding movement of the other shaft.

12. In an electrically-wound clock in combination with the winding mechanism and the electric circuit for energizing it a contact making and breaking device comprising two contacting parts, one in said circuit, and the other not in the circuit, one of said parts being rotated with the train, and the other elastically pressed upon such rotating part in a direction tending to rotate the same.

13. In an electrically-wound clock in combination with the winding device and the electric circuit in which they are energized; a contact making and breaking device comprising two parts in the circuit one of which is elastically pressed upon the other; and a third part, not in the circuit, which is rotated by the running of the train and which holds the elastically-pressed part out of contact with the other during the intervals between winding, the pressure of said elastically-pressed part operating on said third part in direction tending to rotate the latter.

14. In an electrically-wound clock, an electromagnet and the circuit

in which it is energized; the time-train and its motor, and means by which the movement of the magnet-armature winds said motor; a contact-making and breaking device, comprising an element carried by a shaft of the time-train, consisting of a disk connected in the electric circuit and a deflecting-disk in juxtaposition thereto not in the circuit; a spring-finger in the circuit pressing elastically toward the periphery of the deflecting-disk and elastically deflectable laterally from the plane of said disk; said deflecting-disk having a lateral bevel tending to deflect the finger onto the periphery of the circuit-disk, said disks being of equal radius at a distance circumferentially from the foot of the bevel; whereby the spring-finger is permitted to react laterally off from the circuit-disk onto the deflecting-disk when the disks have rotated through the angle between the foot of the bevel and said point of equal radius, the spring-finger being disposed with respect to the periphery of the deflecting-disk so as to press thereon non-radially and in the direction in which the disk rotates in the running movement of the train; whereby said pressure assists such running movement.

15. In an electrically-wound clock, an electromagnet and the circuit in which it is energized; a time-train and its motor; and mechanism whereby the magnet-armature winds such motor; a circuit making and breaking device, comprising an element carried by the shaft of the time-train, consisting of a disk connected in the electric circuit and a deflecting-disk in juxtaposition thereto not in the circuit; a resilient finger in the circuit pressing toward the periphery of the deflecting-disk and elastically deflectable laterally from the plane of said disk; said deflecting-disk having a lateral bevel tending to deflect the finger onto the periphery of the circuit-disk, said disks being of equal radius at a distance circumferentially back from the foot of the bevel, whereby the resilient finger is permitted to react off from the insulated disk onto the deflecting-disk when the disks have rotated through the angle between the foot of the bevel and said point of equal radius; the periphery of the deflecting-disk being eccentric, diminishing in radius from the point at which the finger returns to it to the point at which said finger is deflected off from it.

708,954. LINE-SPACING-LOCK MECHANISM FOR TYPE-WRITING MACHINES. ROBERT J. FISHER, Athens, Texas, assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed Apr. 30, 1901. Serial No. 58,181. (No model.)

Claim.—1. In a type-writing machine, the combination with the line-spacing element located at one end of the machine-frame, of spacing-lock mechanism disposed to lock said element, and a release device for said mechanism mounted on the machine-frame at a point intermediate of the ends of the machine.

2. In a type-writing machine, the combination with a rotary line-spacing element, of spacing-lock mechanism disposed to lock said element against movement in either direction, and a releasing device operatively related to the spacing-lock mechanism and mounted on the machine-frame at a point intermediate of the ends of said frame.

3. In a type-writing machine, the combination with a rotary line-spacing element, of line-spacing mechanism, and spacing-lock mechanism operatively related to the rotary line-spacing element and to each other for interdependent operation, and a releasing device mounted on the machine-frame at a point remote from the spacing-lock mechanism intermediate of the ends of the machine, said releasing device being operatively connected with the spacing-lock mechanism.

4. In a type-writing machine, the combination with a line-spacing element, and a spacing-lock, of a plurality of independent releasing-levers for releasing said lock, and line-spacing mechanism separate from but disposed to operate one of said levers and the line-spacing element.

5. In a type-writing machine, the combination with a line-spacing element, an actuator, and a spacing-lock, of a spacing-lock lever separate from the spacing-lock and actuator respectively but disposed for actuation by said actuator.

6. In a type-writing machine, the combination with a line-spacing element, an actuator, and a spacing-lock, of a separate spacing-lock lever separate from but disposed to operate the spacing-lock and provided with a tailpiece disposed in the path of the actuator for actuation thereby.

7. In a type-writing machine, the combination with a line-spacing element, an actuator having independent movement, and a spacing-lock, of a spacing-lock lever separate from but disposed to operate the spacing-lock and provided with a tailpiece disposed in the path of the actuator for actuation thereby during the independent movement of the latter.

8. In a type-writing machine, the combination with a line-spacing element, a spacing-lock, and an actuator having a projection, of a spacing-lock lever separate from but disposed to operate the spacing-lock and having a tailpiece located to be moved by said projection and to be sustained thereby during the movement of the line-spacing element under the impulse of the actuator.

9. In a type-writing machine, the combination with a line-spacing element, a spacing-lock, and a swinging actuator having a projection and mounted for limited independent movement, a spacing of lock-lever for operating the spacing-lock and having a longitudinally-curved tailpiece disposed in the path of said projection during the independent movement of the actuator and designed to rest upon the projection while the actuator is swung to operate the line-spacing element.

10. In a type-writing machine, the combination with a frame having a frame-bar intermediate of its ends, of spacing-lock mechanism located at a point removed from the bar, and a releasing device contiguous to the bar and having operative relation with the spacing-lock mechanism, whereby the bar may be grasped and the releasing device operated simultaneously with the hand.

11. In a type-writing machine, the combination with a frame comprising a vertical frame-bar located intermediate of its ends, of spacing-lock mechanism located at or adjacent to one end of the frame, and a releasing device for said mechanism located at or adjacent to the vertical frame-bar, whereby the bar may be grasped and the releasing device operated simultaneously with one hand.

12. In a type-writing machine, the combination with a frame comprising a vertical frame-bar, of spacing-lock mechanism disposed at a point removed from the bar, a releasing-lever carried by and disposed opposite the bar, and suitable connections intermediate of the releasing-lever and locking mechanism.

13. In a type-writing machine, the combination with a frame, and spacing-lock mechanism, of a releasing-lever carried by the frame at a point removed from the spacing-lock mechanism, a spacing-lock shaft operatively related at one end to the spacing-lock mechanism and provided with a crank-arm connected to the releasing-lever.

14. In a type-writing machine, the combination with a line-spacing element, and a pair of locking members engaging the line-spacing element to lock it against movement in different directions, of an actuator and means for moving the locking members to their released positions through the movement of the actuator.

15. In a type-writing machine, the combination with a line-spacing element, and a pair of locking members engaging said element to retain it against movement in either direction, of a plurality of independent releasing devices, each of which is operatively related to the locking members to effect the simultaneous actuation of the latter.

16. In a type-writing machine, the combination with a line-spacing element, and a pair of locking members engaging said element to lock it against movement in either direction, of a spacing-lock shaft disposed for rotation to effect the simultaneous movement of said locking members to their released positions, and means for actuating the shaft.

17. In a type-writing machine, the combination with a line-spacing element, and a pair of locking members engaging said element to lock it against rotation in either direction, of a spacing-lock shaft and a lever, each having direct and independent engagement with the locking members to effect the simultaneous movement of said members to their released positions.

18. In a type-writing machine, the combination with a line-spacing element, and a pair of locking members engaging said element to lock it against movement in either direction, of a spacing-lock lever provided with a spreading-pin disposed between the locking members, and a spacing-lock shaft having a spreading-head likewise disposed between the members, whereby the locking members may be thrown out of engagement with the spacing element through the medium of either the shaft or the lever.

19. In a type-writing machine, the combination with a line-spacing element, and a pair of locking members disposed to engage said spacing element to lock it against movement in either direction, of a spacing-lock lever provided with a tailpiece and with a spreading-pin disposed between the locking members, a spacing-lock shaft provided with a spreading-head likewise disposed between the locking members and having a crank-arm at its opposite end, a releasing-lever connected to said crank-arm, and an actuator disposed to actuate the spacing element and provided with a trip-pin disposed to engage the tailpiece of the spacing-lock lever.

20. In a type-writing machine, the combination with a line-spacing element, of a pair of locking members arranged to engage said element, reactive means for retaining the locking members in their locked positions, and means for spreading the locking members against the resistance of the reactive means to effect the simultaneous disengagement of said members from the line-spacing element.

21. In a type-writing machine, the combination with a line-spacing element, and a pair of coaxial divergently-related pivoted locking members disposed to engage said element, said locking members being formed to present contiguous parallel faces and angularly-related cam-faces, of a spreading-head disposed between the parallel faces of the locking members, a spreading-pin disposed between the angularly-related faces thereof, and means for actuating the spreading-head and the spreading-pin respectively to swing the locking members out of engagement with the line-spacing element.

22. In a type-writing machine, the combination with a line-spacing element and an actuator, of a pair of locking-dogs engaging said element to positively lock the same against movement in either direction.

23. In a type-writing machine, the combination with a line-spacing element, and means for actuating the same, of a pair of angularly-related locking-dogs engaging the line-spacing element at different points to lock the same positively against movement in either direction, and means for effecting the simultaneous disengagement of said dogs from the line-spacing element.

24. In a type-writing machine, the combination with a line-spacing element and means for actuating the same, of a pair of locking-dogs swung from a common axis and engaging the line-spacing element at different points to lock the same against movement in either direction.

25. In a type-writing machine, the combination with a line-spacing element and actuating means, of a pair of locking-dogs swung from a common axis and engaging the line-spacing element at different points to retain the latter against movement in either direction, and means for moving said dogs out of engagement with the line-spacing element.

26. In a type-writing machine, the combination with a line-spacing element, and means for actuating the same, of a pair of locking-dogs engaging the line-spacing element at different points to lock the same positively against movement in either direction, and means for effecting the simultaneous disengagement of said dogs from the line-spacing element.

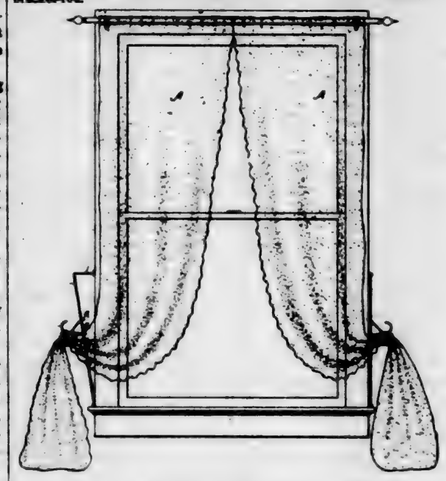
27. In a type-writing machine, the combination with a line-spacing element, and means for actuating the same, of a pair of angularly-related locking-dogs engaging the line-spacing element at different points to lock the same positively against movement in either direction.

708,955. CURTAIN-FIXTURE. EDWARD FLESH, Milwaukee, Wis. Filed May 20, 1901. Serial No. 61,491. (No model.)

Claim.—1. In a device for draping the lower ends of curtains, the combination with the side of a supporting-frame; of a supporting-bracket rod; a hook formed with forked shank-arms of elastic material and provided with bracket-receiving apertures therein; said arms being adapted to spread sufficiently when in normal position to cause the bracket-rod to bind in said apertures.

2. The combination of a curtain-supporting frame; an angular bracket connected with said frame; a slidable hook supported on said bracket; having means for automatically locking said hook at any desired point of adjustment upon said bracket, said hook being adapted, by the angular shape of its supporting-bracket, to be adjusted nearer to, or farther away from, said curtain-supporting frame, substantially as specified.

3. In a device for draping the lower ends of curtains, the combination with the side of a supporting-frame; of a supporting-bracket rod; a curtain-holding device formed of a piece of resilient wire doubled upon itself and bent in the form of a hook, with the free ends extending divergently to form a forked shank, and looped to form end apertures for the insertion of the bracket-rod: said shank ends being normally separated sufficiently to cause the looped ends of the wire to bind on the bracket-rod.



708,956. DRAFT-RIGGING. JAMES R. OSBUN, Thayer, Mo., assignor of one-half to Henry A. Clark, Thayer, Mo. Filed Oct. 21, 1901. Serial No. 79,453. (No model.)

Claim.—1. In a draft-rigging, the combination with a body-bolster having upper and lower members, of draft-timbers connected to and embraced by the members of the body-bolster and also projected in front and rear thereof, and a filling-block located between the draft-timbers and embraced by the members of the body-bolster.

2. In a draft-rigging, the combination with draft-timbers, of a body-bolster comprising top and bottom members embracing the draft-timbers between the ends thereof, the opposite ends of the lower member being inclined upwardly and connected to the upper member, abutments located between the draft-timbers and in front and rear of the body-bolster, front and rear springs bearing against the respective abutments, a draft-connection between the springs and extending between the upper and lower members of the bolster, and a draw-bar engaged with one of the springs.

3. In a draft-rigging, the combination of spaced draft-timbers, an in-

intermediate spacing-block held between the timbers, and a body-bolster secured transversely across the draft-timbers and the spacing-block, whereby said timbers project in front and rear of the body-bolster, the latter and the spacing-block being provided with corresponding vertical openings for the reception of a king-bolt.

4. In a draft-rigging, the combination with spaced draft-timbers, of an intermediate spacing-block held therebetween, and a body-bolster comprising upper and lower members disposed transversely of the draft-timbers and embracing the same and the filling-block, the latter and the members of the body-bolster being provided with corresponding king-bolt openings.

5. In a draft-rigging, the combination of spaced draft-timbers having front and rear pairs of longitudinal slots, a filling-block held rigidly between the timbers and also located between the front and rear pairs of slots, front and rear cross-heads working in the front and rear slots and projected at opposite sides of the timbers, links connecting the corresponding ends of the opposite cross-heads and lying at the outer sides of the timbers, front and rear springs bearing in opposite directions against the respective ends of the filling-block and the adjacent cross-heads to force the latter outwardly in opposite directions, and a draw-bar connected to one of the cross-heads.

6. In a draft-rigging, the combination of spaced draft-timbers having front and rear pairs of longitudinal slots, a filling-block held rigidly between the timbers and also located between the front and rear pairs of slots, wear-plates held rigidly against the respective front and rear ends of the filling-block, whereby the block forms rigid abutments for the wear-plates, front and rear cross-heads working in the front and rear slots and projected at opposite sides of the timbers, links connecting the corresponding ends of the opposite cross-heads and lying at the outer sides of the timbers, front and rear springs bearing in opposite directions against the respective wear-plates and the adjacent cross-heads to force the latter outwardly in opposite directions, and a draw-bar connected to one of the cross-heads.

7. In a draft-rigging, the combination with opposite draft-timbers, of a filling-block interposed between the timbers, the contiguous sides of the timbers and the spacing-block being provided with corresponding vertical notches, keys driven into the corresponding notches, transverse fastenings piercing the timbers, the keys and the filling-block, and a draft-spring bearing against one end of the filling-block.

8. In a draft-rigging, the combination with opposite draft-timbers, of a filling-block held between the same and located intermediate of the ends thereof, the inner faces of the timbers being provided with corresponding vertical notches at the respective ends of the filling-block, the wear-plates held in the pairs of corresponding notches, helical springs located between the timbers and bearing against the respective wear-plates, channel-irons secured to the inner faces of the timbers and overlapping the opposite sides of the respective springs, followers slidably mounted in the channel-irons and bearing against the outer ends of the springs, a coupler bearing against the front follower, a cross-head carried by the coupler and having its opposite ends projected through slots formed in the opposite draft-timbers, a cross-head bearing against the rear follower and having its opposite ends projected through slots formed in the draft-timbers, and opposite connecting-rods having terminal links connected to the corresponding ends of the opposite cross-heads.

9. In a draft-rigging, the combination with opposite draft-timbers, of an intermediate filling-block, a body-bolster secured transversely across the draft-timbers and the filling-block, the latter and the body-bolster being provided with corresponding king-bolt openings, front and rear draft-springs located between the draft-timbers and bearing against the opposite ends of the filling-block, a coupler located between the forward ends of the draft-timbers and bearing against the front spring, front and rear cross-heads for the respective springs and having their ends slidably projected through longitudinal slots formed in the draft-timbers, and opposite connections between the corresponding ends of the cross-heads.

10. In a draft-rigging, the combination with opposite draft-timbers, of a stationary filling-block held between the same, the inner face of the timbers being provided with open-ended vertical notches at one end of the filling-block, a wear-plate held in the notches, a helical spring located between the timbers and bearing against the wear-plate, channel-irons secured to the inner faces of the timbers and overlapping the opposite sides of the spring, the channel-irons being separate from the wear-plate, a follower slidably mounted in the channel-irons and bearing against the outer end of the spring, a coupling bearing against the follower, and a cross-head carried by the coupling and having its opposite ends working in openings formed in the draft-timbers.

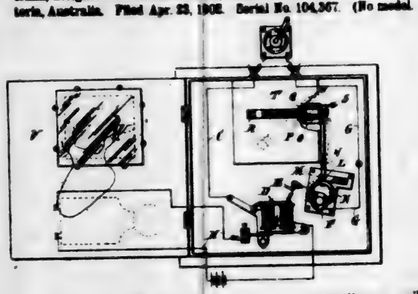
11. In a draft-rigging, the combination with opposite draft-timbers, of a filling-block snugly fitted between the timbers, upper and lower bolster members embracing the top and bottom of the draft-timbers and the filling-block, the contiguous faces of the draft-timbers and the filling-block being provided with corresponding vertical notches, and keys driven into the respective pairs of corresponding notches and lying against the opposite sides of the bolster members.

12. In a draft-rigging, the combination with opposite timbers, of a filling-block interposed between the timbers, top and bottom bolster members embracing the filling-block and the draft-timbers, fastenings piercing the bolster members and the respective draft-timbers, the contiguous faces of the draft-timbers and the filling-block being provided with corresponding notches located at opposite sides of the bolster members, keys driven into the pairs of corresponding notches and lying against opposite sides of the bolster members, and fastenings piercing the draft-timbers, the filling-block and the respective keys at corresponding sides of the bolster members.

13. In a draft-rigging, the combination with opposite draft-timbers having their inner faces provided with corresponding vertical open-ended notches, a fixed wear-plate fitted in said notches, channel-irons secured to the inner faces of the draft-timbers and located in front of the wear-plate, the channel-irons being separate from the wear-plate, a spring supported by the channel-irons and bearing against the wear-plate, a follower working in the channel-irons and bearing against the spring, and a coupling connected to the follower.

14. In a draft-rigging, the combination of opposite draft-timbers, a filling-block held between an intermediate portion of the same, a body-bolster comprising top and bottom members embracing the draft-timbers and the filling-block and having their corresponding ends mutually connected, the top and bottom bolster members and the filling-block being provided with vertically-alined king-bolt openings, a coupling located between the timbers and in front of the filling-block, a buffing-spring interposed between the coupling and the filling-block, a cross-head carried by the coupling and projected outwardly through longitudinal slots formed in the draft-timbers, a buffer-spring located between the draft-timbers and bearing against the rear end of the filling-block, a cross-head bearing against the rear end of the rear spring and having its opposite ends projected through longitudinal slots formed in the draft-timbers, and connections between the corresponding ends of the cross-heads, said connections lying upon the outer sides of the respective timbers and between the top and bottom members of the body-bolster.

708,957. SEMAPHORE-INDICATOR FOR ELECTRIC SIGNALING. HARRY GULLIVER, South Yarra, near Melbourne, Victoria, Australia, assignor of one-half to Henry Greer Robinson, Melbourne, Victoria, Australia. Filed Apr. 23, 1902. Serial No. 104,367. (No model.



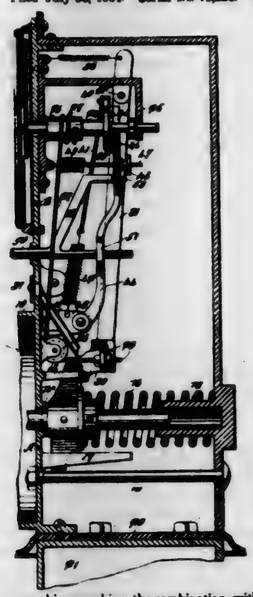
Claim.—1. A semaphore-indicator for electric signaling on railways, tramways and the like, consisting of an electromagnet, an oscillating horseshoe magnetic armature, a rocking bar carrying said armature, an upwardly-extending lever-arm on said rocking bar, a rod or spindle having a crank-arm thereon, a semaphore carried thereby, and a link connecting the crank-arm on said rod or spindle with said lever-arm, substantially as described.

2. In indicators for electric signaling on railways, tramways and the like, an electromagnet, an oscillating horseshoe magnetic armature mounted slightly out of center, with its legs on either side of said electromagnet, the ends being approximately in line with the center of the core, a signal and means connected to said armature for actuating a signal substantially as specified.

708,958. SECTIONAL SHOE-LAST. NILS F. HAGSTRÖM, Brooklyn, N. Y. Filed Apr. 11, 1901. Serial No. 55,322. (No model.)

Claim.—The combination in a sectional shoe-last, of the sole part *a*, having the instep-recess, and the sloping rear end, and also having the groove *i*, *i'*, in said end and recess; the angle-plate *j*, *j'* provided with the dovetail groove *k* lengthwise in the part *j* and fitted in said groove *i*, *i'*, the heel part *c* of the last having the dovetail rib *m* adapted to fit the groove *k*, the instep part *b* of the last fitted in the instep-recess of the sole part, and the screw *o* connecting the rear extremity of the instep part with the sole part by screwing into the part *j* of the angle-plate attached to the rear end and top of the sole part *a*.

708,959. PUNCHING-MACHINE. JOHN HEIMBERGER, New York, N. Y. Filed July 30, 1901. Serial No. 70,228. (No model.)



Claim.—In a punching-machine, the combination, with the casing, a dial, a pointer, and rotary shaft carrying the latter and having a disk 30, of a slidable, spring-pressed, pad-carrying shaft, a pivoted lever, and means for operatively connecting it with the pad-shaft, a rope connecting the pivoted lever with the pointer-carrying shaft, so that the swinging movement of one effects rotation of the other, means for retracting the pointer-carrying shaft, the pivoted lever 44 bearing at its free upper end upon said disk 30, a spring holding the lever in frictional engagement with the disk, and means for varying the pressure, and the slidable trip-bars projecting through the front of the casing and engaging at the inner end the lever 44, all operating as shown and described.

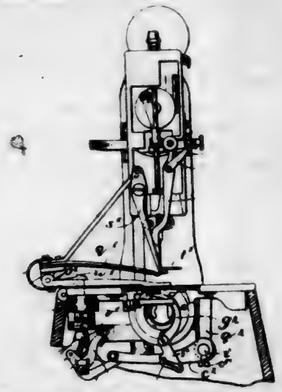
708,960. CUTTING ATTACHMENT FOR SEWING-MACHINES. GEORGE S. HILL, Haverhill, Mass., assignor, by mesne assignments, to The Singer Manufacturing Company, a Corporation of New Jersey. Filed Jan. 13, 1899. Serial No. 702,620. (No model.)

Claim.—1. In a sewing-machine, stitch-forming devices, comprising an upper-thread mechanism, and an under-thread mechanism, a stationary blade, a movable blade, said blades being located under the work, and being adapted to cut both the upper and the under threads, and means for automatically actuating said movable blade to cut said threads immediately upon the completion of a stitching operation, whereby said work may be removed from the machine.

2. In combination with a two-thread sewing-machine, a stationary blade located below the work, a movable blade having two cutting edges, (one for the upper thread and the other for the under thread,) and means for actuating the movable blade.

3. In a sewing-machine, stitch-forming devices comprising upper-thread mechanism and under-thread mechanism, a cutting device for severing the under thread, and means for drawing out the under thread to leave an end of sufficient length for the next stitch.

4. In a sewing-machine, an upper-thread mechanism, an under-thread mechanism, a cutting device for severing the under thread, and a pivoted pull-off for drawing out the under thread whereby it will be sufficiently long for the next stitch.



5. In a sewing-machine, an upper-thread mechanism an under-thread mechanism, a cutting device for severing the under thread, a pull-off for the under thread, and means for actuating the cutting device and the pull-off.

6. In a sewing-machine, upper-thread mechanism, under-thread mechanism, a cutting device for severing the under thread, and a pull-off movable relatively to the cutting device for drawing out the under thread.

7. In a sewing-machine, upper-thread mechanism, under-thread mechanism, a cutting device for severing the under thread, and a pull-off independent of said cutting devices for drawing out said under thread to provide a loose end of sufficient length for the next stitch.

8. A sewing-machine, comprising under-thread mechanism, a pull-off for drawing out the under thread, a cutting device for severing the thread, means for actuating both the pull-off and the cutting device, and means for locking the first said means to hold the said pull-off in an inoperative position.

9. A sewing-machine, comprising an under-thread mechanism, a pull-off for drawing out the thread, a cutting device for severing the under thread, means for actuating both the pull-off and the cutting device, and mechanism comprising toggle-levers for intermittingly locking said means against movement.

10. In a sewing-machine, the combination with a stitch-forming mechanism, including an upper needle and its bar, of a device for severing the needle-thread located below the work, and an automatic device for engaging said thread between the needle-eye and the work and drawing the severed end of said thread out of the work without moving said work.

11. In a sewing-machine, the combination with a stitch-forming mechanism, including an upper needle and its bar, of a device for severing the needle-thread, an automatic kicker for drawing the severed end of the thread out of the work, and means for maintaining said kicker inoperative during the operation of the stitch-forming mechanism.

12. In a sewing-machine, the combination with a stitch-forming mechanism, of a device located below the work for severing the thread, a kicker for drawing out the severed end of the thread, and means including toggle-levers for holding said kicker in a non-operative position.

13. In a sewing-machine, the combination with a stitch-forming mechanism, of a device located below the work for severing the needle-thread, a kicker for drawing out the severed end of the thread, means including toggle-levers for holding said kicker in a non-operative position, and an automatically-acting device for unlocking said toggle-levers.

14. In a sewing-machine, the combination of the lower clamp, a pivoted lever, an upper clamp secured thereto, a kicker for the thread pivoted to the standard, a link connecting the lever with the kicker, a spring for raising the lever up so as to move the upper clamp away from the lower clamp and the kicker into its operative position, and toggle-levers for locking said lever down with the upper clamp against the lower clamp and the kicker in an inoperative position.

15. In a two-thread sewing-machine, the combination with a stitch-forming mechanism, of a cutting device for the threads, a lever for drawing out the under thread prior to its being severed, and means for varying the movements of the said device and the said lever.

16. A sewing-machine comprising a driving-shaft for the stitch-forming mechanism, a cutting device for severing the thread, a movable bar connected medially with the said device for operating it; and a cam

on the said shaft, against which the bar is adapted to press, said cam being adjustable relatively to said shaft.

17. A sewing-machine including a continuously-rotating shaft, a driving-shaft for the stitch-forming mechanism, belt-shifting mechanism, a device for cutting the thread, a device for drawing out the severed end of said thread, means for operating the belt-shifting mechanism and both said devices and mechanism including a hand-operated key for connecting said means with said continuously-rotating shaft.

708,961. LINE-SPACING MECHANISM FOR TYPE-WRITING MACHINES. CHARLES F. LOGANER, Cleveland, Ohio, assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed Feb. 7, 1901. Serial No. 46,378. (No model.)

Claim.—1. A line-spacing mechanism for type-writing machines, comprising a single actuator, and spacing means including separate devices for fixed or predetermined spacing and for universal spacing, the latter being adjustable, said spacing means and actuator being relatively movable to effect an operative relation between the actuator and either of said devices without disturbing the adjustment of the universal-spacing device.

2. A line-spacing mechanism for type-writing machines comprising actuating means, and fixed and adjustable stop elements coöperating with said actuating means to provide respectively for fixed and universal spacings, either of said stop elements being shiftable into and out of operative position without disturbing the adjustment of the adjustable stop element.

3. A line-spacing mechanism for type-writing machines comprising an actuator, and a device having fixed and adjustable elements coöperating with said actuator to provide respectively for fixed and universal spacings, said device being shiftable to move either of said elements into or out of its operative position without disturbing the adjustment of the adjustable element.

4. A line-spacing mechanism for type-writing machines comprising an actuator, and a single device having fixed and adjustable elements coöperating with said actuator to provide respectively for fixed and universal spacings, said device being shiftable to move all of the elements simultaneously for the purpose of presenting any one of them in operative relation with the actuator without disturbing the adjustment of the adjustable element.

5. A line-spacing mechanism for type-writing machines comprising actuating means, and shiftable fixed and adjustable stop elements coöperating with said actuating means and arranged for movement into and out of their operative positions without disturbing the adjustment of the adjustable stop element.

6. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable device having fixed and adjustable stop elements coöperating with said actuator to provide for fixed and universal spacings and shiftable to present either of the stop elements to the actuator without disturbing the adjustment of the adjustable stop element.

7. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device comprising means for effecting a plurality of fixed or predetermined adjustments for the movement of the actuator, and also for the universal adjustment thereof.

8. A line-spacing mechanism for type-writing machines comprising an actuator, and a single stop device comprising means for effecting a plurality of fixed or predetermined adjustments for the movement of the actuator, and also for the universal adjustment thereof.

9. A line-spacing mechanism for type-writing machines comprising an actuator, and a single shiftable device having fixed and adjustable stop elements coöperating with the said actuator to provide respectively for fixed or predetermined and universal spacings.

10. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable stop device having a plurality of contacts adapted to coöperate with said actuator to determine the play thereof, one of said contacts being capable of individual adjustment.

11. A line-spacing mechanism for type-writing machines comprising an actuator, and a single shiftable stop device having a plurality of contacts disposed to be simultaneously shifted and adapted to individually coöperate with the actuator, one of said contacts being capable of individual adjustment.

12. A line-spacing mechanism for type-writing machines comprising an actuator, and a single stop device having a plurality of fixed contact-points, and a universal-adjustment element, which are arranged to individually coöperate with the actuator.

13. A line-spacing mechanism for type-writing machines comprising an actuator, and a single stop device shiftable transversely across the path of the actuator and having a plurality of contacts individually coöperating therewith, one of said contacts being capable of individual adjustment.

14. A line-spacing mechanism for type-writing machines comprising an actuator, and a single stop device shiftable in a plane intersecting the path of movement of the actuator and having a plurality of fixed contact-points for predetermined spacings, and a universal-adjustment element for universal spacing, said fixed contact-points and the universal-adjustment element individually coöperating with the actuator.

15. A line-spacing mechanism for type-writing machines comprising actuating mechanism and a stop device having fixed contact-points for predetermined spacings, and an adjustable stop-screw for universal spacing.

16. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable stop device having a plurality of fixed contact-points for predetermined spacings, and an adjustable stop-screw for universal spacing.

17. A line-spacing mechanism for type-writing machines comprising an actuator, and a single shiftable stop device having a plurality of fixed contact-points for predetermined spacings, and an adjustable stop-screw for universal spacing.

18. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device arranged for adjustment in a plane intersecting the path of the actuator and having individual elements for fixed and universal spacings.

19. A line-spacing mechanism for type-writing machines comprising an actuator, and a single shiftable stop device adjustable in a plane intersecting the path of movement of the actuator and having a fixed stop element provided with a plurality of fixed contact-points, and an adjustable stop-screw, the latter and said contact-points being arranged to be individually presented to the actuator.

20. A line-spacing mechanism for type-writing machines comprising an actuator, a shiftable stop device having a stop element whose active portion is disposed obliquely or at an inclination to provide a plurality of stop-points for the actuator and a universal stop element also carried by the stop device and shiftable into and out of the path of the actuator.

21. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable stop device having a stepped series of stop-shoulders coöperating with the actuator, and an independently-adjustable universal stop element.

22. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable stop device having a stop element provided with an active contact portion arranged to present a plurality of stop-points in different planes, and a universal-adjustment element shiftable with said stop device.

23. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device consisting of a rotary head having a universal-adjustment element shiftable into and out of the path of the actuator.

24. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable stop device consisting of a suitably-supported rotary head having a plurality of fixed contact-points for predetermined spacings, and a universal-adjustment element.

25. A line-spacing mechanism for type-writing machines comprising an actuator, a suitably-arranged support, and a shiftable stop device consisting of a rotary head mounted upon the support and having a plurality of fixed stop-points for predetermined spacings, and a universal-adjustment element.

26. A line-spacing mechanism for type-writing machines comprising an actuator, and a shiftable stop device having an adjustable stop-screw movable into and out of the path of the actuator.

27. A line-spacing mechanism for type-writing machines comprising a spacing element, an actuator, and a stop device disposed to normally retain the actuator in positive engagement with the spacing element to act as a boldback-dog for the machine.

28. A line-spacing mechanism for type-writing machines comprising a spacing element, a pivoted actuator, and a stop device disposed for presentation to the actuator in front of the pivot to hold said actuator in positive engagement with the spacing element to act as a boldback-dog for the machine.

29. A line-spacing mechanism for type-writing machines comprising a spacing element, a pivoted actuator coöperating therewith, and a stop device disposed for presentation to the actuator at the side of its pivot opposite the spacing element to hold said actuator normally in engagement with said spacing element.

30. A line-spacing mechanism for type-writing machines comprising a spacing element, a pivoted actuator coöperating therewith, and a variable stop device disposed for presentation to the actuator at a point between the spacing element and the pivot of the actuator to normally hold said actuator out of engagement with the spacing element.

31. A line-spacing mechanism for type-writing machines comprising a spacing element, an actuator, and a shiftable stop device arranged to limit the movement of the spacing element and also disposed to locate the actuator normally in and out of engagement with the spacing element, as desired.

32. A line-spacing mechanism for type-writing machines comprising a spacing element, an actuator, and a shiftable stop device disposed for presentation to the actuator at either side of its pivot.

33. A line-spacing mechanism for type-writing machines comprising a spacing element, a movable support, means for urging the support, an actuator pivoted upon said support, and a shiftable stop device disposed for presentation to the actuator at either side of its pivot.

34. A line-spacing mechanism for type-writing machines comprising a spacing element, a pivoted actuator, and a rotary stop device disposed for presentation to the actuator at either side of its pivot.

35. A line-spacing mechanism for type-writing machines comprising a spacing element, a movable support, means for urging the support, an actuator pivoted upon the said support, and a rotary stop device disposed for presentation to the actuator at either side of its pivot.

36. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device consisting of a rotary head mounted opposite the pivotal point of the actuator and having a stop element presentable to the actuator at either side of the pivotal point thereof.

37. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device consisting of a rotary head having a plurality of fixed stop elements of different lengths, and an adjustable stop-screw, either of said stop elements or the stop-screw being shiftable into or out of the path of the actuator.

38. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device consisting of a rotary head having a plurality of arms, fixed stop elements carried by certain of said arms, and an adjustable stop element carried by one of the arms.

39. A line-spacing mechanism for type-writing machines comprising an actuator, and a stop device comprising a rotary head mounted directly opposite the bearing-point of the actuator and having a plurality of radial arms, stop-fingers of different lengths depending from certain of said arms, and an adjustable stop-screw piercing one of the arms and extending therebelow.

40. A line-spacing mechanism for type-writing machines comprising an actuator a stop device coöperating with the actuator and provided with a series of shallow depressions, a relatively fixed part opposed to the stop device, and a spring-urged stop-pin carried by the fixed part and yieldingly engaging the depressions in the stop device.

41. A line-spacing mechanism for type-writing machines comprising an actuator, a shiftable stop device having a plurality of fixed points for predetermined spacings and a universal-adjustment point, and a stop-retainer for retaining the stop device in position to present any of said points to the actuator.

42. In a line-spacing mechanism for type-writing machines, the combination with the movable machine member carrying a knurled wheel, of a single rocker-arm, a spacing-lever pivotally mounted upon said rocker-arm and provided at one side of the plane of its pivot with a gripping-shoe coöperating with said wheel, and stops shiftable into direct coöperative relation with the spacing-lever.

43. A line-spacing mechanism for type-writing machines comprising a spacing element, a rocker-arm, an actuator carried by the rocker-arm and coöperating with the spacing element, and a single operating-spring common to the rocker-arm and actuator.

44. A line-spacing mechanism for type-writing machines comprising a spacing element, a pivoted rocker-arm, an actuator pivoted upon said rocker-arm and provided with a notch, and a stop-pin extending into said notch from the rocker-arm.

45. A line-spacing mechanism for type-writing machines comprising a spacing element, an actuator coöperating with said spacing element, and a spring having one end fixed and its opposite end operatively connected to the actuator and disposed to be wound by the downward movement thereof.

46. A line-spacing mechanism for type-writing machines comprising an actuator and a stop device consisting of a plurality of fixed stop elements of different lengths, and an adjustable stop element, either of said fixed stop elements, or the adjustable stop element, being shiftable into or out of the path of the actuator.

47. A line-spacing mechanism for type-writing machines comprising a shiftable stop device having a plurality of fixed points for predetermined spacings and a universal-adjustment element, and means for retaining the stop device in position to present either of said fixed contact-points or the universal element in position for presentation to the actuator.

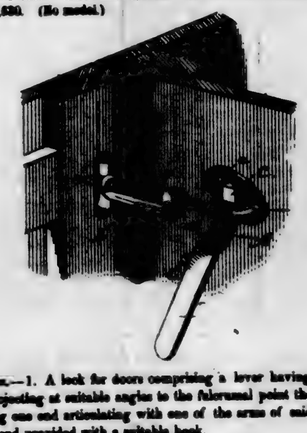
48. A line-spacing mechanism for type-writing machines comprising an actuator, a plurality of stops for predetermined spacing, an adjustable stop for universal spacing, and means for operatively connecting the several stops, whereby the displacement of one stop from the path of the actuator will effect its replacement by another of said stops.

49. In a line-spacing mechanism for type-writing machines, the combination with an actuator, of a universal stop element adjustable in one direction to regulate the throw of the actuator and shiftable in another direction to move said universal stop element into and out of the path of the actuator, and a fixed stop element shiftable with the universal stop element, whereby the shifting of one stop out of the path of the actuator will cause its replacement by the other stop element.

50. In a line-spacing mechanism for type-writing machines, the combination with an actuator, of a universal stop element adjustable to regulate the throw of the actuator, and shiftable into and out of the path of the actuator without disturbing adjustment of said stop element.

51. In a type-writing machine, the combination with an actuator, of a single device carrying individual means for fixed spacings and for universal spacings, said individual means being shiftable into and out of the path of the actuator without disturbing the adjustment of the universal-spacing means.

708,962. LOCK. JOHN F. LYDON, Davenport, Iowa, assignor to the International Manufacturing Company, Davenport, Iowa, a Corporation of Iowa. Filed Mar. 9, 1901. Renewed Nov. 26, 1901. Serial No. 83,630. (No model.)



Claim.—1. A lock for doors comprising a lever having the arms thereof projecting at suitable angles to the fulcrumal point thereof and a link having one end articulating with one of the arms of said lever and the other end provided with a suitable hook.

2. In a lock for doors, the combination with a lever having arms projecting at suitable angles to the fulcrumal point thereof of a link having one end articulating with one of the arms of said lever, and an adjustable hook carried by the other end of said link.

3. In a lock for doors the combination with a lever having arms projecting at suitable angles to the fulcrumal point thereof, of a link having one end articulating with one of the arms of said lever, and the other end portion screw-threaded, and a hook consisting of a short bar of metal having one end hook-shaped and the other end tapped to engage the screw-threaded end of the link.

4. A lock for doors comprising a T-shaped lever fulcrumed at the confluence of its arms, and a link one end of which is adapted to articulate with either of the alining arms, and the other end of which is provided with a hook.

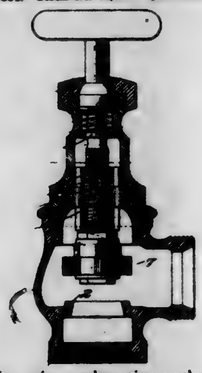
5. A lock for doors comprising a T-shaped lever fulcrumed at the confluence of its arms and having bearing-openings in the ends of its alining arms, of a link having its headed end bent laterally and adapted to be journaled in either of said openings and its other end provided with a suitable hook.

6. In a lock for doors, the combination with a T-shaped lever fulcrumed at the confluence of its arms, and having bearing-openings in the ends of its alining arms, of a link having its headed end bent laterally and adapted to be journaled in either of said openings, and having its other end portion screw-threaded, and a hook consisting of a short bar of metal having one end hook-shaped and the other end tapped to engage the screw-threaded end of the link.

7. The combination with a door and staple suitably secured thereto, and a door-frame and stop-pin projecting from the side thereof, of a lever having arms extending at suitable angles to each other from its fulcrum, and a link articulating at one end with one of said arms and having the other pin provided with a hook.

8. The combination with a door and staple suitably secured thereto, and a door-frame and stop-pin projecting from the sides thereof, of a lever having arms extending at suitable angles to each other from its fulcrum, having one end articulating with the shorter arm of said lever and having its opposite end portion screw-threaded, and an adjustable hook adapted to engage the screw-threaded portion of said link.

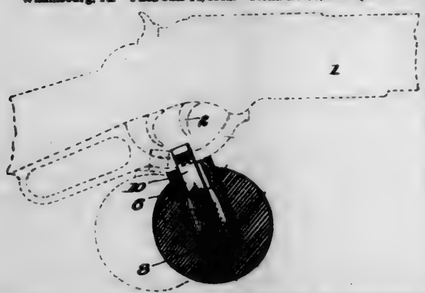
703,963. **VALVE.** CHARLES P. LYNCH, St. Louis, Mo., assignor to St. Louis University, St. Louis, Mo., a Corporation of Missouri. Filed Dec. 6, 1901. Serial No. 84,935. (No model.)



Claim.—1. In a valve, a valve-casing, a valve-stem, a cap having a seat in its lower face, an enlargement upon said stem fitting said seat, and a fixed casing portion extending under said enlargement and adjacent thereto: substantially as described.

2. In a valve, a casing having an inwardly-extending shoulder, a cap having a seat in its lower face, a valve-stem, an enlargement thereon fitting said seat, a spring about said stem and between said shoulder and said enlargement, and a collar upon said stem at substantially the point thereof which lies opposite said shoulder when the parts are assembled, said collar engaging said spring but being of less diameter than the same substantially as described.

703,964. **PALM-REST FOR FIREARMS.** HENRY MOSBAUGHER, Wilkinsburg, Pa. Filed Jan. 14, 1902. Serial No. 89,650. (No model.



Claim.—1. In a palm-rest for guns and the like, the combination of a spherical body portion, a casing secured in said body portion, a screw-threaded shank secured in said casing, and clamping members formed integral with said shank, substantially as described.

2. In a palm-rest for guns and the like, the combination of a spherical body portion having an opening formed therein, a cylindrical casing secured in said opening having a screw-threaded opening formed in the lower portion thereof, a screw-threaded shank secured in said screw-threaded openings, and clamps carried by said shank, all parts being arranged substantially as described and for the purpose set forth.

703,965. **SAFETY-PIN.** EDWARD MCCONNELL, Richmond, Va. Filed Apr. 4, 1902. Serial No. 101,415. (No model.)

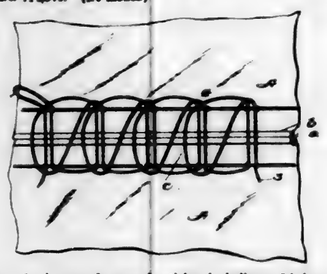
Claim.—1. A safety-pin comprising a body member formed of a coil of wire having a pin-point retainer near one end, and a pin member having one end fitted and secured to a plurality of convolutions of the body member opposite the keeper, the outer portion of said pin member being returned toward the keeper, substantially as described.

2. A safety-pin comprising a body member formed of a coil of wire having its convolutions near one end enlarged to form a keeper, and a pin member having one end passing into and secured to a plurality of the convolutions of the body member at the end opposite the keeper, and its outer portion returned toward the keeper, substantially as described.

3. The herein-described safety-pin consisting of a pin member and a body member, the body member comprising a coil of wire surrounding a straight bar, said bar and coil being unattached except at the end opposite the shield, as set forth.

4. A safety-pin comprising a body member formed of a coil of wire having a keeper at one end, and a stiffening-bar extending within the coil, and a pin member having one end fitted and secured to a plurality of convolutions of the body member at the end thereof opposite the keeper, and its outer end returned toward the keeper, substantially as described.

703,966. **COVERED SEAM FOR SEWED ARTICLES.** CHESTER MCNEIL, Chicago, Ill., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Apr. 26, 1899. Serial No. 714,579. (No model.)



Claim.—1. A seam for sewed articles, including a fabric, and parallel rows of loops passed into the fabric and out again upon the same face of the fabric in advance of the entering point, whereby the loops lie in the direction of the length of the seam, and an interlocking cross-thread for locking the loops upon the upper surface of the fabric at the point where they emerge therefrom; substantially as described.

2. The herein-described covered seam for sewed articles, comprising the two pieces of fabric A arranged with their edges abutting and united by a line of stitching *a* and a row of loops passing into each fabric and out again upon the same face of the fabric in advance of the entering point, said rows being parallel with each other, whereby the loops lie in the direction of the length of the seam, and an interlocking cross-thread for locking the loops upon the upper surface of the fabric at the point where they emerge therefrom, substantially as described.

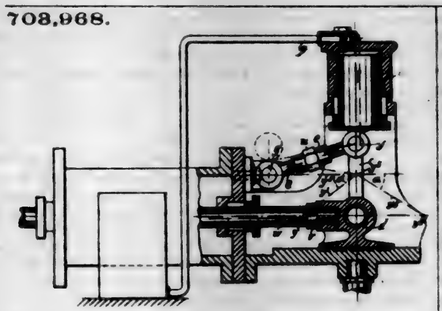
703,967. **PENCIL-SHARPENER.** WILLIAM O'BYRNE, New York, N. Y., assignor of one-half to William Winters, New York, N. Y. Filed Aug. 21, 1901. Serial No. 72,838. (No model.)

Claim.—A pencil-sharpener comprising a hollow cone, the angle of inclination thereof being less at its upper portion than that of the remainder thereof and formed with a spiral slot continuously extending throughout the length of the cone, including said upper portion, whereby a cutting edge is provided, a cylindrical extension below the base of the cone, and a finger-piece below said extension, said extension being formed with a horizontal slot and a vertical slot, the latter also extending through the finger-piece.

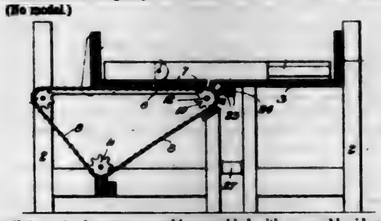
703,968. **STEAM-PUMP.** PHILIP F. ODDIE, Wimbledon, England. Filed Oct. 1, 1900. Serial No. 31,696. (No model.)

Claim.—In a steam-pump, the combination with the power-cylinder; of an auxiliary-cylinder set at an angle thereto, a lever pivotally connected to the piston of said power-cylinder, a secondary lever, having one end pivoted at a stationary point, and its other end connected to the free end of said first lever, means for adjusting the length of said second lever, a plunger in said auxiliary cylinder, abutting against the free ends of said jointed levers, a reservoir connected to said auxiliary cylinder, and a valve interposed between said cylinder and reservoir.

703,968.



703,969. **MATTRESS-STUFFING MACHINE.** HARRY W. PRENTPACKER, Allegheny, Pa. Filed Jan. 11, 1902. Serial No. 89,302. (No model.)



Claim.—1. A mattress-machine provided with a movable side and a normally stationary, laterally-adjustable flexible floor portion.

2. A mattress-machine provided with a permanent floor-section and a flexible floor adapted to form a continuation of the permanent floor-section.

3. A mattress-machine provided with a permanent side and floor-section, and an adjustable side and flexible floor-section with means for adjusting such adjustable side and floor-section.

4. A mattress-machine provided with a flexible floor-section composed of downwardly-tapered slats mounted on flexible carrying devices, with operating-wheels therefor, said slats being adapted to close together at the top on a level and to separate from each other around the wheels, and a vertical side adapted to move in conformity with the floor-section.

5. A mattress-machine provided with a laterally-adjustable flexible floor portion, composed of downwardly-tapered slats, adapted to conform to the level of a permanent floor-section, with means for supporting and carrying the slats.

6. A mattress-machine provided with a plunger having central slotted openings, longitudinal guideways, a carrier mounted therein provided with upwardly-extending fingers in engagement with the slotted openings of the plunger, and a carrying-chain connected with the carrier, with means for transmitting movement to the chain.

7. In a mattress-machine: a plunger composed of two interfitting laterally-extensible portions, and a supplemental folding plate pivoted to one of said portions.

8. A mattress-machine provided with a plunger having a laterally-extensible portion, a supplemental pivoted plate, and means for moving the plunger.

9. A mattress-machine provided with a plunger having a laterally-extensible portion, a supplemental pivoted plate, and a flexible carrier provided with means adapted to engage the plunger.

10. A plunger for mattress-machines consisting of a frame having a laterally-movable portion slidingly mounted on the frame, and a supplemental pivoted plate adapted to provide an extension of the plunger.

11. A mattress-machine provided with a laterally-extensible clamping-top, consisting of longitudinal members pivotally mounted at one end, interfitting sliding cross members, and removable slats, with means for supporting the slats.

12. A mattress-machine provided with a laterally-extensible clamping-top consisting of longitudinal members pivotally mounted at one end, interfitting sliding cross members, slat-supporting bars, and removable slats mounted thereon.

13. A mattress-machine provided with a laterally-extensible clamping-top consisting of longitudinal members pivotally mounted at one end, interfitting sliding cross members, slat-supporting bars, and slats provided with cleats adapted to engage the bars.

14. A mattress-machine provided with a laterally-extensible clamping-top consisting of longitudinal members pivotally mounted at one end, interfitting sliding cross members, slat-supporting bars, and slats provided with pivotally-attached cleats adapted to engage the bars.

15. A mattress-machine provided with a laterally-extensible clamping-top consisting of longitudinal members, pivotally mounted at one end, interfitting sliding cross members, removable slats, and a cross-bar, with means for applying pressure thereon, and for locking the top in position.

16. A mattress-machine provided with a laterally-extensible clamping-top consisting of longitudinal members pivotally mounted at one end, interfitting sliding cross members, removable slats, and a cross-bar, with pressure-levers and pivoted locking-hooks adapted to engage the bar.

17. A laterally-adjustable mattress-machine provided with an end-gate slidingly mounted on a bar, with means for raising and lowering the bar.

18. End-gate mechanism for a mattress-machine consisting of a bar, raising and lowering levers therefor, and a gate slidingly mounted on the bar.

19. In a mattress-machine, the combination of adjustable spout-sections, and spring-controlled hinged sections adapted to fold outwardly to form the sides of the spout.

20. In a mattress-machine, the combination of adjustable spout-sections and spring-controlled hinged sections, adapted to fold outwardly to form the sides of the spout, and a rising-and-falling gate.

21. In a mattress-machine, the combination of adjustable spout-sections, and spring-controlled hinged sections adapted to fold outwardly to form the sides of the spout, and a rising-and-falling gate laterally movable on its supporting mechanism.

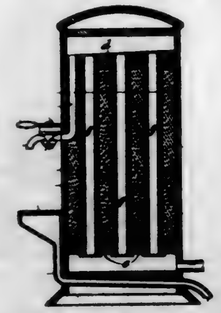
22. In a mattress-machine the combination of a framework provided with a flexible laterally-adjustable sectional floor and an adjustable side, an adjustable plunger, a chain provided with means for engaging the plunger, and an adjustable clamping-top.

23. In a mattress-machine, the combination of a framework, provided with a flexible laterally-adjustable sectional floor and an adjustable side, an adjustable plunger, a chain provided with means for engaging the plunger, an adjustable clamping-top, and an adjustable spout.

24. In a mattress-machine, the combination of a framework provided with an adjustable floor and side, an adjustable plunger, a chain provided with means for engaging the plunger, an adjustable clamping-top, and an adjustable spout, with spring-controlled folding sides for the spout.

25. In a mattress-machine, the combination of a framework provided with an adjustable floor and side, an adjustable plunger, a chain provided with means for engaging the plunger, an adjustable clamping-top, an adjustable spout, and a laterally-adjustable vertically-movable gate.

703,970. **ELECTRICAL HEATING APPARATUS.** JOHN R. CHAIN, Middlesex county, England. Filed Mar. 10, 1902. Serial No. 97,618. (No model.)



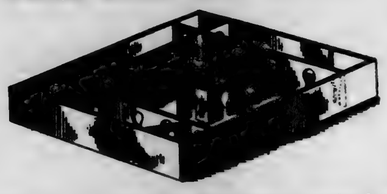
Claim.—1. In an electrical heating apparatus, the combination of a vessel provided with an inlet and an outlet, substantially parallel diaphragms mounted in said vessel, a block, provided with vertical perforations, between said diaphragms, heating-tubes passing through the perforations in said block, and means for heating said tubes by a current of electricity, substantially as described.

2. In an electrical heating apparatus, the combination of a vessel provided with an inlet and outlet, substantially parallel diaphragms mounted in said vessel, a vertically-perforated block of non-conducting material between said diaphragms, heating-tubes passing through the perforations in said block, said tubes being composed of material which offers considerable resistance to the passage of electricity therethrough, and electric connections leading to said tubes respectively, substantially as described.

3. In an electrical heating apparatus, the combination of a vessel pro-

vided with an inlet and outlet, substantially parallel diaphragms mounted in said vessel, the upper surface of the upper diaphragm being inclined, a vertically-perforated block of non-conducting material between said diaphragms, metallic tubes passing through the perforations in said block, and electrical connections leading to said metallic tubes, said block and upper diaphragm being provided with a passage communicating with the outlet of the vessel, substantially as described.

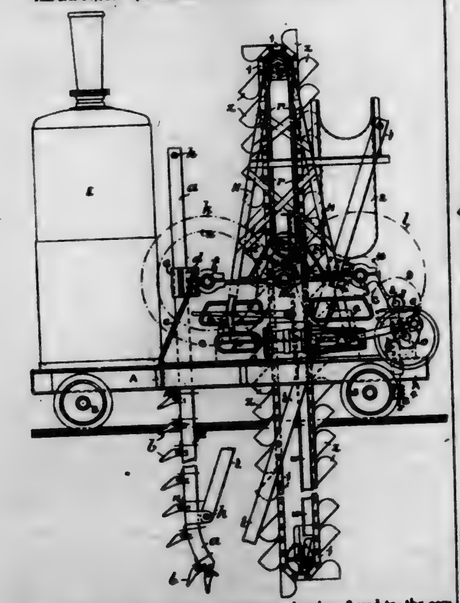
708,971. GAME-BOARD. SOPHIE SOMER, Chicago, Ill., assignor of one-half to Emerson Ingalls, Oakpark, Ill. Filed June 27, 1901. Serial No. 66,203. (No model.)



Claim.—1. In a device of the kind described, a game-board comprising a plane table, slitted marginal walls surrounding the same, intersecting vertical partitions having apertures therein larger at the top than at the bottom and adapted to permit the passage of a spinning-top therethrough, and means whereby the top of one player may be excluded from a compartment containing the top of another.

2. In a device of the kind described the combination of a plane table of vertical marginal walls surrounding the same, intersecting vertical partitions dividing the board into a plurality of compartments and provided with a plurality of apertures adapted to permit the passage of a spinning-top therethrough, means for closing one compartment with respect to the others and pins located on said board and within the compartments formed by the partitions adapted to be displaced by the spinning-top or the like, thereby affording the count or score.

708,972. EXCAVATOR FOR TRENCHES, CUTTINGS, OR THE LIKE. ERNEST SHOVELER, Leeds, England. Filed Mar. 8, 1902. Serial No. 97,311. (No model.)



Claim.—1. In excavators of the type herein referred to, the combination of a platform A mounted on wheels B a motor D motor-shaft *p* a pair of crank-shafts *f* and *j* geared together and to the shaft *p* driving rods *a a*, carrying excavating-tools *b*, and thrust-rods *i i* connected to gether toward their rower ends and respectively to the cranks of the shafts *f* and *j* a bucket elevator comprising buckets *z* link chain 1 adjustable vertical beam *w* carrying the lower tumbler-shaft *v* top tumbler-shaft *q* driving-chain *r* and driving-shaft *s* and platform-traversing mechanism comprising worm-wheel 3 on the axle of one of the pair of wheels B worm 4 vertical shaft 5 bevel-wheels 6 and 7 cross-shaft 8 and connecting gear-wheels between the shafts *s* and 8 and the motor-shaft *p* respectively all substantially as herein set forth.

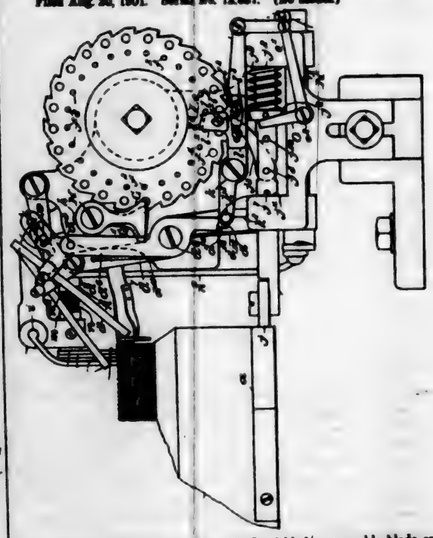
2. In excavators of the type herein referred to the combination of a platform A mounted on wheels B a motor D motor-shaft *p* a pair of crank-shafts *f* and *j* geared together and to the motor-shaft *p* driving-rods *a a* carrying excavating-tools *c b* thrust-rods *i i* connected at their lower ends to the driving-rods *a a* clamping and split journal-pieces *e d* a bucket elevator comprising buckets *z* link chain 1 adjustable vertical beam *w* carrying the lower tumbler-shaft *v* top tumbler-shaft *q* driving-chain *r* and driving-shaft *s* and gear-wheels *t* and *u* all substantially as and for the purposes specified.

3. In excavators the combination of so-called driving-rods *a* carrying excavating-tools *b c*, thrust-rods *i i* connected at their lower ends to the driving-rods a pair of crank-shafts *f* and *j* geared to rotate in the same direction and clamping and split journal-pieces *e d* all substantially as and for the purposes specified.

4. In excavators the combination of a traveling platform A carrying a motor D and frames C with a pair of crank-shafts *f* and *j* mounted thereon so-called driving-rods *a a* carrying excavating-tools *b c* thrust-rods *i i* connected at their lower ends to the rods *a a* platform-traversing mechanism comprising worm-wheel 3 worm 4 vertical shaft 5 bevel-wheels 6 and 7 cross-shaft 8 and gear-wheels between the motor-shaft *p* and the crank-shafts *f* and *j* and the shaft 8 respectively substantially as and for the purposes specified.

5. In excavators the combination of so-called driving-rods *a a* carrying excavating-tools *b c* thrust-rods *i i*, cranks *f* and *j*, clamping and journal pieces *e d* bucket elevator comprising buckets *z* link chain 1 adjustable vertical beam *w* top and bottom tumblers and shafts *q v* and chain 2 motor D and connecting-gear between the motor and the crank-shafts *f* and *j* and top tumbler-shaft *q* substantially as set forth and illustrated.

708,978. KNITTING-MACHINE. DANIEL F. SULLIVAN, Lowell, Mass., assignor of one-half to Michael J. Sullivan, Randolph, Mass. Filed Aug. 20, 1901. Serial No. 72,667. (No model.)



Claim.—1. The combination of a fixed blade, a movable blade and a holder, arranged in contact with said movable blade and adapted to be opened by a cam projection, with which said movable blade is provided, when said movable blade is opened, said movable blade being normally closed.

2. The combination of a fixed blade, a holder, arranged parallel with said blade, a movable blade, arranged between and in contact with said fixed blade and said holder, means for pressing said holder against said movable blade, said blades constituting a pair of shears and said movable blade being provided with a cam projection, to crowd said holder away from the body of said movable blade when said shears are opening and to permit said holder to press against said movable blade when said shears are closed, said shears being normally closed, and means of opening said shears to receive one yarn and to release another yarn.

3. In a stripping attachment for circular-knitting machines, the combination of shears, a needle-cylinder, and positive means actuated by said pattern-wheel for opening said shears, and positive means actuated by said needle-cylinder for closing said shears.

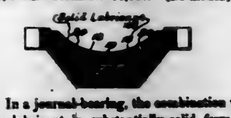
4. The combination of the needle-cylinder and needles, the shears arranged inside the circle of needles and stationary guides arranged opposite each other, one within and the other without said circle, to guide a yarn into said shears.

5. The combined fixed blade and guide-piece, provided with a notch, and a movable blade, in combination with a needle-cylinder and needles and another guide, arranged outside of said needles, opposite said first-named guides, said blades and first-named guide being arranged inside of said needles.

6. The combination with the needle-cylinder and needles of yarn-carrying levers, swinging cams to operate said levers, a pattern-wheel adapted to engage said cams, a locking-lever, adapted to engage said first-named levers, to hold them out of operative position.

7. The combination with the needle-cylinder and needles of yarn-carrying levers, swinging cams to operate said levers, a pattern-wheel adapted to engage said cams, a locking-lever, adapted to engage said first-named levers to hold them out of operative position, an incline carried by said locking-lever, unlocking-pins, carried by said pattern-wheel and engaging said incline, to move said locking-lever to unlock said first-named levers, and springs, to restore said first-named levers to operative position.

708,974. JOURNAL-BEARING. JAMES SWAN, Topeka, Kans. Filed July 13, 1901. Serial No. 68,697. (No model.)



Claim.—1. In a journal-bearing, the combination with a body having a pocket, of a lubricant in substantially solid form arranged in the pocket, and a lining cast upon the body and covering the pocket and the lubricant located therein, said lining having a feed passage-way communicating with the pocket.

2. In a journal-bearing, the combination with a body having a pocket, of a solid lubricant arranged in the pocket, said lubricant comprising a granular mass and a binder holding the same together, and a lining cast upon the body and covering the pocket and the lubricant located therein, said lining having a feed passage-way communicating with the pocket.

3. In a journal-bearing, the combination with a body having a pocket, of a solid lubricant arranged in the pocket, said lubricant comprising a granular mass and a soluble binder holding the same together, and a lining cast upon the body and covering the pocket and the lubricant located therein, said lining having a passage-way communicating with the pocket.

4. In a journal-bearing, the combination with a body having a concave face, said face being provided with a pocket, of a lubricant arranged in the pocket and comprising a mixture of graphite and gum-arabic, and a bearing-lining cast upon the concave face and covering the pocket and the lubricant located therein, said lining being provided with feed-openings that communicate with the pocket.

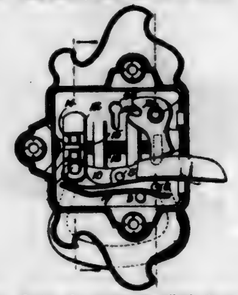
5. In a journal-bearing, a body having a concave inner face, said face being provided with sockets, holding-lugs extending into said sockets from their outer edges, said lugs terminating short of the opposite sides of the sockets and having their ends so formed as to constitute undercut retaining-shoulders, and a bearing-lining cast upon the concave face and engaged behind said shoulders.

6. In a journal-bearing, a body having a concave face, said face being provided with oppositely-disposed sockets, holding-lugs extending into said sockets from their outer edges and tapering toward their inner ends, said lugs terminating short of the opposite sides of the sockets, and having said inner ends so formed as to constitute undercut shoulders, and a metallic bearing-lining cast upon the concave face and engaged behind said shoulders and the tapered sides of the holding-lugs.

7. In a journal-bearing, the combination with a body having a lubricant-receiving pocket, of a bearing-lining cast upon the body and forming a wall over the pocket, said lining having a lubricant-discharge opening leading from the pocket.

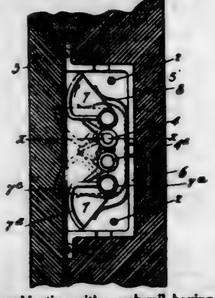
8. In a journal-bearing, a body having a concaved inner face, said body being provided with sockets that open from its concaved face, holding-lugs extending into the sockets from their outer edges, said lugs terminating short of the bottoms of the sockets and the opposite sides of the same and having their outer faces curved and flush with the concaved face of the body to constitute a part of the bearing-surface thereof, and a lining cast upon the concaved face and filling the pockets, said lining covering the lugs and engaging beneath the inner ends thereof.

708,975. COMBINED LATCH AND LOCK. DANIEL W. TOWNE, Grand Rapids, Mich., assignor to Grand Rapids Brass Company, Grand Rapids, Mich. Filed Dec. 2, 1901. Serial No. 84,414. (No model.)



Claim.—In a device of the class described, the combination of a casing, a bolt pivotally mounted within the casing and provided with a stud, a handle pivotally mounted on the casing and provided with a bifurcated lug extending into the casing at one side of the bolt, and a link located wholly within the casing and arranged at right angles to the bolt and extending therefrom to the lug, said link being provided at one end with an aperture to receive the stud and having near its other end, a bowed portion provided with apertures receiving the sides of the bifurcated portion of the lug and forming a cross-bar for engaging the latter, substantially as described.

708,976. SASH-LOCK. ABRAHAM H. SOUTHARD, Denver, Colo., assignor of one-fourth to Augustus W. Colburn, Denver, Colo. Filed Sept. 14, 1901. Serial No. 75,470. (No model.)

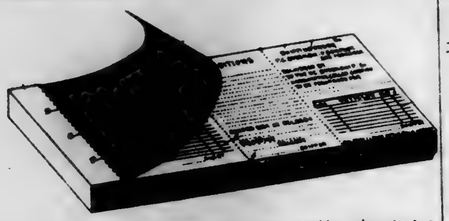


Claim.—The combination with a sash-rail having a recess or mortise, of a sash-lock comprising a casing located in said mortise of the sash-rail and open on one side, two cams journaled in said casing, each cam having a spindle, a face 7ª projecting radially from the spindle, a working face 7ᵇ and a central web, a bow-shaped leaf-spring embracing the webs of the cams and normally causing their working faces to protrude through the opening in the casing to engagement with the adjacent part of the window-frame or other structure in which the sash is located, and two auxiliary members located intermediate the cams and provided with holes journaled in the opposite walls of the casing, said members being provided with wings adapted to engage the face 7ᵃ of the cams for unlocking purposes, the holes of the auxiliary members being toothed and arranged to mesh for unlocking purposes, the spindle of one of the auxiliary members being fashioned to receive a key, the arrangement being such that the respective cams normally lock the sash against movement in the opposite direction.

REISSUES.

12,005. MANIFOLD-BOOK. ALEXANDER LEVENS, San Francisco, Cal. Filed Mar. 13, 1902. Serial No. 98,113. Original No. 694,168, dated Feb. 25, 1902.

Claim.—1. A manifold-book composed of sections, each section comprising in order a double carbon-sheet, a plurality of recording-sheets, and a cardboard backing, the record-sheets outside the stubs being divided into three substantially equal separable parts, the carbon-sheets extending the width of two of said parts, and the cardboard backing extending the width of one of said parts, said recording-sheets and backings having stubs to which they are attached along lines of perforations, said stubs and one side of each carbon-sheet being all bound together to form a book, substantially as described.



2. A manifold-book comprising in order a double carbon-sheet, a plurality of recording-sheets, and a cardboard backing, the record-sheets outside the stubs being divided into three substantially equal separable parts, and the carbon-sheet extending the width of two of said parts, said recording-sheets having stubs to which they are attached along lines of perforations, said stubs and one side of the carbon-sheet and backing being all bound together to form a book, substantially as described.

3. A manifold-book comprising in order a double carbon-sheet, and a plurality of recording-sheets, the record-sheets outside the stubs being divided into three substantially equal separable parts, and the carbon-sheet extending the width of two of said parts, said recording-sheets having stubs to which they are attached along lines of perforations, said stubs and one side of the carbon-sheet being all bound together to form a book, substantially as described.

4. A manifold-book comprising in order a double carbon-sheet, and a plurality of recording-sheets, each of said sheets outside the stubs being divided into a plurality, not less than three, of substantially equal separable parts, and the carbon-sheet extending the width of said parts except the outermost, said recording-sheets having stubs to which they are attached along lines of perforations, said stubs and one side of the carbon-sheet being all bound together to form a book, substantially as described.

5. A manifold-book comprising in order a double carbon-sheet, and a plurality of recording-sheets, each recording-sheet outside the stub being divided into a plurality not less than three of separable parts joined along lines of perforations, each part being not greater than the part next it on the side toward the stub, and the carbon-sheet extending the width of the whole of said parts except the outermost, said recording-sheet having stubs to which they are attached along lines of perforations, said stubs and one side of the carbon-sheet being all bound together to form a book, substantially as described.

12,006. NUT-LOCK. MILTON BARTLEY, Polk, Pa., assignor, by direct and mesne assignments, to the American Nut and Bolt Fastener Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Apr 30, 1902. Serial No. 105,419. Original No. 686,153, dated Aug. 14 1900. Reissue No. 11,963, dated Jan. 28, 1902.

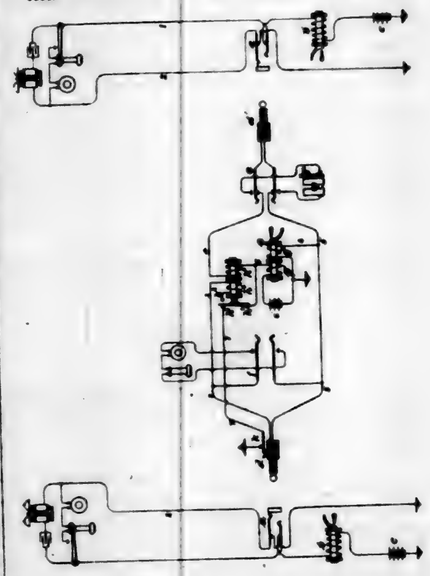
Claim.—1. A nut-lock washer consisting of a plate provided with a bolt-hole and a bearing edge, a tongue extension partially severed from the plate on a line corresponding to the edge of the nut and bent outwardly at an angle to the face of the washer on the line of severance whereby when the tongue is bent down it will bind inwardly against the side of the nut.

2. In a nut-lock, the combination with a bolt and a nut, of a washer-plate engaging the bolt under the nut provided with a bearing edge, a partially-severed tongue extension bent outwardly on the line of severance at an angle to the face of the washer, and adapted to be bent down and to bind inwardly against the side of the nut.

3. A nut-lock washer consisting of a plate provided with a bolt-hole and a bearing edge, and a tongue partially severed from the plate on a line corresponding to the edge of the nut, and bent outwardly at an angle to the face of the washer on the line of severance whereby when the tongue is bent it will bind inwardly against the side of the nut.

4. In a nut-lock, the combination with a bolt and a nut, of a washer-plate engaging the bolt under the nut provided with a bearing edge, a partially-severed tongue bent outwardly on the line of severance, and at an angle to the face of the washer, and adapted to be bent and to bind inwardly against the side of the nut.

12,007. SUPERVISORY SIGNAL FOR TELEPHONE-SWITCHBOARDS. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 25, 1901. Serial No. 48,863. Original No. 638,426, dated Dec. 5 1899.



Claim.—1. The combination with united telephone-lines each provided at its station with means for determining the flow of current in the line in the use of the telephone, a bridge of the united lines and a supervisory signal and a source of current included therein, of a relay with two windings, one included in the line to each station between said station and the bridge, the switch-contacts of the said relay being adapted to break the circuit of the line between the bridge and the calling-station when the magnet is inert; whereby the supervisory signal is rendered responsive to current in both telephone-lines, substantially as and for the purpose set forth.

2. The combination with telephone-lines each provided with means at its station for determining the flow of current in the line in the use of the telephone, and link conductors uniting the lines, of a bridge between said link conductors, and a supervisory signal and a source of current included therein, a calling-key in said link conductors adapted to connect a source of calling-current with one of said lines, a relay having two windings one being placed in a link conductor toward each station, between the station and said bridge, the switch-contacts of said relay being open when the relay is inert, said switch-contacts being interposed in the link conductor between the said bridge and the calling-station, as described.

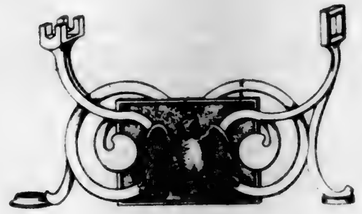
3. The combination with two telephone-lines each provided at its station with a switch for determining the flow of current in the line during the use of the telephone, of a bridge of the circuit, a supervisory signal and a source of current in the bridge, a magnet-winding in a line conductor to each station between said station and the bridge, a normal break of the line-circuit between the bridge and the calling-station, and switch-contacts actuated by said magnet-windings adapted to close the break when the winding in circuit with the called station is excited, as described.

4. In combination, a telephone-line provided at its station with means for determining the flow of current in the line during the use of the telephone, a pair of plugs and the plug-circuit thereof for making connection with the line, a bridge of the plug-circuit, a supervisory signal and a source of current in the bridge, a magnet with two windings, one of said windings being in the conductor leading from said bridge to each station, switch-contacts controlled by the said windings, one pair of said contacts adapted to be closed when the magnet is excited being interposed in a conductor of the plug-circuit between said bridge and one of the stations, and other switch-contacts adapted to be closed when the magnet is inert controlling a local circuit including a winding of the supervisory signal together with a source of current, as described.

5. In combination with telephone-lines, each provided with a switch at its station for determining the flow of current in the line during the use of the telephone, a pair of plugs and the plug-circuit thereof for making connection between lines, a bridge of the plug-circuit, and a supervisory signal and source of current therein, a relay-magnet with two windings, one of said windings being included in the plug-circuit at each side of the bridge, switch-contacts of the relay adapted to be closed when the relay is excited interposed in the conductor of the plug-circuit with one of said magnet-windings, other switch-contacts of the relay adapted to be closed when the magnet is inert, a local circuit of the supervisory signal including a source of current controlled by said last-mentioned switch-contacts of the relay, and a plug-seat switch for one of the plugs adapted to open the said local circuit when the plug is removed from its socket, substantially as described.

DESIGNS.

35,969. SCALE-BEAM SUPPORT. WILLIS H. SARGENT, St. Johnsbury, Vt., assignor to the E. & T. Fairbanks & Co., St. Johnsbury, Vt., a Corporation of Vermont. Filed May 12, 1902. Serial No. 107,046. Term of patent 7 years.



Claim.—The ornamental design for a scale-beam support; substantially as shown and described.

35,970. SCALE-BASE AND SUPPORTING-COLUMN. WILLIS H. SARGENT, St. Johnsbury, Vt., assignor to the E. & T. Fairbanks & Co., St. Johnsbury, Vt., a Corporation of Vermont. Filed May 12, 1902. Serial No. 107,046. Term of patent 7 years.

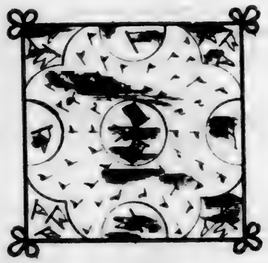
35,970.

Claim.—The ornamental design for a scale-base; substantially as shown and described.

35,971. FONT OF BORDER-TYPE. JOSEPH W. PHINNEY, Medford, Mass., assignor to American Type Founders Company, New York, N. Y., a Corporation of New Jersey. Filed Mar. 12, 1902. Serial No. 98,087. Term of patent 14 years.

Claim.—The design for a font of border-type as herein shown and described.

35,972. SOFA-PILLOW. ELIZABETH FIELD, Scotchplains, N. J. Filed May 15, 1902. Serial No. 107,523. Term of patent 7 years.



Claim.—The ornamental design for a sofa-pillow, substantially as herein shown and described.

TRADE-MARKS

REGISTERED JULY 1, 1902.

38,525. CERTAIN NAMED STATIONERY. J. S. STAEDTLER, a Firm, Nuremberg, Germany. Filed Oct. 24, 1901.

The representation of a cock. Used since May 1, 1894.

38,526. WATCHES, WATCHCASES, AND WATCH-MOVEMENTS. THE KEYSTONE WATCH CASE COMPANY, Philadelphia, Pa. Filed Mar. 31, 1902.

C

The letter "C." Used since February, 1890.

38,527. BELTS. SAMUAS & HILDER BROS., New York, N. Y. Filed May 27, 1902.

Fitform

The word "FITFORM." Used since May 1, 1902.

38,528. GLOVES. JACOB ADLER & Co., New York, N. Y. Filed Apr. 11, 1902.

A circular figure inclosing an oval-shaped figure, the body of the circular figure being stippled between its periphery and the said oval figure. Used since January 1, 1890.

38,529. SHOES. T. D. BARRY & Co., Brockton and Boston, Mass. Filed May 16, 1902.

ALLRIGHT

The word "ALLRIGHT." Used since May 1, 1896.

38,530. COTTON CLOTH. COMPAÑIA GENERAL DE TABACOS DE FILIPINAS, Barcelona, Spain. Filed Feb. 13, 1902.

CGTF

The representation of a steam-yacht, the terrestrial globe showing the Eastern Hemisphere, and the letters "C G T F." Used since August, 1901.

38,531. MERCERIZED COTTON YARN. DEXTER YARN CO., Pawtucket, R. I. Filed Mar. 15, 1902.

SILKRON

A portrait of the late Nathaniel G. B. Dexter, the originator of the business to which the applicant corporation has succeeded, together with the word "SILKRON." Used since March 13, 1902.

38,532. LEAF-TOBACCO. W. T. GRANT & Co., Louisville, Ky. Filed Apr. 23, 1902.

LS

The letters "LS" inclosed in a diamond-shaped figure. Used since January 1, 1886.

38,533. LEAF-TOBACCO. W. T. GRANT & Co., Louisville, Ky. Filed Apr. 23, 1902.

LG

The letters "L. G." inclosed in a diamond-shaped figure. Used since January 1, 1876.

38,534. SYRUPS, FLAVORINGS, TONICS, OR EXTRACTS FOR NON-INTOXICATING AERATED BEVERAGES. ELIAS HOWELL CRANE, Gadsden, Ala. Filed Apr. 17, 1902.

PepToLac

The hyphenated word "PEP-TO-LAC." Used since January 1, 1902.

38,535. COFFEES AND TEAS. WOOLSON SPICE COMPANY, Toledo, Ohio. Filed Apr. 23, 1902.

MAXIMO

The word "MAXIMO." Used since June 25, 1901.

38,536. FRUIT-JUICES. WARREN H. EARLE, Los Angeles, Cal. Filed Apr. 10, 1902.

Navelade

The word "NAVELADE," and behind the same a rectangular figure, above and below which are shown upper and lower portions of a bunch of oranges, together with orange-leaves. Used since December, 1900.

38,537. CERTAIN NAMED PACKING-HOUSE PRODUCTS. LIGHT, MCILHENNY & LIGHT, Chicago, Ill. Filed June 24, 1901.

Melrose

The word "MELROSE." Used since September 14, 1900.

38,538. CERTAIN NAMED PACKING-HOUSE PRODUCTS. SWIFT AND COMPANY, Chicago, Ill. Filed May 13, 1902.

JEWEL

The word "JEWEL." Used since April 1, 1902.

38,539. CERTAIN NAMED GROCERIES. SPRAGUE, WARNER & COMPANY, Chicago, Ill. Filed Mar. 10, 1902.

MOOSE

The word "MOOSE." Used since February 19, 1902.

38,540. BREAD. THE HEBREW BAKING COMPANY, Chicago, Ill. Filed June 7, 1902.

The representation of a woman cutting a loaf of bread. Used since March, 1898.

38,541. WITHDRAWN.

38,542. COUGH-DROPS. JOSEPH A. ARBENT, Portland, Oreg. Filed Mar. 10, 1902.

88,542.

The words "QUEEN BEE" and the representation of a beehive sitting on a slab surrounded with vegetation, with a large bee shown upon the beehive surrounded by an oval-shaped figure having projecting tabs at the opposite extremities thereof inclosing small bees. Used since October 25, 1901.

88,543. MEDICINES FOR TREATMENT OF THE BLOOD. WILLIAM MOORE HOSHAW, Bisbee, Ariz. Filed May 22, 1902.

The representation of an Indian chief in sitting position supporting in one hand a hat and in the other hand a battle-club. Used since October, 1901.

88,544. CERTAIN NAMED MEDICINAL COMPOUND. JULIUS HOFNEKER, Vienna, Austria-Hungary. Filed May 23, 1902.

PHORXAL

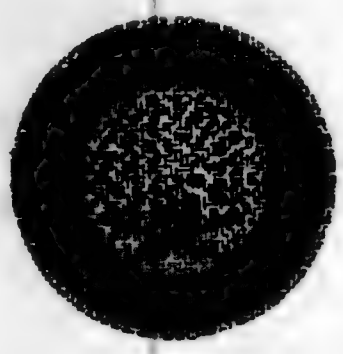
The word "PHORXAL." Used since November 1, 1901.

88,545. ANTISEPTICS FOR TOILET AND MEDICINAL PURPOSES. THE R. PAXTON COMPANY, Boston, Mass. Filed May 31, 1902.

PAXTINE

The word "PAXTINE." Used since December, 1898.

88,546. CERTAIN DISTILLED PRODUCT OF WITCH-HAZEL. EDWARD E. DICKINSON & Co., Essex, Conn. Filed May 9, 1902.



A yellow circular medallion having upon its face a red ring which is contained within two concentric black circles. On the lower part of the medallion is the representation of two crossed swords and a crown. Used since 1887.

88,547. REMEDY FOR DANDRUFF. JOHN F. HAMILTON & Co., Maple Lake, Minn. Filed May 26, 1902.

The photograph of J. F. Hamilton, with the autograph signature of "J. F. HAMILTON" associated therewith. Used since May 7, 1902.

88,548. HAIR-TONICS AND DANDRUFF CURES. MYRON A. PEARCE, Chicago, Ill. Filed May 13, 1902.

FUR-FUR

The compound word "FUR-FUR." Used since January 1, 1902.

88,549. MEDICINAL COMPOUND FOR RESTORING HAIR. THE NATIONAL HAIRCOME CO., Milwaukee, Wis. Filed Feb. 19, 1902.

The representation of a Maltese cross having the word "COME" arranged across its center and the arbitrarily-chosen letters "ARHI" particularly arranged thereon in the manner following: The upper and lower arms have the letters "A" and "R," respectively, and the side arms have the letters "H" and "I," the arm at the left having the letter "H" and the arm at the right having the letter "I." Used since January 1, 1899.

88,550. TOILET SOAP. [illegible] Soap Works, Nashville, Tenn. Filed May 3, 1902.

The portrait of Charles A. Cozzy. Used since April 15, 1901.

88,551. VEGETABLE ALBUMENS IN DRY OR LIQUID FORM. United States Plantose Company, Limited, Saginaw, Mich. Filed Jan. 27, 1902.

Plantose.

The word "PLANTOSE." Used since December 27, 1901.

88,552. CERTAIN NAMED CHEMICAL COMPOUND. Rosenwerg & Ramdahl, Cassel, Germany. Filed Feb. 6, 1902.

Mikrosol.

The word "MIKROSOL." Used since October 31, 1900.

88,553. CERTAIN NAMED PAINTS. James G. Cosgrove & Co. Philadelphia, Pa. Filed June 15, 1901.

Battery

The word "BATTERY." Used since June 8, 1899.

88,554. INSULATING MATERIAL. Dennison M. Steward, Chattanooga, Tenn., and New York, N. Y. Filed May 19, 1902.

LAVITE

The word "LAVITE." Used since April 1, 1902.

88,555. ROOF-PAINT IN LIQUID FORM. Albert F. Hawthorn, Lancaster, Pa. Filed May 15, 1902.

The monogrammic symbol composed of the letters "A F H R P." Used since March 15, 1902.

88,556. APPLES, APPLE-TREES, SCIONS, CUTTINGS, GRAFTS, ROOTS, AND STOCKS. Stark Bro's Nurseries & Orchards Co., Louisiana, Mo. Filed May 14, 1902.

BLACK BEN

The words "BLACK BEN." Used since November 11, 1895.

88,557. TUBULAR AND PRONGED RIVETS. Tubular Rivet & Stud Co., Boston, Mass. Filed May 22, 1902.

A monogram of the letters and character "T R & S Co." Used since May 1, 1902.

88,558. STOVES, FURNACES, AND ATTACHMENTS THEREFOR. Allen Gardiner Dallas, Montreal, Canada. Filed May 19, 1902.

KINETIC HEAT

The words "KINETIC HEAT." Used since February 20, 1901.

88,559. ORE-CRUSHING MILLS. Simeon V. Trent, Salt Lake City, Utah. Filed May 20, 1902.

MONADNOCK

The word "MONADNOCK." Used since June 1, 1901.

88,560. FIRE, BURGLAR, AND WATER PROOF SAFES AND VAULTS. HARRY D. CASEY, New York, N. Y. Filed May 5, 1902.

PAN-AMERICAN.

The compound word "PAN-AMERICAN." Used since May 1, 1901.

88,561. CERTAIN NAMED AMMUNITION. THE PETERS CARTRIDGE CO., Cincinnati, Ohio. Filed May 21, 1902.

RECORD

The word "RECORD." Used since May 16, 1902.

88,562. CERTAIN NAMED AMMUNITION. THE PETERS CARTRIDGE CO., Cincinnati, Ohio. Filed June 2, 1902.

HIGH GUN

The words "HIGH GUN." Used since May 16, 1902.

88,563. EXPLOSIVES. EVERARD SCHOLA, Mill Valley, Cal. Filed June 3, 1902.

STEELITE.

The word "STEELITE." Used since May 6, 1902.

THE NORRIS PETERS CO.

LABELS

REGISTERED JULY 1, 1902.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

LUGER v. BROWNING.

Decided February 7, 1903.

1. ALLOWANCE OF CLAIMS—NOTICE—INTERFERENCE.

Where the Examiner has rejected certain claims, but subsequently declares an interference as to them, *Held* that this amounts to an allowance of them, although no formal notice to that effect was sent.

2. INTERFERENCE—IRREGULARITY—ALLOWANCE OF CLAIMS.

Where the Examiner has not notified the parties that the claims in issue are patentable, *Held* that this does not constitute such irregularity as will preclude a proper decision of the question of priority of invention and does not warrant a dissolution of the interference.

3. SAME—INTERLOCUTORY QUESTIONS—FINAL HEARING.

Held that questions as to the patentability of the claims and irregularity in the declaration should be raised by motion under Rule 122 and that they will not be considered upon an appeal relating to priority of invention.

APPEAL from Examiners-in-Chief.

RECOIL-OPERATED MAGAZINE-GUN.

Application of Georg Luger filed March 17, 1900, No. 9,083. Application of John M. Browning filed May 6, 1899, No. 715,822.

Mr. Herbert W. T. Jenner for Luger.

Messrs. Seymour & Earle for Browning.

ALLEN, *Commissioner:*

This is an appeal by Luger from the decision of the Examiners-in-Chief affirming the decision of the Examiner of Interferences awarding priority of invention to Browning upon the following issue:

"In recoil-firearms having movable barrels, the combination of the rearward-moving barrel with linked levers, a stud or projection at the bending or "knee" point of the linked levers, and a curved guide-surface of the casing located in the path of the said projection, which in consequence of the recoil after firing is pressed against the said surface, substantially as shown and described.

The testimony shows clearly that Browning made the invention before Luger, who is a foreigner, introduced a knowledge of the invention into this country, and therefore the decision in favor of Browning is correct.

Luger's present appeal alleges the following errors in the decision below:

Granting motion to strike out rebuttal testimony of Luger. Awarding priority to Browning without qualification. Irregularity in declaring the interference.

An examination of the rebuttal testimony on behalf of Luger shows that it was properly suppressed, and even if it were accepted and considered it would not affect the decision on the question of priority.

The award of priority to Browning was proper, for the reason that the evidence shows him to be the first inventor. The facts of this case do not bring it within the doctrine announced in *Bechman* v. *Wood*, (81 O. G., 287.)

The alleged irregularity in declaring the interference seems to have been the failure of the Examiner to formally allow the claims of the applications before declaring the interference or suggesting the claims to one of the parties. The declaration of the interference amounted to a formal allowance of the claims involved and showed that the Examiner had changed his mind upon the question of patentability of the claims which had previously been rejected. Even if it could be considered an error by the Examiner not to have formally notified the parties of the allowance of the claims before declaring the interference it was not such irregularity as would preclude a proper determination of the question of priority. This matter is furthermore one which if raised at all should have been presented by a motion to dissolve under Rule 122.

In his present appeal Luger protests against the issue of a patent to Browning upon the ground that certain newly-discovered references mentioned anticipate the invention. It is well settled that the question of anticipation will not be considered and decided upon an appeal of this kind, except under very unusual circumstances. The Primary Examiner is the tribunal to pass upon that question in the first instance. No good reason is seen for departing from the usual practice in this case. The Primary Examiner is directed to consider the newly-discovered references cited in Luger's brief in connection with the claims of Browning's application when it comes before him for *ex parte* consideration after the conclusion of this interference.

The decision of the Examiners-in-Chief awarding priority of invention to Browning is affirmed.

EX PARTE ORGAN.

Decided June 11, 1903.

PETITION—PRACTICE—STATEMENT OF POINTS.

A petition to the Commissioner should state the point or points to be reviewed and should not be taken until the questions have been twice acted upon by the Examiner.

ON petition.

HORSESHOE.

Application of Joseph H. Organ filed October 5, 1903, No. 77,696.

Mr. Organ pro se.

ALLEN, *Commissioner:*

This is a petition from an action of the Examiner in charge of the above-entitled application making certain objections to the specification and claim and also rejecting the claim. The petitioner asks that the Commissioner "examine into the case and review the points at issue, that justice may be done in the premises." The petition does not comply with the rules, because it does not state the facts involved and the "point or points to be reviewed." (Rule 145.) Moreover, it is improperly taken, inasmuch as it requests a review by the Commissioner of matters involving the merits of the invention and the rejection of a claim. A review of the Examiner's action on these matters is to be made in the first instance by the Examiners-in-Chief, as provided by Rule 133.

It appears, further, that the petition is premature, since the questions have not been twice acted upon by the Examiner.

The petition is dismissed.

GALES *v.* BERRIGAN.

Decided June 20, 1902.

PRELIMINARY STATEMENT—AMENDMENT.

Where it appears that an amendment to a preliminary statement will not carry the date of reduction to practice back of that of the opposing party and a reasonable excuse is offered for the delay in presenting the amendment and, further, that no testimony has been taken, *Held* that the amendment should be permitted.

APPEAL on motion.

CENTRIFUGAL CREAM-SEPARATOR.

Application of Nicholas W. Gales filed October 4, 1900, No. 32,019. Patent granted John J. Berrigan December 4, 1900, No. 663,115.

Messrs. C. A. Snow & Co. for Gales.

Messrs. Harding & Harding for Berrigan.

ALLEN, *Commissioner:*

This is an appeal by Gales from a decision of the Examiner of Interferences denying his motion to amend his preliminary statement.

It appears that Gales filed his preliminary statement October 1, 1901. In this statement he alleges that he completed a full-sized working separator on or about the 28th day of May, 1900. On April 9, 1902, the present motion to amend was filed to permit Gales to amend this statement to carry back his date of reduction to practice from May 28, 1900, to September 5, 1899, a period of more than eight months. In his affidavit accompanying the motion Gales gives as a reason why he did not include this earlier date in his original statement—

* * * that he supposed that the power-separator completed in May, 1900, was the one of most importance and * * * neglected to advise his attorneys * * * thereof; that the hand-power separator completed in September 1899 was the first completed separator containing the elements of the invention.

There is also an affidavit by one Jordan—

* * * that during the fore part of September, 1899, deponent saw in Gales's possession a hand-operated cream-separator wherein the whole milk is discharged between the milk and cream cones at an angle to the radius of the conical plates; * * * and that deponent believes this construction and arrangement, as embodied in the aforesaid hand-operated machine, to have been the invention of said Gales.

No testimony has yet been taken in the case, and the proposed amendment does not carry Gales's date of reduction to practice back of that alleged by Berrigan in his preliminary statement.

There has been a delay of some seven months in filing the motion to amend; but this delay is explained by the fact set forth in the affidavits accompanying the motion, that Gales was suffering from an accident to his eyes, which occurred in the summer of 1901, and during a large part of the time since has been unfit for business and has been in a hospital under treatment.

In view of all the facts appearing of record it is believed that the amendment should be permitted. The opposing party will not be injured, since no testimony has been taken, he has not been misled, nor have the expenses of the proceeding been increased. In this case, therefore, the necessity for the strict rule laid down in *Franklin* v. *Morton* v. *Cooley* (95 O. G., 2063) does not arise. The case comes, rather, within the doctrine announced in *May* v. *Merker*, (85 O. G., 150,) in which it was said:

It is the duty of the Office to issue a patent to the one entitled thereto, and to that end it is desirable to have before it for consideration all the facts essential to a correct determination of the question of priority. Where, therefore, an adversary will not be injured by the grant of a motion to amend a statement, and to deny the motion would be unjust to the moving party and might lead to the grant of a patent to one who was not entitled to it, *Held*, that the motion to amend should be granted. (Syllabus.)

The decision of the Examiner of Interferences is reversed.

EX PARTE FOULIS.

Decided June 20, 1902.

DIVISION—ARTICLE—PROCESS.

Division was properly required between claims covering a golf-ball and claims covering the process of making the same where it appears that the golf-balls are not necessarily the product of the method and that they could be made by other methods than that claimed.

ON petition.

GOLF-BALLS AND PROCESSES OF MANUFACTURING THE SAME.

Application of James and David Foulis filed February 10, 1902, No. 93,479.

Mr. Thomas F. Sheridan for the applicants.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner requiring division between claims 1 and 2, which cover a process of making a golf-ball, and the remaining claims, which cover a golf-ball.

The petitioners contend that claims 1 and 2 are confined to methods of making golf-balls and that no other article than a golf-ball, such as covered in the remaining claims, can result from this method.

The Examiner does not regard the method claims to be limited to making golf-balls, but holds that any other articles of various shapes can be made as well by this method—as, for instance, bicycle-handles.

Whether the method claims are limited to the making of golf-balls or are broad enough to cover the method of making articles of other shapes it is not necessary to decide.

An examination of the article claims makes it

clear that the golf-balls covered by them are not necessarily the products of the methods set forth in claims 1 and 2. It does not appear that the article claimed is the necessary result of the particular sequence of steps set forth in claims 1 and 2.

The article covered in claims 3 and 6 could be formed by placing the hardened blocks of material on a lathe and turning them down to the shape of a ball or by operating in other ways by means of sharp tools. The product covered in all of the claims could, moreover, be formed by compression before the material is allowed to become completely cool and hard, which is a distinct step in the method claimed.

It is clear, therefore, that the article covered in claims 3 to 6 can be made by other methods than that covered by claims 1 and 2, and that a disclosure of the article does not necessarily disclose the method.

Division was properly required. (*Ex parte Erdman*, 93 O. G., 2581.)

The petition is denied.

EX PARTE LEE.

Decided June 20, 1902.

DIVISION—INSULATING COMPOUND AND INSULATED CONDUCTOR.

Division properly required between claims for an insulating compound and process of making it and claims for an insulated conductor and process of making the same.

ON petition.

INSULATING MATERIAL, INSULATED CONDUCTOR AND PROCESS.

Application of John C. Lee filed April 10, 1902, No. 102,299.

Mr. Thomas D. Lockwood and *Mr. Philip Mauro* for the applicant.

ALLEN, *Commissioner:*

This is a petition from an action of the Examiner requiring division between the claims of the above-entitled application.

Division has been required between claims 1 to 4, inclusive, which cover an insulating compound and the process of making it, and claims 5 to 12, inclusive, which cover an insulated conductor and the process of making the same.

The insulated conductor covering the last set of claims is made by coating a conductor with the compound covered by the first set of claims; but it is clear that this compound is not limited in use to conductors. Moreover, insulating compounds are recognized in the Office classification as distinct articles from conductors. Such compounds are also separate subjects of manufacture and sale. It is true that the classification in this Office is not in all cases a controlling test as to whether or not division should be required; but it is a most important test, especially when, as in the present case, it indicates the lines of invention and manufacture which have arisen in the art. As was said in the decision in *ex parte Fox and Barrett*, (99 O. G., 862:)

The mere fact that inventions would be separately classified in this Office is not in itself sufficient to warrant a requirement for division, but in the present case the classification has followed the lines established by inventors and manufacturers and is evidence of the fact that the devices have acquired such a distinct status in the art as warrants not only separate classification, but also separate applications for inventions included therein.

The action of the Examiner was right and is affirmed.

EX PARTE WATERMAN.

Decided June 20, 1902.

1. DIVISIONAL APPLICATION—DESIGN APPLICATION—MECHANICAL APPLICATION.

A mechanical application cannot be considered a division of a design application.

2. SAME—SUBJECT-MATTER OF.

It is fundamental that "a proper divisional application does and can contain only matter carved out of the original case." (*Ex parte Henry*, 64 O. G., 999.) The subject-matter of the divisional application need not have been claimed or reached by any statement of invention in the original case. It is sufficient if the matter has been fully disclosed in the original application.

3. SAME—SAME—DISCLOSURE.

This disclosure, however, must be in an application in which the applicant would be permitted to present and prosecute a claim for the matter so disclosed. In other words, an applicant will be permitted to claim in a divisional application such segregable matter as might have, had he so elected, been claimed in the original application.

4. SAME—DESIGN AND MECHANICAL PATENTS.

Design patents and mechanical patents cover different monopolies. They are granted under different sections of the statute for different terms.

5. DESIGN PATENTS—SUBJECT-MATTER OF.

The subject-matter of a design application relates to the appearance of the article and not to its mechanical function. It is immaterial in what manner the invention is described in such an application or what the showing is, the subject-matter still relates to a design.

6. SAME—MISTAKE IN DESCRIPTION AND CLAIM.

If through ignorance or mistake an applicant claims in a design application subject-matter for which a design patent cannot under the statutes be granted, the claims must be rejected. (*Ex parte Proudfit*, 10 O. G., 585.)

7. SAME—REQUIREMENT FOR DIVISION UNWARRANTED.

There is no warrant for a requirement for division in such a case. Since claims for mechanical functions cannot be made in a design application, it follows that such claims cannot be divided out of such an application.

ON petition.

FOUNTAIN-PENS.

Application of Frank D. Waterman filed March 27, 1902, No. 100,204.

Mr. James A. Skilton for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner refusing to treat the above-entitled application as a division of a certain design application filed September 28, 1897.

It appears that a design application was filed for a fountain-pen, as above stated, on September 28, 1897, and that the drawing of this application contained a complete disclosure of the invention claimed in the present application, while the specification of said design application contained a full description of the invention and claimed the same. This design application was for the term of fourteen years and the fee of thirty dollars was paid thereon.

The claims of this application were refused consideration by the Examiner because they did not

cover proper subject-matter for a design and were by amendment limited to the design.

On March 27, 1902, the present application for a mechanical patent was filed, containing claims to the structure disclosed and claimed in the earlier design application, and it is sought to have this application considered and treated as a division of the design application, so as to have the benefit of the filing date thereof in order that the statutory bar of public use may be avoided.

It is fundamental that "a proper divisional application does and can contain only matter carved out of the original case." (*Ex parte Henry*, 64 O. G., 299.) By a liberal interpretation of the rules it has been held (see *ex parte Henry*, *supra*) that the subject-matter of the divisional application need not have been claimed or reached by any statement of invention in the original case, but that it is sufficient if the matter has been fully disclosed in the original application. It is to be observed, however, that this disclosure must be in an application in which the applicant would be permitted to present and prosecute a claim for the matter so disclosed. In other words, an applicant will be permitted to claim in a divisional application such segregable matter as might have, had he so elected, been claimed in the original application. Such a divisional application relates back to and has the benefit of the filing date of the original application as a date of constructive reduction to practice and to avoid the bars of prior publication and public use.

Design patents and mechanical patents cover different monopolies. They are granted under different sections of the statute for different terms. It is true that the procedure in obtaining a design patent is very similar to that in obtaining a mechanical patent, but nevertheless the monopolies granted in such cases, as above stated, are different. It is possible to obtain a design patent and a mechanical patent for the same article of manufacture.

When, therefore, an application for a design patent is filed, the subject-matter of this application relates to the appearance of the article and not to its mechanical function. It is immaterial in what manner the invention is described in such an application or what the showing is, the subject-matter still relates to a design. If the description and showing are incorrect, they may be changed by proper amendment. If through ignorance or mistake an applicant claims in a design application subject-matter for which a design patent cannot under the statutes be granted, the claims must be rejected. (*Ex parte Proudfit*, 10 O. G., 585.) There is no warrant for a requirement for division in such a case, because, as stated above, a divisional application must contain such matter as might have been claimed in the original application. Since claims for mechanical functions cannot be made in a design application, it follows that such claims cannot be divided out of such an application.

A consideration of the nature of a divisional application will throw further light upon this subject.

Such an application has the benefit of the filing date of the original case as a date of constructive reduction to practice. This is so because the applicant may be said to have filed an allowable application for the subject-matter divided out at the earlier date and could have claimed it then had he so elected. But no description of a mechanical device in a design application, however complete it may be, can be held to be such a constructive reduction to practice, because the filing of the design application is not and cannot be under any circumstances the filing of an allowable application for the mechanical device. The same is true when the statutory bars of two years prior publication or two years prior public use or sale are concerned. These bars can be avoided only by the filing of an application. The filing of an application for a design, however, is not the filing of an application for the mechanical structure and cannot operate to avoid these bars to patentability of the mechanical structure.

It must be held that the application now under consideration is not a proper division of the earlier design application.

The Examiner's action was right, and it is affirmed.

EX PARTE GOLDMAN.

Decided June 20, 1902.

1. REQUIREMENT OF DIVISION—ACTION ON MERITS—PRACTICE.

Where the independence of the inventions is clear, it is the usual practice not to act on the merits of the case when the requirement of division is made in the first action. The most that is usually done is to cite patents after a cursory examination in order to show that the requirement of division has been correctly made.

2. SAME—SAME—SAME.

If the Examiner desires to make a complete action on the merits of the case in the same letter in which division has been required, there is no objection to his doing so; but it should be made clear in said action that the whole case has been considered on its merits and that not only those claims which are specifically rejected have been considered, but all of the others as well.

3. FINAL REJECTION PREMATURE—RIGHT TO AMEND.

Where in requiring division the Examiner rejects some of the claims upon references, but does not make it plain that he has given a full action upon the merits, *Held* that a final rejection given in the next letter is premature and that the applicant is thereafter entitled to amend.

ON petition.

CALCULATING-MACHINE.

Application of Henry Goldman filed August 1, 1900, No. 25,483.

Messrs. Parker & Carter for the applicant.

ALLEN, *Commissioner:*

This is a petition from the refusal of the Examiner to enter and consider a proposed amendment filed after a final rejection of certain claims in the above-entitled application and from his action holding the application to be abandoned for failure to take such action as the condition of the case required within one year from the date of such final rejection.

The record shows that the first Office action was made on August 30, 1900. In this action the Examiner made certain formal objections to the specification and to some of the claims, the claims were held to cover three separate and independent inventions, and division was therefore required. The Examiner proceeded further and specifically rejected two of the seventeen claims presented. The following language was used:

> The only point of difference between claim 9 and the structure of the former patent No. 634,788, is the groove in the lever. As such a groove does not diminish friction the claim is rejected. * * *
>
> Claim 15 is also rejected on No. 634,788.

On January 31, 1901, the petitioner filed an amendment which cured most of the formal objections that were urged by the Examiner and canceled two of the groups of claims which covered two of the independent inventions which were at first claimed. The cancellation of these claims changed the number of those remaining, so that the claims which were originally numbered 9 and 15 became claims 7 and 12.

On February 18, 1901, the Examiner finally rejected claims 7 and 12 and made final an objection which had been originally made to one of the other claims.

On February 10, 1902, the petitioner filed an amendment inserting three new claims and accompanied the same with an argument.

On February 24, 1902, the Examiner refused to enter and consider this amendment on the ground that the application was under final rejection and the amendment not being such a proper action as the condition of the case required the application had become abandoned. From this action this petition is taken.

The facts in this case make it necessary to determine whether the final rejection of February 18, 1901, was a proper one, for if it was the subsequent actions of the Examiner are clearly correct. The determination of this question depends solely on whether or not the two claims should have been rejected in the first Office action in which the requirement of division was made.

Rule 42 provides in part as follows:

> 42. If several inventions, claimed in a single application, be of such a nature that a single patent may not be issued to cover them, the inventor will be required to limit the description, drawing, and claim of the pending application to whichever invention he may elect. * * * If the independence of the inventions be clear, such limitation will be made before any action upon the merits; otherwise it may be made at any time before final action thereon, in the discretion of the Examiner.

It is the usual practice not to act on the merits of an application, especially in the first action, when a requirement of division is made. The most that is usually done is to cite patents after a cursory examination in order to show that the requirement of division has been correctly made and that patents have been granted covering the separate and independent inventions which are held by the Examiner to be claimed in the single application before him.

If the Examiner desires to make a complete action on the merits of the case in the same letter in which division has been required, there is no objection to his doing so; but it should be made clear in said action that the whole case has been considered on its merits and that not only those claims which are specifically rejected have been considered, but all of the others as well. If this is not done, in view of the usual practice when division is required the applicant may easily fall into error and believe that the patents cited were only to show the state of the art and were not meant to be formally cited against the claims for the purpose of rejecting them.

In the letter the Examiner used the word "reject" in treating the two claims in question. Nothing was said as to the merits of the other claims. The action is full and complete as to the requirement of division, but it does not appear from the letter that it was intended to act also on the merits of the case throughout. In view of the fact that such an action is unusual it is not surprising that the applicant did not appreciate the fact that the Examiner intended to act on the merits of the case throughout, but that he merely intended to cite the best references at hand to show the state of the art pending the final determination of the question of division.

In cases where division is required and the Examiner also makes a complete action on the merits of the case this fact should be clearly brought out in the letter requiring division. That the applicant did not appreciate the fact that the Examiner intended to act fully on the merits of the case in addition to this requirement of division is apparent from the following statement of the petitioner in referring to the first action which was made by the Examiner:

> Some references were cited but in view of the division applicant did not think this was a full action for it is not customary to give a complete action when division is called.

In view of the fact that it does not appear in the first action requiring division that it was the intention also to act throughout on the merits of the case and that, in fact, the case was so acted upon it is held that the final rejection of February 18, 1901, was premature.

It follows, therefore, that the amendment filed February 10, 1902, should be entered and considered.

The petition is granted.

EX PARTE DOWNIE AND MESSNER.

Decided June 20, 1902.

DIVISION—STEAM-BOILER—FURNACE.

Division was properly required between claims covering a boiler construction and claims covering a furnace construction, as they are recognized by inventors and manufacturers as separate and independent inventions and are capable of separate use irrespective of their particular construction.

ON petition.

STEAM-BOILER.

Application of Robert M. Downie and David A. Messner filed February 21, 1902, No. 95,106.

Mr. E. G. Siggers for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner requiring division between claims 12 and 13 and the remaining claims in the above-entitled application.

The Examiners of Divisions XVIII and XIX are each of the opinion that all the claims in the above-entitled application, with the exception of claims 12 and 13, relate to a furnace construction and should be examined in Division XIX. The Examiner of Division XVIII is also of the opinion that claims 12 and 13 cover a boiler construction and that an application including only such claims should be examined in his division.

A boiler construction and a furnace construction are recognized by inventors and manufacturers as separate and independent inventions. They are capable of separate use irrespective of their particular construction.

Claims 12 and 13 are the only claims now presented in this case which include the water-tubes as elements in the combinations. The result is that claims 12 and 13 necessarily cover a boiler construction. The remaining claims are not limited to a boiler construction, but merely cover a furnace construction capable of use in other relations than with a boiler—a hot-air furnace, for example.

It is held, therefore, that claims 12 and 13 cover a separate and independent invention from that covered by the remaining claims. The requirement of division was a proper one.

The petition is denied.

EX PARTE LUDINGTON.

Decided June 25, 1902.

APPLICATION—COMPLETE PROCESS—NO DRAWING.

Where an application for a process was filed December 11, 1901, complete as to all of its parts except the drawing and it appeared that a drawing was not necessary for a full disclosure of the invention, *Held* that the application should be given a filing date as of December 11, 1901.

ON petition.

PROCESS OF MAKING CIGARETTES FROM CONTINUOUS CIGARETTE-RODS.

Application of Frank J. Ludington filed January 16, 1902, No. 90,052.

Mr. Thomas S. Crane for the applicant.

ALLEN, *Commissioner:*

This is a petition that the filing date of the above-entitled application be changed from January 16, 1902, to December 11, 1901.

It appears that the invention described in this application related to a process for making cigarettes. On December 11, 1901, all the parts of the application were filed except the drawing, which was afterward filed, upon request, January 16, 1902.

The process constituting the invention was fully disclosed in the specification as filed on December 11, 1901, and the disclosure was sufficient for the purpose of examination of the invention upon its merits.

Under these circumstances the rule laid down in *ex parte Russell* (84 O. G., 2021) is applicable to this case. This rule is stated as follows:

Where the application is drawn to cover a process and discloses the invention sufficiently to permit of examination on the merits, although no drawing is furnished, *Held* that it must be given the time of filing as the date of application, although a drawing is subsequently found to be desirable and is required not to show the invention, but as showing some means for carrying into practice.

In the present case the disclosure made in the application as filed on December 11, 1901, was sufficient for action on the merits. The application is therefore entitled to that date as its date of filing.

The petition is granted.

Changes in Classification.

(ORDER No. 1,485.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 26, 1902.

Changes in classification are directed as follows:

The following subclasses in classes 178, Telegraphy, and 179, Telephony, are abolished, and subclasses of the same numbers and titles are established in class 177, Electric Signaling:

Class 178, Telegraphy—

311. Alarms—
312. Æquoreal,
313. Barokinetic,
314. Burglar,
315. Hose,
316. Safe.
10. Circuit-closers—
208. Burglar,

Circuit-closers—
201. Letter-box,
205. Lock,
204. Retarded,
198. Thermal—
202. Fluid,
203. Fusible.

Class 179, Telephony—

3. Annunciators—
188. Drop,
189. Drop-system,

Annunciators—
190. Elevator,
191. Step-by-step.

The following subclasses are abolished in class 178, Telegraphy:

30. Lightning-arresters—
214. Magnetic,
215. Thermal.

Subclasses with the same numbers and titles are established in class 175, Electricity, Special Applications.

Subclass 81, Conductors, anti-inductive, is transferred from class 179, Telephony, to class 173, Electricity, Conductors.

In class 126, Stoves and Furnaces, subclass 117, Electric heaters, is abolished.

In class 206, Metal-Welding, the following subclasses are abolished:

Metal-working—
8. Electric—
11. Arc system,
12. Liquid electrode,
13. Riveting.

A new class is established to be entitled class 219, Electric Heaters, with the following subclasses:

Metal-working—
2. Electric—
3. Arc system,
4. Liquid electrode,
5. Riveting,
1. Miscellaneous.

Class 50, Fluid-Pressure Regulators, is transferred from Division XXXV to Division XXX.

F. I. ALLEN,
Commissioner.

Patents Nos. 703,977 to 704,491.

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office.

[BY AUTHORITY OF CONGRESS.]

Photographic Copies of Drawings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 1, 1902.

The Patent Office is now prepared to furnish black line on white ground copies of any unbound drawing, foreign or domestic, which may be in its possession, instead of the blue-prints heretofore furnished. Only the 7x11 (patent) size and the full or 10x15 size prints will hereafter be furnished, at 15 and 25 cents per sheet, respectively.

Copies of drawings of pending, abandoned, forfeited, or informal cases and of caveats may be had in either of the above-named sizes except when they are to be certified, in which case they must be the 10x15 size.

Copies of United States or foreign patent drawings will be made only in the 10x15 size.

When ordering copies of foreign patent drawings, either the serial number of the applications in which they were cited as references or the class and subclass where they may be found must be given. The title of the invention or the number of the division will not be sufficient. Bound volumes cannot be used for making prints. Failure to give the fullest data whereby the mounted drawing may be found will result in delay and unnecessary correspondence.

The work will be much facilitated if a separate order be made for each drawing. The Office will furnish, gratuitously, blanks for this purpose on request.

As a result of abolishing the small (5x8) size the requirement that duplicate prints must be ordered in certain cases will no longer be enforced. The requirement that less than all the sheets of a case will not be printed unless there is already a full set in the file will not be insisted upon; but applicants or attorneys are strongly urged to file a set of prints or order them to be made by the Office at the time of filing an application. Such procedure will save delay later if correction of the drawing is desired or required.

F. I. ALLEN,
Commissioner.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business July 1, 1902.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	In arrears—Under one month.			
106	II. Farm Products, etc., Lubricators, Presses, etc.	June 11	June 10	213
317	XXXIII. *Designs, †Trade-Marks, ‡Labels and Prints, Optics, and Photography.	June 10	June 6	84
253	X. Carriages and Wagons	June 7	June 19	62
246	I. Tillage, etc., and Fences	June 2	June 16	256
147	XXXI. Gas, Ammonia, Water, and Wood Distillation, Charcoal and Coke, Hides, Skins, and Leather, Oils, Fats, and Glue, Painting, etc.	June 2	June 6	200
80	IV. Cranes and Derricks, Bridges, Fire-Proof Buildings, Excavating, Iron Structures, Conveyers, Hoisting, etc.	June 2	June 5	294
102	XIX. Stoves and Furnaces and Steam-Boiler Furnaces.	June 2	June 4	251
255	XII. Elevators, Journal-Boxes, Pulleys and Shafting, and Machine Elements.	May 31	June 17	217
	Between one and two months.			
123	XXIV. Sewing-Machines, Apparel, Tents, Umbrellas, and Canes, and Toilet.	May 29	June 17	211
221	XXIII. Acoustics, Electric Signaling, Horology, Recorders, and Registers.	May 28	June 11	220
251	XIII. Metal-Working, Arms and Projectiles, Making, Boring and Drilling, Hardware-Making, Nails and Spikes, Needles and Pins, Turning, etc.	May 27	June 6	217
258	VI. Chemistry, Explosives, Fertilizers, Medicines, Sugar and Salt, Surgery, etc.	May 27	June 4	264
155	XX. Builders' Hardware, Artificial Limbs, Dentistry, Locks and Latches, Safes, and Undertaking.	May 26	June 16	197
218	XVII. Printing, Type-Writing Machines, Linotyping, and Matrix-Making.	May 26	June 11	235
251	XXXIV. Railways, Railway-Brakes, Draft Appliances, and Rolling-Stock.	May 24	June 11	317
197	XXX. Fluid Pressure Regulators, Lamps and Gas-Fittings.	May 21	June 10	316
87	XXVI. Electricity, Generation, Motive Power, Medical and Surgical, and Electric Railways.	May 22	June 10	184
207	XV. Plastics, Paper-Making, Paving, Cutlery, Glass, Fuel, Bread-Making, etc.	May 21	June 17	266
208	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	May 20	June 9	216
44	XXIV. Accoutrements, Baggage, Buckles, Buttons, and Clasps, Card, Picture, and Sign Exhibiting, Packing and Storing Vessels, etc.	May 19	June 12	322
250	VIII. Furniture, Beds, Kitchen and Table Articles, and Check-Controlled Apparatus.	May 19	June 9	486
249	VII. Velocipedes, Clutches, Fire-Escapes, Games and Toys, Ladders, Mechanical Motors, and Paper Manufactures.	May 19	June 5	400
256	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	May 19	June 3	289
125	XXXII. Carbonating and Dispensing Beverages, Metallic Shipping and Storing Vessels, Refrigeration, etc.	May 17	June 19	274
149	III. Metallurgy, Metal-Founding, Electro-Chemistry, Coating with Metal, etc.	May 15	May 28	267
209	XIV. Metal Bending, Ornamenting, and Personal Wear, Farriery, Nut and Bolt Locks, Tools, Wire-Working, Sheet-Metal Ware, Making, etc.	May 6	May 13	335

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
123	XXIX. Wood-Working Machines, Coopering and Roofing.	May 5	June 6	255
120	IX. Hydraulics, Fire-Extinguishers, Baths and Closets, Pumps, Sewerage, and Water Distribution.	May 3	May 15	435
243	XXV. Butchering, Mills, Threshing, and Vegetable Cutters and Crushers.	May 3	Apr. 28	446
93	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	May 1	Apr. 24	462
	Between two and three months.			
248	XVIII. Steam-Engineering, etc.	Apr. 21	May 3	452
143	V. Fine Arts, Book-Binding, Harvesters, Jewelry, and Music.	Apr. 16	May 12	451
109	XXII. Fire-Arms, Ordnance, Navigation.	Apr. 12	May 20	248
91	XVI. Telegraphy and Telephony.	Apr. 7	Apr. 5	720
89	XXVIII. Pneumatics, Air and Gas Engines and Pumps.	Apr. 5	Apr. 5	573
	Between three and four months.			
105	XI. Boots and Shoes, Harness, Hose and Belting, Leather Manufactures, Nailing and Stapling, Button-Setting, and Whips.	Mar. 7	May 19	477
89	XXXVII. Electricity, Conductors and Special Applications, Electric Lighting and Signaling. Heaters.			
222	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Educational Appliances, Signals, Stone-Working, Store Furniture, Care of Live Stock, Stationery, Fishing and Trapping.			

Total number of applications awaiting action.....11,042

Under one month.			
*Designs	June 20	June 20	86
†Trade-Marks	June 6	June 23	154
‡Labels and Prints	June 26	June 26	8

Disclaimer.

683,6[illegible]—*Henry W. Avery*, Cleveland, Ohio. SEAT FOR HARVESTERS OR THE LIKE. Patent dated October 1, 1901. Disclaimer filed June 30, 1902, by the patentee and the assignee, *The Avery Stamping Company*.

Enter their disclaimer—

"To the construction which is defined by claims 1 and 2 of said patent in the following words, to wit:

"1. A seat made of sheet metal and reinforced by a plate held to the seat by rivets which have downwardly-projecting heads adapted to abut a supporting-bar, substantially as described.

"2. A seat made of sheet metal and reinforced by a plate held to the seat by a plurality of rivets, which rivets have downwardly-extending heads and are adapted to have their inner sides engage the edges of a supporting-bar beneath the seat, substantially as described."

Hearings.

Notice is hereby given that there will be no cases placed upon the docket to be heard by either the Commissioner or the Assistant Commissioner during the months of July and August, 1902.

F. I. ALLEN,
Commissioner.

Inks.

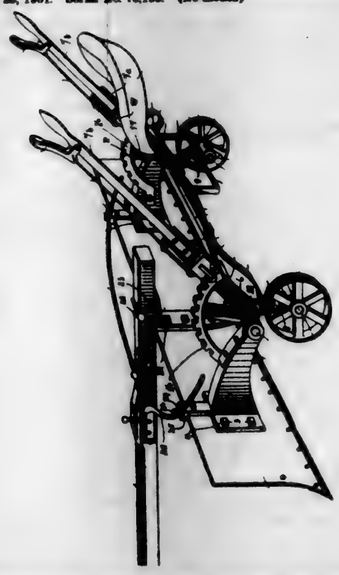
(ORDER NO. 37.)

All applications, communications, and other instruments in writing or print, which should properly constitute a permanent record in this Office, must be prepared with a substantially permanent ink. Aniline and other perishable inks will not be accepted.

PATENTS

GRANTED JULY 8, 1902.

708,977. ROAD-GRADER. JONAS H. ALDRICH, Butler, Ind. Filed Sept. 23, 1901. Serial No. 76,198. (No model.)

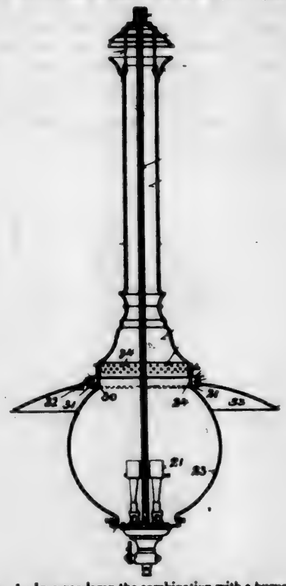


Claim.—1. In a road-grader, the combination with a cutter, of a pair of brackets secured to and projecting from the back of the cutter; bell-crank levers pivoted at their angles to the rear ends of the brackets and having their lower ends trailing behind the cutter and provided with casters; a tongue for the cutter; means for securing the tongue to the cutter and adjusting it at different angles thereto; means to lock each lever in different positions throughout the arc of its movement; and means to set and lock the casters against turning in their sockets with their wheels adjusted to the line of draft.

2. In a road-grader, the combination with a cutter, of a pair of brackets secured to and projecting from the back of the cutter; bell-crank levers pivoted at their angles to the rear ends of the brackets and having their lower ends trailing behind the cutter and provided with casters; a tongue for the cutter; means for securing the tongue to the cutter and adjusting it at different angles thereto; means to lock each lever in different positions throughout the arc of its movement; a seat-supporting bar secured to the rear ends of the tongue and extending to the rear of the caster-wheels; and a seat mounted on the outer end of the bar.

3. In a road-grader, the combination with a cutter, of a pair of brackets secured to and projecting rearward from the back of the cutter and provided at their free ends with transverse horizontal pivots; bell-crank levers mounted on the pivots by bearings at their angles with their lever-arms trailing behind the cutter and provided with casters; a tongue for the cutter; means to secure the tongue to the cutter at various angles thereto, comprising a table-bracket centrally secured to the back of the cutter and pivotally supporting the rear end of the tongue, clips integral with the lever-brackets engaging the top of the cutter and provided with eyelets, bounds secured to the tongue and projecting through the eyelets, and set-screws in the eyelets adapted to engage the bounds; and means to lock each lever in different positions throughout the arc of its movement.

708,978. INCANDESCENT GAS-LAMP. LEE T. ALTON, Brooklyn, N. Y. Filed Mar. 26, 1901. Serial No. 52,895. (No model.)



Claim.—1. In a gas-lamp the combination with a burner, of a globe, provided with an annular rim and inclosing said burner, and a draft-tube superposed above said globe and provided with an annular channeled projection at the base thereof surrounding said rim and forming therewith an annular chamber at the top of the globe.

2. In a gas-lamp, the combination with a burner, of a globe, provided with an annular rim and inclosing said burner, a draft-tube superposed above said globe, provided with a perforated base portion and an annular channeled projection below said perforated portion surrounding said rim and forming therewith an annular air-chamber, and a circular band revolubly supported on said annular projection and provided with perforations adapted to register with the perforations in the base portion of the draft-tube for admitting air to the draft-tube when desired.

708,979. RAILWAY-RAIL JOINT. WILLIAM J. AMERN, Milwaukee, Wis., assignor to Permilla J. Austin. Original application filed Mar. 3, 1898, Serial No. 672,422. Divided and this application filed Nov. 12, 1900. Serial No. 36,311. (No model.)

Claim.—1. A rail-joint comprising the proximate ends of two rail lengths; a sleeve partially encompassing said ends; and a filling of metal between the sleeve and the rails, and united to both by fusion.

2. A rail-joint comprising the proximate ends of two rails; a sleeve or coupling partially encompassing said rail ends; and a body of cast metal

filling the space between the rails and the sleeve, passing through the webs of the rails, and united by fusion both to the rails and to the sleeve.

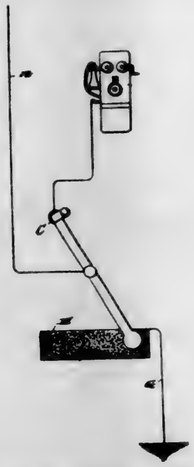
3. In combination with the proximate ends of two railway-rails; a longitudinally-divided sleeve or coupling applied to and partially encompassing said rail ends; and a filling of cast metal within the sleeve and united to the sleeve and the rails by fusion.

4. In combination with two rails; a sleeve or coupling comprising members A and A' overlapping the meeting-point of said rails; fastenings G applied to the sections A, A' and serving to hold them together; and a filling of cast metal between the sleeve and the rails and fused to both.

5. In combination with the proximate ends of two rails; a longitudinally-divided sleeve extending beneath and upward beside said ends; projections extending inward from the members of the sleeve toward the webs of the rails; and a filling of metal introduced within the sleeve and united by fusion to the sleeve and rails.

6. The combination of a pair of rail ends; a jacket adjusted to the rail ends; adjusting-bolts passing transversely through openings in the webs of the rail-sections and through the sides of the jacket; and a body of metal molded in the jacket, and adhering to said jacket and to the rail ends.

708,980. COMBINED SWITCH AND LIGHTNING-ARRESTER. WILLIAM J. BELL, Baraboo, Wis. Filed Mar. 26, 1902. Serial No. 100,088. (No model.)



Claim.—1. In a combined switch and lightning-arrester, the combination of the line-wire of a telephone or other electrical system, an instrument, a carbon plate electrically connected with the ground, and a movable device for making and breaking electrical connection between the line-wire and the instrument; the said device having a portion of carbon, movable in close proximity to the carbon plate.

2. In a combined switch and lightning-arrester, the combination with the line-wire of a telephone or other electrical system, and an instrument; of a carbon plate electrically connected with the ground, and a lever for making and breaking electrical connection between the line-wire and the instrument; the said lever having a portion of carbon movable over the carbon plate, substantially as and for the purpose specified.

708,981. SUSPENDER. CASPER BLOOMBERG, New York, N. Y. Filed Apr. 14, 1902. Serial No. 102,896. (No model.)

Claim.—1. A suspender for trousers comprising a shoulder-strap looped at the end and having loosely held in the loop a connector, a suspender-end the width of the upper end of which substantially equals the width of said connector, said suspender-end being constructed of a single member or tab slitted to form a buttonhole and provided with a reinforcing-flap at the upper end thereof, the edge of said flap crossing the tab in close proximity to the upper end of said buttonhole and the flap being stitched to the tab also in close proximity to said upper end of the buttonhole, as and for the purpose set forth.

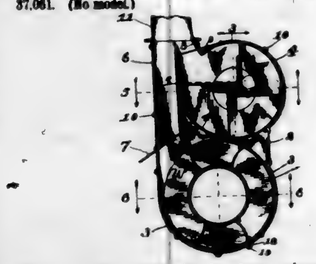
2. A suspender for trousers comprising a shoulder-strap looped at the end and having loosely held in the loop a connector, a suspender-end the width of the upper end of which substantially equals the width of said connector, said suspender-end being constructed of a single member or tab folded over at its upper end for connection to said connector and slitted to form a buttonhole, and provided with a reinforcing-flap at the upper end thereof, the edge of said flap crossing the tab in close proximity to the upper end of said buttonhole and the flap being stitched to the tab also in close proximity to said upper end of the buttonhole, as and for the purpose set forth.

3. A suspender for trousers comprising a shoulder-strap looped at the end and having loosely held in the loop a connector, a suspender-end the width of the upper end of which substantially equals the width of said connector and which upper end is folded over and stitched to fit the loop, said suspender-end being constructed of a single member or tab slitted to form a buttonhole and also having a reinforcing-flap substantially hemispherical in form secured to the tab by stitching which crosses the tab in close proximity to the upper end of said buttonhole.

708,982. GAS-STOVE. HEWSON BOMBOR, Birmingham, England. Filed Feb. 13, 1902. Serial No. 93,990. (No model.)

Claim.—The combination with an open grate having a bottom dead-plate and a chimney, of a plurality of vertical open-ended tubes passing upward through said dead-plate and grate and curving outwardly through the wall of the chimney, said tubes having deflected portions or bends, and burners located directly beneath said deflected portions, substantially as described.

708,983. BOOT OR HOUSING FOR PNEUMATIC ELEVATORS. CHESTER BRADFORD, Indianapolis, Ind. Filed Nov. 19, 1900. Serial No. 37,061. (No model.)



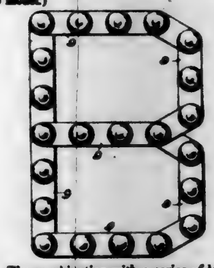
Claim.—1. The combination, in a boot or housing for pneumatic elevators, of two cast sides having grooves therein, rim-pieces substantially surrounding the spaces therein wherein the throwing-wheel and fan are situated, division and side walls arranged as shown, whereby said throwing-wheel and said fan are separately inclosed and the egress-passages divided keeping the grain and air separate until the neck of the housing is reached, said rim-pieces, division and side walls entering said grooves in the sides, and bolts passing through the sides and clamping the same onto the rim-pieces and walls, substantially as shown and described.

2. The combination, in a boot or housing for pneumatic elevators embodying two wheel-receptacles having passages leading therefrom to a common discharging point or neck, of a slide positioned below said neck and adapted to extend across one of said passages to the partition dividing the same from the other passage, whereby the blast from one wheel may be cut off, substantially as shown and described.

3. The combination, in a boot or housing for pneumatic elevators embodying two wheel-receptacles having passages leading therefrom to a common discharging point or neck, of an adjustable slide positioned below said neck and adapted to extend across one of said passages to the partition dividing the same from the other passage, whereby any desired portion of the blast from one wheel may be cut off, and a clamping device, as 13, whereby said slide may be secured in any position to which it may be adjusted.

4. The combination, in a boot or housing for pneumatic elevators, of two cast sides having grooves therein, sheet-metal rims or walls for the housing-chambers and egress-passages the edges of which enter said grooves, and which separately inclose the throwing-wheel and the fan and divide the passages leading therefrom to the housing-neck, bolts passing through the sides and clamping the same against the edges of the sheet-metal walls, and a cast neck-piece secured to said housing over the passages leading from the chambers of the housing, substantially as shown and described.

708,984. SUPPORTING DEVICE FOR ELECTRIC LAMPS. WILLIAM F. BREWSTER, New York, N. Y. Filed Dec. 19, 1901. Serial No. 86,504. (No model.)



Claim.—1. The combination with a series of lamp-receptacles, and a series of separate adjustable receptacle-supporting devices connecting said lamp-receptacles, of independent plates or strips also connecting the several receptacles and located in front of the adjustable connecting devices.

2. The combination with a series of lamp-receptacles and a series of adjustable links connecting said receptacles, of independent plates or strips connecting the several receptacles and covering the links and wire conductors.

3. The combination with a series of lamp-receptacles, and a series of adjustable links connecting said receptacles, of independent plates or strips connecting the several receptacles and covering the links and wire conductors, and sleeves over the outer ends of the receptacles.

4. The combination with a series of lamp-receptacles, a series of flat links each having serrated ends and means for adjustably connecting the links to the receptacles, of plates connected to the several receptacles and covering and concealing said links from the front.

5. The combination with a series of lamp-receptacles, a series of links and means for adjustably connecting the links to the receptacles, of plates supported by the receptacles in front of the links, and sleeves or guards covering the exposed front ends of the receptacles.

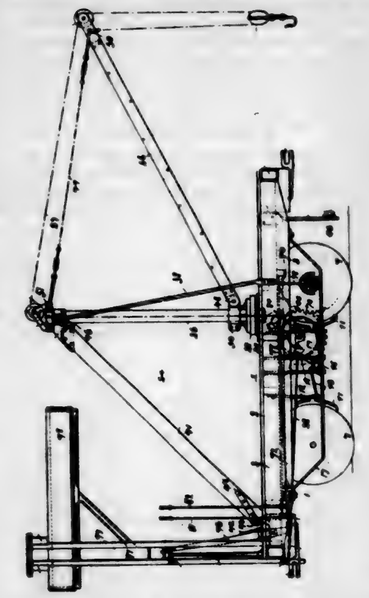
6. The combination with a series of lamp-receptacles, a series of links, and means for adjustably connecting the links to the receptacles, of plates supported by the receptacles in front of the links, and spring-pressed sleeves or guards embracing the outer exposed ends of the receptacles.

7. The combination with a series of lamp-receptacles, a series of links and means for adjustably connecting the links to the receptacles, of plates supported by the receptacles in front of the links, and spring-pressed sleeves or guards embracing the outer exposed ends of the receptacles, each sleeve or guard having an inwardly-projecting flange at its outer end.

8. The combination with a series of lamp-receptacles and a sectional and adjustable supporting-frame therefor, of a spring-pressed sleeve or guard embracing the outer end of each receptacle and provided at its outer end with an inwardly-projecting flange adapted to bear against the lamp.

9. The combination of a series of lamp-receptacles, a series of links each having interlocking serrated or toothed ends, and means connecting said links with the lamp-receptacles.

708,985. ELECTRIC LOCOMOTIVE-CRANE. GEORGE M. BRILL, Philadelphia, Pa. Filed Jan. 4, 1901. Serial No. 42,043. (No model.)



Claim.—1. In a crane, the combination with a locomotive provided with driving-wheels; of a swinging crane mounted upon the platform of said locomotive, a winding-drum mounted beneath said platform adapted to receive the hoisting-rope, a motor carried beneath said platform, mechanism controlled from one end of said locomotive for connecting said motor and said driving-wheels, mechanism controlled from the same end of said locomotive for connecting said motor, and winding-drum and brake mechanisms for said winding-drum and said locomotive-wheels, controlled from the same end of said locomotive, substantially as described.

2. In a crane, the combination with a locomotive, provided with driving-wheels; of a swinging crane mounted upon the platform of said locomotive, a winding-drum mounted beneath said platform, a brake-band upon said drum and mechanism for operating the same from the front of the locomotive, a motor suspended beneath said platform, adapted to be connected with said winding-drum and said driving-wheels, substantially as described.

3. In a crane, the combination with a locomotive provided with driving-wheels; of a swinging crane mounted upon the platform of said locomotive, a bearing-plate provided with raceways resting upon said platform, and a pivot-plate secured upon the lower portion of said crane, having corresponding raceways adapted to receive balls or rollers, said crane passing through said bearing-plate, and secured beneath the platform, substantially as described.

4. In a crane, the combination with a locomotive provided with driving-wheels; of a crane mounted upon the platform of said locomotive, a winding-drum beneath said platform, a motor suspended beneath said platform, a gear-wheel loosely mounted upon the shaft with said drum, a clutch carried by said shaft, a gear-wheel also loosely mounted upon the axle of said driving-wheels, a clutch also carried by said axle, and means for throwing said clutch into and out of action, substantially as described.

5. In a crane, the combination with a locomotive provided with a pair of driving-wheels; of a swinging crane mounted upon the platform of said locomotive, a winding-drum mounted beneath said platform, a friction-brake carried by said drum, means for operating said brake from the front of said locomotive, a motor suspended beneath the platform of said locomotive and mechanism controlled from the front of said locomotive for throwing said motor into gear with said driving-wheels or said winding-drum, substantially as described.

6. In a crane, the combination with the locomotive provided with driving-wheels; of a swinging crane mounted upon the platform of said locomotive, a motor suspended beneath the platform of said locomotive, a pinion upon the shaft of said motor, a gear-wheel loosely mounted upon the axle of said driving-wheels, a clutch carried by said axle, a rock-shaft

adapted to operate said clutch, and means for actuating said rock-shaft from the front of said locomotive, substantially as described.

7. In a crane, the combination with a locomotive provided with driving-wheels, of a crane mounted upon the platform of said locomotive, a hoisting-drum mounted beneath the platform of said locomotive, a gear-wheel loosely mounted upon the shaft of said drum, a motor suspended beneath the platform of said locomotive, a pinion upon the shaft of said motor, intermediate gearing between said pinion and said loose gear-wheel, a clutch carried upon the shaft of said drum, and mechanism for operating said shaft from the front of said locomotive, substantially as described.

8. In a crane, the combination with a locomotive provided with a pair of driving-wheels; of a crane mounted upon the platform of said locomotive, a hoisting-drum beneath said platform, a gear-wheel loosely mounted upon the shaft with said gear-wheel, a motor suspended beneath said platform, a pinion carried upon the shaft of said motor, a gear-wheel loosely mounted upon the axle of said driving-wheels, said loose wheels and said pinion intermeshing, and mechanism for locking either or both of said loose gears upon their respective shafts, substantially as described.

9. In a crane, the combination with a locomotive provided with a pair of driving-wheels; of a swinging crane mounted upon the platform of said locomotive, a winding-drum carried by said locomotive, intermeshing gear-wheels loosely mounted upon the shaft of said drum and the axle of said driving-wheels, a motor, a pinion provided upon the shaft of said motor meshing with said gear-wheels and clutches for transmitting motion from said gear-wheels to said shafts, substantially as described.

10. In a crane, the combination with a locomotive provided with a pair of driving-wheels; of a crane mounted upon the said locomotive, a winding-drum carried by said locomotive, a brake carried by said winding-drum, mechanism for operating said brake from the front of the locomotive, gear-wheels loosely mounted upon the shaft of said winding-drum, and the axle of said driving-wheels, clutches carried by said shaft and axle, mechanism for operating said clutches independently from the front of said locomotive, and a motor provided with a pinion adapted to mesh with said loose gears, substantially as described.

11. In a crane, the combination with the vertical mast, the swinging boom carried thereby, and a bracket clamped upon the lower end of said mast, and supporting the lower end of said boom; of an upper bearing-plate rigidly secured upon the lower end of said mast and having its upper edge abutting against the bottom of said bracket, and a lower bearing adapted to receive the weight from said upper bearing-plate, substantially as described.

12. In a swinging crane, the combination with the vertical mast, and the swinging boom carried thereby, and a bracket clamped upon the lower end of said mast, said bracket securing the lower end of said boom; of an upper bearing-plate rigidly secured upon said mast upon which rests said bracket, raceways provided upon the lower surface of said plate, said plate being provided with a flanged edge, and a lower bearing-plate adapted to fit up under said flange, raceways provided upon the upper surface of said bearing and antifriction devices adapted to run in said raceways, substantially as described.

13. In an electric locomotive-crane, the combination with a locomotive provided with a deck or platform, of a swinging hoisting-crane thereon comprising a hollow iron mast journaled at the top and bottom, bracing to maintain the same erect, a boom secured to the mast at the lower end, the other end being supported by a rod or chain from the upper end of the mast, a sheave mounted at the end of the boom, another sheave mounted on top of the mast, a guide-wheel secured to the platform and located beneath the end of the mast, a winding-drum located beneath said platform, a hoisting rope or chain passing over the two sheaves, down the hollow mast and over the guide-wheel to the drum, a single electric motor for driving both said locomotive and said crane, the said motor being supported beneath the platform of the locomotive in the usual way, and gearing connecting said motor with both the locomotive-axle and the winding-drum whereby either may be operated.

14. In an electric locomotive-crane, the combination with a locomotive provided with a deck or platform, of a swinging hoisting-crane thereon comprising a hollow iron mast journaled at the top and bottom, bracing to maintain the same erect, a boom secured to the mast at the lower end, the other end being supported by a rod or chain from the upper end of the mast, a sheave mounted at the end of the boom, another sheave mounted on top of the mast, a guide-wheel secured to the platform and located beneath the end of the mast, a winding-drum shaft located beneath the platform on one side of one of the locomotive-axles, an electric motor on the other side of the said axle, a driving-pinion connected therewith, gears loosely mounted upon the axle and drum-shaft and meshing with each other and the motor-pinion, and means to clutch said gears to their shafts, to operate either the locomotive or the drum from the said electric motor.

15. In an electric locomotive-crane, the combination with a locomotive provided with a deck or platform, of a swinging hoisting-crane thereon comprising a hollow iron mast journaled at the top and bottom, bracing to maintain the same erect, a boom secured to the mast at the lower end, the other end being supported by a rod or chain from the upper end of the mast, a sheave mounted at the end of the boom, another sheave mounted on top of the mast, a guide-wheel secured to the platform and located beneath the end of the mast, a winding-drum shaft located beneath the platform on one side of the locomotive-axle, an electric motor on the other side having a shaft with a pinion secured thereto, a gear-wheel loosely mounted upon the shaft of the drum, and another on the axles, said gears intermeshing and the axle-gear meshing with the motor-pinion, whereby, when the motor is operated both gears are also operated, clutches carried on the axle and drum-shafts, to rotatably connect said gears with the axle or shaft, clutch-operating levers arranged near the forward end of the locomotive and connected with the said clutches whereby the crane or the locomotive may be handily connected with the motor from the forward end of the platform.

16. In an electric crane, the combination with a hoisting-crane and a winding-drum therefor, of an electric locomotive, on the deck of which the crane is carried and comprising the wheels and axles, and a motor for driving the same supported from one of the axles and the frame of the locomotive, and having a driving-pinion, a gear-wheel connected with the axle and meshing with said pinion, and means to connect said motor with the winding-drum of the crane.

17. The combination with an electric locomotive comprising a deck or platform and the usual wheels and axles, and a motor suspended beneath the deck-frame to propel the locomotive of a hoisting-crane located on the deck, and having a winding-drum therefor, and mechanism to connect said motor with said drum, or with one of the axles, of the locomotive.

18. The combination with an electric locomotive having a deck or platform, wheels and axles therefor, a motor suspended from the axle in the usual way and from the deck-frame and having a driving-pinion, a gear loosely carried upon axle and meshing with the said pinion and the clutch to connect said gear to said axle, of a hoisting-crane carried upon said deck, a winding-drum and shaft therefor, a gear-wheel loosely carried upon the drum-shaft, a clutch to rigidly connect said gear with the drum-shaft and means to operate both said clutches whereby the usual car-motor may also be utilized to operate the winding-drum.

19. In an electric locomotive-crane, a frame, an axle and a winding-drum shaft having a winding-drum secured thereto, intermeshing gears loosely mounted upon said axle and shaft, a motor supported from said axle and the frame of the locomotive and having a driving-pinion meshing with the axle-gear, and clutching means to operatively engage and disengage said gears and their shafts.

20. In an electric locomotive-crane, an axle and wheels for the locomotive, a winding-drum for the crane having its shaft located adjacent the axle, intermeshing gears loosely mounted upon the axle and shaft, a motor having a driving-pinion meshing with the gear carried by said axle, clutches to engage said gears and the shaft and axle, a hand-brake for the drum and shoe-brakes for the wheels.

21. In a swinging hoisting-crane, the combination with a revoluble mast, a platform for the mast, a lower pivot-plate through which the mast extends, an upper pivot-plate to bear upon the lower pivot-plate, through which the mast passes, clamping rings or bands about the mast and above the upper plate to clamp or grip the mast.

22. In a swinging hoisting-crane, a platform, a mast thereon, pivot-plates to form a bearing for the mast through which it extends, the lower plate being secured to said platform, a boom for the crane, clamping rings, bars or bands about the mast above the upper plate, the boom being secured at its lower end to said clamping members.

23. In a crane, a top mast-sheave holder, consisting of substantially semicircular bands or bars, bolts adapted to clamp the same about the top of the mast, bars curved upward near the middle, and supported at their ends on the said clamping-plates, and a sheave or pulley journaled between said upwardly-bent supporting-bars.

24. In a swinging crane, the combination with a cast-metal-pipe mast-holder having niches or places formed therein to which the main and side braces are attached, a mast journaled in the same, and extended up through the same clamping bars or rings, bolts to clamp the same about the upper end of the mast, sheaves supporting bars 54 secured at their ends on the said clamping-bolts, a sheave journaled between said supported bars over the end of the mast, and a boom-supporting chain or rod also secured to one of said clamping-bolts.

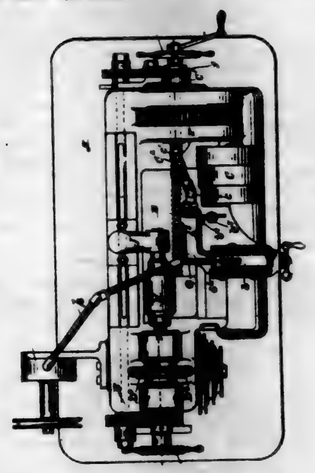
25. The combination with a flat-car, of a trolley-stand mounted thereon, at one end comprising vertical standards or posts, cross braces or girths secured to said standards near their upper ends, and a trolley base or pedestal secured to the said girths or braces, a motor carried by the car, and means to control the car from the front end thereof.

26. The combination with a flat-car, of a trolley-stand mounted thereon at one end, comprising vertical standards or posts, cross braces or girths secured to said standards near their upper ends, and a trolley base or pedestal secured to the said girths or braces, and a roof also supported by said standards arranged beneath the trolley-pedestal, substantially as described.

27. The combination of a flat-car, a trolley-stand carried thereon at one end, and comprising vertical standards placed near each side of the car and secured to the platform, cross braces or girths extending between said standards at their upper ends, and a trolley-stand proper or pedestal secured to said braces near the center line of the car, and a roof extending between and supported by said braces.

28. The combination of a flat-car having a platform including end sills in its construction, a trolley-stand erected at one end of the car, and comprising vertical standards near each end sill, each including two pieces secured to either side of the sill, and two joists or girths extending between the top of the two standards, and each secured to corresponding pieces thereof, and a flat base or pedestal secured to said two joists near the center on which a trolley is adapted to be mounted.

703,986. **MACHINE FOR CUTTING WORM-THREADS.** JOHN P. ROPER, Cleveland, Ohio, assignor to the Cleveland Machine Screw Company, Cleveland, Ohio, a Corporation of Ohio. Filed July 30, 1900. Serial No. 25,261. (No model.)



Claims.—1. In a machine for cutting worm-threads, the combination of a tool-carriage, a screw for feeding same longitudinally of the work, driving means, and a graduated disk mounted upon said screw so as to be rotatable therewith but movable thereon.

2. In a machine for cutting worm-threads, the combination of a tool-carriage, a screw for feeding same, driving means, a clutch member secured to said screw, and a graduated ring mounted upon the latter so as to be rotatable therewith but movable independently thereof.

3. In a machine for cutting worm-threads, the combination of a tool-carriage, a screw for feeding said carriage longitudinally of the work head-stock, means for driving said head-stock, gearing connecting said feed-screw and driving means, mechanism for disconnecting the driving means from the head-stock, whereby said screw and the work may be rotated independently of the driving means, and mechanism for driving the cutting-tool independently of said head-stock-driving means.

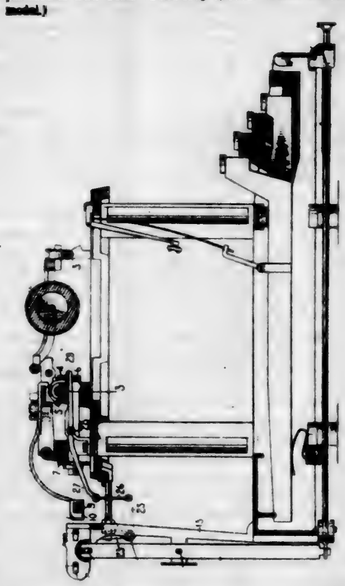
4. In a machine for cutting worm-threads, the combination of a tool-carriage, a screw for feeding same, driving means, a clutch member secured to said screw and provided with a shoulder, a graduated ring mounted upon such shoulder, and clamping means for securing such ring in place, said means adapted to permit of the movement of the ring upon the clutch member.

5. In a machine for cutting worm-threads, the combination of a tool-carriage, a screw for feeding same, driving means, a clutch member secured to said screw provided with a shoulder and mounted in proximity to the machine-frame, a graduated ring mounted upon said shoulder, the contiguous frame portion provided with a mark cooperating with said ring, and a series of clamps adapted to secure said ring to the clutch member to effect simultaneous rotation and permit of its movement independently of said member.

6. In a machine for cutting worms, the combination of a live spindle, a movable tool-carriage, a rotatable arm mounted in said carriage, the lines of the spindle and arm-axes lying in the same plane, a tool-spindle mounted transversely in the end of said arm, and a tool mounted upon said tool-spindle and having its center lying in said plane.

7. In a machine for cutting worm-threads, the combination of a tool-carriage, a screw for feeding said carriage longitudinally of the work, head-stock-driving means, gearing connecting said feed-screw and driving means, means for disconnecting the latter means from the head-stock whereby said screw and work may be rotated independently of said head-stock-driving means, and means for driving said tool independently of said head-stock-driving means embodying a tool-shaft provided with universal joints.

703,987. **TYPE-WRITING MACHINE.** ROYAL M. BULLARD, Chicago, Ill., assignor to Wyckoff, Seamans & Benedict, Ilion, N. Y., a Corporation of New York. Filed May 9, 1902. Serial No. 106,601. (No model.)



Claims.—1. In a type-writing machine and in a tabulating mechanism, the combination of a plurality of column-stops, a stop adapted to cooperate with each of said column-stops, a skipping-stop arranged to avoid each of said column-stops, and a special column-stop adapted to cooperate with said skipping-stop.

2. In a type-writing machine and in a tabulating mechanism, the combination of a plurality of column-stops, a stop adapted to engage with each of said column-stops, a supplemental column-stop having a greater projection than said plurality of column-stops, and a skipping-stop having a projection only great enough to cooperate with said supplemental column-stop.

3. In a type-writing machine and in a tabulating mechanism, the combination with a plurality of column-stops of uniform projection, a denomination-stop adapted to cooperate with each of said column-stops, a supplemental column-stop having a greater projection than the said plurality of stops, and a skipping-stop having a less projection than said denomination-stop, whereby the said skipping-stop when operated will cooperate only with the said supplemental column-stop.

4. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of uniform column-stops on said bar and also a supplemental column-stop extending beyond the working faces of said plurality of column-stops, a key-actuated stop adapted to engage with each of said plurality of column-stops, and a key-actuated skipping-stop adapted to cooperate only with said supplemental column-stop.

5. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of uniform column-stops on said bar and also a supplemental column-stop extending beyond the working faces of said plurality of column-stops, a key-actuated stop adapted to cooperate with the said plurality of column-stops, and a key-actuated skipping-stop having a less projection than the other said key-actuated stop and adapted to cooperate only with the said supplemental column-stop.

6. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of uniform column-stops on said bar and also a supplemental column-stop extending beyond the working faces of said plurality of column-stops, a key-actuated stop adapted to engage with each of said plurality of column-stops, a key-actuated skipping-stop adapted to coöperate only with said supplemental column-stop, and means connected to each of said key-actuated stops for releasing the carriage when either of said stops is projected.

7. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of uniform column-stops on said bar and also a supplemental column-stop extending beyond the working faces of said plurality of column-stops, a key-actuated stop adapted to coöperate with the said plurality of column-stops, a key-actuated skipping-stop having a less projection than the other said key-actuated stop and adapted to coöperate only with the said supplemental column-stop, and means connected to each of said key-actuated stops for releasing the carriage when either of said stops is projected.

8. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop on said carriage, a key-actuated stop upon the framework to engage said stop, a second column-stop on said carriage and having a greater projection than the first, and a key-actuated skipping-stop on the framework to coöperate only with the said second column-stop.

9. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop on said carriage, a key-actuated stop upon the framework to engage said stop, a second column-stop on the carriage and having a greater projection than the first, a key-actuated skipping-stop on the framework to coöperate only with the said second column-stop, and means for releasing the carriage when either one of said key-actuated stops is projected.

10. In a type-writing machine and in a tabulating mechanism, the combination of column-stops projecting different distances and coöperating stops one of which is adapted to engage only that one of the column-stops having the greatest projection.

11. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of column-stops of uniform projection, a supplemental column-stop of greater projection, a key-actuated stop on the framework adapted to coöperate with each of said plurality of column-stops, and a key-actuated skipping-stop on the framework of less length than the other key-actuated stop and adapted to coöperate only with the said supplemental column-stop.

12. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of column-stops of uniform projection, a supplemental column-stop of greater projection, a key-actuated stop on the framework adapted to coöperate with each of said plurality of column-stops, a key-actuated skipping-stop on the framework of less length than the other key-actuated stop and adapted to coöperate only with the said supplemental column-stop, and means connected with each of said key-actuated stops for releasing the carriage when either of said stops is projected.

13. In a type-writing machine and in a tabulating mechanism, the combination of a plurality of column-stops of equal projection, a plurality of denomination-stops of equal projection, and each adapted to coöperate with said plurality of column-stops, a skipping-stop having a less projection than said denomination-stops, and a supplemental column-stop of greater projection than said plurality of column-stops.

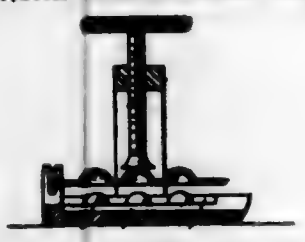
14. In a type-writing machine and in a tabulating mechanism, the combination of a plurality of column-stops of equal projection, a plurality of denomination-stops of equal projection and each adapted to coöperate with said plurality of column-stops, a skipping-stop having a less projection than said denomination-stops, a supplemental column-stop of greater projection than said plurality of column-stops, and means for releasing the carriage when any one of said denomination-stops or said skipping-stop is actuated.

15. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of uniform column-stops on said bar, a plurality of key-actuated denomination-stops of equal projection on the framework of the machine to coöperate with said column-stops, a key-actuated skipping-stop of less length or projection than the said denomination-stops, and an elongated column-stop on the column-stop bar adapted to coöperate only with said skipping-stop.

16. In a type-writing machine and in a tabulating mechanism, the combination of a power-driven carriage, a column-stop bar thereon, a plurality of uniform column-stops on said bar, a plurality of key-actuated denomination-stops of equal projection on the framework of the machine to coöperate with said column-stops, a key-actuated skipping-stop of less length or projection than the said denomination-stops, an elongated column-stop on the column-stop bar adapted to coöperate only with said skipping-stop, and means for releasing the carriage when any one of said key-actuated stops is operated.

17. In a type-writing machine and in a tabulating mechanism, the combination with a plurality of column-stops and coöperating key-actuated denomination-stops, of a skipping-stop arranged on the right of said series of denomination-stops, and a supplemental column-stop to coöperate only with said skipping-stop and arranged on the right of said plurality of column-stops.

708,988. LEMON-SQUEEZER. JOSEPH G. BULLOCH, Cherokee, N. C. Filed Sept. 25, 1901. Serial No. 76,472. (No model.)



Claim.—A lemon-squeezer comprising a base having a raised edge and a spout leading from the inclosure of the edge, said base having also a plurality of projections within the inclosure of the edge and having channels between the projections and leading to the spout, a presser-plate having recesses to receive the projections and adapted to enter the inclosure of the edge of the base, said plate being mounted upon the base for pivotal and bodily movement into and out of the inclosure of the edge, an upright at each end of the base, one of the said uprights having a slotted upper end and a spring-latch, a beam pivoted to the other upright and adapted for engagement of its free end in the slot of the first upright and beneath the latch, and a screw engaged with the beam and adapted to engage the pressure-plate and force it into the inclosure of the edge of the base.

708,989. MAGNETO-THERAPEUTIC APPARATUS. JOHN BURRY, Fort Lee, N. J., assignor to Max Wyler, Fort Lee, N. J., and Marie Burry, Brooklyn, N. Y. Filed May 3, 1900. Serial No. 15,870. (No model.)

Claim.—1. A therapeutic apparatus consisting of a solenoid combined with but insulated from a metal lining, substantially as described.

2. A therapeutic apparatus consisting of a solenoid combined with but insulated from a copper lining, substantially as described.

3. A therapeutic apparatus consisting of a solenoid combined with but insulated from an iron jacket, substantially as described.

4. A therapeutic apparatus consisting of a solenoid combined with but insulated from a copper lining and an iron jacket, substantially as described.

5. A therapeutic apparatus consisting of a solenoid combined with a protective closed metallic casing or sheath through which the terminals of the solenoid project, said casing being insulated from the solenoid, substantially as described.

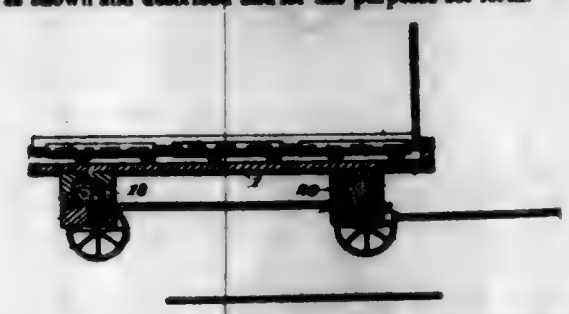
6. A therapeutic apparatus consisting of a solenoid combined with a copper lining-tube and an iron jacketing-tube, the said tubes being joined together in a water-tight manner at the ends of the solenoid and the terminals of the solenoid projecting through the casing formed by said tubes and connecting ends, substantially as described.

7. A therapeutic apparatus consisting of a solenoid combined with a copper lining-tube provided with an outside flange at one end of the solenoid and an iron jacketing-tube provided with an inside flange at the other end of the solenoid, said flanges and tubes being joined together, substantially as described.

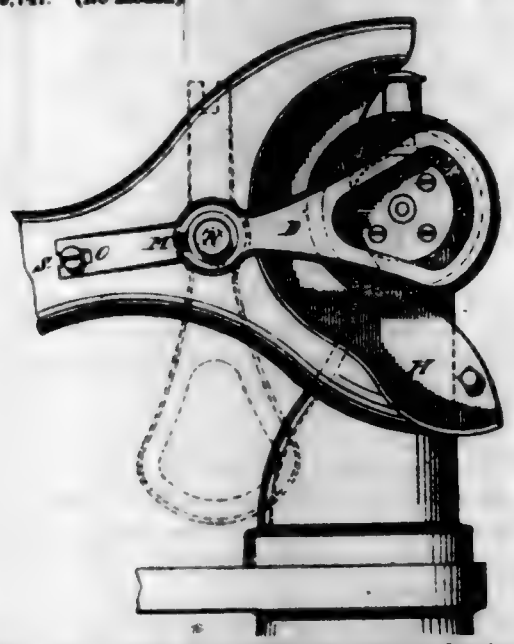
708,990. BAGGAGE-TRUCK. GALE W. BURTON, Muncie, Ind. Filed Nov. 13, 1901. Serial No. 82,110. (No model.)

Claim.—An adjustable baggage-truck, consisting of a running-gear; lower recessed bolsters mounted on the running-gear; upper recessed bol-

stors mounted above said lower bolsters; coupling-tongues uniting said lower bolsters; cogged hoisting-beams secured in the recesses of the upper bolsters, and passing down into depressions in the lower bolsters; a system of shafts and cog-wheels secured to the lower bolsters, and coupling-tongues, adapted to raise and lower the upper bolsters; a bed, having end and side walls, secured to the upper faces of the upper bolsters; rollers vertically journaled in the side walls of said bed with their peripheries extending slightly inwardly and beyond the inner faces of said side walls; rollers journaled longitudinally on the upper edge of one of the walls of said bed; a leaf extending downwardly from said wall; a shelf extending outwardly at right angles to said leaf; a table mounted on casters and adapted to run forwardly and rearwardly in said bed; rollers journaled longitudinally in the upper face of said table, their peripheries extending slightly above the upper face of said table; rollers journaled crosswise said table, their peripheries extending slightly above the upper face thereof; a frame secured vertically to the forward end of said table, substantially as shown and described and for the purposes set forth.



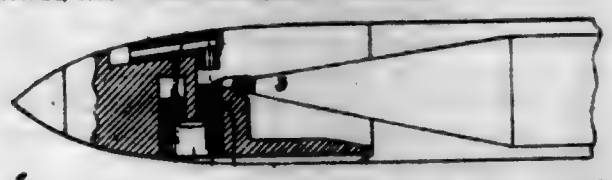
703,991. MACHINE FOR ABRADING FRONTS OF SHOE-HEELS. JOHN G. BURRELL, Lynn, Mass. Filed Mar. 22, 1900. Serial No. 9,747. (No model.)



Claim.—In a machine for abrading the fronts of shoe-heels the combination of a disk having abrading material upon a face making an acute angle with the free end of the disk, means adapted to cause said disk to revolve, a metal guard conforming to the working edge of the disk, having slots therein, said guard being held rigidly close to said working edge, the stud N and thumb-screw S which engage slots M and O of the guard substantially as shown or described

---

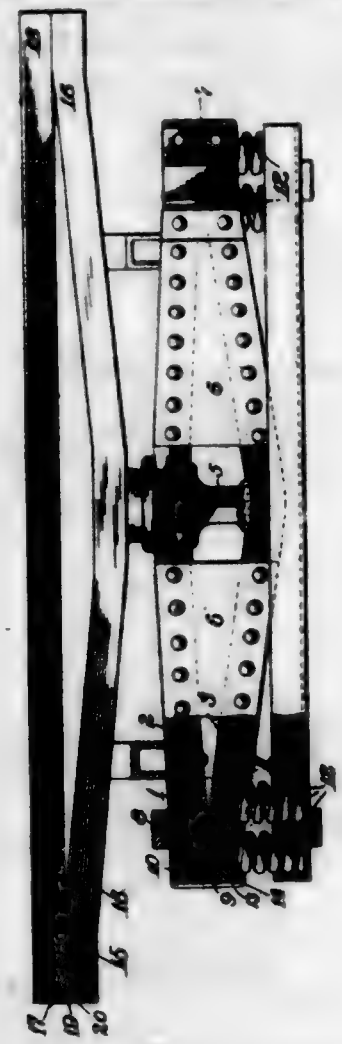
703,992. LOOM-SHUTTLE. LEON W. CAMPBELL, Woonsocket, R. I., assignor of one-half to Malcolm Campbell, Boston, Mass. Filed Nov. 24, 1900. Serial No. 37,618. (No model.)



Claim.—A shuttle having a thread-aperture, the inlet of which extends out toward the bottom thereof, and the outlet of which extends toward the side thereof, with a communicating duct extending upward from the inlet to the outlet, said shuttle having a device consisting of an induction-tube located in the groove of the top of the shuttle, and having a nozzle located above the inlet of the thread-aperture.

703,998. BOLSTER. EDWARD CARLSON and JAMES PERRIE, Chicago, Ill. Filed Mar. 7, 1902. Serial No. 97,160. (No model.)

Claim.—1. A bolster having its compression and tension members formed of two bars or plates, one of which is provided with end flanges and the other one of which is provided at its ends with double-angled flanges engaging said first-named flanges; substantially as described.



2. A bolster having its compression and tension members formed of channel-bars gibbed at their meeting ends as to both their webs and flanges; substantially as described.

3. A bolster having its compression and tension members formed of channel-bars arranged web to web with their flanges outwardly directed, said members being gibbed as to their ends.

4. A bolster having its compression and tension members arranged web to web, the ends of said members being gibbed; substantially as described.

5. A bolster having its compression and tension members arranged web to web with their meeting ends gibbed and plates secured to the sides of said members; substantially as described.

6. A bolster having its compression and tension members arranged web to web, the web of one member having a flange and the web of the other member having a double-angled flange receiving the first-mentioned flange; substantially as described.

7. A truck-bolster having compression and tension members gibbed together at their ends, spring-seats, and means on the ends of each tension member to hold said seats in place; substantially as described.

8. A truck-bolster having its compression and tension members gibbed together at their ends, spring-seats, and a flange on the ends of each tension member to hold said seats in place; substantially as described.

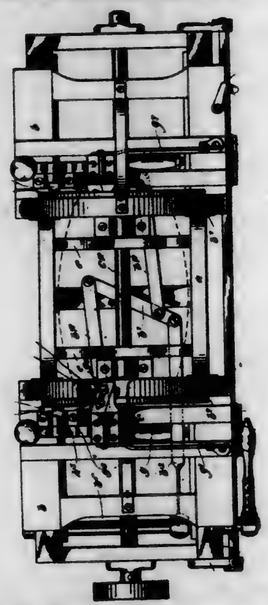
9. A truck-bolster having a compression and a tension member formed of channel-bars, and spring-seats, the end of the web of the tension member being upset to form a flange both above and below the web, the end of the other web bearing against the upper flange whereby the said members are gibbed together at their ends and the spring-seats bearing against the lower flange and held in place thereby; substantially as described.

10. A truck-bolster having a compression and a tension member, and spring-seats, the end of the web of the tension member being upset to form a flange both above and below the web, the end of the web having a double-angled flange receiving the upper flange of the tension member and the spring-seats bearing against the lower flange; substantially as described.

11. A truck-bolster comprising a compression member having a web 1 and flanges 2, a tension member having a web 3 and flanges 4, the members being arranged web to web, a central support, the web 3 being upset to form upper and lower flanges 8 and 9 and the web 1 having a

double-angled flange 10 to fit the flange 8, and a spring-seat 11 bearing against the under side of the web 3 and having a flange 13 fitting against the flange 9; substantially as described.

708,994. MACHINE FOR FINISHING BARRELS. GEORGE M. CARTER, Poplarbluff, Mo., assignor to himself and William Ferguson, Poplarbluff, Mo. Filed Sept. 24, 1901. Serial No. 76,491. (No model.)



Claim.—1. The combination with a frame, of a carriage mounted thereon, a ring arranged to turn in the carriage, the ring receiving the end of a barrel, means for turning the ring, cam-shaped dogs mounted in the ring to engage the barrel and hold it firmly therein, and a tool working with the barrel, for the purpose specified.

2. The combination of a frame, a carriage mounted thereon, a gear-ring arranged to turn in the carriage, a driven gear meshing with the gear-ring to drive it, a choke-ring fitted in and turning with the gear-ring, cam-shaped dogs mounted in the choke-ring to engage and hold the barrel, and a tool working with the barrel, for the purpose specified.

3. The combination with a frame and means for carrying and turning a barrel, of a lever mounted on the frame, a tool carried by the lever and adapted to work with the barrel, a second tool, and means for mounting said tool to swing into and out of operative position, the lever striking said means when moving the first tool into action, whereby to throw the second tool into action.

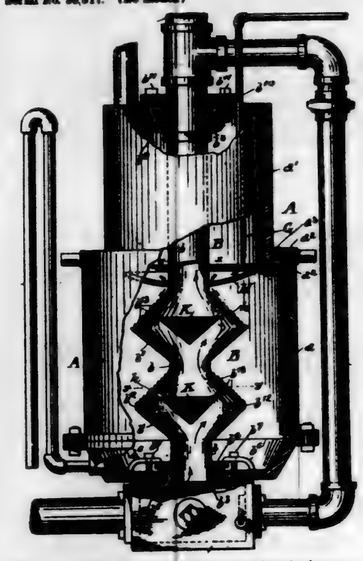
4. The combination with a frame and with means for mounting and turning a barrel, of a lever mounted on the frame, a tool carried thereby and adapted to work with the barrel, a rock-shaft, a second tool mounted on the rock-shaft, and an arm on the rock-shaft, the arm being struck by a part of the lever, whereby to throw the second-named tool into operative position.

5. The combination with a frame and means for mounting and carrying a barrel, of a tool, means for mounting said tool to move into and out of operative position, a second tool, and means for mounting the second tool to move into and out of operative position, the mounting means of one tool striking the other to actuate it, whereby the tools are moved simultaneously into operative position.

6. In a machine for finishing barrels, the combination with a frame and the means for mounting and turning a barrel, of a tool, means for carrying the tool to work against the inside of the barrel, a second tool, and means for carrying the second tool to work against the end of the barrel to trim it, said tool-carrying means being juxtaposed to be actuated the one from the other.

7. The combination with a frame and means for mounting and turning a barrel, of a lever mounted on the frame, a cutter-head projecting transversely from the lever, a tool carried by the cutter-head and working on the inside of the barrel, a second tool working on the end of the barrel, and means for carrying the second tool to move into and out of operation, said means for carrying the second tool being struck by a part of the lever to throw both tools into action simultaneously.

708,995. GAS-GENERATOR. FRED R. CATON and FRANKLIN B. WARRING, San Jose, Cal., assignors to Caton's Foundry and Machine Company, San Jose, Cal., a Corporation of California. Filed Mar. 1, 1902. Serial No. 96,317. (No model.)



Claim.—1. In a gas-generator having an interior heater or vaporizer over which the oil flows, an exterior casing inclosing said heater or vaporizer, said casing being constructed of telescopic sections, adapting a section to be slipped upon another to expose and afford access to the heater or vaporizer.

2. In a gas-generator having an interior heater or vaporizer over which the oil flows, an exterior casing inclosing said heater or vaporizer, said casing being constructed of telescopic sections, adapting a section to be slipped upon another to expose and afford access to the heater or vaporizer and a safety-joint between the sections to relieve abnormal gas-pressure within the casing.

3. In a gas-generator having an interior heater or vaporizer over which the oil flows, an exterior casing inclosing said heater or vaporizer, said casing being constructed of telescopic sections, adapting a section to be slipped upon another to expose and afford access to the heater or vaporizer, said sections having flanges on their adjacent ends, and a temporary packing seated between the flanges, to form a relief or safety joint against abnormal gas-pressure within the casing.

4. In a gas-generator having an exterior casing, a heater or vaporizer over the outer surface of which the oil flows, said heater or vaporizer being mounted in a journal-bearing within said casing adapting it to be rotated upon its axis.

5. In a gas-generator having an exterior casing with means for affording access to its interior, a heater or vaporizer over the outer surface of which the oil flows, said heater or vaporizer being mounted in a journal-bearing within said casing adapting it to be rotated upon its axis.

6. In a gas-generator having an exterior casing, with means affording access to its interior, a heater or vaporizer within said casing and mounted above and below in the top and bottom of the casing with journal-bearings adapting it to be rotated on its axis.

7. In a gas-generator having an exterior casing with means affording access to its interior, a heater or vaporizer within said casing having at its top a journal-bearing adapting it to be axially rotated, and a journal-bearing at its bottom consisting of an end projecting into the base-plate of the casing, a flange with intervening packing resting on said base-plate and releasable clamps bearing on the flange.

8. In a gas-generator the combination of the outer casing, a hollow cone within said casing, a means for feeding the oil to the outer surface of said cone, a means for directing the heating-gases through said cone, and a heat-deflector within and connected directly with said cone.

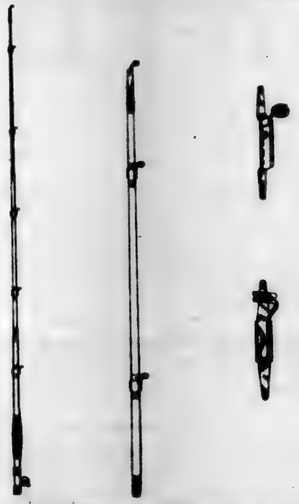
9. In a gas-generator and in combination with hollow cones of its heater or vaporizer, the conical heat-deflectors within the cones and connected directly therewith by spaced arms.

10. In a gas-generator, a hollow heater or vaporizer through which heated gases pass, and consisting of tubular portions and conical portions, the latter having formed upon their upper surfaces a spirally-directed groove forming a continuous channel for the oil.

11. In a gas-generator, a hollow heater or vaporizer through which heated gases pass, and consisting of tubular portions and conical portions, the latter having formed upon their upper surfaces a spirally-directed groove forming a continuous channel for the oil, and heat-deflecting cones within said conical portions and connected directly therewith.

12. A gas-generator consisting of a sectional telescopic casing, having an air-inlet and a gas-outlet, a hollow heater or vaporizer with conical portions, within said casing, said conical portions having upon their surfaces, spirally-directed grooves forming continuous channels for the oil, heat-deflectors within the conical portions and directly connected therewith, a connection for supplying heated gases to the interior of the heater or vaporizer and means for feeding oil to the surface of said heater or vaporizer.

708,996. LINE-GUIDE FOR FISHING-RODS. EDWARD C. CATTLEY and ERNEST H. CATTLEY, Brooklyn, N. Y., assignors of one-third to Hartley C. Cattley, Brooklyn, N. Y. Filed Feb. 8, 1902. Serial No. 93,231. (No model.)



Claim.—1. A line-guide for fishing-rods comprising a ring formed as part of a helix, and a shank, in combination with a keeper adapted to be secured to a rod, and means for removing the shank from the keeper without removing the latter, substantially as described.

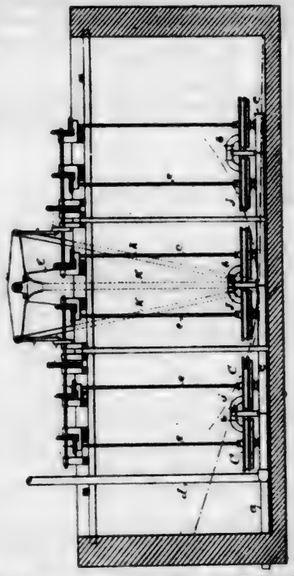
2. A line-guide for fishing-rods comprising a ring formed as part of a helix; a shank; and a spring-tongue formed by bending the shank back upon itself, in combination with a keeper forming a socket for the shank and spring-tongue and having a slot formed in its side to provide a shoulder for engagement by the end of the latter, substantially as described.

3. A line-guide for fishing-rods, comprising a ring formed as part of a helix; a shank; and a spring-tongue formed by bending the shank back upon itself, in combination with a cap to fit on a rod-tip; and a keeper integral with the cap forming a socket for the shank and spring-tongue and having a slot formed at each side to provide shoulders with either of which the end of the spring-tongue may engage, substantially as described.

4. A fishing-rod having two series of keepers secured thereto at opposite sides, and a keeper secured to the end of the tip, in combination with a series of rings formed as parts of a helix; suitable shanks integral with the said rings; means for detachably holding the said shanks in either of the series of keepers; and means for holding the shank of a ring in the keeper at the tip end in either of two opposite positions, substantially as described.

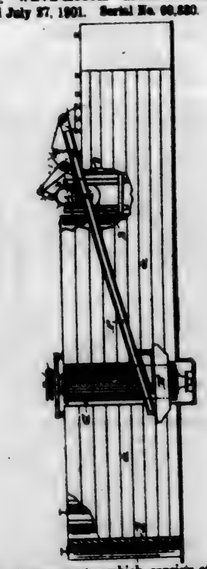
708,997. WAVE-MOTION PUMP. EPHRAIM CHAQUETTE, New Rochelle, N. Y. Filed Apr. 23, 1901. Serial No. 56,236. (No model.)

Claim.—1. A wave-motion pump which consists of a waterway formed between suitable piers, a shaft extending across said waterway, arms extending from said shaft longitudinally over said waterway, a pendulum suspended from said arms and adapted to swing in said waterway, a walking-beam mounted upon said shaft and means substantially as described whereby the reciprocating motion of the walking-beam is converted into a rotary motion and transmitted to the mechanism to be operated thereby.



2. In a wave-motion pump the above-described pendulum consisting of a tapering lower portion extending across the waterway and of rods suspending the same from the cross-arms of the rock-shaft of said pump, substantially as described for the purposes specified.

708,998. WAVE-MOTOR. EPHRAIM CHAQUETTE, New Rochelle, N. Y. Filed July 27, 1901. Serial No. 69,820. (No model.)

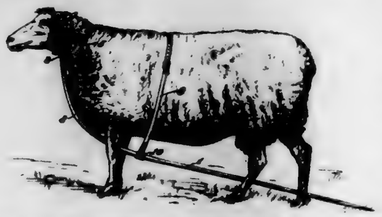


Claim.—1. A wave-motor which consists of piers inclosing a waterway on three sides, a pair of water-gates situated therein and adapted

to control said waterway in the vicinity of the float; and a float set in said waterway and mechanism connected therewith whereby the rising and falling of the float is converted into a continuous rotation of a power-shaft.

2. A wave-motor which is provided with a pair of water-gates of somewhat-semicylindrical character connected together for simultaneous operation and situated in the waterway in such manner that when turned in one position they tend to choke the waterway and bank up the water therein and when turned into the opposite position, offer no impediment to the flow of water through said waterway.

708,999. SHEEP-TRAIL. JOSEPH CHERPAW and FREDERICK MCGUIRE, Uxbridge, Canada. Filed Jan. 29, 1901. Serial No. 45,202. (No model.)



Claim.—1. In a sheep-trail, the combination of a bar pointed at its lower end and curved at its upper end, to conform to the breast of the animal, of a collar secured to said bar near its upper end and by means of which said bar is secured to the animal, and means whereby said bar is held in position, said bar adapted to extend rearwardly and to grip the animal's neck when its pointed end engages the ground.

2. In a sheep-trail, the combination of an extensible bar, of a strap secured to said bar near its central portion, for holding said bar in place, and a collar comprising an adjusting-strap and a semicircular portion of resilient material whereby the upper end of said bar may grip the animal's neck without injury to the animal.

3. In a sheep-trail, the combination of a tubular bar curved at its upper end, a pointed bar adapted to slide within said tubular bar, a set-screw seated in said tubular bar, said set-screw bearing against said pointed bar and holding the same in adjustment; of a strap secured to said tubular bar for holding said tubular bar in place and a collar secured to said tubular bar near the upper end thereof, said collar comprising an adjusting-strap and a semicircular portion of resilient material, whereby the upper end of said tubular bar may grip the animal's neck without injury to the animal.

704,000. LIFE-PRESERVER. GEORGE B. COULBY, Cleveland, Ohio. Filed Jan. 13, 1902. Serial No. 89,495. (No model.)

Claim.—1. A life-preserver comprising the combination of a folding framework consisting of a series of curved ribs hinged together at their respective ends, means for engaging two of the said ribs, a flexible waterproof cover secured at one end to one of the said engaging ribs and at its other end to the other of the said engaging ribs, and arranged to completely envelop the said framework, and springs secured within the said framework and arranged to hold the said ribs properly spaced when the framework is expanded and to cause the ribs to lie closely on each other when the frame is folded up, substantially as described and for the purpose set forth.

2. A life-preserver comprising the combination of an oval framework adapted to fold upon itself, consisting of a series of curved ribs hinged together at their respective ends, means for causing an engagement between two of the said ribs, a flexible waterproof covering secured to one of the last-mentioned ribs and extending around the framework and secured to the other of the last-mentioned ribs, springs secured within the said framework and arranged to hold the said ribs properly spaced when the framework is expanded and to cause the ribs to lie closely upon each other when the frame is folded up, closed sleeves arranged in the sides and bottom of said cover, and means for automatically adjusting the length of the said sleeves, substantially as described and for the purpose set forth.

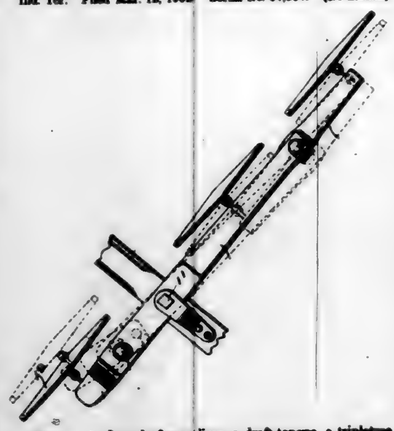
3. A life-preserver comprising the combination of a folding framework consisting of a series of curved ribs hinged together at their respective ends, means for engaging two of the said ribs, and a flexible waterproof cover secured at one end to one of the said engaging ribs and at its other end to the other of the engaging ribs and arranged to completely envelop the said framework, substantially as described and for the purpose set forth.

4. A life-preserver comprising the combination of a folding framework consisting of a series of curved ribs hinged together at their respective ends, means for causing two of the said ribs to engage with each other, a flexible waterproof cover secured at one end to one of the said engaging ribs and at its other end to the other of the said engaging ribs and arranged to completely envelop the said framework, an air-tube arranged in the top of the said cover, sight-holes formed in the sides of said cover, springs secured at their respective ends to ribs at each side of the said engaging ribs and arranged to hold the ribs of the said framework properly spaced when the framework is expanded and to cause the said ribs to lie closely upon each other when the frame is folded up, closed sleeves secured in the sides and bottom of said cover and strips of resilient material secured within the said sleeves, substantially as described and for the purpose set forth.

5. In a life-preserver, the combination of a framework comprising two end plates and a series of curved ribs hinged at their respective ends to the said end plates, sight-holes arranged in the said end plates, a flexible waterproof covering secured to said framework, said covering having an opening at its top, springs having their respective ends secured to the ribs on opposite sides of said opening, and means for locking together the ribs adjacent to the said opening, substantially as described and for the purpose set forth.

6. In a life-preserver, a framework comprising two end plates, a series of curved ribs hinged at their respective ends to the said end plates, sight-holes arranged in the said end plates, a flexible waterproof covering secured to said framework, said cover being arranged to separate at the top, sleeves secured to the sides of the said cover, leg-pieces secured at the bottom of said cover, and means for adjusting the length of said leg-pieces, substantially as described.

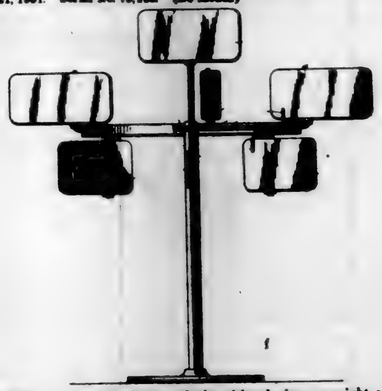
704,001. DRAFT-EQUALIZER. BERNHARD CREPLIN, Goodland Ind. Ter. Filed Mar. 12, 1902. Serial No. 97,937. (No model.)



Claim.—1. In a draft-equalizer, a draft-tongue, a triplotree pivotally united to said tongue at one side of the center, with the doubletree coupled to its long end and with the under side of the short end cut away, a brace-arm rigidly connected to said tongue and extending laterally therefrom beneath the short end of said triplotree, a coupling-bar having its upper part cut away and engaging the space between said brace-bar and said cut-away portion of said triplotree and adapted to support the singletree, a pivot-bolt uniting said triplotree and said coupling-arm, and a pivot-bolt uniting said coupling-arm and said brace-arm, whereby the parts are coupled without increasing the vertical thickness, substantially as described.

2. In a draft-equalizer, a draft-tongue, a triplotree pivotally united to said tongue at one side of the center with the doubletree coupled to its long end and with the under side of the short end cut away, a brace-arm rigidly connected to said tongue, and extending laterally therefrom beneath the short end of said triplotree, a coupling-bar having its upper part cut away and engaging the space between said brace-bar and said cut-away portion of said triplotree and adapted to support the singletree, a wear-plate embracing the upper and lower surfaces and the extremity of the short end of said triplotree and between it and said tongue and between it and said brace-arm, a wear-plate upon the upper and lower surfaces and the inner extremity of said coupling-arm and between it and said brace-arm and between it and said triplotree, a pivot-bolt uniting said triplotree and said coupling-arm, and a pivot-bolt uniting said coupling-arm and said brace-arm, substantially as described.

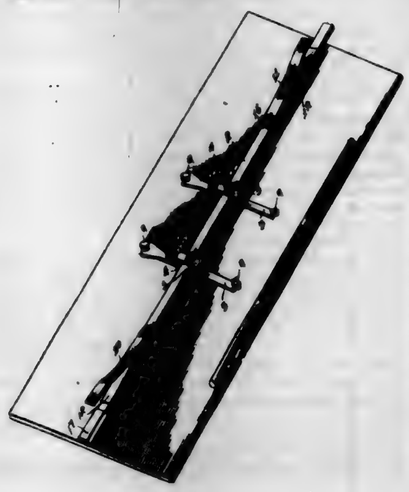
704,002. WIND-ACTUATED ADVERTISING DEVICE. CLINTON G. CRIBBS and FRANCES M. ALLERDING, Benton Harbor, Mich. Filed Oct. 21, 1901. Serial No. 79,466. (No model.)



Claim.—1. In a wind-actuated advertising device, an upright, a hub on the upright, spokes radiating from the hub, a ring through which the spokes project, signs on the spokes and spring-fingers for arresting the signs.

2. In a wind-actuated advertising device, an upright, a frame rotatable thereon and comprising a hub, spokes radiating therefrom, and a ring through which the spokes protrude, said spokes alternately projecting upwardly and downwardly and spring-fingers on the extensions for arresting the signs.

704,008. MUSIC-HOLDER. ALFRED D. CREE, Ada, Ohio. Filed Dec. 3, 1901. Serial No. 84,548. (No model.)



Claim.—1. The combination with a support carrying threaded studs or projections, of a music-holder comprising a clip-carrying bar, brackets adjustably connected therewith and provided at their terminals with means to engage said studs, and thumb-nuts carried by the studs.

2. The combination with a support carrying threaded studs or projections, of a music-holder comprising a bar, brackets connected therewith and having their terminals in engagement with the studs or projections, clamping means carried by the studs to engage the terminals, clips slidably mounted on the bar, and means for limiting the lateral movement of the clips.

704,004. SCREEN. GEORGE W. CROSS, Carbondale, Pa. Filed Mar. 6, 1899. Serial No. 707,970. (No model.)

Claim.—1. An integral screen-surface having substantially quadrilateral interstices, each bounded by four webs, two, opposite, webs of which are parallel and concave from end to end, the other two, opposite, webs being also parallel and curved relatively to the plane of the screen-surface, the interstices of one row being opposite the webs separating and forming the sides of the interstices of the adjacent rows, substantially as described.

2. An integral screen-surface having substantially quadrilateral interstices arranged in staggered relation, one interstice being bounded by four webs, of which two are concave and two convex, while the diagonally adjacent interstice is bounded by four webs all of which are concave, substantially as described.

704,005. DISPLAY-CASE. FRANK B. DEITER, Coudersport, Pa. Filed Mar. 23, 1901. Serial No. 52,580. (No model.)

Claim.—1. In a show-case, a case, each end of which is provided with a curved guideway and the rear is provided with an opening registering with each guideway, a curved front for the case with its ends mounted in said guideways, a spring located in the rear portion of each guideway, a cord secured to each end of the front and extending through its respective spring and out through the opening in the case, and a catch for engaging with the rear of the front and holding it in its rearward position.

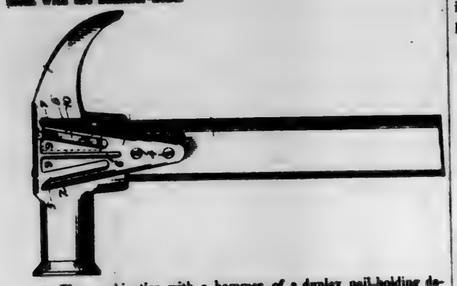
2. In a show-case, a case, the front of which is curved and movable to the rear, springs at the rear of the case for engaging with the front when it is drawn to the rear, a cord secured to each end of the front and provided with means for operating it, a yielding stop in each cord to cushion the force of the front when it reaches the limit of its forward movement, and an automatic catch for holding the front in its rearward position.

704,006. HAMMER. JAMES DEMPSEY, Keating Summit, Pa. Filed Feb. 7, 1902. Serial No. 93,043. (No model.)

Claim.—1. The combination with a hammer, of a duplex nail-holding device, and means coacting with one of the holding devices for projecting the point of a nail held thereby beyond that held by the other device.

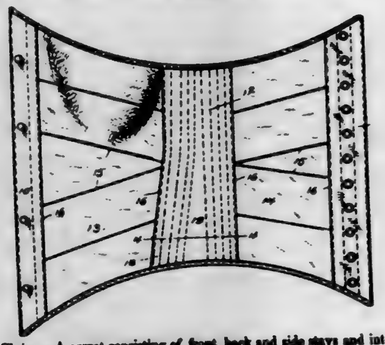
2. The combination with a hammer, of a duplex nail-holding device, and a plate disposed beneath one of the devices for projecting it beyond the plane of the other device.

3. The combination with a hammer, of a nail-holding device having its outer edges curved to hold the intermediate portion out of engagement with the hammer-head.



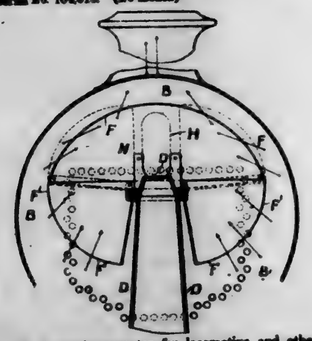
4. The combination with a hammer, of a duplex nail-holding device having its outer edges curved to hold the intermediate portion out of engagement with the hammer-head, and nail-projecting means coacting with one of the holding devices.

704,007. CORSET. JAMES E. DOOLITTLE, Bridgeport, Conn., assignor to Bristol and Somers, Bridgeport, Conn., and New York, N. Y. Filed Mar. 27, 1902. Serial No. 100,314. (No model.)



Claim.—A corset consisting of front, back and side stays and intermediate the side stay and the front and back stays respectively, front and back sections having a plurality of plaits lying in the general direction of the waist-line and attached at the ends only.

704,008. SPARK-PREVENTER FOR LOCOMOTIVE OR OTHER ENGINES. DUGALD DEMMOND, Surbiton, England. Filed Apr. 26, 1902. Serial No. 104,619. (No model.)



Claim.—1. A spark-preventer for locomotive and other engines comprising in combination with the exhaust-pipe a pair of wings fitted on the upper end thereof and extending transversely of the smoke-box, plates pivoted between these wings on either side of said pipe having upturned flanges and a tubular casing communicating with the smoke-box and with the space between the wings, substantially as described.

2. A spark-preventer for locomotive and other engines comprising in combination with the exhaust-pipe a pair of wings fitted on the upper end thereof and extending transversely of the smoke-box and plates having upturned flanges pivoted between these wings on either side of said pipe, substantially as described.

704,009. HOT-WATER HEATING SYSTEM. JOHN EBERSOLE, Chambersburg, Pa. Filed Mar. 27, 1902. Serial No. 100,315. (No model.)

Claim.—In a hot-water heater, the combination with a coal-stove or range, of a heating device arranged within the fire-box of the stove, a flue composed of interfitting sections, provided at their meeting ends with open bearings, a damper mounted in said bearings and adapted to be removed upon the separation of the sections of the flue, boilers arranged one above the other and between which the damper is located, the lower boiler being connected with said heating device, a valved connection between the two boilers for the supply of water from one to the other, hot-water-supply pipes leading from the boilers, and return-pipes for conducting the cooled water from the radiators back to the boilers, substantially as set forth.

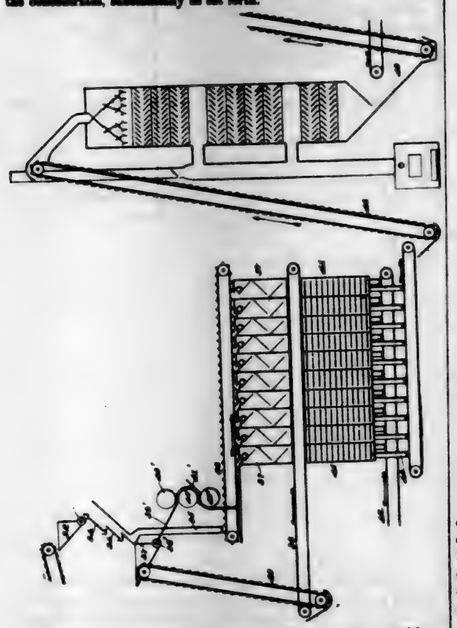
704,010. APPARATUS FOR CONCENTRATING MAGNETIC IRON ORES. THOMAS A. EDISON, Llewellyn Park, N. J. Filed May 23, 1896. Serial No. 591,472. (No model.)

Claim.—1. A connected apparatus for concentrating iron ore, comprising a set of pulverizing-rolls by which the material is finely pulverized, a screen to which the finely-pulverized material is fed, a magnetic separater for separating the magnetic from the non-magnetic particles of the screenings of said screen, a drier to which the magnetic particles are fed and by which they are dried, a fine screen to which the dried magnetic particles are fed, a second set of pulverizing-rolls for pulverizing the tailings of the fine screen, and means for returning the repulverized material to said fine screen, substantially as set forth.

2. A connected apparatus for concentrating iron ore, comprising a set of pulverizing-rolls for finely pulverizing the material, a screen to which the finely-pulverized material is fed, means for returning the tailings of said screen to said pulverizing-rolls, a magnetic separator for separating the magnetic from the non-magnetic particles of the screenings of said screen, a drier for drying the magnetic particles removed by said separator, a fine screen to which the dried magnetic particles are fed, a second set of pulverizing-rolls for repulverizing the tailings of the fine screen, and means for returning said repulverized tailings to the fine screen, substantially as set forth.

3. A connected apparatus for concentrating iron ore, comprising a set of pulverizing-rolls by which the material is finely pulverized, a screen to which the finely-pulverized material is fed, means for returning the tailings of said screen to the pulverizing-rolls, a magnetic separator for separating the magnetic from the non-magnetic particles of the screenings of said screen, a drier, a fine screen to which the magnetic particles are fed, a second set of pulverizing-rolls for repulverizing the tailings of said fine screen, means for returning said repulverized tailings to the fine screen, a second magnetic separator for separating the magnetic from the non-magnetic particles of the screenings of the second screen, and means for conveying the particles rejected by the second separator to the second set of pulverizing-rolls, substantially as set forth.

4. A connected apparatus for concentrating iron ore, comprising a set of pulverizing-rolls by which the material will be pulverized, a screen to which the finely-pulverized material is fed, means for returning the tailings of said screen to the pulverizing-rolls, a magnetic separater for separating the magnetic from the non-magnetic particles of the screenings of said screen, a drier for drying the magnetic particles, a fine screen to which the dried magnetic particles are fed, a second set of pulverizing-rolls for repulverizing the tailings of the fine screen, means for returning said repulverized tailings to the fine screen, a second magnetic separater for separating the magnetic from the non-magnetic particles of the screenings of the said fine screen, and a dusting apparatus for removing dust from the concentrates, substantially as set forth.

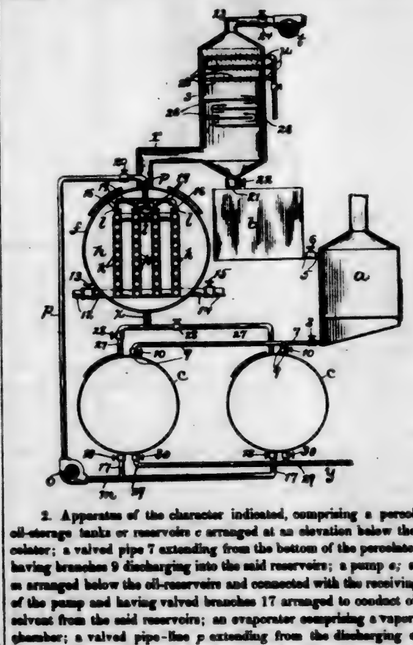


5. A connected apparatus for concentrating iron ore, comprising a set of pulverizing-rolls by which the material will be pulverized, a screen to which the finely-pulverized material is fed, means for returning the tailings of said screen to the pulverizing-rolls, a magnetic separater for separating the magnetic from the non-magnetic particles of the screenings of said screen, a drier for drying the magnetic particles, a fine screen to which the dried magnetic particles are fed, a second set of pulverizing-rolls for repulverizing the tailings of the fine screen, means for returning said repulverized tailings to the fine screen, a second magnetic separater for separating the magnetic from the non-magnetic particles of the screenings of the said fine screen, a dusting apparatus for removing dust from the concentrates, and a third magnetic separater for effecting a final separation of the dusted concentrates, substantially as set forth.

6. A connected apparatus for concentrating iron ore, comprising a set of pulverizing-rolls by which the material will be finely pulverized, a screen to which the finely-pulverized material is fed, means for returning the tailings of said screen to the pulverizing-rolls, a magnetic separater for separating the magnetic from the non-magnetic particles of the screenings of said screen, a drier for drying the magnetic particles, a fine screen to which the dried magnetic particles are fed, a second set of pulverizing-rolls for repulverizing the tailings of the fine screen, a second magnetic separater to which the screenings of the fine screen are fed and by which the magnetic particles will be separated from the non-magnetic particles, a dusting apparatus for dusting the magnetic particles, a third magnetic separater for effecting a final separation of the dusted concentrates, and means for returning the particles rejected by the third separater to the repulverizing-rolls, substantially as set forth.

704,011. APPARATUS FOR SEPARATING NAPHTHA FROM OIL. ERNEST R. ENNIS, Cleveland, Ohio. Filed Aug. 26, 1901. Serial No. 73,279. (No model.)

Claim.—1. Apparatus of the character indicated, comprising a percolator; an oil-storage tank or reservoir; a valved pipe arranged to conduct oil from the percolator to the said reservoir; a pump; a valved pipe arranged to conduct oil from the said reservoir and connected with the receiving end of the pump; an evaporator comprising a vaporizing-chamber; a pipe-line extending from the discharging end of the pump into the aforesaid vaporizing-chamber; a condenser having an oil-outlet; a pipe or flue connecting the vaporizing-chamber with the chamber of the condenser; a suction-creating device for drawing air and vapor from the vaporizing-chamber into the condenser, and a valved pipe-line connecting the vaporizing-chamber at the bottom with the chamber of the aforesaid reservoir.



2. Apparatus of the character indicated, comprising a percolator, oil-storage tanks or reservoirs *c* arranged at an elevation below the percolator; a valved pipe 7 extending from the bottom of the percolator and having branches 9 discharging into the said reservoirs; a pump *e*; a pipe so arranged below the oil-reservoirs and connected with the receiving end of the pump and having valved branches 17 arranged to conduct oil and solvent from the said reservoirs; an evaporator comprising a vaporizing-chamber; a valved pipe-line *p* extending from the discharging end of the pump into the aforesaid vaporizing-chamber; a condenser having an oil-outlet at the bottom; a pipe or flue *r* connecting the vaporizing-chamber with the chamber of the condenser; a pipe for conducting air from the upper end of the condenser; a suction-creating device connected with the said air-conducting pipe; and a valved pipe-line *s* leading from the bottom of the vaporizing-chamber and having valved branches 27 discharging into the aforesaid oil-reservoirs.

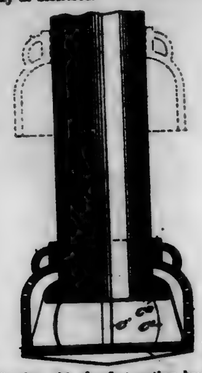
3. Apparatus of the character indicated, comprising a percolator, an oil-storage tank or reservoir, means for conducting oil from the percolator to the said reservoir, an evaporator comprising a vaporizing-chamber, means for conducting oil from the reservoir to the said vaporizing-chamber, a condenser having an oil-outlet, a pipe or flue connecting the vaporizing-chamber with the chamber of the condenser, a suction-creating device for drawing air and vapor from the vaporizing-chamber into the condenser, and means for conducting oil from the vaporizing-chamber to the aforesaid reservoir.

4. Apparatus of the character indicated, comprising a percolator, an oil-storage tank or reservoir, a pump, a pipe arranged to conduct oil from the reservoir and connected with the receiving end of the pump, an evaporator comprising a vaporizing-chamber, a pipe-line extending from the discharging end of the pump to the vaporizing-chamber, a condenser having an oil-outlet, a pipe or flue connecting the vaporizing-chamber with the chamber of the condenser, and a valved pipe-line connecting the vaporizing-chamber at the bottom with the chamber of the aforesaid reservoir.

704,012. STRAINER FOR SUCTION-PIPES OF PUMPS. WILLIAM R. EMERSON, Washington, D. C. Filed Mar. 22, 1902. Serial No. 99,494. (No model.)

Claim.—1. The combination with a suction-pipe for a pump, of a foot-casting carried by but projecting below the pipe and having an imperforate bottom portion with a peripheral seat, of a strainer-casting having a reduced central portion surrounding and guided by the suction-pipe

above the foot-casting, and a perforated apron extending out over said casting and resting at its edge on the peripheral seat of the imperforate portion; substantially as described.



2. The combination with the foot-casting having the imperforate lower portion with arms extending therefrom for attachment to the lower end of a suction-pipe, of the strainer-casting having a central collar for the passage of the suction-pipe, such collar being located above the foot-casting, and a perforated apron extending from said collar out over the foot-casting and adapted to rest on the imperforate portion thereof; substantially as described.

3. The combination with a foot-casting having the imperforate bottom portion, the arms extending therefrom, the annulus uniting the ends of said arms with means whereby said annulus may be secured to the lower end of a suction-pipe, of a strainer-casting having a collar for the passage of the suction-pipe above the foot-casting annulus and a perforated apron adapted to coöperate with the periphery of the imperforate portion of the foot-casting, whereby the strainer-casting is guided by the suction-pipe and is adapted when in working position to bridge the space between the imperforate portion of the foot-casting and the suction-pipe to prevent the entry of obstructions; substantially as described.

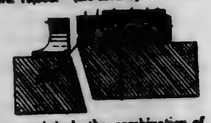
4. The combination with a suction-pipe, a foot-casting secured to its lower end and embodying an imperforate portion and upwardly-extending arms having their outer sides inclined outwardly with an annular inclined seat around the base of said arms, of a strainer-casting having a collar surrounding said suction-pipe above the foot-casting and a dome-shaped perforated apron extending from said collar outwardly and downwardly around the arms and resting at its edge on the inclined annular seat of the foot-casting; substantially as described.

5. A strainer-casting for suction-pipes embodying a movable collar adapted to surround and be guided by the suction-pipe and an outwardly-flaring perforated apron connected with and supported by said collar, combined with a fixed foot-casting having an imperforate portion against which the peripheral portion of the apron rests; substantially as described.

704,013. **INSECTICIDE AND FERTILIZER.** JOHN A. ESSE and JOHN G. KNOUT, York, Pa. Filed Aug. 2, 1901. Serial No. 70,713. (No specimens.)

Claim.—A liquid coating for grain, as a remedy for the Hessian wheat-fly, composed of turpentine, kerosene, and English red.

704,014. **SASH-LOCK.** JOHN A. BENTALLER, Chicago, Ill., assignor of one-half to Albert Wohlstetter, Oakpark, Ill. Filed Oct. 21, 1901. Serial No. 79,285. (No model.)



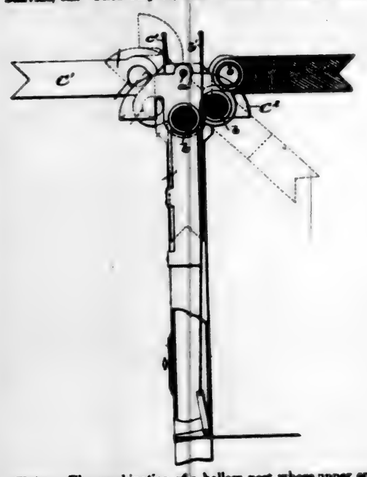
Claim.—1. In a sash-lock, the combination of a horizontal pintle adapted to be secured to one sash, a keeper adapted to be secured to the other sash, a lug projecting transversely of said pintle and a sleeve journaled on said pintle and having a cam-slot with which said lug engages and a hook formed on and projecting from the edge of said sleeve at one end for engaging said keeper, substantially as set forth.

2. In a sash-lock the combination of a horizontal pintle adapted to be secured to one sash, a keeper adapted to be secured to the other sash, a lug projecting transversely of and supporting said pintle and a sleeve journaled on said pintle and provided in its side with a cam-slot with which said lug engages and at its end with a hook for engaging with said keeper, substantially as set forth.

3. In a sash-lock a blank for constituting the bolt thereof, formed with a V-shaped slot and two projections extending substantially at right angles to each other and constituting respectively a handle and the hook for engaging the keeper of the sash-lock, substantially as set forth.

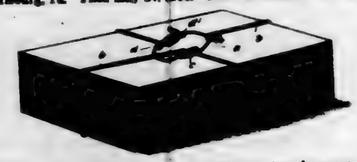
4. In a sash-lock the combination of a rotary reciprocatory bolt adapted to be secured to one sash, a base-plate adapted to be secured to the other sash, a standard rising from and formed integrally with said base-plate, and a horizontal pintle formed of sheet metal integrally with said standard and rolled into a cylindrical form, and a bolt journaled on said pintle and adapted to engage said keeper, substantially as set forth.

704,015. **RAILWAY-SEMAPHORE, &c.** WILLIAM D. FARRIS, Danville, Cal. Filed July 24, 1900. Serial No. 24,674. (No model.)



Claim.—The combination of a hollow post whose upper end terminates in an enlarged hood-section and whose opposite faces are provided with apertures, a shaft journaled in the said hood and having its ends projecting through the hood, semaphore-arms secured to the ends of the shaft, the said arms having a series of openings arranged intermediate its ends, one end of the arm having a counterbalance-weight secured thereto, rods projecting from the arms, cords connected to the rods for operating the arms, a lantern arranged within the hood and having a cord connected thereto which passes up over and around the said shaft and suspends the lantern in an elevated position, the lower end of the cord being secured to the post, substantially as shown and described.

704,016. **STRING-FASTENING DEVICE.** ELMER FLOWERS, Harrisburg, Pa. Filed May 27, 1901. Serial No. 62,123. (No model.)



Claim.—1. A string-fastener comprising a clasp, having two hooks lying side by side and a sleeve secured over the hooks and provided with means for the attachment of the string.

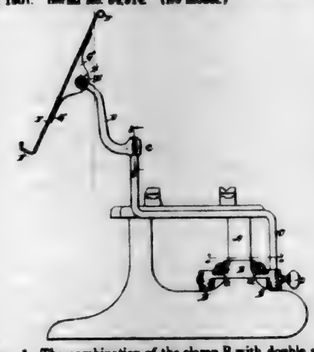
2. A string-fastener having a clasp with an open center, said clasp being provided with means for permanently attaching one end portion of a string thereto, a means on the clasp at one side for removably holding an intermediate part of the string and a double hook at the other side of the clasp for removably holding the other end portion of the string, said double hook comprising two oppositely-projected hook members joined together by a downwardly-bowed or crescent-shaped part, said part being also bent toward the hook members to lie parallel therewith for the purpose specified.

3. A fastener comprising a clasp having thereon a double hook for the purpose specified, said hook being formed of two oppositely-projected hook members joined together by a downwardly-bowed or crescent-shaped part, said part being also bent toward the hook members to lie parallel therewith for the purpose specified.

704,017. **RESPIRATOR.** GEORGE L. FOWLER, London, England. Filed Dec. 13, 1901. Serial No. 85,798. (No model.)

Claim.—The respirator described composed of framework plates of a material not affected by the acids of the mouth, an asbestos layer interposed between said plates, a smooth hollow rounded rim embracing the edges of said plates and asbestos layer, the said rim being divided, means for uniting the ends of said rim at the division, the said device being curved and shaped to fit the mouth of the wearer between the inside of the lips and the gums, all substantially as shown and described.

704,018. **COPY-HOLDER.** WILLIAM R. FOX, Grand Rapids, Mich., assignor to the Fox Machine Company, Grand Rapids, Mich. Filed Dec. 2, 1901. Serial No. 84,914. (No model.)



Claim.—1. The combination of the clamp B with double sockets B and a clip-piece B″ for retaining it; a crank-shaped standard C; a copy-holder frame F of sheet metal with rearwardly-projecting ears and a supporting-arm adjustably secured between the ears and supported on the crank-shaped standard, for the purpose specified.

2. The combination of a clamp having vertically-opening sockets B′ at each side and a clip-piece at the back for retaining it; a standard for insertion into either of the said sockets, whereby the standard may be held in different positions; and a copy-holder carried by said standard, for the purpose specified.

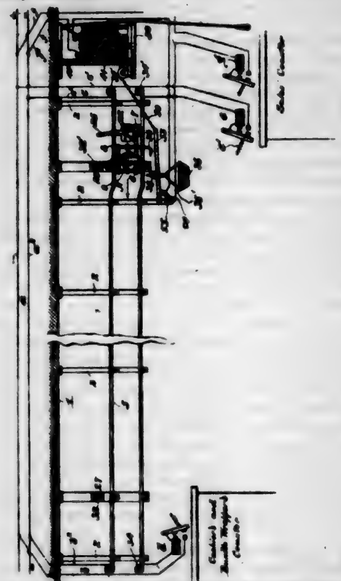
3. The combination of a copy-holder frame of sheet metal formed into a shelf at the bottom and having a central portion struck up to form a supporting-rim G″; ears G′; and a supporting-arm adjustably secured between the ears G′; and a suitable screw E with a thumb-nut E′ thereon, for the purpose specified.

4. The combination of a copy-holder frame of sheet metal having a central portion struck up to form a supporting-rim; a supporting-arm adjustably secured to said rim; and a suitable screw E with a thumb-nut E thereon, for the purpose specified.

5. The combination of a copy-holder frame of sheet metal having a central portion struck up to form supporting-ears; and a supporting-arm adjustably secured between said ears, for the purpose specified.

704,019. **ELECTRICAL TRANSPORTATION SYSTEM.** HENRY F. FREED, Harrisburg, Pa., assignor of nine-tenths to Isaac Frost, Harrisburg, Pa., and Sylvester G. Spring, Peoria, Ill. Filed Mar. 11, 1901. Renewed Jan. 13, 1902. Serial No. 89,462. (No model.)

Claim.—1. In an electrical transportation system, the combination of separate track-rails, a carriage supported to travel upon said track-rails, an electric motor carried by said carriage and geared with one of the track-rails, a reversing-switch carried by said carriage and circuited with said electric motor and said separate track-rails, quick-break switches circuited with the track-rails, and means located within the path of movement of the reversing-switch to shift said reversing-switch to break the circuit, open said quick-break switch and reverse said reversing-switch, substantially as set forth.



2. In an electrical transportation system, the combination of separate track-rails, a motor-carriage mounted to travel along said track-rails, a reversing-switch carried by said carriage and circuited with the motor and track-rails, quick-break switches located near the ends of said track-rails and circuited therewith and devices arranged within the path of movement of the reversing-switch for operating said reversing-switch to break the circuit through the track-rails and quick-break switches and for reversing said reversing-switch, substantially as set forth.

3. In an electrical transportation system, the combination of the separate track-rails, a motor-carriage mounted to travel along said track-rails, a reversing-switch having a shifting-lever and carried by said carriage, quick-break switches, said reversing-switch circuited with the motor, the track-rails and the quick-break switches, trips arranged at opposite ends of the track within the path of movement of said lever, each trip movable by pressure from one direction to permit the lever to pass freely from engagement with it without being reversed and immovable by pressure from the opposite direction to trip said lever to reverse the switch said trips being movable in opposite directions, substantially as set forth.

4. In an electrical transportation system, the combination of the separate track-rails, a motor-carriage mounted to travel along the track-rails, a reversing-switch having a shifting-lever and carried by said carriage, quick-break switches, said reversing-switch circuited with the motor, the track-rails and the quick-break switches, trips arranged near the opposite ends of the track within the path of movement of the shifting-lever, said trips mounted to swing in opposite directions from their normal positions within the path of movement of the shifting-lever, in an inclined plane out of the path of movement of said shifting-lever, substantially as set forth.

5. In an electrical transportation system, the combination with track-rails and an electrically-propelled carriage, of a receptacle or car releasably connected to the carriage, a lever pivoted adjacent to the rails in position to receive the receptacle or car and disengage it from the carriage and means for lowering said lever with its supported receptacle or car, substantially as set forth.

6. In an electrical transportation system, the combination with track-rails and an electrically-propelled carriage, of a receptacle or car releasably connected to the carriage, a lever pivoted adjacent to the rails in position to receive the receptacle or car and disengage it from the carriage, means for lowering said lever with its supported receptacle or car, and means for elevating said lever to raise the receptacle or car within the path of movement of the carriage, substantially as set forth.

7. In an electrical transportation system, the combination with the track-rails and an electrically-propelled carriage, of a receptacle or car releasably connected to the carriage, a lever pivoted adjacent to the rails in

position to receive the receptacle or car and disengage it from the carriage, and means for elevating the lever to raise the receptacle or car within the path of movement of the carriage, substantially as set forth.

8. In an electrical transportation system, the combination with the track-rails deflected at one end and the electrically-propelled carriage mounted to travel along said track-rails, of a receptacle or car releasably connected with said carriage, a bar or lever arranged under the track-rails and normally retained at an angle to the track-rails in position to release the car or receptacle from the carriage and support the same, and means for raising and lowering said bar, substantially as set forth.

9. In an electrical transportation system, the combination with the track-rails and the carriage mounted thereon, of a car or receptacle releasably connected to the carriage, a bar supported under the track, and designed to disengage the car or receptacle from the carriage, and an electric motor for moving said bar upward to raise the car in the path of movement of the carriage, substantially as set forth.

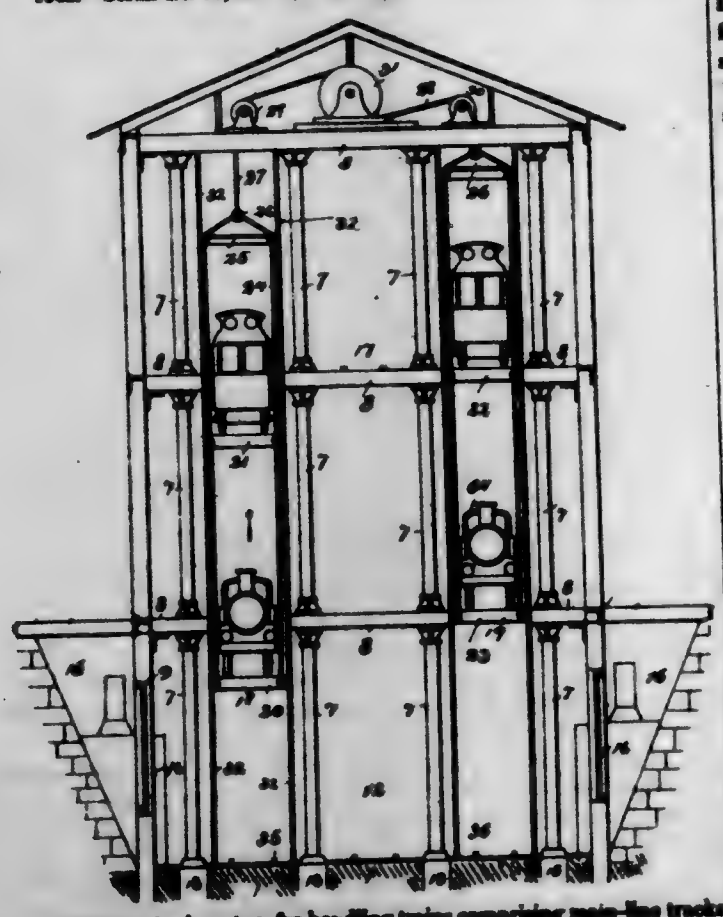
10. In an electrical transportation system, the combination with the track-rails and the carriage mounted to travel thereon and provided with a hook, a bar or lever mounted below the track-rails, of a car or receptacle, and a double hook connecting the car or receptacle with the carriage and provided with a grooved wheel to ride upon the bar or lever, substantially as set forth.

11. In a hoisting device for the purpose described, the combination of a suitably-supported windlass, an electric motor geared to the windlass, a hoisting bar or lever, a connection between the hoisting bar or lever and the windlass, a contact-point, a second contact-point carried by the lever and adapted to engage with the first contact-point, and a switch circuited with the motor and the contact-points, substantially as set forth.

12. In a hoisting device for the purpose described, the combination of a suitably-supported windlass, an electric motor geared to the windlass, a hoisting bar or lever, a connection between the hoisting bar or lever and the windlass, a contact-point, a second contact-point carried by the lever and adapted to engage with the first contact-point, and a quick-break switch circuited with the motor and the contact-points, substantially as set forth.

13. In a hoisting device for the purpose described, the combination of a suitably-supported windlass, an electric motor geared to the windlass, a pawl and ratchet for controlling the backward movement of the windlass, a hoisting bar or lever, a connection between the hoisting bar or lever and the windlass, a contact-point, a second contact-point carried by the lever and adapted to engage with the first contact-point, and a switch circuited with the motor and the contact-points, substantially as set forth.

704,020. SYSTEM OF TRAIN MANIPULATION. LOUIS A. FREEMAN and CHARLES I. FREEMAN, New York, N. Y. Filed Mar. 1, 1902. Serial No. 96,231. (No model.)



Claim.—1. A system for handling trains comprising main-line tracks and a plurality of elevators in connection with the said main-line tracks, and tracks supported at a level above and below the main line, each of the auxiliary system of tracks being connected by switches, one of them being provided with a turn-table.

2. A system of handling trains comprising main-line tracks, and elevator and lower-level track to which said elevator may descend, a shunting-track leading from said level, a further lower-level shunting-track, an elevator operating in connection therewith, means for placing both lower-level shunting-tracks in connection with each other, another main-line track between which and the latter lower-level shunting-track said elevator may operate, substantially as described.

3. A system of handling trains comprising main-line tracks, an elevator on ' lower-level track to which said elevator may descend, a shunting-track leading from said lower level, a further lower-level shunting-track, an elevator operating in connection therewith, means for placing both lower-level shunting-tracks in communication with each other, another main-line track between which and the latter lower-level shunting-track said elevator may operate, a turn-table in connection with the shunting-track, substantially as described.

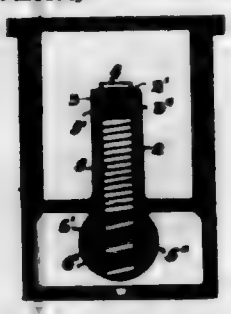
4. In a system for manipulating railroad-trains, the combination with the following instrumentalities: a plurality of main-line tracks, a double-decked elevator adapted to be vertically operative in alinement with the main-line tracks so as to bring either deck in alinement with said main-line track, and a plurality of shunting-tracks arranged at a level above and below, and in alinement with the main-line tracks, and switches for placing the shunting-tracks in communication with each other and with the several elevator-tracks.

5. In a system for manipulating railroad-trains, the combination with the following instrumentalities: a plurality of main-line tracks, a double-decked elevator adapted to be vertically operative in alinement with the main-line tracks so as to bring either deck in alinement with said main-line tracks, and a plurality of shunting-tracks arranged at a level above and below, and in alinement with the main-line tracks and switches for placing the shunting-tracks in communication with each other and with the several elevator-decks, and an intermediate storage-track in communication with the shunting-tracks.

6. In a system for manipulating railroad-trains, the combination with the following instrumentalities: a plurality of main-line tracks, a double-decked elevator adapted to be vertically operative in alinement with the main-line tracks, and a plurality of shunting-tracks at a level above and below, and in alinement with the main-line tracks, and switches for placing the shunting in communication with each other and with the several elevator-decks, and a turn-table and the lower-level shunting-tracks.

7. In a system for manipulating railroad-trains, the combination with the following instrumentalities: a plurality of main-line tracks, a double-decked elevator adapted to be vertically operative in alinement with the main-line tracks, and a plurality of shunting-tracks at a level above and below, and in alinement with the main-line tracks and switches for placing the shunting in communication with each other and with the several elevator-decks, an intermediate storage-track in communication with the shunting-track, a turn-table and the lower-level shunting-tracks, and an intermediate track and turn-table.

704,021. AUTOMATIC LUBRICATOR. ALBERT A. FREEMAN, Philadelphia, Pa., assignor to Standard Automatic Lubricator Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Aug. 26, 1901. Serial No. 73,256. (No model.)



Claim.—1. In an automatic lubricator, a valve comprising a shell and a core cast therein, in combination with a spring having coils thereof embedded in said core, substantially as specified.

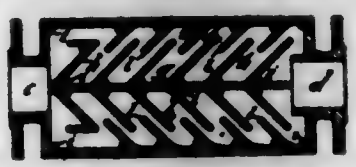
2. In an automatic lubricator, a valve comprising a spherical shell, and a core of loading material cast therein, in combination with a spring having open coils embedded in said core and closed coils forming a flexible supporting-column, substantially as specified.

3. In an automatic lubricator, a reservoir, an open pedestal therein, a head having shoulders for holding the same against turning by engagement with said pedestal, a coiled spring supported by said head, said head having a threaded shank which engages the coils of said spring, and a valve permanently fixed to said spring and supported thereby, said valve

comprising a shell and a core in which the end of said spring is embedded, substantially as specified.

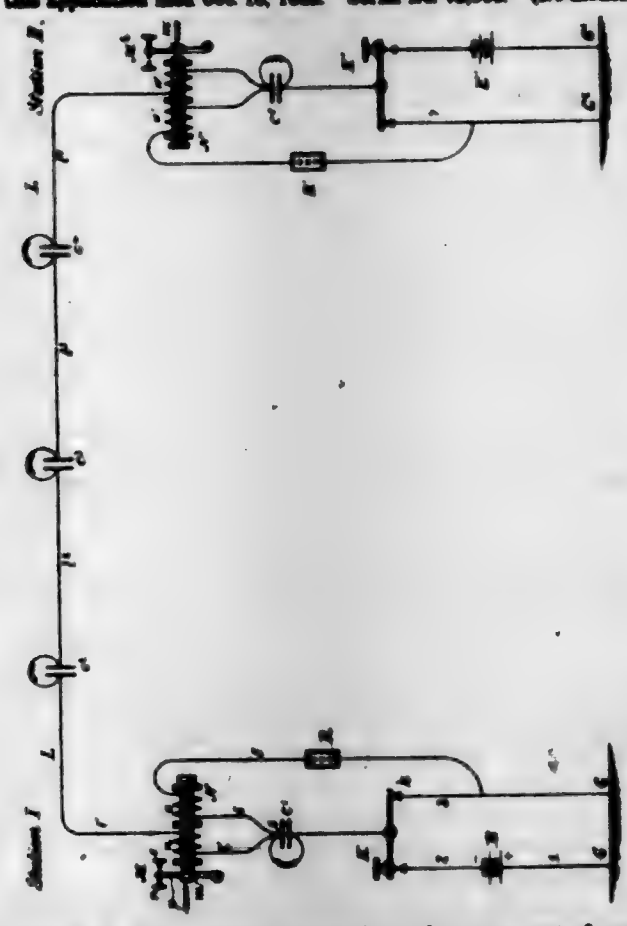
4. In an automatic lubricator, a reservoir, guiding-struts therein, a head having shoulders for holding the same longitudinally and against turning, a coiled spring forming a closed column supported by said head, and a valve comprising a spherical shell having a core of leading material cast therein, the lower coils of said spring being embedded in said core, substantially as specified.

704,022. **STEAM AND OIL SEPARATOR.** EDUARD FRIEDRICH, Bietigheim, Germany. Filed Nov. 18, 1901. Serial No. 82,770. (No model.)



Claim.—In an apparatus for the separation of oil and condensation-water from exhaust-steam, the combination of a rectangular outer vessel open at the top and provided with a double bottom, vertical ribs arranged on the inner side of the two longitudinal walls of same, said ribs being inclined toward their bearing edges or surfaces, horizontal nozzles for the inlet and outlet of the steam, located on the two narrow sides of the outer vessel, a flat cover having on its inner side a central wall extending to the bottom of the said outer vessel when the parts are assembled, the said middle wall being provided with a number of vertical ribs inclined toward their bearing surfaces or edges, and projecting between said vertical ribs of the side walls, as and for the purpose set forth.

704,023. **TELEGRAPH.** CHARLES E. PIERCE, New York, N. Y. Original application filed Apr. 2, 1901, Serial No. 54,552. Divided and this application filed Oct. 10, 1902. Serial No. 77,008. (No model.)



Claim.—1. An improved construction and arrangement of conductors and apparatus for telegraphic and like purposes, consisting in the combination substantially as hereinbefore set forth of a composite and organized main line composed of two or more non-inductive and non-retarding sections inductively connected together in series by condensers; water-tight casings, which protect said connecting devices from the tension of the line and are suitable for forming a constituent part of the line in the open air, earth or sea; one or more sets of transmitting apparatus at the terminal stations for producing electrical signals or impulses and thereby charging the terminal condensers of the line; and one or more sets of receiving apparatus at the ends of the line for recording or translating said signals or impulses.

2. A main line for telegraphic and like uses, made non-inductive for a given work or speed consisting of sections having electrostatic capacities between stations which will individually permit of such working or speed, and inductive devices uniting them into a line which has the same special fitness or properties as its sections, substantially as set forth.

3. A main line for telegraphic and like uses, consisting of the combination of a wire or cable divided between two stations into two or more sections, condensers inductively connecting the sections in series, and means for protecting said condensers and connections from injury by strain, water or weather.

4. A main line for telegraphic and like uses, consisting of sections whose electrostatic capacities by the rules herein set forth come below or within a capacity fixed upon as a maximum allowable in the given conditions, and condensers inductively uniting the sections together in series, substantially as set forth.

5. A composite and organized main line for telegraphic and like uses, consisting of the combination of two or more non-inductive and non-retarding sections of suitable conductor or cable; inductive devices connecting said sections in series and adapted to transmit signals or impulses from one section to and over the next one, in either direction, without mechanism or moving parts but by induction alone; means for protecting said devices from the tension of the line; and suitable water-tight casings or coverings when required for protecting the inductive devices and their connections and adapted to be used in the open air, earth or sea as a constituent part of the line.

6. The combination of a main line connecting two stations and consisting of sections connected by condensers, and an artificial line connected thereto at one of the stations and having an electrostatic capacity equal to that of the terminal section of the main line to which it is connected, instead of being adjusted to the whole of the main line as is usually done.

7. In a sectional main line, the combination of two or more sections approximately equal in inductive resistances, such resistances being not greater than is consistent with the work and speed required on the line; and condensers inductively connecting said sections in series and also being approximately equal in capacity.

8. A circuit for variable currents, having the sections adjusted to enable the desired current to flow over the line by the interposition of condensers suited to the electrical resistances in the sections.

9. An electric circuit divided into sections, and having the sections adjusted to enable the selected or predetermined current to flow over the line by the interposition between the sections of condensers suited to the number of them in the series or line.

10. A non-inductive sectional line consisting of the combination of sections of approximately equal electrical and inductive resistances, connected by the interposition of approximately equal condensers or equivalent devices.

11. The combination of two terminal stations with transmitting and receiving apparatus; a circuit or line connecting said stations, consisting of practically non-inductive sections; and condensers or equivalent devices interposed between them, whose capacities are approximately equal, and proportionate to the number of them connected in the series or line.

12. The combination of a main line between stations consisting of sections free from inductive resistance inductively connected in series by condensers; suitable transmitting apparatus at the terminal station or stations; and a transmitting-condenser connecting said apparatus to the main line and having double the capacity of the condensers in the main line.

13. The combination of a practically non-inductive sectional main line between stations; suitable transmitting apparatus at the terminal station or stations; and a transmitting-condenser connecting said apparatus to the main line, having double the capacity of the condensers in the line, one pole of the battery or generator being connected directly to said condenser with a very low resistance between them.

14. The combination of transmitting apparatus; a main line between stations which, for the purpose of avoiding, preventing or lessening static charge and retardation, is constructed from two or more sections without inductive resistances inductively connected in series by condensers; and a condenser connecting said transmitting apparatus to one end of the line and forming the connection between said line and the local circuit at the transmitting-station.

15. The combination of a sectional main line between stations; suitable transmitting and receiving apparatus at the terminal stations; condensers inductively connecting said apparatus and the main line; and artificial lines at each station, whose resistances are adjusted to those of the particular sections or circuits to which they are connected.

16. The combination, substantially as hereinbefore set forth, of a main-line conductor divided between stations into sections without inductive resistance by the interposition of condensers between said sections; and a differential electromagnet having one of its coils included in one section of said main line between two condensers, and its remaining coil in the circuit of a conductor extending from the adjacent plate of one of said condensers and forming an artificial line uniting the terminals of said condenser, whereby an electric current traversing the first-mentioned coil

to the condenser and reverting through the second coil will in each case produce a like magnetic effect upon the core of said electromagnet.

17. The combination of a sectional main line between stations which is divided into sections by the interposition of condensers between said sections; an artificial line whose electrostatic capacity is equal to that of the main-line section to which it is connected; and a differential receiving instrument one coil or part of which is in the main line and the other coil in the artificial line.

18. The combination of a sectional main line which is divided into sections by the interposition of condensers between said sections; means for producing alternating electrical signals or impulses; a condenser connecting said means to one end of the line; suitable receiving apparatus, adapted to respond to incoming but not to outgoing currents, at the other end of the line; and a condenser at said end connecting it to a grounded wire or circuit.

19. The combination of a circuit divided into practically non-inductive sections disposed in inductive relation and in series; sections approximately equal in inductive and electrical resistances; and condensers interposed between said sections which are suitable for the resistances in the sections and the number of them connected in the series or circuit.

20. The combination of a non-inductive line consisting of sections connected by condensers, as described; generating apparatus sending to said line currents or impulses which charge and discharge the condensers in equal ratios; and condensers having electrostatic capacities capable of receiving and storing as charges the longest impulses or signals sent over the line.

21. The combination of sections made short enough to have the desired freedom from electrical and inductive resistances; condensers or equivalent devices connecting the sections in series and having capacities proportionate to the resistances in the sections and the number of them in the series or line.

22. In a sectional main line, an inductive connection between the sections consisting of the combination substantially as described of a condenser of suitable construction and capacity inserted directly in the line, means for protecting the condensers from exposure and from strain from the tension of the line, and means for electrically connecting the sections with the armatures of the condenser, the whole adapted to be used in the open air, earth or sea, as a part of the line.

23. In a sectional line, an inductive connection between the sections consisting of the combination of condenser-plates insulated from each other by dielectrics and rolled upon a non-conducting rod, and means for sustaining the strain of the conductors from the opposite extremities of said rod and electrically connecting the same with the respective plates.

24. In a non-inductive line in which sections made from cables and lines of high electrostatic capacity may be connected with sections of bare wire or conductor of low electrostatic capacity, the combination of sections of different characters or kinds but adjusted to have approximately equal electrostatic capacities, with condensers or equivalent devices having approximately equal capacities, as inductive connections between the sections.

25. The combination of a cable or electric line or circuit divided into sections free from inductive resistance; a device for transmitting electrical impulses by electrical induction from one section to and over the adjacent one, in both directions, interposed between the sections and having each section electrically connected with one side of said device; means for securing the cable or line and preventing any strain upon the connections of the conductor to said device; and a suitable water-tight casing inclosing the same.

26. In a sectional line, an inductive connection for uniting the terminals of the adjacent sections consisting of the combination of a dielectric composed of thin sheets of india-rubber or other suitable insulating material; conducting plates or armatures arranged between said sheets means for attaching the terminals of the sections to the opposite armatures or plates without subjecting them to strain or tension from the line; and a water-tight casing inclosing the same, adapted to be used in the open air, earth or sea and to form a constituent part of the line itself between stations.

27. The combination of a plurality of non-inductive sections such as described, arranged in series as a discontinuous line; and condensers or equivalent devices connecting said sections into a line, and transmitting the line-currents through them, to and over the adjacent sections in both directions, without mechanism or moving parts, but by induction only.

28. The combination of a line consisting of sections inductively connected by condensers; shunts around the condensers; and resistances in said shunts which are high enough to stop the passage of signals or impulses through the shunts, and cause them to charge the condensers and be transmitted by them over the line.

29. In a line consisting of sections inductively connected by condensers, the combination of a condenser; a shunt around the condenser; and a resistance in said shunt, having no movable parts and performing no other function in the line, the whole arranged and operating to send the signals or impulses through the condenser and to prevent any currents passing through the resistance till they acquire their full strength at the condenser, and to then let the opposite charges thereof pass freely through the resistance and neutralize each other immediately therein.

30. In a line consisting of sections inductively connected in series by condensers, the combination of a condenser; a shunt around said condenser; a discharging resistance in the shunt approximately equal to the resistance of the adjacent sections of the line.

31. In a sectional line, the combination of a condenser; a shunt connecting the opposite terminals or armatures of the condenser; and a charging resistance in said shunt which is sufficiently high to practically prevent the signals or impulses from passing through it till they have acquired their full strength at the condenser, and sufficiently low in electrical resistance to then allow the opposite charges to pass freely through it and neutralize each other.

32. In a sectional line, the combination of a condenser; a shunt around the condenser; a discharging resistance in said shunt, adjusted to regulate the speed and perfection of the neutralization of the opposite charges of the condenser through it, substantially as set forth.

33. The combination substantially as set forth of a main-line conductor divided between stations into sections; a condenser inductively uniting the adjacent terminals of said sections; a conductor uniting the opposite terminal plates of the condenser; a suitable resistance in said shunt-conductor; and a water-tight casing or covering for protecting the condenser, resistance and connections, and adapted to be used as a part of the line in the open air, earth or sea, between stations.

34. In a composite and organized main line for telegraphic and like uses, the combination of terminal sections containing transmitting and receiving apparatus; interior non-inductive sections substantially alike and having no such apparatus; and condensers inductively uniting said sections in series; substantially as and for the purposes set forth.

35. In a composite and organized main line for telegraphic and like uses, the combination of terminal sections containing transmitting and receiving apparatus; interior sections having no such apparatus; condensers inductively connecting said sections in series; a conductor connecting the opposite armatures of the terminal condensers; and a suitable shunt resistance in each of said conductors, all substantially as and for the purposes set forth.

36. In a sectional line such as described, the combination of a non-inductive standard or normal section, that is to say, one in which static induction and retardation are substantially removed and prevented, thus adapting it for the required speed of transmission over the line; one or more other sections whose electrostatic capacities are approximately equal to that of the standard section, that is to say, the same or fewer; condensers inductively connecting said sections in series and adapted to be used in the open air, earth or sea, as a part of the line between stations.

37. In a sectional line such as described, the combination of a standard non-inductive section, that is to say, one which has been altered and shortened till static induction and retardation are removed and thus adapted for the required speed of transmission over it; one or more other sections whose electrostatic capacities are less than that of the standard section; terminal sections containing transmitting and receiving apparatus; and condensers inductively uniting said sections in series, substantially as and for the purposes set forth.

38. A non-inductive line, consisting of the combination of a line or cable divided into sections which will be practically free from inductive resistances in the proposed conditions; a sufficient number of sections having such proper lengths and properties arranged in inductive relation and in series; and suitable condensers connecting the adjacent ends of said sections into a line.

39. The combination of a condenser between two sections of a sectional line; a conductor connecting the two sides of said condenser; and suitable shunt resistance in said conductor, as set forth.

40. The combination of a sectional line consisting of non-inductive sections connected in series by condensers; a transmitting-condenser connected to the end of said line; and a transmitting or charging generator therefor, having its pole connected directly to the transmitting-condenser.

41. In a sectional line, the combination of non-inductive sections or conductors, and condensers connecting them in series, with capacities proportional to the predetermined line-current.

42. A sectional line consisting of the combination of sections or conductors; condensers connecting them in series; and total resistance in each section conforming to the standard section resistance of the line.

43. In a sectional line, the combination of standardized sections connected in series by standardized condensers, as set forth.

44. A line consisting of two or more conductors or sections connected in series by condensers, each of the sections having its resistances, capacities and electromotive forces coördinated or proportioned to conform

to a predetermined section standard, whereby the selected line-current can be transmitted successively over all of the sections.

45. The combination of a line or conductor divided into practically non-inductive sections; and condensers or equivalent devices between the adjacent terminals of the sections; and acting as inductive connections, which transmit electrical impulses through them by electric induction from each section to and over the adjacent sections in both directions.

46. The combination of a line or conductor divided into practically non-inductive sections; condensers or equivalent devices between the adjacent terminals of the sections, acting as inductive connections between them; conductors connecting the opposite poles or armatures of one or more of said condensers; and suitable resistances in said shunts which are high enough to prevent the passage of any current through them till the condensers are fully charged and ready to discharge, and which are then low enough to permit the opposite condenser charges to flow freely through them and neutralize each other therein—whereby discharge or return currents are prevented from flowing back over the line.

47. The combination of a main-line conductor divided into two or more non-inductive sections as described; and a series of condensers or equivalent devices inductively uniting the adjacent terminals of said sections.

48. The combination of a main-line conductor divided into two or more non-inductive sections such as described, and having approximately equal inductive capacities, or at least none of them exceeding the standard or proper section capacity for that line; and condensers or equivalent devices inductively connecting the adjacent terminals of said sections.

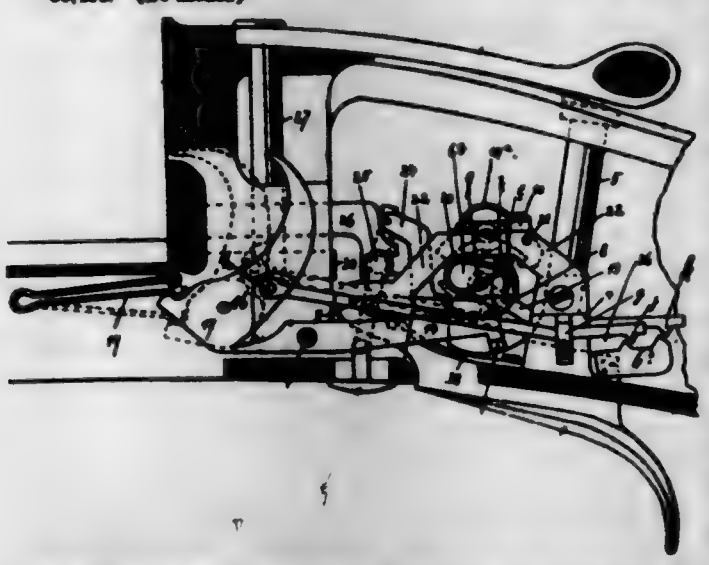
49. The combination of sections made short enough to be practically equal in freedom from inductive resistances, and without any earth connections between the terminal stations while operating; and suitable condensers or equivalent devices connecting said sections into a line, substantially as set forth.

50. The combination of sections made short enough to be practically equal and free from inductive resistances, and without any earth connections between the terminal stations while operating; suitable condensers or equivalent devices connecting said sections into a line; shunts around said condensers; containing suitable resistances such as described, but having no other branch circuits nor resistances in shunt with said condensers.

51. The combination of a line divided into practically non-inductive sections approximately equal in length, or at least in electrical and inductive resistances; and connected in series by the interposition at periodically-recurring points of condensers or equivalent devices, which receive impulses or signals on one side, and by electrical induction through them send equivalent impulses or signals from their other sides, to and over the adjacent sections in both directions.

52. The combination of a line divided into practically non-inductive sections approximately equal in electrical and inductive resistances, or at least none of the sections much exceed the standard or proper amount of section resistance for that line; connected in series by condensers or equivalent devices which receive and transmit currents through them by electrical induction, to and over the adjacent sections in both directions.

704,024. SINGLE-TRIGGER MECHANISM FOR FIREARMS. ELIJAH D. FELPORE, Utica, N. Y., assignor of one-half to J. H. Webster and Paul Korth, Cleveland, Ohio. Filed July 24, 1901. Serial No. 69,463. (No model.)



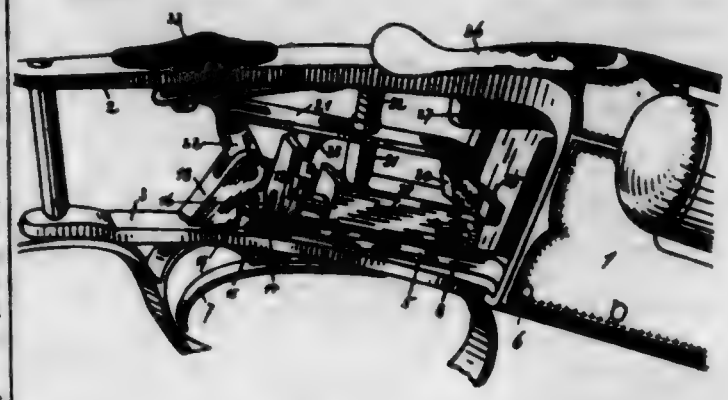
Claim.—1. In a single-trigger mechanism, the combination of a trigger, an escapement-wheel mounted on the trigger and sear-catches connected therewith, an escapement-anchor also mounted on the trigger and movable therewith and means for securing one end of the escapement-anchor whereby the same is operated in the movement of the trigger, substantially as set forth.

2. In a single-trigger mechanism for firearms, the combination of the trigger, a ratchet or escapement wheel mounted upon and movable with the trigger, adjustable sear-catches connected with and temporarily secured to said ratchet-wheel, an escapement-anchor mounted upon the trigger, means for holding one end of the escapement-anchor against play and means for resetting said sear-catches, substantially as set forth.

3. The combination in a single-trigger mechanism for firearms of the single trigger, a ratchet-wheel mounted thereon having catches for successively engaging the sears, an escapement-anchor mounted on the trigger, means for securing one end of said escapement-anchor from oscillating movement and means for resetting said ratchet-wheel and sear-catches, substantially as set forth.

4. In a single-trigger mechanism for firearms, the combination of the sear, the trigger, catches for successively engaging the sears mounted on the trigger, a ratchet-wheel controlling the movement of said catches, an escapement-anchor for said ratchet-wheel, a joint in said escapement-anchor and means for resetting said catches, substantially as set forth.

704,025. SINGLE TRIGGER FOR FIREARMS. ELIJAH D. FELPORE, Utica, N. Y., assignor of one-half to J. H. Webster and Paul Korth, Cleveland, Ohio. Filed Aug. 21, 1901. Serial No. 72,726. (No model.)



Claim.—1. In a single-trigger mechanism the combination of sears each having two points of engagement as between the sears and triggers, a trigger, an adjustable catch-piece on the trigger arranged to engage with one or the other of the sears at the first point of engagement, a movable catch arranged to engage with the second points of engagement of both sears, means for moving said catch and means for holding the same in check and releasing upon the first movement of the trigger substantially as set forth.

2. The combination in a single-trigger mechanism of the sears, the trigger having an adjustable catch-piece adapted to engage with one only at a time of the sears, a cylinder mounted on said trigger, a piston and spring in the cylinder, a movable catch attached to said piston and adapted to engage with the sears, means for moving said catches and piston, means for securing and releasing said catches upon the first movement of said trigger and means for resetting the parts substantially as set forth.

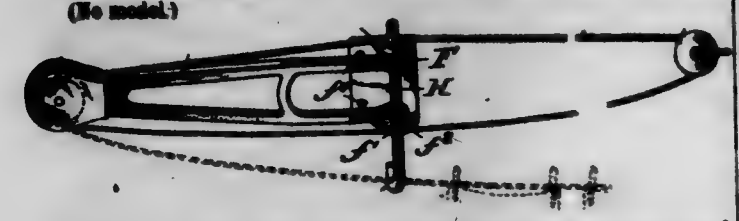
3. In a single-trigger mechanism, the combination of two sears, a trigger, a shifter-catch and a movable catch both mounted on the trigger and adapted to engage with the sears, means for adjusting the shifter-catch, an air-cushion for retarding the movement of and means for securing, releasing and resetting the movable catch, substantially as set forth.

4. In a single-trigger mechanism the combination with the frame-hammers and sears of a single trigger, having a cylinder, piston and operating-spring therefor mounted thereon, a movable catch connected with said piston for operating on the sears an adjustable catch also mounted on the trigger for engaging with the sears, a catch for securing the movable catch and parts in check and a resetting device substantially as set forth.

5. The combination with the sears and hammer of a firearm of a single trigger, having a cylinder-body and piston arranged thereon, a movable sear-catch connected with said piston, a catch for securing said parts in retracted position and a resetting mechanism consisting of a multiplying lever 20 adapted to be engaged by the catch-bar of the firearm, the connecting-bar 21 and the shoulder-piece 28 adapted to engage with movable catch mechanism substantially as set forth.

6. The combination in a single-trigger mechanism of the trigger and sears, a movable, primarily-disconnected catch between the trigger and sears, means for moving said catch into locking engagement with the sears, means for securing and for releasing said catch upon the first operation of the trigger and a cylinder and piston connected with said catch for retarding by an air cushion or pressure the movement of said catch, substantially as set forth.

704,026. CLOTHES-LINE SUPPORT. MEETHOSEH T. GORDON and FRANK DAVE, Stapleton, N. Y. Filed Jan. 3, 1902. Serial No. 88,201. (No model.)



Claim.—1. The combination in a clothes-line support, with a stand adapted to be secured to the window-casing or other support and provided with an upper and an under ear projecting from its face, the under of which ears is equipped with an upwardly-extending notched flange, of a crane pivoted between such ears and not only adapted to engage with the notches in such flange, but constructed of a depth slightly less than that between the upper ear and the upper edge of this upwardly-extending flange on the under ear, substantially as described.

2. The combination in a clothes-line support, with a stand adapted to be secured to the side of a window or other support and provided with an upper and an under ear extending outward from its face, a crane carrying a pulley at its free end, a pivot by which this crane is pivoted between such ears provided with ends that extend both above and below these ears, a pole or other support provided with a second pulley, of an endless clothes-line extending over and from one of these pulleys to and over the other on the side of the pivot opposite to that toward which the crane will move when being swung from the interior of a flat or other apartment to the exterior thereof and means for locking the crane in adjusted positions, substantially as described.

704,027. PROCESS OF PURIFYING SUGAR-JUICES. HENRI GOUTHIÈRE, Paris, France, assignor to Gustav Edward Juntas, London, England. Filed May 7, 1901. Serial No. 59,079. (No specimens.)

Claim.—1. The process of purifying sugar-juice, which consists in treating it with ferric fluorid, substantially as described.

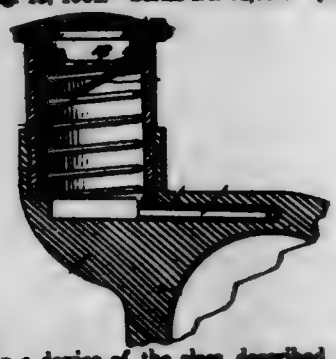
2. The process of purifying sugar-juice, which consists in treating it with ferric fluorid in the shape of a concentrated solution, substantially as described.

3. The process of purifying sugar-juice which consists in treating it with ferric fluorid and adding milk of lime.

4. The process of purifying sugar-juice which consists in treating it with a concentrated solution of ferric fluorid and adding milk of lime whereby calcium fluorid and hydrated ferric oxid are produced in a nascent state and act to purify and clarify the juice, substantially as described.

5. The process of purifying sugar-juice which consists in treating it with ferric fluorid, in adding milk of lime, and in then precipitating the iron as a phosphate, substantially as described.

704,028. AXLE-LUBRICATOR. RICHARD H. SOWAR, Corsicana, Tex. Filed Aug. 13, 1901. Serial No. 71,884. (No model.)



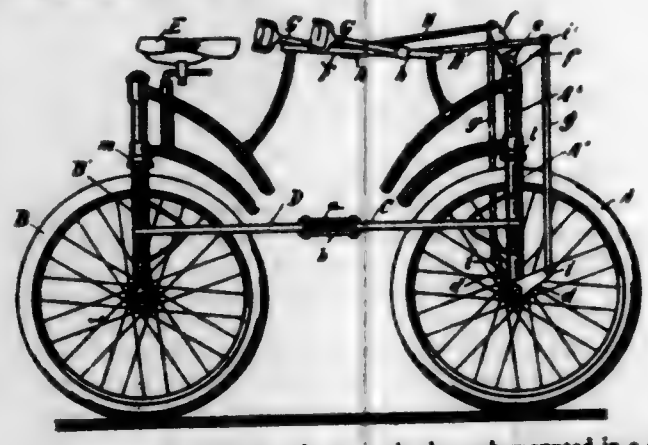
Claim.—1. In a device of the class described, the combination of an axle having an oil-passage extending to the bearing, an oil-cup arranged at the outer end of the passage, a depressible spring-supported plunger arranged within the oil-cup at the top thereof and adapted to be moved downward to force the oil through the oil-passage, said plunger being provided with an opening to permit the cup to be supplied with oil and having a valve arranged to cover the opening when the plunger is forced downward, substantially as described.

2. In a device of the class described, the combination of an axle provided with an oil-passage, an oil-cup, a spring-supported plunger arranged within the oil-cup at the top thereof and provided with an opening adapted to permit oil to be introduced into the oil-cup, and having an automatically-closing valve arranged to cover the opening when the plunger is depressed, substantially as described.

3. In a device of the class described, the combination of an axle having an oil-passage, an oil-cup, a plunger arranged within the oil-cup and having a cross-piece and provided at opposite sides thereof with openings, a valve arranged to close the openings when the plunger is depressed, and a coiled spring arranged beneath and supporting the plunger, substantially as described.

4. In a device of the class described, the combination of an axle having an oil-passage and provided with a socket, an oil-cup secured within the socket and provided at its top with a stop and having a lid closing the top of the cup and located above the stop, a plunger arranged within the oil-cup and provided with a valve, and a spring supporting the plunger in an elevated position and holding the same normally against the said stop, said stop limiting the upward movement of the plunger and preventing the same from raising the lid, substantially as described.

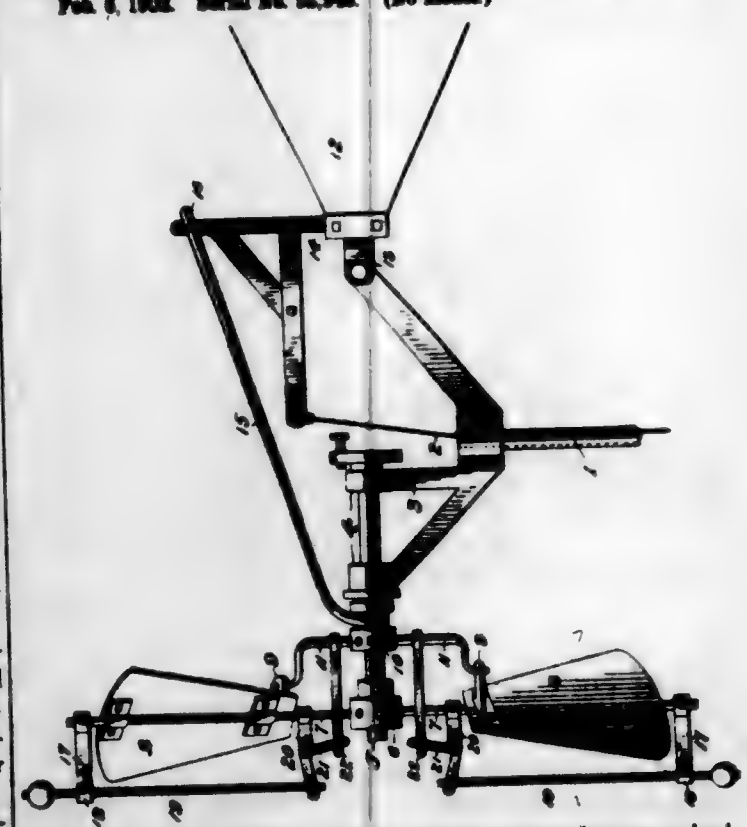
704,029. BICYCLE. OLIVER W. GRIFFITH, Brooklyn, N. Y. Filed May 14, 1896. Serial No. 591,506. (No model.)



Claim.—1. In a bicycle, the two wheels, each mounted in a separate turning post at the extremity of the vehicle-frame, and two arcs connected by cross-links, *a*, *b*, one of which arcs is arranged to support the feet of the rider, substantially as explained, the turning of one arc with the feet compelling the turning of the other in the opposite direction, for the purpose of steering, the whole vehicle being arranged to be propelled by the hands and arms, for the objects set forth.

2. In a bicycle, the wheels mounted in turning posts located at the extremities of the vehicle-frame and the two arcs connected by cross-links, *a*, *b*, as explained, the forward wheel being arranged to be driven by the hands and arms of the rider from a shaft on the top of its post, said shaft being connected with the axle of the wheel, and the wheel-connecting arcs arranged to be moved simultaneously but in opposite direction by the feet of the rider supported on one of the said arcs, the whole being combined and arranged for operation substantially as and for the purposes set forth.

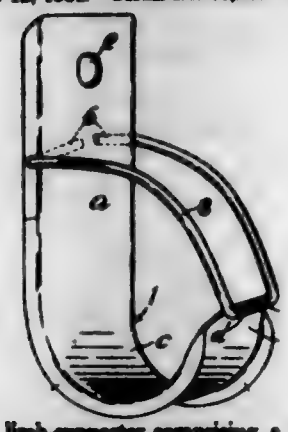
704,030. WINDMILL. LEVI A. HADLEY, Kansas City, Mo. Filed Feb. 6, 1902. Serial No. 92,948. (No model.)



Claim.—In combination a frame, a shaft mounted thereon, a wheel mounted on said shaft, a sleeve on said shaft, weighted rods 19 and el-

bow-levers 21 attached to the sleeve by rods 22 whereby the centrifugal force of the weighted rods when operating to throw said weighted rods outward will pull the sleeve toward the hub of the wheel, and in combination the attachment of all the parts together to work in the manner and for the purpose substantially as described.

704,031. TREE-LIMB SUPPORT. SYLVESTER T. HALL, Riverside, Cal. Filed Sept. 12, 1901. Serial No. 75,226. (No model.)



Claim.—1. A limb-supporter comprising a loop furnished with a broad limb-supporting portion and a tie-retaining spring-catch; and a tie pivoted to one member of the loop and constructed to extend across the loop and engage the catch.

2. A limb-supporter comprising a loop furnished with a broad limb-supporting portion and a tie-retaining spring-catch; and an arched tie pivoted to one member of the loop and constructed to engage the catch.

3. A limb-supporter comprising a sheet-metal loop furnished with a tie-retaining spring-catch and a tie pivoted to the loop and constructed to extend across the loop and engage the catch.

4. A limb-supporter comprising a sheet-metal loop bent at one end to form a catch; and a wire loop having free ends pivoted to the sheet-metal loop and having an end member to engage the catch.

5. A limb-supporter comprising a ribbed sheet-metal limb-supporting loop bent at one end to form a catch and a tie consisting in a wire loop having inbent ends inserted through the ribs of the limb-supporting loop.

6. A limb-supporter comprising a limb-supporting loop, one member of which is furnished with a catch, and a wire tie having inbent ends by which it is pivoted to the other member of the loop, one or both of said ends being deflected to afford means for manipulating the tie.

7. The combination of a sheet-metal loop furnished at the end of one member with a spring-catch; and a wire-loop tie constructed to engage the catch and pivoted to the other member of the sheet-metal loop.

8. The combination of a ribbed sheet-metal loop furnished at the end of one member with a spring-catch, and a loop-tie constructed to engage the catch, and pivoted to the other member and furnished at the pivot with means for manipulating the tie.

9. The combination of a loop furnished with a catch and a loop-tie constructed to extend across the loop and to engage the catch, and pivoted to the loop and furnished at the pivot with means by which to manipulate the tie.

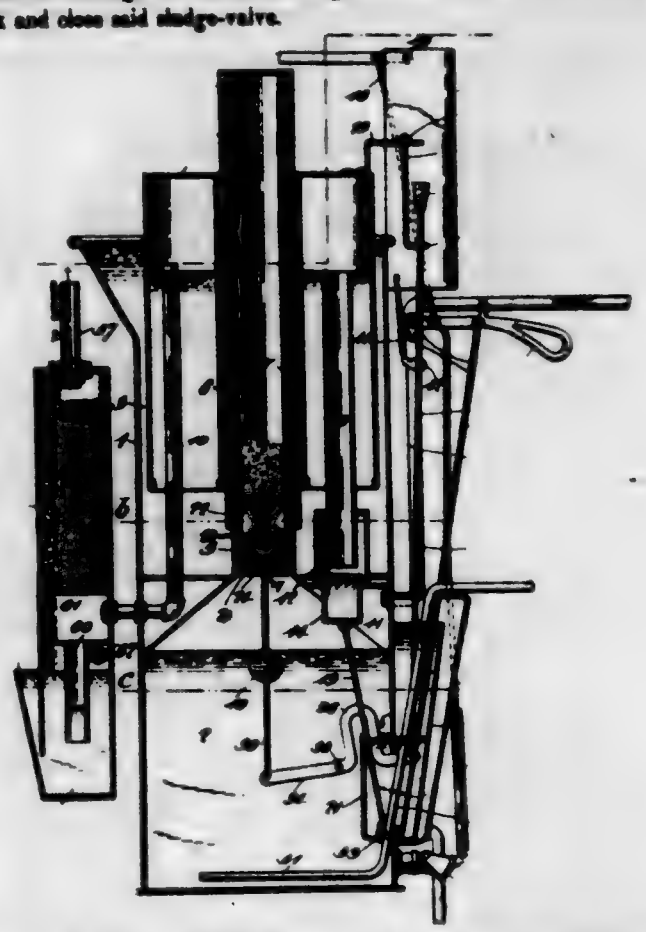
10. A loop furnished with a catch and a loop-tie constructed to extend across the loop and to engage the catch, and being pivoted to the loop on the outer side thereof, and there provided with means for manipulating the tie.

704,032. ACETYLENE-GAS GENERATOR. ISAAC L. HARRIS, Jacksonville, Fla., assignor of one-half to Hugh Partridge, Jacksonville, Fla. Filed Aug. 31, 1901. Serial No. 74,007. (No model.)

Claim.—1. In an acetylene-gas generator, a generating-tank, a water-tank, a gas-bell in the latter, a gas-pipe leading from the generating-chamber to the gas-space of the bell, a cup-shaped valve situated in the generating-tank and having a body of water adapted to close and seal the lower end of said gas-passage, said valve being arranged immediately below the gas-pipe and adapted to receive its sealing-water from the overflow through said gas-pipe, and a dome or casing surrounding the lower end of the gas-pipe and serving to receive and guide the valve.

2. In an acetylene-gas generator, a generating-tank having a vent-pipe, a valve in said vent-pipe, an operating-lever for said valve, a water-tank above the generator, a gas-bell in the latter, a gas-pipe leading up through the water-tank from said generating-tank to the gas-space of the bell and having open upper and lower ends, a valve having a body of water adapted to close and seal the open lower end of said gas-pipe, and a rod connecting said operating-lever and sealing-valve for simultaneously opening the valve of the vent-pipe and closing the valve of the gas-pipe.

3. An acetylene-gas generator having a vent-valve and a sludge-discharge valve, in combination with a telescopic rod connecting said valves, the lower rod-section being connected to the sludge-valve and the upper to the vent-valve, whereby an opening movement of said vent-valve will release said sludge-valve, and a closing movement of the vent-valve will lock and close said sludge-valve.



4. In an acetylene-gas generator, a gas-generating tank having a lower opening for the discharge of water and sludge, an overflow-spout arranged above said opening, a water seal formed by an open-top chamber communicating with the interior of the tank and with the spout on the exterior of said tank, the side wall of the tank being extended below the top of said chamber to form a water seal and the chamber serving to retain a quantity of water and thus prevent the escape of gas through the spout when the water and sludge are withdrawn through the lower discharge-opening.

5. In an acetylene-gas generator, the combination of the generator-tank having a valved vent-pipe, an operating-handle secured to said valve, a water-tank, a gas-bell situated therein and having a movable element, a carbid-magazine, a carbid-feed valve therefor, a valve-operating rod connected to the carbid-feed valve and mounted in operable relation to the movable element of the gas-bell, a weight normally maintaining said rod in operative position, and a finger or lug carried by the vent-valve lever and adapted to move said rod to inoperative position when the vent-valve is opened, substantially as specified.

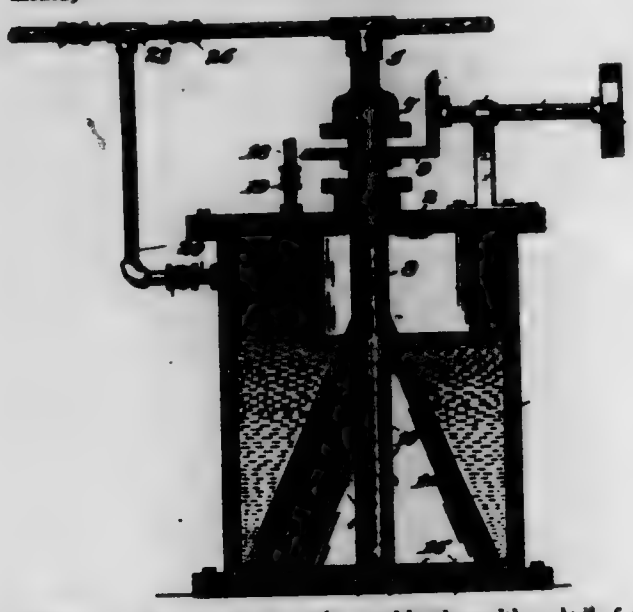
6. In an acetylene-gas generator, the combination of a gas-bell, a carbid-feed valve, a trip-rod connected to the feed-valve, a tappet on the gas-bell adapted to depress said trip-rod when the bell descends and thereby open the carbid-feed valve, a weight normally acting to hold the trip-rod in operative relation to the tappet, means for moving said rod from operative position, a link depending from the tappet and having an eye surrounding and forming a guide for the trip-rod, said link being adapted to engage with the upper end of the trip-rod on the ascent of the gas-bell and thereby to lock said carbid-valve in closed position, substantially as specified.

704,033. SKIRT FACING AND BINDING. WILLIAM J. HAY, Oshkosh, Wis. Filed Nov. 5, 1900. Renewed May 29, 1902. Serial No. 108,482. (No model.)

Claim.—A skirt facing and binding, consisting of a facing-strip a separate supplemental strip looped around and secured to the lower edge of the facing-strip, with its outer face outermost, and which outer face is adapted to be of the same color as the skirt to which the facing and binding is attached, a binding-strip also arranged within the loop of the supplemental strip, the three members being stitched or secured together, and the binding-strip turned down and around the supplemental strip and finally brought around on the inner side of the facing-strip and secured to

said inner side, the completed facing and binding being adapted to be secured to the lower edge of a skirt on the inner side of the skirt, and with the roll projecting inwardly, laterally therefrom, the separate supplemental strip being of considerable thickness, and thereby forming a filling for the completed roll.

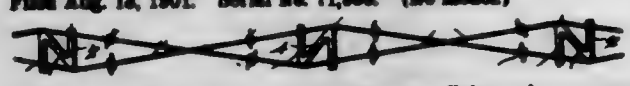
704,084. CARBURETER. WILLIAM S. HEAD and GEORGE J. DOVEY, Latrobe, Pa. Filed Apr. 9, 1902. Serial No. 101,961. (No model.)



Claim.—1. In a gas-machine, the combination with a shell of a revolving air-shaft carried therein provided with perforations therein, a cone carried on said shaft, a perforated bottom on said cone, means for admitting air to said revolving shaft, and means for conducting the carbureted air from the machine.

2. In a gas-machine the combination with a shell of an air-pipe, a gas-line leading from said shell a pipe connecting said air-pipe and gas-line, a revolving perforated air-shaft, a cone carried thereon and provided with a perforated bottom.

704,085. FENCE-POST. ALBERT HENRY, Nebraska City, Nebr. Filed Aug. 13, 1901. Serial No. 71,959. (No model.)



Claim.—1. A fence-post comprising two parallel members connected by a diagonally-disposed web, the members being rounded at their point of juncture with the web, and provided, adjacent to their edges, with wire-openings disposed approximately in line with the crest of the rounded corners.

2. A fence-post comprising two parallel members connected by a diagonally-disposed web, the members being rounded at their point of juncture with the web, and provided adjacent to their edges with wire-openings disposed approximately in line with the crest of the rounded corners, and with oblique slits entering the openings.

3. A fence composed of a plurality of fence-posts each comprising two members connected by a diagonally-disposed web, the members having rounded corners, and provided adjacent their edges with wire-openings disposed approximately in line with the crest of the said corners, and fence-wires alternately engaging the openings in the members, in zigzag order, all substantially as and for the purpose specified.

4. A fence-post, comprising two parallel members connected by a diagonally-disposed web, the members being rounded at their point of juncture with the web, and provided adjacent to their edges with wire-openings disposed approximately in line with the crest of the rounded corners and with oblique slits entering the openings, the lower end of each member being beveled or cut away to present, in conjunction with the web, a chisel-point, substantially as and for the purpose specified.

704,086. PROCESS OF SEPARATING ALKALI-METAL SULFATES FROM MIXED SOLUTIONS. CARL HOEPFNER, Frankfort-on-the-Main, Germany; Henry Orth, Jr., administrator of said Hoepfner, deceased. Filed Sept. 27, 1899. Serial No. 731,353. (No specimens.)

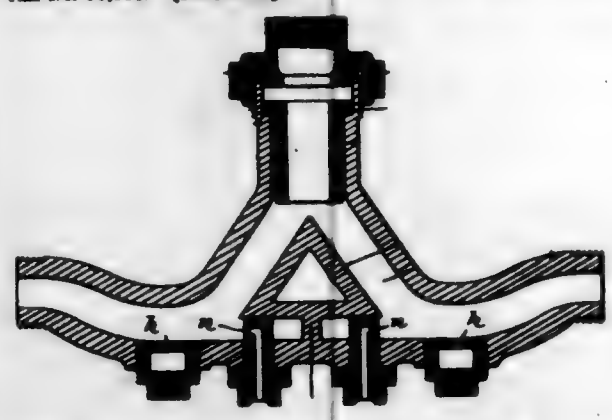
Claim.—1. The method of separating alkaline sulfates from mixed solutions, which consists in rapidly cooling the same by allowing them to flow into a cold solution of a suitable chlorid, thereby preventing the formation of double salts, substantially as set forth.

2. The method of separating alkaline sulfates from mixed solutions, which consists in rapidly cooling the same by allowing them to flow into a suitable cold chlorid solution while being constantly stirred, substantially as set forth.

3. The method of separating alkali-metal sulfates from mixed solutions of high concentration, which consists in rapidly cooling the same by allowing them to flow into a cold solution of a suitable chlorid while being constantly stirred, substantially as set forth.

4. The method of separating alkaline sulfates from mixed solutions, which consists in rapidly cooling the same by allowing them to flow into a cold solution of a chlorid while being constantly stirred, using the resulting cold solution to reduce the temperature of cooling-gases used in the refrigerating plant, substantially as set forth.

704,087. LOCOMOTIVE SANDING DEVICE. JOHN C. HOOVER, Baltimore, Md., assignor to Boonsboro Locomotive Sander Company, Baltimore, Md., a Corporation of Maryland. Filed Mar. 6, 1902. Serial No. 96,533. (No model.)



Claim.—1. A sanding device consisting essentially of an integral casing containing an initial vertically-arranged tubular inlet-passage, having an enlarged diameter at its mouth end, an adjustable sleeve in said passage supported between the two diameters thereof, a tubular coupling-nut and an annular coupling-ring, a downwardly-inclined passage leading from the base of the inlet-passage, an air-blast nozzle below the same, in the base of the casing, a shield over the same, and a substantially horizontal tubular discharge-passage communicating with the inclined passage at its lower end, and arranged in alinement with the direction of discharge from the air-nozzle.

2. A sanding device consisting essentially of an integral casing containing an initial vertically-arranged tubular inlet-passage, a downwardly-inclined passage leading therefrom, an air-blast nozzle below the same, in the base of the casing, a shield over the same, and a tubular discharge-passage communicating with the inclined passage at its lower end and slightly curved upward, said air-nozzle being arranged to discharge an air-blast in the direction of the flow of sand through the curved discharge-passage.

3. A sanding device consisting essentially of an integral casing containing an initial vertically-arranged tubular inlet-passage, means to connect sand-delivery tubes therewith, means to adjustably change the size of the passage, a downwardly-inclined passage leading from said initial inlet, an air-blast nozzle below the inclined passage in the base of the casing, a shield over the same, and a tubular discharge-passage slightly curved upward communicating with the inclined passage at its lower end, and arranged in substantial alinement with the direction of discharge from the air-nozzle.

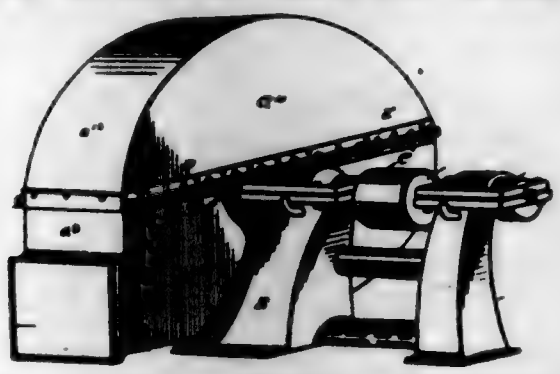
4. In combination with a sand-dome having a discharge-pipe, of a sanding device into which sand is fed by gravity, said sanding device consisting essentially of a vertical tubular inlet and downwardly-inclined passage leading therefrom, a horizontally-disposed tubular discharge-passage leading from the base of the inclined passage and slightly curved upward toward its discharge end, an air-blast nozzle arranged and adapted to discharge at the rear of and in alinement with the tubular discharge-chamber, and a shield over said air-blast nozzle adapted to deflect therefrom the flow of sand through the inclined passage and direct it wholly against the body of sand in the discharge-chamber.

5. A sanding device consisting essentially of a hollow casing having at top an initial tubular sand-inlet, and at base a horizontally-disposed tubular sand-discharge passage, a wall at the interior base of the casing, and a shield supported thereon, said shield having a flat base and a vertically-inclined side at the top thereof in alinement with the said inlet, forming by such construction and combination of said elements an inclined sand-passage leading from the sand-inlet to the sand-discharge, and also forming thereby an air-chamber in alinement with said sand-discharge; and an air-nozzle within said chamber discharging outwardly; substantially as described.

6. A sanding device consisting essentially of an integral hollow casing having at top an initial vertically-arranged tubular inlet-passage for sand,

and two oppositely-disposed tubular sand-discharge passages leading from the base of the casing, a shield having a flat base and opposite inclined sides centrally disposed within the casing and with its apex in alinement with the initial sand-passage, thereby forming two oppositely disposed inclined passages leading from the initial sand-inlet to the respective sand-discharge passages, a partition-wall supporting said shield above the base of the casing in such manner as to form separate chambers, and an air-blast nipple in each of said chambers arranged to discharge in alinement with the adjacent tubular sand-discharge passage of the casing; substantially as described.

704,088. FAN-CASE FOR BLAST-FANS. JOHN T. HOPE, Kansas City, Mo. Filed June 28, 1901. Serial No. 66,376. (No model.)

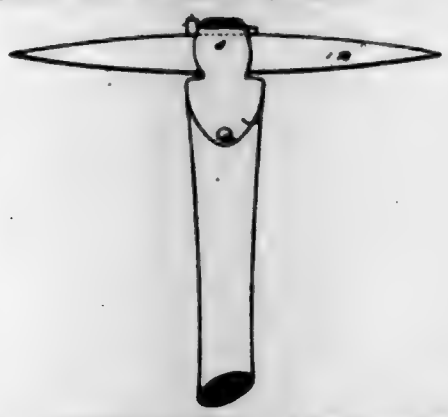


Claim.—1. A fan-case comprising a lower sectional part and a shaft extending through one side thereof and an upper sectional part of said case separable transversely to the case upon a line above the plane of said shaft, angle-plates upon the side of said case through which said shaft extends and near the line of separation of said upper and lower sectional parts one of which angle-plates extends from one end of said case to the other and suitable fastening devices for said angle-plates substantially as described.

2. A fan-case comprising a lower sectional part and a shaft extending through one side thereof, and a support for said shaft adjacent to said side an upper sectional part of said case separable transversely to the case upon a line above the plane of said shaft, angle-plates upon the side of said case through which the shaft extends and near the line of separation of said upper and lower sectional parts, one of which angle-plates extends from one end of said case to the other end, fastening devices for said angle-plates and a lug on the support for said shaft beneath said angle-plates.

3. In a fan-case comprising a lower sectional part and an upper sectional part the combination of angle-plates upon the sides of said sectional parts at the line of separation of said upper and lower parts, devices for securing said plates together and separate air-excluding plates connected with the ends of one of said sectional parts in position to engage with the other when the parts are brought together.

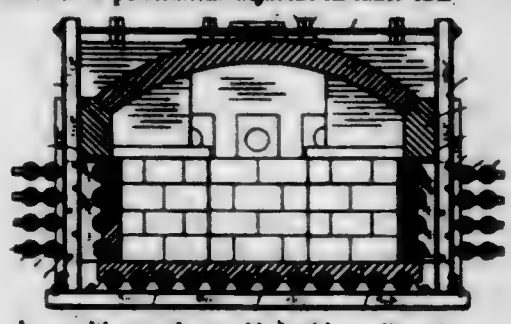
704,089. COAL-PICK. FERDINAND HOKE, Coshocton, Ohio. Filed Sept. 17, 1900. Serial No. 30,296. (No model.)



Claim.—A coal-pick comprising a helve-socket provided with an eye having its lower wall reduced in width to present a shoulder, a pick having a recess to engage the shoulder, and a solid key firmly bearing against the pick and the walls of the eye and constituting a non-yielding surface which will operate to prevent vibration of the pick, in the eye, under impact, one end of the key being provided with a step and the other end with laterally-projecting members disposed exteriorly of the eye and operating positively to hold the key against accidental separation therefrom.

704,040. GLASS-TANK. LEE HOUSE, Hartford City, Ind. Filed Mar. 29, 1901. Serial No. 53,377. (No model.)

Claim.—1. The combination with a melting-tank, of a cooling-pipe within the tank consisting of an outer shell having an outlet adjacent one of its ends and both of its ends closed, a stud extending inwardly from the closed end of the shell farthest away from the outlet, an inlet-pipe extending into the shell through the end nearest the outlet, the inner end of the inlet-pipe being secured to and supported by the stud and provided with a series of perforations adjacent its inner end.

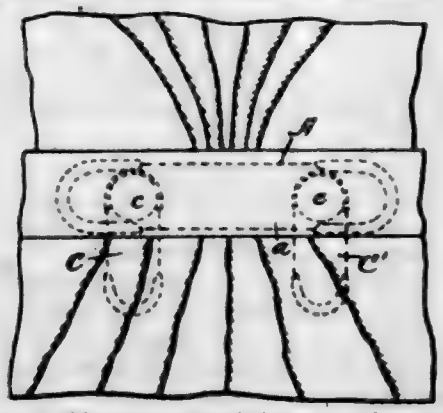


2. A glass-melting tank provided with cooling-pipes, supporting-bars on the outside of the furnace, a plate secured to the bars and provided with semicircular grooves, and bricks on the interior of the furnace also provided with semicircular grooves registering with the grooves in the plate the cooling-pipes being located in the grooves in the plate and bricks.

704,041. COMBINED VELOCIPEDE AND WAGON. REBIA L. HOY, Lovey, Iowa, assignor of one-half to Charles Ridgway, Lovey, Iowa. Filed Jan. 27, 1902. Serial No. 91,304. (No model.)

Claim.—In a combined velocipede and wagon, the combination with a wagon-body having rear supporting-wheels, and a velocipede having a front steering-wheel; of an axle removably mounted to swing upon the front end of the wagon-body and removably secured to the rear end of the velocipede, and interchangeable as a common support for both or independent support for either, whereby the parts may be connected up to form the combined velocipede and wagon or the axle removed from one and used upon the other to form a complete velocipede or a complete wagon, substantially as set forth.

704,042. SKIRT-RETAINER. MARY C. HUFFMAN, Boston, Mass. Filed May 15, 1899. Serial No. 716,808. (No model.)

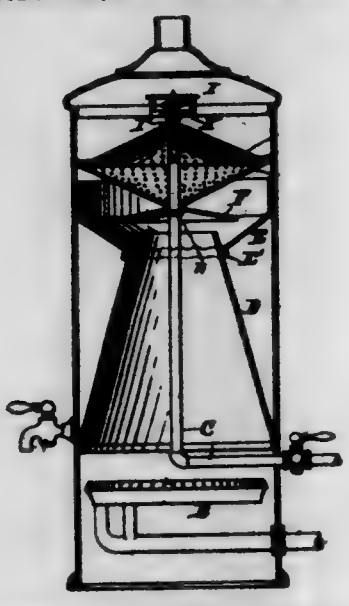


Claim.—1. A skirt-supporter and placket-opening retainer comprising a flexible strip adapted to be sewed or otherwise secured to a belt or skirt-waist at the waist-line in a horizontal position said strip having parts of separable fasteners secured thereto with the separable fasteners one on either side of the line of the skirt-opening or placket; and two vertically-disposed flexible strips having the companion parts of said separable fasteners secured to their upper ends for engagement with the fastener members on said horizontally-placed strip, said vertically-disposed strips being adapted to be secured at their lower ends to a skirt below the waistband, one on either side of the placket-opening.

2. A skirt-supporter and placket-opening retainer comprising a flexible strip A adapted to be attached in a horizontal position to a belt or other article of apparel at the waist-line, said strip A having parts B, B' of separable fasteners secured thereto, one on either side of the line of the skirt-opening or placket; two flexible strips C, C', provided at their lower ends with a detachable fastening device by which they may be secured in a vertical position to a skirt at points just below the waistband

thereof, one on either side of the skirt-opening or placket; the companion parts *c*, *c*, of said separable fasteners secured to the upper ends of said vertically-disposed strips C, C' for engagement with the said fastener members B, B', whereby the said strips C, C' may be separably connected to the strip A, the skirt upheld, the placket-opening maintained in closed position, and strain upon and sagging of the waistband prevented.

704,048. HEATER. ALFRED H. HUMPHREY, Kalamazoo, Mich., assignor to Herbert S. Humphrey, Kalamazoo, Mich. Filed July 13, 1898. Renewed Dec. 30, 1901. Serial No. 87,892. (No model.)



Claim.—1. In a water-heater, the combination of a casing; a plurality of perforated cones mounted one upon another within the casing forming a complete partition therein and adapted to guide and finely divide the water fed to the same so as to seal or partially seal said perforations; devices for feeding the water to said cones in a finely-divided state; and means for introducing heated gases into said casing below said cones, whereby said gases are caused to pass upwardly through said perforations and break the film of water formed over the same, for the purpose specified.

2. In a water-heater, the combination of a casing; a perforated cone within the casing adapted to finely divide the water fed to the same so as to seal or partially seal said perforations; devices for feeding the water to said cone near its top in a finely-divided state; and means for introducing heated gases into said casing below said cone, whereby said gases are caused to pass upwardly through said perforations and break the film of water formed over the same, for the purpose specified.

704,044. SIDE BEARING FOR RAILWAY-CARS. CHARLES F. HUNTOON, Chicago, Ill., assignor to the Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed Apr. 23, 1902. Serial No. 104,231. (No model.)

Claim.—1. In a side bearing for railway-cars, the combination with spring-posts, of a casting supported upon the upper ends of said posts, and antifriction devices arranged in said casting for supporting the load imparted thereto; substantially as described.

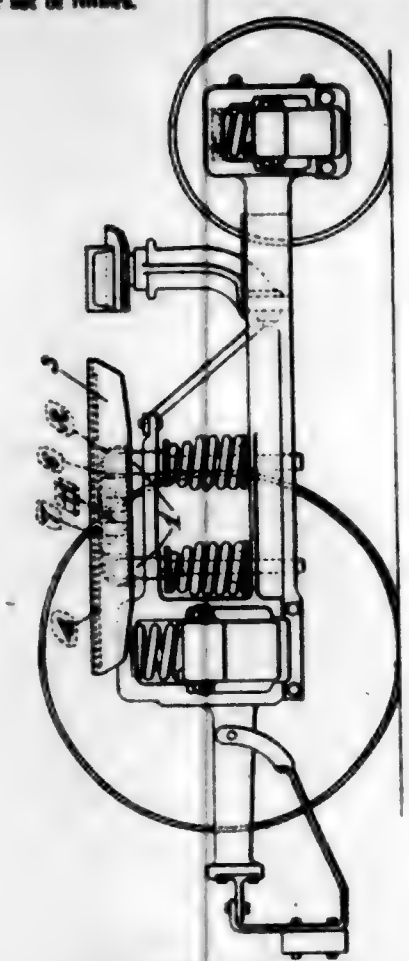
2. In a side bearing for railway-cars, the combination with spring-posts, of a casting carried by the upper ends thereof, antifriction devices arranged in said casting and capable of vertical and lateral contact, and means carried by the car-body for coöperating with said antifriction devices; substantially as described.

3. In a side bearing for railway-cars, the combination with suitable supports, of a casting, rollers mounted within said casting and protruding through the upper wall thereof, and rollers mounted at the sides of the casting for lateral contact; substantially as described.

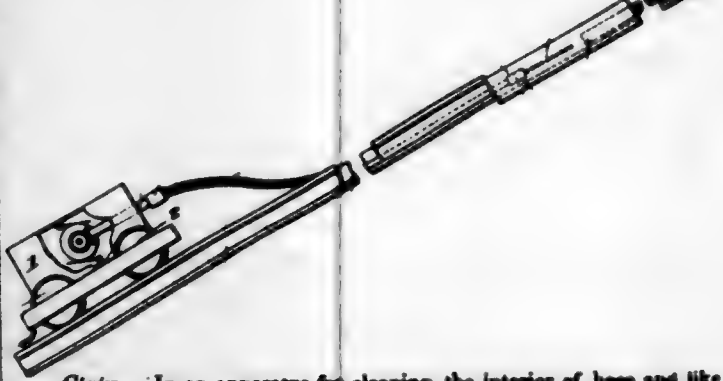
4. In a side bearing for railway-cars, the combination with a casting, of rollers housed within the casting and protruding through the top wall thereof, perforated lugs or ears projecting from the side of the casting, and rollers mounted between said lugs or ears; substantially as described.

5. In a side bearing for railway-cars, the combination with a casting, of antifriction devices carried thereby and capable of vertical and lateral contact, and angular projections at the ends of the casting, said projections being provided with sockets for receiving the ends of supporting-posts; substantially as described.

6. In a side bearing for railway-cars, the combination with spring-supporting posts, of a casting carried by the upper ends of said posts, rollers mounted in said casting and rotating about horizontal and vertical axes respectively, and an angle-iron on the car-body whose horizontal leg coöperates with one set of rollers and whose vertical leg coöperates with the other set of rollers.

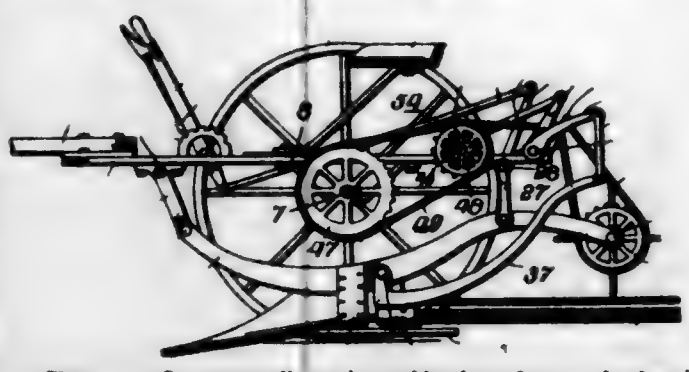


704,045. APPARATUS FOR CLEANING THE INTERIOR OF HOSE OR LIKE PIPES. SVEN HYDÉN and KNUT A. SIEGBAHN, Stockholm, Sweden. Filed May 8, 1901. Serial No. 59,204. (No model.)



Claim.—In an apparatus for cleaning the interior of hose and like pipes, a motor, a carriage supporting the same and adapted to travel on rails or other guideways, a shaft operatively connected with said motor, a transmission-shaft of coiled wire coupled to said shaft, and a brush coupled to the end of the transmission-shaft, trough to receive the hose to be cleaned, and means for supplying water to said trough, substantially as shown and described.

704,046. POTATO-DIGGER. JOHN L. IRVERSOLL, Mayville, Mich. Filed Feb. 28, 1902. Serial No. 96,165. (No model.)

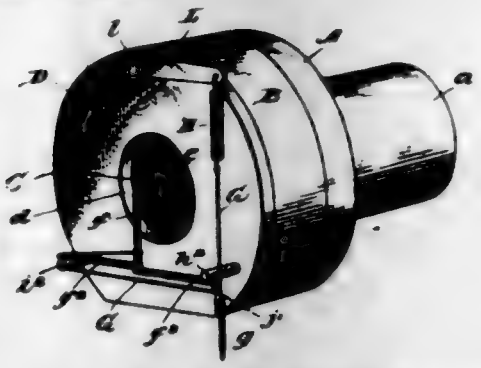


Claim.—1. In a potato-digger, in combination, a frame and a shovel, and means to support and vertically adjust the shovel comprising hori-

zontally-disposed bars to and between which the shovel is attached, said bars having at their front ends connecting-links to the frame, and levers fulcrumed on the frame and connected to the bars rearward of the shovel to adjustably elevate the same.

2. The combination with a wheeled frame, of bars linked at their forward ends to the frame at each side thereof, a shovel secured to and between the bars, bent vibrating levers pivoted to the bars, a screen suspended from the levers behind the shovel, and a revolving tedder journaled in the bars and extending across above the screen.

704,047. SOUND RECORDING AND REPRODUCING DEVICE. ELDRIDGE R. JOHNSON, Philadelphia, Pa. Filed Nov. 2, 1900. Serial No. 35,193. (No model.)



Claim.—1. In a sound-recording apparatus, the combination with the sound-box frame having a diaphragm located therein, of a horizontally-disposed stylus-bar having an arm perpendicularly disposed and connected with the diaphragm, knife-edge bearings on the under side of the horizontally-disposed bar at one end and on the upper side at the opposite end, and means for maintaining the said stylus-bar in contact with its bearings, for the purpose described.

2. In a sound-recording apparatus, the combination with the sound-box frame, of a diaphragm located therein, a horizontally-disposed stylus-bar having a central arm connecting with the diaphragm, supports carried by the sound-box frame extending under one end of the stylus-bar and above the opposite end, knife-edges carried by the under and upper ends of the stylus-bar respectively adapted to bear against the supports and means for keeping the stylus-bar in contact with its bearings, substantially as described.

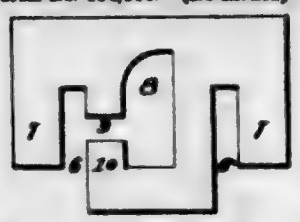
3. In a sound-recording apparatus, the combination with the sound-box frame, a diaphragm located therein, a horizontally-disposed arm connecting the stylus-bar with the diaphragm, knife-edge bearings located at each end of the stylus-bar on its upper and lower sides respectively, studs carried by the sound-box frame against which the knife-edges bear, and a cord secured to the central arm of the stylus-bar bearing against one end of the horizontal bar and passing under its supporting-stud and through an opening provided in the opposite end of the same, the end of said cord being yieldingly secured to the sound-box frame, substantially as described.

4. In a sound recording and reproducing apparatus, the combination with the sound-box frame, of a diaphragm, a horizontally-disposed stylus-bar, a central arm for said bar having a connection with the diaphragm, studs arranged below one end and above the other end of the stylus-bar, knife-edges adapted to bear against the said studs, a cord secured to the stylus-bar and passing under each of its bearings, a spring secured to the other end of said cord and means for adjusting the tension of said spring, substantially as described.

5. The combination with the sound-box frame, of a diaphragm located therein, a T-shaped stylus-bar having its vertical arm secured to the diaphragm, a pair of studs secured to the sound-box frame, extending under the stylus-bar at one end and above the same at the other end, V-shaped notches formed in said studs, knife-edges carried by the lower side of the bar at one end and the upper side at the opposite end, a cord secured to the stylus-bar and passing under each of its bearings for keeping the said bearings in contact with the studs, a yielding spring connecting the end of the cord, and an adjustable arm secured to the sound-box to which the free end of the spring is connected, substantially as described.

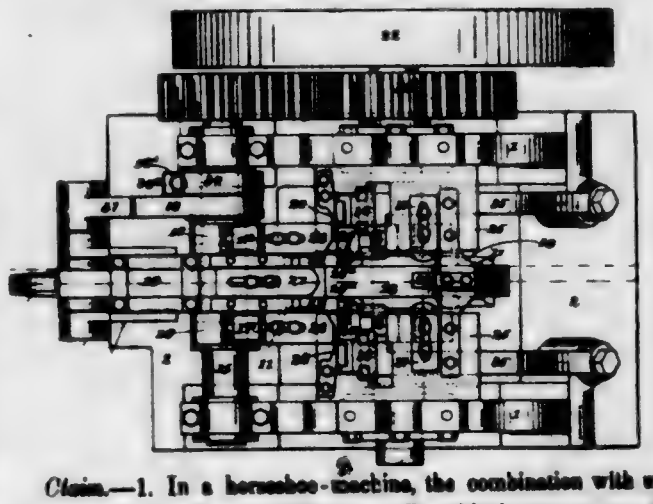
6. The combination with the sound-box casing, of a diaphragm located therein, a T-shaped stylus-bar having its vertical arm connected to the diaphragm, a stud, i^3, extending under one end of the stylus-bar, a knife-edge carried by the lower side of the stylus-bar adapted to a V-shaped groove in the stud, a stud, h^3, located above the other end of the stylus-arm, a knife-edge carried by the upper side of the stylus-bar adapted to a V-shaped groove provided in the stud, a cord, G, secured to the stylus-bar passing over the end of same and under the stud, i^3, said cord passing through an eye formed in the opposite end of the stylus-bar and passing upwardly against the stud, h^3, a coiled spring secured to the upper end of the cord, an arm, L, carried by the sound-box frame supporting the coiled spring at its free end, and a set-screw, *l*, for adjusting the said arm, substantially as described.

704,048. BALE-TIE. WILLIAM T. JOHNSON, Sylvan, Tex. Filed Apr. 22, 1902. Serial No. 104,160. (No model.)



Claim.—A bale-tie comprising a buckle-plate having a middle portion with an opening therein, arms at each end separated from the middle portion by spaces open at one side, a longitudinal entering-passage connecting the opening with one of said spaces, and a hoop the free ends of which are looped down through said opening and up through the spaces, resting upon the arms under the standing part of the hoop.

704,049. HORSESHOE-MACHINE. MICHAEL J. KELLY, Troy, N. Y. Filed Nov. 20, 1900. Serial No. 37,114. (No model.)



Claim.—1. In a horseshoe-machine, the combination with upper and lower rotating dies, of stationary anvils, a blank-support, a reciprocating bar provided with a bending-tongue, and means for operating said reciprocating bar and dies, substantially as shown and described.

2. In a horseshoe-machine, the combination with upper and lower rotating dies, of a blank-support, stationary anvils, swaging-blocks secured to oscillating levers, a reciprocating bar provided with a bending-tongue, and means for operating said dies, reciprocating bar and swaging-blocks, substantially as shown and described.

3. In a horseshoe-machine, the combination with a rotating die-wheel having frog-form dies provided with a longitudinal groove, of an upper die mounted upon a rotating shaft, a reciprocating arm provided with a bending-tongue and a longitudinal rib adapted to engage the groove of said dies, stationary anvils and means for operating said dies and bar, substantially as shown and described.

4. In a horseshoe-machine, the combination with upper and lower rotating dies, of a blank-support, stationary anvils, a reciprocating bar provided with a bending-tongue, a cam adjustably mounted upon a rotating shaft, and an oscillating shaft provided with an upper lever adapted to bear against said reciprocating bar and a lower lever adapted to engage said adjustable cam, substantially as shown and described.

5. In a horseshoe-machine, the combination with upper and lower rotating dies, of a blank-support, stationary anvils, a reciprocating bar provided with a bending-tongue, a collar or hub rigidly secured to a rotating shaft, a cam loosely mounted upon said shaft and adjustably secured to said hub, an oscillating shaft provided with the levers adapted to engage said cam and reciprocating bar, substantially as shown and described.

6. In a horseshoe-machine, the combination with upper and lower rotating dies, of a blank-support, stationary anvils, a reciprocating bar provided with a bending-tongue, means for moving said bar forwardly and a segmental collar mounted upon a rotating shaft adapted to bear against said bar and move it backwardly, substantially as shown and described.

7. In a horseshoe-machine, the combination with a main die-wheel provided with frog-form dies, of an upper die mounted upon a rotating shaft, stationary anvils and a reciprocating arm provided with a bending-tongue movable in a line tangential to said die-wheel, substantially as shown and described.

8. In a horseshoe-machine, the combination with a main die-wheel provided with frog-form dies, of an upper die mounted upon a rotating

shaft, stationary anvils, a reciprocating bar provided with a bending-tongue having a slow forward movement by means of upper and lower levers mounted on an oscillating shaft and a cam mounted upon a rotating shaft, and a quicker return movement by means of a segmental collar mounted upon said rotating shaft and provided with a shoulder, substantially as shown and described.

9. In a horseshoe-machine, the combination with upper and lower rotating dies, of stationary anvils provided with curved ends and flanges projected horizontally from their upper surfaces, a blank-support, a reciprocating bar provided with a bending-tongue, and means for operating said reciprocating bar, substantially as shown and described.

10. In a horseshoe-machine, the combination with a die-wheel provided with frog-form dies having a longitudinal recess in the frog of each die, a reciprocating tongue having a rib adapted to engage the recess of said dies, stationary anvils and means for moving said reciprocating tongue inward and outward, substantially as shown and described.

11. In a horseshoe-machine, the combination with upper and lower rotating dies, of stationary anvils, a blank-support, a reciprocating bar provided with a bending-tongue, means for operating said reciprocating bar, and heel-swagers, cams secured to a rotating shaft arranged to operate said swagers in advance of the movement of said bar, substantially as shown and described.

704,050. TORPEDO AND MEANS FOR PROPELLING SAME. ALEXANDER KLEMIN, Silverton, Colo. Filed Oct. 12, 1901. Serial No. 78,478. (No model.)

Claim.—1. Means for propelling and controlling a torpedo comprising a vessel equipped with a propeller; a float or shell connected with said vessel and also provided with a propeller; a float supported above said float or shell; a torpedo connected to the forward end of said float or shell and suspended from a float.

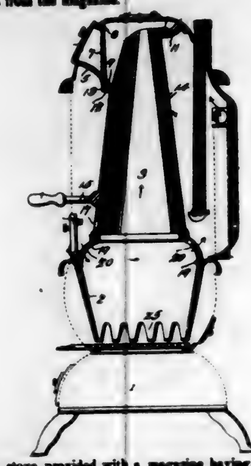
2. Means for propelling and controlling a torpedo comprising a vessel equipped with a propeller; conning-tower rising from said vessel and formed with a sight-opening; a float or shell secured to the vessel; and also provided with a propeller; a float supported above said float or shell and provided with a projecting sight; a torpedo secured to the forward end of said float or shell; and a float supported above the torpedo and provided with a projecting sight.

3. Means for propelling and controlling a submarine torpedo comprising a vessel equipped with a propeller, a turret formed with a sight-opening, an air-pipe; a float or shell having a propeller and secured detachably to the vessel, a float supported above the shell, a torpedo secured to the front end of said shell, and a float supported above the torpedo.

704,051. STOVE. EDWARD J. LAHAM, Quincy, Ill. Filed Dec. 14, 1901. Serial No. 86,048. (No model.)

Claim.—1. A stove provided with a magazine having near the upper end of its rear portion a plurality of gas-escape openings, a main back flue having its inlet end disposed below the said openings, and means for supplying a constant current of air to the upper portion of the said flue thereby to draw gases out of the magazine through the said openings and to set up secondary combustion within the said flue to increase the draft of the stove.

2. A stove having a magazine provided at its top with a damper, and having at its rear a plurality of gas-escape openings, a main back flue having its inner wall terminating short of the magazine, and an air-intake flue entering the main back flue near its top and operating to withdraw gases from the magazine.



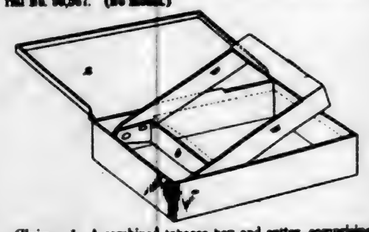
3. A stove provided with a magazine having gas-escape openings near the upper end of its rear side and operating normally to withdraw gases from the magazine, a main back flue having its intake end disposed near the fire-pot, and a damper arranged above or near the magazine and operating, when opened, to drive the gases downward into the fire-pot.

4. A stove provided with a magazine supported for rotary movement therein and having its rear wall extended to a point near the top of the stove and provided with gas-escape openings, a feed-door, a gravity-controlled door normally closing the inlet to the magazine, and a main back flue having its inlet end disposed below the gas-escape openings.

5. A stove provided with a magazine supported for rotary movement about a vertical axis, a fire-pot, a circle grate arranged between the lower end of the magazine and the fire-pot and operating to prevent fuel from contacting with the drum, and a main back flue having its inner wall disposed adjacent to the circle grate.

6. A stove provided with a magazine, circle grate, and fire-pot, combined with a main back flue, the inner wall of which terminates short of the bottom of the magazine, and an air-supply pipe entering the back flue near its top.

704,052. COMBINED TOBACCO BOX AND CUTTER. FRANK LAPORTE and LOUIS RAPPERT, St. Louis, Mo. Filed Mar. 24, 1902. Serial No. 99,567. (No model.)

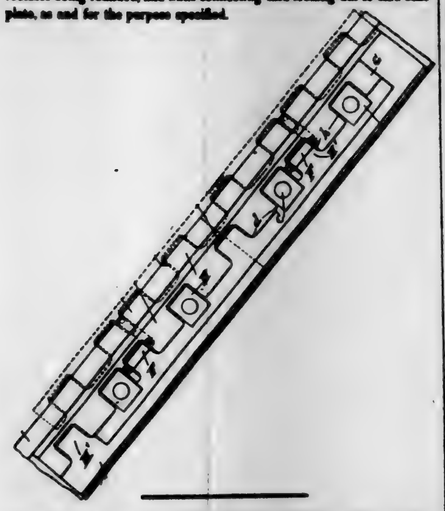


Claim.—1. A combined tobacco box and cutter, comprising a box, a frame composed of two sides and a cross-bar, a knife-blade carried by the sides of said frame and extending across and in the box, said frame pivoted at its ends to the inner sides of the box, and a cover for concealing the contents of said box, substantially as specified.

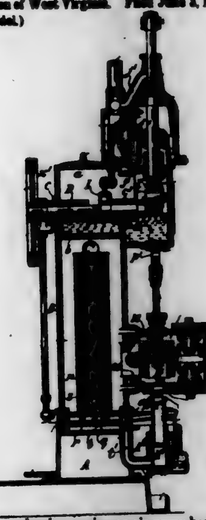
2. A combined tobacco box and cutter, comprising a box, a pivoted lid therefor, a frame composed of two sides and a cross-bar pivotally mounted within the box, and a knife-blade carried by the sides of the frame at an inclined angle; said frame being adapted to fit within the box so that the lid may inclose the frame within the box.

704,053. NUT-LOCK. GEORGE H. LAING, Havelock, Canada. Filed Oct. 4, 1901. Serial No. 77,560. (No model.)

Claim.—A nut-lock comprising a base-plate through which the bolts of the nuts to be locked, pass, and against which the nuts are jammed, a locking-bar provided with a suitable number of recesses, the sides of said recesses being provided with flanges which are designed to engage the sides of the nuts to be locked and lock the same, the lower corners of said recesses being rounded, and links connecting said locking-bar to said base-plate, as and for the purpose specified.



704,054. CONDENSING PUMPING-ENGINE. FRANK H. LEAVITT, Brooklyn, N. Y., assignor to the R. W. Hunt Company, Brooklyn, N. Y., a Corporation of West Virginia. Filed June 3, 1899. Serial No. 719,226. (No model.)



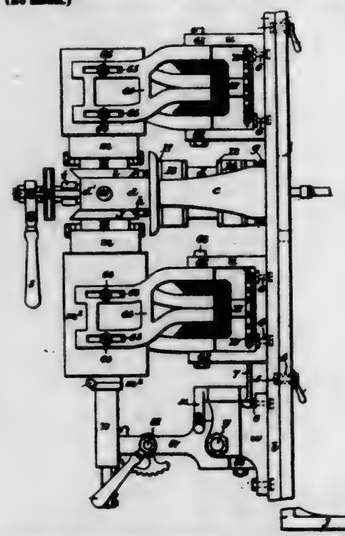
Claim.—1. In a condensing-engine, an air-pump having a discharge-port, a suction-passage terminating adjacent to said port, a slide-valve adapted to connect said discharge-port with said suction-passage, whereby to place the latter in communication with the pump-cylinder, and adapted to open said discharge-port to permit discharge from said cylinder, and a water-chamber inclosing said valve and receiving the discharge from said cylinder, whereby the water discharged from said cylinder forms a seal for said valve.

2. In a condensing-engine, a standard, formed with an exhaust-passage, a pump-cylinder fitting said standard and formed with a continuation of said passage, and a water-chamber surrounding said cylinder and sealing the joint between said passages.

3. In a condensing-engine, an air-pump cylinder having an annular internal water-groove against its plunger, and a water-chamber surrounding said cylinder and in communication with said groove, adapted to keep said groove filled with water to constitute a water seal around the plunger.

4. In a condensing pumping-engine, the steam-cylinder, water-pump cylinder and air-pump cylinder arranged in line, cross-heads connected to the steam-piston and pump-pistons, parallel connecting-rods connecting said cross-heads, a crank-shaft driven from the engine-piston, an eccentric thereon, a slide-valve for said air-pump, and a mechanical connection from said eccentric to said valve.

704,055. MACHINE FOR MAKING GLASS BOTTLES. CARL LEISTNER, London, England. Filed Aug. 31, 1901. Serial No. 73,967. (No model.)



Claim.—1. A machine for making glass bottles having, in combination, a pair of normally vertical neck-molds movable around a horizontal axis, a parison-mold adapted to be aligned with said neck-molds in succession at top, a blowing-mold adapted to be aligned with the same in succession at bottom, and means for introducing the air.

2. A machine for making glass bottles having, in combination, a pair of normally vertical neck-molds movable around a horizontal axis, a parison-mold adapted to be aligned with said neck-molds in succession at top, a blowing-mold adapted to be aligned with the same in succession at bottom, means for transmitting rotary motion to either neck-mold at will, and means for introducing the air.

3. A machine for making glass bottles having, in combination, a pair of normally vertical neck-molds movable around a horizontal axis, a parison-mold adapted to be aligned with said neck-molds in succession at top, a blowing-mold adapted to be aligned with the same in succession at bottom, and an air-supply device common to both neck-molds.

4. A machine for making glass bottles having, in combination, a pair of normally vertical neck-molds movable around a horizontal axis, a parison-mold adapted to be aligned with said neck-molds in succession at top, a blowing-mold adapted to be aligned with the same in succession at bottom, means for transmitting rotary motion to either neck-mold at will, comprising a shaft substantially concentric with said horizontal axis and means for continuously rotating said shaft, and means for introducing the air.

5. A machine for making glass bottles having, in combination, a pair of normally vertical neck-molds movable around a horizontal axis, a parison-mold adapted to be aligned with said neck-molds in succession at top, a blowing-mold adapted to be aligned with the same in succession at bottom, and an air-supply device common to both neck-molds, comprising an inlet-pipe and a spigot-valve concentric with said horizontal axis.

6. A machine for making glass bottles having, in combination, a pair of neck-molds, normally vertical, arranged back to back, and movable around a horizontal axis common to both, a longitudinally-bisected parison-mold adapted to be aligned with said neck-molds in succession at top, a longitudinally-bisected blowing-mold adapted to be aligned with

said neck-molds in succession at bottom, and mechanism for opening and closing said parison-mold and said blowing-mold simultaneously.

7. A machine for making glass bottles having, in combination, a pair of neck-molds, normally vertical, arranged back to back, and movable around a horizontal axis common to both, a longitudinally-bisected parison-mold adapted to be alined with said neck-molds in succession at top, a longitudinally-bisected blowing-mold adapted to be alined with said neck-molds in succession at bottom, and mechanism for opening and closing said parison-mold and said blowing-mold simultaneously, comprising a treadle, a tension-rod coupled thereto, an endless sprocket-chain, a pair of sprocket-wheels embraced by said chain, and miter-gearing transmitting motion from each sprocket-wheel to the parts of one of the molds last named.

8. A machine for making glass bottles having, in combination, a pair of neck-molds, normally vertical, arranged back to back, and movable around a horizontal axis common to both, a longitudinally-bisected parison-mold adapted to be alined with said neck-molds in succession at top, a longitudinally-bisected blowing-mold adapted to be alined with said neck-molds in succession at bottom, means for retracting the parts of said parison-mold and said blowing-mold, and means for swinging the stripped parison from the normal position of said parison-mold to the normal position of said blowing-mold, and for swinging the same in its depending position to elongate the parison.

9. A machine for making glass bottles having, in combination with means for introducing the air, a pair of longitudinally-bisected neck-molds, normally vertical, arranged back to back, and movable around a horizontal axis common to both, a parison-mold adapted to be alined with said neck-molds in succession at top, a bisected blowing-mold, having internally-movable parts, adapted to be alined with said neck-molds in succession at bottom, means for simultaneously opening the blowing-mold and the neck-mold in communication therewith sufficiently to release the blown bottle, and means for lowering the blown bottle.

10. A machine for making glass bottles having, in combination with means for introducing the air, a pair of longitudinally-bisected neck-molds, normally vertical, arranged back to back, and movable around a horizontal axis common to both, a parison-mold adapted to be alined with said neck-molds in succession at top, a bisected blowing-mold, having internally-movable parts, adapted to be alined with said neck-molds in succession at bottom, means for simultaneously opening the blowing-mold and the neck-mold in communication therewith sufficiently to release the blown bottle, means for lowering the blown bottle, and means for moving the blown bottle laterally to a discharge-point.

11. A machine for making glass bottles having, in combination with means for introducing the air, a pair of longitudinally-bisected neck-molds, normally vertical, arranged back to back, and movable around a horizontal axis common to both, a parison-mold adapted to be alined with said neck-molds in succession at top, a bisected blowing-mold, having laterally-movable parts, adapted to be alined with said neck-molds in succession at bottom, means for simultaneously opening the blowing-mold and the neck-mold in communication therewith sufficiently to release the blown bottle, means for lowering the blown bottle, and means for moving the blown bottle laterally to a discharge-point, comprising a mold-bottom adapted to be tilted.

12. A machine for making glass bottles having, in combination with means for introducing the air, a pair of longitudinally-bisected neck-molds, normally vertical, springs which render the same normally closed, means for revolving the closed neck-molds around a horizontal axis, a parison-mold adapted to be alined with said neck-molds in succession at top, a bisected blowing-mold, having internally-movable parts, adapted to be alined with said neck-molds in succession at bottom, and means whereby the separation of said parts of the blowing-mold opens the neck-mold in communication therewith.

13. In a machine for making glass bottles by casting and blowing, the combination with means for introducing the air and with parison and blowing molds of a neck-mold with which each parison-mold and each blowing-mold are alined in succession, a support for the same having a cylinder within it, a piston movable within said cylinder, a mouth-core carried by said piston, means for rendering said mouth-core normally protruded for the casting operation, and means for retracting said mouth-core by the air on its way to the interior of the bottle.

14. In a machine for making glass bottles by casting and blowing, the combination with means for introducing the air and with parison and blowing molds of a neck-mold with which each parison-mold and each blowing-mold are alined in succession, a support for the same having a cylinder within it, a piston movable within said cylinder, a mouth-core carried by said piston, a spring arranged behind said piston within said cylinder which renders said mouth-core normally protruded for the casting operation, and means for retracting said mouth-core by the air on its way to the interior of the bottle.

15. In a machine for making glass bottles by casting and blowing, the combination with means for introducing the air and with parison and blowing molds of a neck-mold with which each parison-mold and each blowing-mold are alined in succession, a support for the same having an axial cylinder within it, a piston movable within said cylinder, a mouth-core carried by said piston, a spring arranged behind said piston within said cylinder which renders said mouth-core normally protruded for the casting operation, and means for retracting said mouth-core by the air on its way to the interior of the bottle, such means comprising an inlet-pipe, a chambered neck-mold carrier to which said pipe is coupled, a hand-actuated valve within said carrier, and an open-ended tube embraced by said piston and in communication with said pipe by way of said valve in one position of the lever-handle.

16. In a machine for making glass bottles by casting and blowing, the combination with means for introducing the air, and with parison and blowing molds, of a neck-mold with which each parison-mold and each blowing-mold are alined in succession, a rotatable support for the same having a conical bore concentric with the neck-mold, a neck-mold carrier having a seat for said rotatable support and a concentric tapped bore, a cylinder-forming hollow screw fitted to said bores, a piston within each cylinder, a normally protruding mouth-core carried by said piston, and means for retracting said mouth-core by the air on its way to the interior of the bottle.

17. In a machine for making glass bottles by casting and blowing, the combination with means for introducing the air, and with parison and blowing molds, of a neck-mold with which each parison-mold and each blowing-mold are alined in succession, a separable mouth-core within the same interchangeable with others of different shapes and sizes, means for rendering such mouth-core normally protruded, and an interchangeable lip-molding ring surrounding said mouth-core and limiting its protrusion.

18. The combination, in a machine for making glass bottles, of a vertical parison-mold, a subjacent neck-mold alined therewith and rotatable around its longitudinal axis, a shaft substantially at right angles to the axis of said neck-mold, means for continuously rotating said shaft, a bearing for said shaft having diametrical pivots, means for tilting said bearing on said pivots, a friction-wheel carried by said shaft, and a driven friction-wheel by which said neck-mold is carried.

19. The combination, in a machine for making glass bottles, of a vertical parison-mold, a subjacent neck-mold alined therewith and rotatable around its longitudinal axis, a shaft substantially at right angles to the axis of said neck-mold, means for continuously rotating said shaft, a bearing for said shaft having diametrical pivots, means for tilting said bearing on said pivots, a friction-wheel carried by said shaft, a driven friction-wheel by which said neck-mold is carried, and means for tilting said bearing comprising a swiveled ring surrounding said shaft and provided with beveled lugs, rods having oblique forks engaged with said lugs, a connecting-ring to which said rods are attached, a ring swiveled to said connecting-ring, and a lever-handle connected with the ring last named.

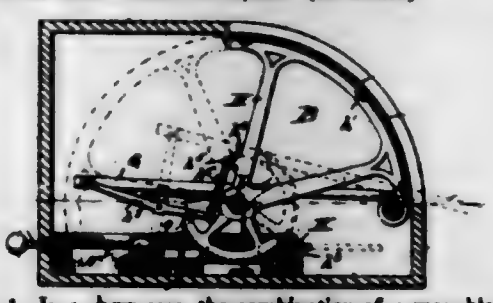
20. The combination, in a machine for making glass bottles, of a neck-mold, a blowing-mold vertically alined therewith, means for introducing the air, and means for rotating the neck-mold, the latter comprising a shaft substantially at right angles to the axis of said neck-mold, means for continuously rotating said shaft, a bearing for said shaft having diametrical pivots, means for tilting said bearing on said pivots, a friction-wheel carried by said shaft and a driven friction-wheel by which said neck-mold is carried.

21. The combination, in a machine for making glass bottles, of a neck-mold, a blowing-mold vertically alined therewith, means for introducing the air, and means for rotating the neck-mold, the latter comprising a shaft substantially at right angles to the axis of said neck-mold, means for continuously rotating said shaft, a bearing for said shaft having diametrical pivots, a friction-wheel carried by said shaft, a driven friction-wheel by which said neck-mold is carried, and means for tilting said bearing comprising a swiveled ring surrounding said shaft and provided with beveled lugs, rods having oblique forks engaged with said lugs, a connecting-ring to which said rods are attached, a ring swiveled to said connecting-ring, and a lever-handle connected with the ring last named.

22. The combination, in a machine for making glass bottles, of a neck-mold adapted to be rotated, a subjacent blowing-mold vertically alined therewith, and means for introducing the air and for rotating the glass at will, such means comprising a lever-handle common to both operations and having a hand end movable in different planes, a spigot-valve turned by said lever-handle, a fork carried by the inner end of said lever-handle, a swiveled ring to which said fork is connected, a connecting-ring carrying said swiveled ring, rods attached at one end to said connecting-ring and having oblique forks at their other ends, a swiveled ring having beveled lugs embraced by said forks, a continuously-driven shaft, and friction-gearing, thrown into and out of mesh by the edgewise movement of the ring last named, for transmitting motion from said shaft to the neck-mold.

23. The combination, in a machine for making glass bottles, of a pair of neck-molds, arranged back to back, adapted to be rotated and to be moved around a horizontal axis into alternative vertical positions, a parison-mold and a blowing-mold alined with the respective neck-molds, and means for introducing the air and for rotating the glass at will, such means comprising a lever-handle common to both operations and having a hand end movable in different planes, a spigot-valve, concentric with said horizontal axis, turned by said lever-handle, a fork carried by the inner end of said lever-handle, a swiveled ring to which said fork is connected, a connecting-ring carrying said swiveled ring, rods attached at one end to said connecting-ring and having oblique forks at their other ends, a swiveled ring having beveled lugs embraced by said forks, a continuously-driven shaft, and friction-gearing, thrown into and out of mesh by the edgewise movement of the ring last named, for transmitting motion from said shaft to either neck-mold, substantially as hereinbefore specified.

704,056. **SHOW-CASE.** JOHN S. LEWIS and DANIEL F. SNOW, Wabash, Ind., assignors of three-tenths to Ludwig Wolf, Wabash, Ind. Filed Nov. 18, 1900. Serial No. 37,015. (No model.)



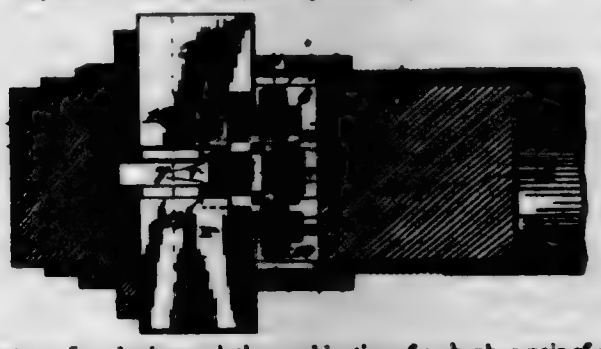
Claim.—1. In a show-case the combination of a movable front, a movable bottom secured to said case, and connected to said front; an operating-rod under said bottom adapted to operate said movable front and movable bottom, intermediate mechanism, between said operating-rod and said movable front and said movable bottom, whereby said bottom is extended and tilted and said front raised, substantially as described.

2. In a show-case the combination of a movable front, a movable bottom secured in said case, an operating-rod under said bottom whereby said movable front and movable bottom are simultaneously operated intermediate mechanism, an operating-lever adapted to turn said operating-rod, a spring-catch adapted to engage said operating-rod, a cash-drawer secured to said spring-catch, and means for releasing said drawer by said operating-rod substantially as described.

3. In a show-case, the combination of a movable front, a bracket supporting said front, a toothed arc integral therewith, an operating-rod adapted to move said toothed arc, means on said rod for coöperating with said toothed arc, a movable bottom connected to said bracket, and means for simultaneously moving said front and bottom, substantially as described.

4. In a show-case, the combination of a movable front, means for supporting said front, a movable bottom connected to said supporting means, means for extending and tilting said bottom, and simultaneously moving said front.

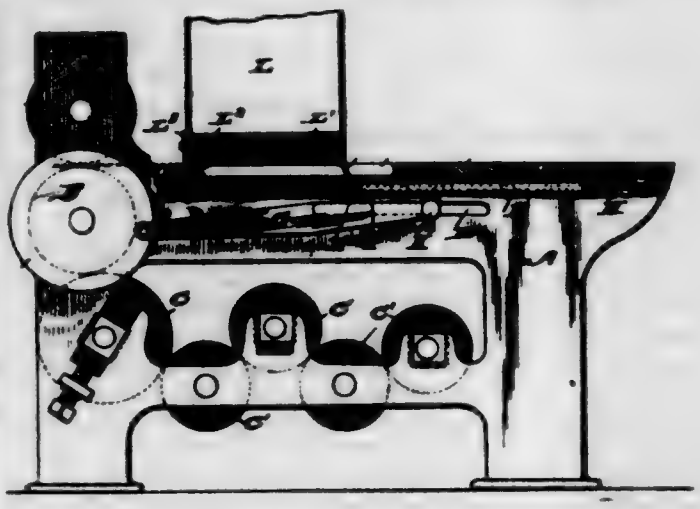
704,057. **EXPANSIBLE BORING-TOOL.** HENRY LIEBERKNECHT, St. Louis, Mo., assignor to Sandford Northrop, St. Louis, Mo. Filed Oct. 21, 1901. Serial No. 79,201. (No model.)



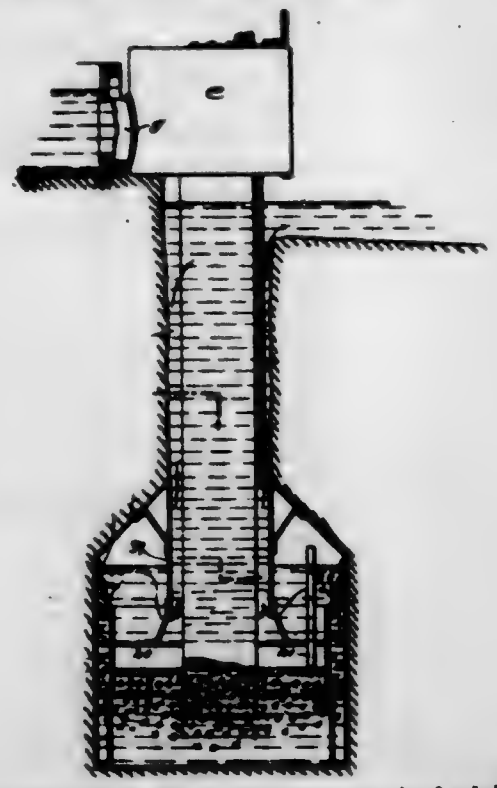
Claim.—In a boring-tool, the combination of a shank, a pair of cutter-holders movably located in said shank, carrier-blocks connected to said cutter-holders, an adjustment-rod having right and left screws seated in said carrier-blocks, a collar loosely fitted to said adjustment-rod, and a set-screw by which said collar is removably held, substantially as described.

704,058. **ENVELOP-FEEDER FOR PRINTING-PRESSES.** HYMEN W. LILLY, Leavenworth, Kans. Filed Apr. 13, 1901. Serial No. 55,747. (No model.)

Claim.—A machine for feeding and printing envelops comprising in combination a main frame having the printing-roll, the platen-roll and inking-rolls journaled therein, the table having a plurality of longitudinal slots, a block sliding in ways in the sides of the main frame, and beneath the table, the forward end of said block being inclined, the feed-plate having an elongated opening, said plate having a plurality of pusher-fingers which project through the slots of the table, said feed-plate being adjustable upon the end of the sliding block, the envelop-hopper arranged above the slotted portion of the table, said hopper having openings at the bottom of the front and rear sides, and a gage-plate adjustable upon the exterior of the front side of hopper, and means for operatively connecting the printing-roll and sliding block for the purpose described.



704,059. **HYDRAULIC AIR-COMPRESSOR.** WILLIAM J. LEITCH, Woodstock, Canada, assignor to the Taylor Hydraulic Air Compressing Company, Limited, Montreal, Canada, a Corporation of Canada. Filed Feb. 21, 1900. Serial No. 6,044. (No model.)



Claim.—1. In a hydraulic air-compressor, a pair of subchambers located one above the other, a vertical water-conduit communicating at its lower end with the lower subchamber; a water-passage leading from said lower to said upper subchambers; a water-conduit leading from the upper subchamber to the overflow of the compressor; an air-pipe leading from the lower to the upper subchambers and an air-pipe leading from the upper subchamber to the point of consumption.

2. In a hydraulic air-compressor, a pair of subchambers located one above the other; a vertical water-conduit communicating at its lower end with the lower subchamber at a point a short distance from the lower end thereof; a water-passage leading from said lower to said upper subchamber; a water-conduit leading from the upper subchamber to the overflow of the compressor; an air-pipe leading from the lower to the upper subchamber; and an air-pipe leading from the upper subchamber to the point of consumption, substantially as described and for the purpose set forth.

3. In a hydraulic air-compressor, a pair of subchambers located one above the other; a vertical water conduit communicating at its lower end with the lower subchamber at a point a short distance from the lower end

thereof; a water-passage leading from a short distance above the level of the lower end of said vertical water-conduit in said lower subchamber to a point above the lower end of said upper subchamber; a water-conduit leading from a point in the upper subchamber slightly below the upper end of the said water-passage to the overflow of the compressor; an air-pipe leading from the lower to the upper subchamber; and an air-pipe leading from the upper subchamber to the point of consumption, substantially as described and for the purpose set forth.

4. In a hydraulic air-compressor, a pair of subchambers located one above the other; a vertical water-conduit communicating at its lower end with the lower subchamber at a point a short distance from the lower end thereof; a water-passage leading from said lower to said upper subchamber; a water-conduit leading from the upper subchamber to the overflow of the compressor; an air-pipe leading from a point in the lower subchamber intermediate the top thereof and the lower end of said water-passage to a point in the upper subchamber intermediate the top thereof, and the upper end of said water-passage; and an air-pipe leading from the upper end of the upper subchamber to the point of consumption, substantially as described and for the purpose set forth.

5. In a hydraulic air-compressor, a pair of subchambers located one above the other; a vertical water-conduit communicating at its lower end with the lower subchamber at a point a short distance from the lower end thereof; a water-passage leading from a short distance above the level of the lower end of said vertical water-conduit in said lower subchamber to a point above the lower end of said upper subchamber; a water-conduit leading from a point in the upper subchamber slightly below the upper end of the said water-passage to the overflow of the compressor; an air-pipe leading from a point in the lower subchamber intermediate the top thereof and the lower end of said water-passage to a point in the upper subchamber intermediate the top thereof and the upper end of said water-passage; and an air-pipe leading from the upper end of the upper subchamber to the point of consumption, substantially as described and for the purpose set forth.

6. A hydraulic air-compressing apparatus having a vertical stand-pipe for conducting the water downwardly a dome inclosing the lower end of said stand-pipe and interiorly divided to form a pair of subchambers located one above and adjacent to the other said lower subchamber having its lower end open and said upper subchamber having its upper end open; an air-pipe leading from the lower to the upper subchamber, a second air-pipe leading from the upper subchamber to the point of consumption, and a water-conductor leading upwardly from the dome, substantially as described and for the purpose set forth.

7. A hydraulic air-compressing apparatus having a vertical stand-pipe for conducting the water downwardly, a dome inclosing the lower end of said stand-pipe and interiorly divided to form a subchamber above and adjacent to the lower end of said stand-pipe, said subchamber having its lower end open; a truncated conical top upon said dome; a water-passage leading from said subchamber to the space in the dome above said subchamber; a tubular section connected at its upper end to the edge of the opening in said truncated top and extending downwardly into said dome to close proximity to said subchamber; an air-pipe leading from the subchamber to the space between said tubular section and the top of the dome; a second air-pipe leading from the said space between the tubular section and the top of the dome to the point of consumption, and a water-conductor leading upwardly from the upper end of said tubular section, substantially as described and for the purpose set forth.

8. A hydraulic air-compressing apparatus having a vertical stand-pipe for conducting the water downwardly, a dome located at and inclosing the lower end of said stand-pipe and having a truncated conical top; a vertically-arranged cylindrical section with open ends supported in said dome above the lower end of said stand-pipe and of sufficiently less diameter than said dome to provide a vertical passage therebetween and said dome, a horizontal diaphragm dividing said cylindrical section midway of its height; a tubular section connected at its upper end to the edge of the opening in the top of the dome and extending downwardly a short distance below the upper edge of the cylindrical section, an air-pipe leading from a point a short distance above the lower end of said cylindrical section upwardly to the space between said tubular section and the top of the dome; and a second air-pipe leading from said space to the point of consumption, substantially as described and for the purpose set forth.

9. The combination with a water-conductor, of an air-supplying bar and means for supplying air to said bar, said bar being arranged transversely of the said conductor and adapted to supply air throughout one side thereof to the body of water traveling through said conductor.

10. In a hydraulic air-compressor of the class described, the combination with the water-conductor, of an air-supplying bar and means for supplying air to said bar, said bar being arranged transversely of the said conductor and adapted to supply air throughout one side thereof to the body of water traveling through said conductor to provide an air-supply of extended area.

11. In a hydraulic air-compressor of the class described, the combination with the water-conductor, of an air-supplying bar, and a valve-controlled pipe for supplying air to said bar, said bar being arranged transversely of the said conductor and adapted to supply air throughout one side thereof to the body of water traveling through said conductor to provide an air-supply of extended area.

12. In a hydraulic air-compressor of the class described, the combination with the water-conductor of an air-supplying bar of V cross-section and extending transversely of said conductor with its open side facing the exit end of said conductor, substantially as and for the purpose set forth.

13. The combination with a water-conductor, of an air-supplying section consisting of a hollow annular part; a series of air-conducting bars extending transversely of and communicating at their ends with said annular part, and having air-exits in their sides facing the direction of water-flow; and an air-conducting pipe connected to said annular part.

14. In a hydraulic air-compressor of the class described, the combination with the water-conductor of an air-supplying section consisting of a hollow annular part resting upon the upper end of said water-conductor; a series of air-conducting bars extending transversely of and communicating at their ends with said annular part, and having air-exits in their under sides; and an air-conducting pipe communicating with the atmosphere at its upper end and connected to said annular part at its lower end substantially as described and for the purpose set forth.

15. In a hydraulic air-compressor of the class described, the combination with the water-conductor of an air-supplying section consisting of a hollow annular part resting upon the upper end of said water-conductor; a series of air-conducting bars extending transversely of and communicating at their ends with said annular part and having air-exits in their under sides; an air-conducting pipe communicating with the atmosphere at its upper end and connected to said annular part at its lower end and a damper for controlling said pipe, substantially as described and for the purpose set forth.

16. In a hydraulic air-compressor of the class described, the combination with the water-conductor of an air-supplying section consisting of a hollow annular part resting upon the upper end of said water-conductor; a series of air-conducting bars of V cross-section arranged with their open sides facing downwardly and extending transversely of and communicating at their ends with said annular part; and an air-conducting pipe communicating with the atmosphere at its upper end and connected to said annular part at its lower end, substantially as described and for the purpose set forth.

17. In a hydraulic air-compressor of the class described, the combination with the water-conductor of an air-supplying section consisting of a hollow annular part resting upon the upper end of said water-conductor; a series of air-conducting bars of V cross-section arranged with their open sides facing downwardly and extending transversely of and communicating at their ends with said annular parts; an air-conducting pipe communicating with the atmosphere at its upper end and connected to said annular part at its lower end and a damper for controlling said pipe, substantially as described and for the purpose set forth.

18. In an air-compressor of the class described, the combination with the stand-pipe, of a series of horizontally-arranged air-supplying sections superimposed one upon the other, and an independent air-conducting pipe leading to each section, substantially as and for the purpose set forth.

19. In an air-compressor of the class described, the combination with the stand-pipe, of a series of horizontally-arranged air-supplying sections superimposed one upon the other, an independent air-conducting pipe leading to each section, and a damper for controlling each pipe, substantially as and for the purpose set forth.

20. In an air-compressor of the class described, the combination with the stand-pipe, of a series of horizontally-arranged air-supplying sections superimposed one upon the other, each section consisting of a hollow annular part and a series of air-conducting bars extending transversely of and communicating at their ends with said annular part and having air-exits in their under sides; and an independent air-conducting pipe leading to each section, substantially as and for the purpose set forth.

21. In an air-compressor of the class described, the combination with the stand-pipe, of a series of horizontally-arranged air-supplying sections superimposed one upon the other, each section consisting of a hollow annular part and a series of air-conducting bars of V cross-section arranged with their open sides facing downward extending transversely of and communicating at their ends with said annular part, and an independent air-conducting pipe leading to each section, substantially as and for the purpose set forth.

22. In an air-compressor of the class described, the combination with the stand-pipe of a series of horizontally-arranged air-supplying sections superimposed one upon the other, each section consisting of a hollow annular part and a series of air-conducting bars of V cross-section arranged with their open sides facing downward extending transversely of and com-

communicating at their ends with said annular part; an independent air-conducting pipe leading to each section, and a damper for controlling each pipe, substantially as and for the purpose set forth.

22. In a hydraulic air-compressor comprising a descending body of water, a series of air-supplying devices immersed at their lower ends in said descending body of water and communicating at their upper ends with the atmosphere, and means for deflecting said water to flow across and in close proximity to the air-egress ports of said devices, for the purpose set forth.

24. In a hydraulic air-compressor comprising a descending body of water, a series of air-supplying devices immersed at their lower ends in said descending body of water and communicating at their upper ends with the atmosphere, and adjustable means for deflecting said water as it varies in volume to flow across and in close proximity to the air-egress ports of said devices, for the purpose set forth.

25. In a hydraulic air-compressor comprising a descending body of water, a series of air-supplying devices immersed at their lower ends in said descending body of water and communicating at their upper ends with the atmosphere, means for automatically controlling the passage of air through the air-egress ports of said devices, for the purpose set forth.

26. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and means located between the lower sides of said bars for deflecting the descending water to flow across and in close proximity to said open sides, substantially for the purpose set forth.

27. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and vertically-adjustable means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, for the purpose set forth.

28. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, said deflecting means consisting of a ring, a series of bars triangular in cross-section with concave upper sides and set rigidly at their ends in said ring, and means for supporting said ring, substantially as and for the purpose set forth.

29. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and automatically vertically adjustable means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, for the purpose set forth.

30. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, said deflecting means consisting of a ring, a series of bars triangular in cross-section with concave upper sides and set rigidly at their ends in said ring, and vertically-adjustable means for supporting said ring, substantially as and for the purpose set forth.

31. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, said deflecting means consisting of a ring, a series of bars triangular in cross-section with concave upper sides and set rigidly at their ends in said ring, and vertically-adjustable rods for supporting said ring and means for adjusting said rods, substantially as and for the purpose set forth.

32. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, said deflecting means consisting of a ring, a series of bars triangular in cross-section with concave upper sides and set rigidly at their ends in said ring, means for supporting said ring, and means for automatically vertically adjusting said supporting means, substantially as and for the purpose set forth.

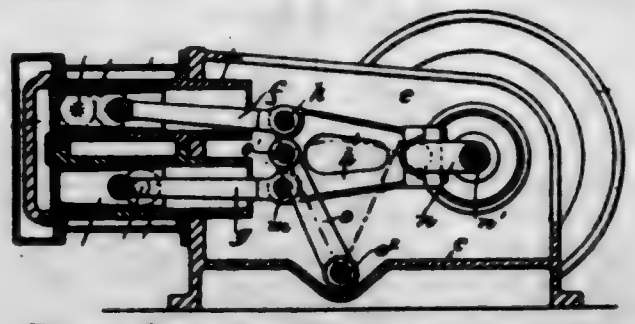
33. In a hydraulic air-compressor comprising a descending body of water, a series of air-bars of V cross-section arranged parallel to one another with their open sides facing downwardly and in the same horizontal plane, means for supplying air to said bars, and means located between the lower sides of said bars for deflecting the descending water to envelop said open sides, said deflecting means consisting of a ring, a series of bars triangular in cross-section concave upper sides and set rigidly at their ends in said ring, and vertically-adjustable rods for supporting said ring and means for automatically adjusting said rods, substantially as and for the purpose set forth.

34. In combination with the stand-pipe of a hydraulic air-compressor of the class described, a valvular cylindrical section of a diameter to rest upon the top of said stand-pipe, and means for adjusting said valvular section to and from said stand-pipe, for the purpose set forth.

35. In combination with the stand-pipe of a hydraulic air-compressor of the class described, a valvular cylindrical section of a diameter to rest upon the top of said stand-pipe and means under control of the air compressed by said compressor for automatically adjusting said valvular section to and from said stand-pipe, substantially as and for the purpose set forth.

36. In a hydraulic air-compressor, the combination with the stand-pipe thereof and the pipe for conducting the compressed air therefrom, of a valvular cylindrical section of a diameter to rest upon the top of said stand-pipe; a vertical cylinder; means for supporting said vertical cylinder above said annular section; a piston within said vertical cylinder; a piston-rod connected at its upper end to said piston and at its lower end to said valvular section; a three-way valve; a branch pipe connecting the lower end of said vertical cylinder to one of the ports of said three-way valve; a second branch pipe connecting another of the ports of said three-way valve to the said compressed-air conducting-pipe; a horizontal cylinder located adjacent to said three-way valve; a piston within said last-mentioned cylinder; a piston-rod connected at one end to said last-mentioned piston; a bell-crank lever; means for supporting said bell-crank lever; one of the arms of said bell-crank lever being connected to the outer end of said last-mentioned piston-rod, the other arm of said bell-crank lever being elongated and graduated in the form of a beam and having a counterpoise movable longitudinally thereon; a lever connected rigidly at one end to the valve-stem of said three-way valve and at its other end to the outer end of said last-mentioned piston-rod; a branch pipe connecting said second branch pipe to said horizontal cylinder; and means for guiding said valvular cylindrical section in its movement to and from the top of the stand-pipe; substantially as described and for the purpose set forth.

704,060. INTERNAL-COMBUSTION ENGINE. FRANK LEITER, Keighley, England. Filed July 27, 1901. Serial No. 69,998. (No model.)



Claim.—1. In an engine of the class described, a cylinder having an inlet-port, a cylinder having an exhaust-port, pistons operating in said cylinders, a crank-shaft, an intermediate rigid connecting-piece extending rearward from the crank toward the two pistons and pivotally connected with the crank and pistons, and means for guiding said intermediate piece in a predetermined path during its reciprocations, whereby said crank-shaft is coupled to said pistons so that one piston leads the other, substantially as herein specified.

2. In an engine of the class described, a cylinder having an inlet-port, a cylinder having an exhaust-port, an explosion-chamber common to these cylinders, pistons in said cylinders, a crank-shaft and an intermediate connecting-piece extending rearward from the crank toward the two pistons and pivotally connected with the crank and pistons, and means for guiding said connecting-piece in a predetermined path during its reciprocations to enable one piston to lead the other.

3. In an engine of the class described, two cylinders having a common explosion-chamber, pistons in said cylinders, connecting-rods on said pistons, a triangular piece or three-armed lever pivotally connected to said rods and a crank to which said triangular piece is pivotally connected, in combination substantially as herein set forth.

4. In an engine of the class described, a plurality of cylinders, pistons for said cylinders, rods pivotally connected to said pistons, a crank, a triangular piece, connecting said rods to said crank, and a lever for supporting the triangular piece in combination substantially as herein specified.

5. In an engine of the class described, a plurality of cylinders, pistons to operate in the same, piston-rods, a crank-shaft, rigid connections separate from the crank-shaft and interposed between said crank-shaft and the piston-rods, and means for controlling the movements of said connections, whereby one piston will lead the other.

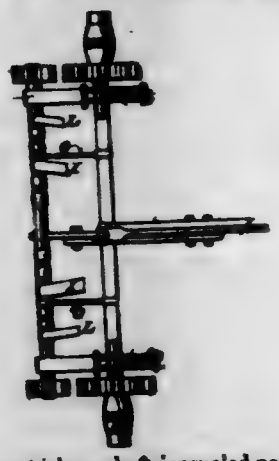
6. In an engine of the class described, a plurality of cylinders, feed and exhaust ports having valves mounted within them in connection with said cylinders, pistons constructed to operate in said cylinders and other means in conjunction with said pistons whereby after expansion and exhaust of the waste gases during movement of the pistons in one direction the charge is induced to enter the cylinders by the continued motion of said pistons and the other parts in the same direction whereby said pistons may be coupled to the crank and said crank in combination substantially as specified.

7. In an engine of the class described, a plurality of parallel cylinders, pistons operating in said cylinders, a crank, a rigid connecting-piece for coupling said crank and said pistons together, means for controlling the movements of said connecting-piece, and a pump for supplying the charge to said cylinders and means for operating said pump in combination substantially as herein specified.

8. In an engine of the class described, a plurality of parallel cylinders, pistons for same, a crank, a rigid connecting-piece for coupling said crank to said pistons, means for controlling the movements of said connecting-piece, a casing for inclosing said crank and other parts, a valve mounted on said casing, an inlet-port leading from the interior of said casing to the interior of the cylinders and said casing in combination substantially as herein specified.

9. In an engine of the class described, a plurality of parallel cylinders, pistons for same, a crank, a rigid connecting-piece for coupling said crank to said pistons, means for controlling the movements of said connecting-piece, a pump for supplying the charge to said cylinders, a governor on said pump whereby the charge when not required is forced back into the main, and means for operating same in combination substantially as herein specified.

704,061. **HORSE-HOLDING DEVICE.** MATEO LOPESON, Sacramento, Cal. Filed Apr. 21, 1902. Serial No. 103,894. (No model.)



Claim.—1. In a vehicle, a shaft journaled parallel with and behind the rear axle, the guides slidable upon the rear axle, and to which the journal-boxes of the shaft are connected whereby the guides and shaft move in unison, gears fixed to the ends of the shaft, corresponding gears in line therewith carried upon the rear-wheel hubs, springs by which the shaft is normally drawn toward the axle and the gears engaged, and a lever and connections by which the shaft and guides may be moved backward and the gears disengaged.

2. A vehicle having a shaft movably journaled with relation to the rear axle, guides extending from the shaft and slidably mounted upon said axle said shaft and guides movable in unison, gears carried by the shaft in the rear wheels, springs by which the shaft is normally drawn forward and the gears engaged, straps coiled upon the shaft extending forwardly, and means for detachably connecting the straps with the driving-reins and also with the breeching of the harness.

3. A vehicle having a shaft movably journaled with relation to the rear axle, gears carried by the shaft and the rear wheels, springs by which the shaft is normally drawn forward and the gears engaged, straps coiled upon the shaft extending forwardly, other straps detachably connected therewith leading through guides upon the tugs or traces and returned and connected with the breeching of the harness.

4. Means for controlling horses attached to vehicle consisting of a shaft guided and movably mounted with relation to the rear axle of the vehicle, gears carried upon the rear-axle hubs, corresponding gears mounted upon the shaft, springs by which the shaft is normally drawn toward the axle and gears engaged, straps adapted to coil upon the shaft when rotated, connections between said straps and the breeching and driving-reins, and a foot-lever and connections between it and the shaft whereby the latter may be moved and the gears held out of engagement while the vehicle is being driven.
